THEATRUM BOTANICVM:

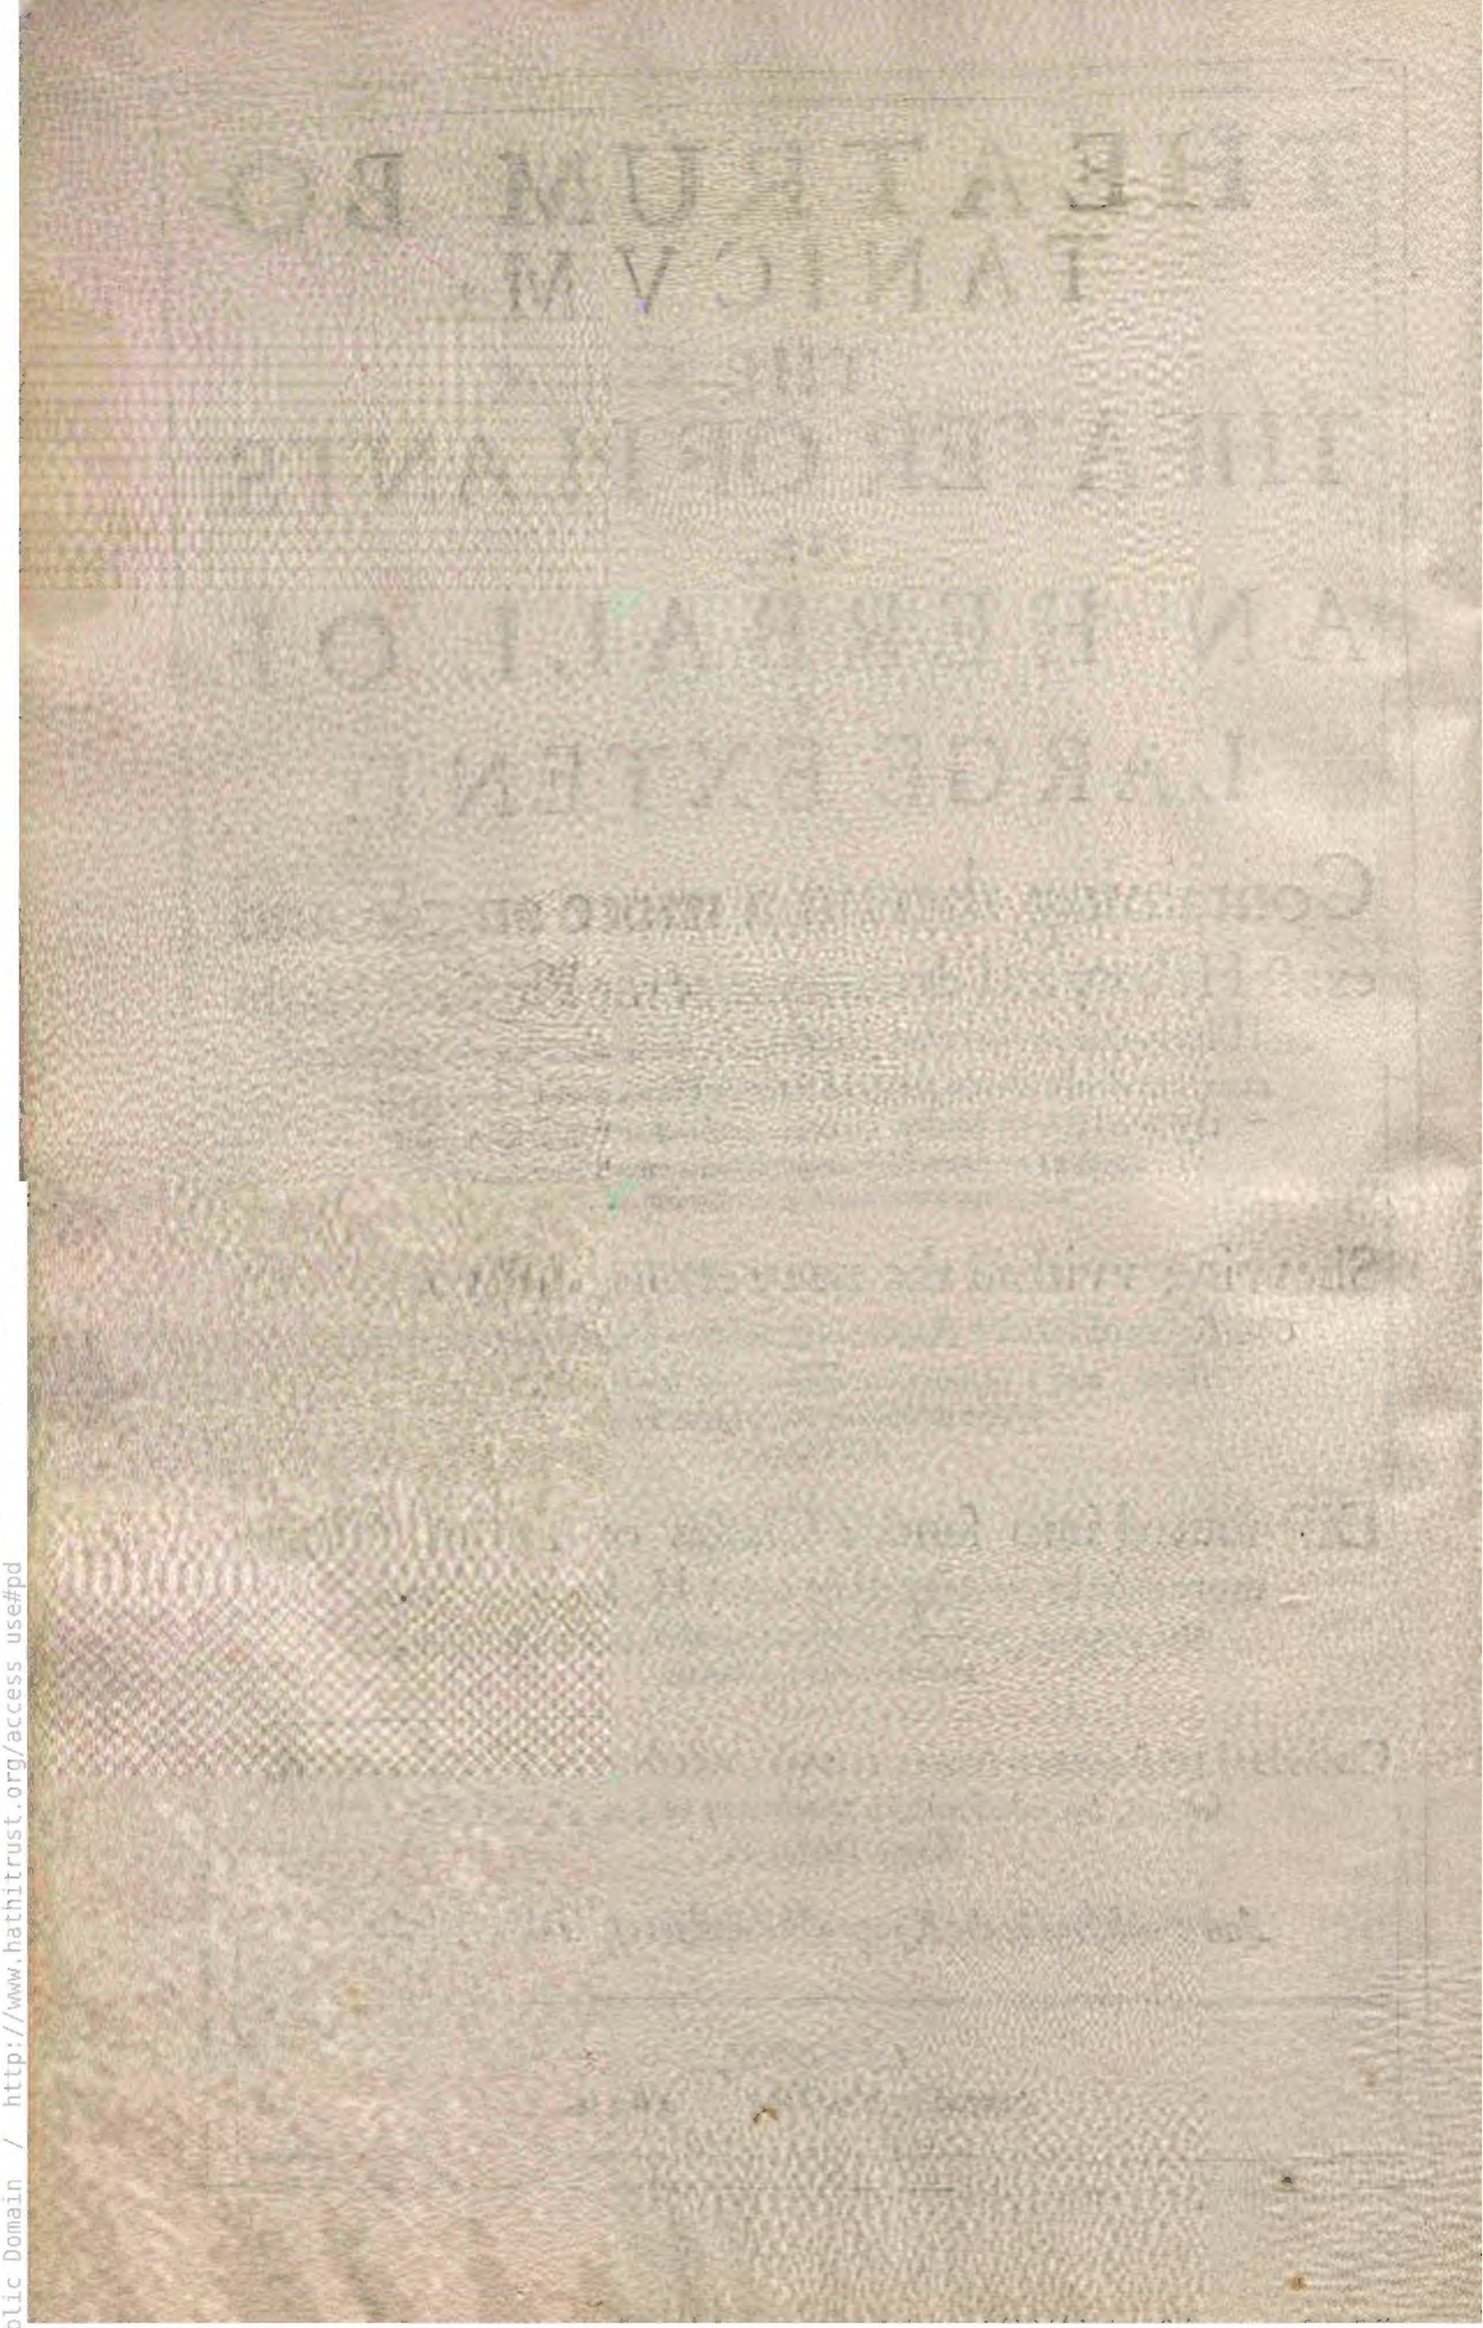
THE THEATER OF PLANTS.

OR,

AN HERBALL OF A LARGE EXTENT:

Containing therein a more ample and exact History and declaration of the Physicall Herbs and Plants that are in other Authours, encreased by the accesse of many hundreds of new, rare, and strange Plants from all the parts of the world, with sundry Gummes, and other Physicall materials, than hath beene hitherto published by any before; And a most large demonstration of their Natures and Vertues.

Shewing withall the many errors, differences, and oversights of sundry Authors that have formerly written of them; and a certaine confidence, or most probable conjecture of the true and genuine Herbes and Plants.



Distributed into sundry Classes or Tribes, for the more easie knowledge of the many Herbes of one nature and property, with the chiefe notes of Dr. *Lobel*, Dr. *Bonham*, and others inserted therein.

Collected by the many yeares travaile, industry, and experience in this subject, by *John Parkinson* Apothecary of *London*, and the Kings Herbarist.

And Published by the Kings Majesties especiall privilege.

LONDON,
Printed by *Tho. Cotes*. 1640.

TO THE KINGS MOST EXCELLENT MAIESTIE.

HAving by long paines and endeavours, compoſed this Manlike Worke of Herbes and Plants, Moſt gracious Soveraigne (as formerly did a Feminine of Flowers, and preſented it to the Queenes moſt excellent Majeſty) I could doe no leſſe then ſubmiſſively lay it at your Majeſties feet, to be approved or condemned, and if thought fit and worthy a publique paſſage, to offer it on the Altar of your Majeſtyes many favours to me, to be commanded as well as commended unto all for their owne good. For as your Majeſty is *Summus Pater patriæ*, the chiefe of your people under God, that not onely provideth for their ſoules health, that they may have the pure Word of God, whereby to live ever, wherein we juſtly claime the prerogative above any Nation under Heaven, and moſt devoutly praiſe God for the ſame, and deſire religiouſly to live thereunder: but many wayes alſo for their bodily eſtates, by good and wholeſome Lawes, that every one may live obediently and peaceably under their owne Vine and Figtree, and by protection, &c. And I doubt not of your Majeſties further care of their bodies health, that ſuch Workes as deliver approved remedyes may be divulged, whereby they may both cure and prevent their diſeaſes. Moſt properly therefore doth this Worke belong to your Majeſties Patronage both to further and defend, that malevolent ſpirits ſhould not dare to caſt forth their venome or aſperſions, to the prejudice of any well deſerving, but that thereby under God and good direction, all may live in health, as well as wealth, peace, and godlines, which God grant, and that this boldneſſe may be pardoned to

Your Majeſtyes

Loyall Subject,

Servant, and Herbariſt,

John Parkinſon.

To the Reader.

THe disastrous times, but much more wretched and perverse men have so farre prevailed against my intended purpose, and promise, to exhibite this Worke to the publicke view of all; that their extreame avretousnesse had well nigh deprived my Country of the fruition: But having at last, though long and with much adoe, broken through all obstacles opposing tandem prodiit in lucem. And although by the revolution of time it hath changed the note (that is from a Physicall Garden of Simples, to a Theater of Plants) yet not the nature, yea rather it hath gained the more matter by the overture, that intending to exclude many of those things that were not proper for it, this enclusing a tot quot dici potcrint. For finding in my Profession many slips and errors crept therein and incident thereto, it stirred up a desire in me, having rightly weighed them, seriously to consider how such a customary custome will be left off and amended; yet not doubting of the effect, by the rationall examination of my Country when just reasons shall be shewed therefore, (although some delight to be obstinate, and because they were bred up in errors, they will not be wiser then their Fathers, but together live and dye in them, yea and condemne that light that others have (as unto them seemes) their darkenesse better) both to avoyd and amend them; but to accomplish that, hic labor hoc opus erat, this was a taske lay some what heavy on me to undergoe, and tooke up no small time to finish, howsoever Master Johnsons agility could easily wade through with it, and his younger yeares carry away greater burdens, for such be heavy taskes are well borne by them that are lesse able, but his quicke speed may conclude with that adage Canis festinans cæcos parit catulos: but how and in what sort it is done I leave to judicious censures, not to sharpe toothed and tongued selfe-gnawing envy, that will traduce all others workes to magnifie their owne; for mine owne part, although I boast not of great learning, lest it might better have illustrated this worke, yet seeing my genius hath ever driven me to these studies, and my many yeares I thinke hath given me a little more experience, being solong versit thereabout, I hope my time hath not been ill spent if well taken both in the detection and direction, as also that it will prove more usefull and certaine in rem publicam Botanicam, then some others have gone before me, yet if any after me can without envy, having younger and clearer eyes and more setled judgement withall, amend ought that I have set amisse, or not fully declared, per me licet. I know that whosoever shall runne through some my Fields, Woods, Hils, &c. as this worke includeth, and shall trip at no time, hic erit mihi magnus Apollo, I will crowne him with such a Garland as neither his antecessors or successors ever did or shall weare; yea let not any presumptuous spirit malice or menace the Author if he have laid open some of their errors, as if they might ever free, or thinke themselves better then Theophrastus, Dioscorides, Galen, Pliny, &c. of the Ancients; or, Tragus, Matthiolus, Clusius, Lobel, Bauhinus, of the Moderns, whose slips and errors I unfold likewise, who no doubt if now alive, being equally experiment, would rather embrace then spurne the same that strake them. One hint more and Mercury in a Booksellers shop, for more roome I must not overslip, that would tease the Reader, because I have not followed Gesners method, in setting Letters to the severall vertues of the Plants, and must therefore be villifyed as if no other method were comparable thereto. I verily say

for mistaken by the alteration you enjoy a double benefit, first in the Booke which if that enough had beene, I also first would have beene intreated to have taken much more, and made it the more compleate, and likewise the dearer and never a whit the better. Secondly, in regard of the time spent in looking for what you seek, you may read that which may be more helpefull and beneficiall to you. Let Momus shape therefore be fowel apes backe no more. Among other the good uses this worke affordeth, this may be one, that it will helpe to correct the English names in all the Dictionaries to bee hereafter set forth, which have them in many quantities, in some contrary, in most devious, in very few true, whereby many hoping for helpe in their Dictionaries when on Yarball was not at hand have beene frustrated, the blind leading the blind, which how profitable, I leave to every intelligent eye to consider. And lastly, although I goe not about to teach Doctors (who but little intended this practise, having enough to doe otherwayes, and yet it is as I may so say, the fundamentall part thereof, and approved by Galen in his censure of Simples, and Dioscorides Text.) but to helpe their memories, and withall to shew them my judgement, that they mistake not one thing for another, or one mans plant for another, which I hope will well deserve their good liking: for the various conceites of men about Plants is for the most part according to their knowledge in them, and hath caused such mistakings and controversie, as are to be seene in their writings. Goe forth now therefore thou issue artificiall of mine, and supply the defect of a Naturall, to beare up thy Fathers name and memory to succeeding ages, and what in thee lyeth effect more good to thy Prince and Country then numerous of others, which often prove rather plagues then profits thereto, and scare not the face of thy fiercest foe: but say that while we live, (although the course of the World is Orientem semper adorare Solem non occidentem) and per multa discrimina rerum tendimus in Xaviam supercœlestem, if any oppose thee, or professe himselfe a Proctor for Bauhinus or any others slips, the lists shall be ready, and the controversie ex ore decided: if extinct let the judicious determine the matter. And because some may object I am somewhat too tart and quicke, my Apology to all is Amicus mihi Plato, Amicus Seneca sed magis Amica mihi veritas: *accept therefore in courtesie of his paines that hath only intended it for your good, and if I have either slipped or overslipped, with a gentle hand amend it, so shall he still be*

Thine in what he may,

IOHN PARKINSON,

Botanicus Regius.

In Laudem Operis, & Authoris Domini Iohannis Parkinsoni Archi Botanici Regii Dignissimi & Pharmacopolæ Peritissimi.

Ela quod invidiæ dentes quod despuit ævi,
Hic *Parkinsoni* Nobile cernis opus.
Hic simul Alcinoi spectas & Adonidis hortos,
Quicquid & Herbarum barbara Colchis habet.
Aspicis hic quicquid Borex contermina Thule,
Quicquid & *Æthiopum* torrida fundit humus.
Nobilis hic Tamesis messes miratur Eoas,
Quotquot & peciduo gramina sole tepent.
Qui dedit has Patriæ gazas, me Iudice, vincit
Asta Cleonæi Pharmacopola ducis.
Claruit Hesperidum spoliis Tyrinthius: hortos
Hic expulsis quotquot in Orbe vides.

Matthæus Listerus Eques Auratus
Regiarum Majestatum
Medicus Cubicularius.

Dignissimo

Dignissimo viro Io. Parkinsono Pharmacopæo experti-ssimo, & Botanico Regio solertissimo.

Audio te gaudere (Charissime Parkinsone) lucubrationes tuas Botanicas nunc tandem prodire in lucem, te verum Theatri tui fœtum quando ab incude tua quam optabas prudenti manu hac verna tempestate exporrigere: cum Planta ipsa, hyemis compedibus expedita, emergunt e terra, & nunc vestitum amittat quam summe longa tua desiderio nostro etiam libro tuo veniat, salus si quid in hoc genere videri plenum aut limatum: nam quicquid per artis fores hodierne in sua lucubratione viderit & mira, asseruerit & rara, maximo suo quoque Herbarii, ipsum ad hoc opus vellit strenuum videris exarasse. Qui jam ridet in luce prodiit Paradisus tuus, cui veterum fuit merito conflatus ex prædictis virtutibus, ut jucunda ad videndum, delectabilis ad meditandum, ita quam carduelis omnis floris genere vernis tuis, quo volucres vere Parkinsono, Deliciæ medicinæ Hygeæ & Panaceæ delectant; sed illud tuum Theatrum longum secundis fere, magnifice hic quam forsan luxuriat, ipsius Æsculapii patrocinio dignum, & ad ultimum usum accommodatum: ubi enim medicamentorum inferni omnis apparatu, tanquam fidei pharmacopœi mentibus rarum vere & opulentum congeris in erarium pharmaceuticum. Hic non species tantum utiles & suavis odoris ad ornatum & Medelarum universi, sed commodiora ejusmodi silvestria delectum & possessione generis humani, pro sanctis diuturnis, pro ægrotis pharmaca, pro longævitatibus cardiaca, pro singulis morbis singula remedia ex-tracta terræ tuæ & gremio decerpsisti. Ex imo namque terræ & gremio, non ex infima terræ superficie & mediocribus, Mineralia quidem in profundis terræ receptibus recondita, & procul a liberorum conspectu abscondita sagacissimus naturæ pervestigator, quanquam cubiculum gladius stellio illarum scrupulosus naturæ & pertinax vero tuæ quam terræ nimium & liberalissimus explicuisti & exhibuisti superficie tuæ prædilectæ, ubi non ex omni duntaxat semine emergunt, sed vere & sensu adhuc virentium etiam plantæ, & studio nutriuntur a terræ omnibus. Quæ vero tam habent redditi circumforanei Empirici in medendum, juris in alimentum, quia blanda quadam naturæ familiaritate sensim delabuntur in eorum viscera, & insinuant se in eorum sanguinem, illic quasi cognata sanguinis naturalia vero ipsa cum sint vitæ experta, vitam invident, mortem inferunt circumforaneis, ni innata illarum malitia in fornacibus Vulcani mitis Spagyricorum artibus edometur. Plantarum cum hominibus tam arcta fœderatio, ut hominem plantare dicerem. Etenim Plantarum nutrimentum, mineralium quia penetrat nulla est cum homine cognatione similitudo, nullo vero (ut loquuntur Scholæ) assimilatio. Fuit aliquando Midæ in aurum fabulosa metamorphosis, at aurum in Midam nequaquam: ubi quid semiviri, neque vero solam generis cum hominibus, quia nobis in una viventium familia, sed illarum plurimæ strictiorem vendicent cum humanis partibus sympathiam & analogiam, unde alia capiti, alia oculis, alia pulmonibus, alia jecori, alia lieni specialem dicarunt operam, & ab illis quibus simulantur partibus nomen latarum suas derivarunt, neque nudæ tantum nominacarum ferunt, sed insignia, quibus ut magnatum familiæ differminantur: nam (si Hermeticis credimus) signaturas physiognomonicas plenas insuit summus naturæ pictor, & ipsis quasi tot emblemata & characteres insculpsit, non modo occultarum suarum virtutum indices & notas, sed partium quibus inserviunt figuras & expressas imagines, incundissima similitudine referentes, quas Quercetanus & Crollius curiosius delineavere: gestit calamus in hoc campo liberius spatiari, sed ne cancellos tuos meas translilias Epistola, revoco me ad Theatrum tuum, in quo apparet mira gentis ingeniique tui in re Botanica fœlicitas, labor indefessus, nec horarum modo sed (quod pudet dicere) summorum virorum sumptus non mediocris: Vereor ne Parkinsone, ne non posse cum Matthiolo gloriari, te Mæcenates habuisse Imperatores, Reges, Archiduces, Cardinales, Episcopos, (ipsius mirabile dictu) quo auro argentoque hos omnes tam juverint cumulatius. Credo nullos imbres aureos hortum tuum irrigasse, ne ponas ut hanc publico inservientes privato defuisti, ut liberius vacares studio. Pharmacopolium deseruisti, speroque vilioris lucelli incapto retinet in hortulo tuo consenescit quid dicis, te senescere? nullane in Paradiso tuo arborina, quæ senectutem tuam retardet? nullane in Theatro tuo herbæ Balsamicæ, nectaris naturæ restauratrices, ex quibus Medea suum nutrimentum composuit, magnum illud secretum, quo Æsonem ultimis confectum senio pristinæ juventæ succis illarum nutritis reficiam pervenit, ut nolentes Herbæ quæ quotannis repullulant, convivant, reflorescunt, parem si non ætati tuæ, famæ quidem tuæ gratiam indulgebunt, & perenni gratitudine semper spirabunt suavem nominis tui auram: mihi cum talia desint Pharmaca, non deerunt vota, ut dia verus & valeas.

Datum Calend
Aprilis. 1640.

Tuus

Simon Baskervill
Eques Auratus. D. M.
To

To Englands chiefest Herbarist, Master *John Parkinson.*

worthy Sir,

I Have given (as was due) many thankes to my learned good friend Dr. *Bainbridge*, for communicating to me the light and perusall of your elargeable, industrious, judicious, usefull, *Herculean Botanicall* labours. The Commonwealth of learning, particularly the Tribe of Physitians, Apothecaries, Chirurgians, the Court of Nobles, and Gentles, of all who love knowledge, delight, and the honour and good of their Country, owe thankes to you, a Benefactour to the publique, to your Nation, to many millions of particular persons, to the present and succeeding ages. A Triumphall evergreene Lawrell crowne is due to you, for mastering such difficulties, for conquering the great enemyes of a civill World, ignorance and barbarisme, for saving so many Citizens of your owne Country, from danger, diseases, destruction, by your carefull understanding directions, for proper fit remedies, in such a rationall pleasing way. *Oxford* and *England* are happy in the foundation of a specious illustrious physicke Garden, compleately beautifully walled, and gated, now in levelling, and planting, with the charges and expences of thousands by the many wayes Honourable Earle of *Derby*, the furnishing and enriching whereof, and of many a glorious *Temple*, with all usefull delightfull plants, will be the better expended by your prudent happy satisfying Worke.

THO. CLAYTON, *His Majesties professor of Physicke*, Oxon.

To the excellent Herbarist Mr. *John Parkinson.*

Sir,

I Am a stranger to your selfe, but not to your learned, and elaborate volumnes. I have with delight, and admiration surveyed your *Theatrum Botanicum*, a specious, and lately fabrique, collected and compiled with excessive paines, and charges, exquisite Art, and Iudgement: wherein, may at once be seene, whatsoever (worth th' observing) hath dispersed in the severall Botanique monuments of former Ages, and the present. It being indeed, a select Deflouration of them all: enriched, and beautifyed with new discoveries (at home, and abroad, so far as both th' Indies) of many rare Plants, Herbes, and Flowers. It is a curious peinture, and description of th' Earths flowred mantle, the Botanique Pandects, and the Herbarists Oracle, a rich Magazin of soveraigne Medicines, physicall experiments, and rare curiosities. And which I may not omit. It is (not without th' influence of some benigne Constellation) an Euphrosinous delight of our *Oxford* Garden, which being (by the Munificence of the Honorable Founder) once furnished, will be * [illegible] th' eyes *Rendez-vous*, * Fairest of mirth delightfull, and ravishing objects: another Paradise. In a word, this Theater, is without * delightful Parallel, the worke of compleate, and absolute Workes (in this kinde) yet knowne unto the world: and will be a perpetuall Monument of your Name, Art, and Industry. Such (Sir) is your merit, and the more of me, that is worthy.

Your affectionate friend,
IOHN BAINBRIDGE,
Doctor of Physique, and
Professor of Astronomy, Oxon.

To the Worthy Apothecary and Herbarist

Master John Parkinson.

Worthy Sir,

Ou have built us a Botanicke Theater; with such excellent skill and advantage to the Spectator; that at one view he commands the prospect of both Hemispheres; and all their vegetables in the pride of beauty: ranged in their proper orders, decking the Hills, Plaines, Valleyes, Medowes, Woods, and Bankes, with such a world of shapes and colours, so delightfull to the eye, so winning upon the rationall Soule which feeds on rarities! that we cannot hope for a more compleate Paradise upon earth, till Nature have found out a new Sphere for more variety; what can be added to this I see not; nor is it (I believe) yet known to the best of Artists that have made search. *Vale Consule.*

Tuus Synod. Med. D. Oxon.

Elogium in Theatrum Botanicum

Iohannis Parkinsoni.

Ne amplius nobis indet Cratevam, Andream, Dioscoridem
Græcia, sua, suosque tantum mirari solita;
Ecce, ex ultimo Occidente,
Et *penitus toto divisis orbe* Britannis,
Exoritur nobis jam diu ex optatus
Sol alter Botanicorum,
Qui alios omnes luce sua præstrinxit,
Et, tanquam nimius humeris gigantæis subtexus,
Plus aliis radiat:
Nec id orbe litterato invidet,
Meliore omnia ordine, methodoque accuratiore digessit,
Quæque alii strictim, sparsimque, in unum congessit,
Tibique, Lector, uno intuitu
Spectanda proposuit,
Itaque disposuit,
Ut, quæ mole usquequaque maxima sunt,
Ordine & methodo quasi modica allubescant.
Sileat ætas avorum nostraque,
Tragum, Matthiolum, Fuchsium, Gesnerum, Dodonæum, Lobelium,
Alios item quotcumque, quotescunque;
Unus instar omnium Parkinsonus,
Columna Britannicus, cui vere inscribas licet
Nil ultra.
In quem felice & perquam rara conspiravere
Tam veterum, quam recentium omnium Botanicorum animum in unum commigrasse jures.
Hoc operi laudis vectigal,
Autori amicitiæ tesseram,
Et cultus testimonium,
Non tam amori, quam veritati obsequens
Persolvit. L. M.

Iohannes Mauritius.

Aliud.

Salve, Salve, venerande Senex,
Qui genius, cerebrum, medulla, coryphæus Botanicorum cluis,
Quem natura, tuusque genius
In hæc studia impulit,
Imo vi traxit,
Industria, laborque indefessus perfectum dedit.
Nec vero tibi, musisque solis caneres,
Sed nostræ simul, posteræque ætati pie prospiceres,
Opus hoc doctum, Jupiter & laboriosum
Summo studio laboreque improbo dedalasti;
Spretis interim & insuper habitis vitæ omnibus fere delimentis,
Tanquam Vlysses alter,
Obstructis auribus ad Syrenum cantum,
Scyllam Charybdimque voluptatis lucrique preternavigasti,
Quæ vere sunt mortalium in hac vitæ sola,
Scopuli, Syrtes, Symplegades,
Ut totum te hisce studiis immergeres.
Tanquam Alexander alter,
Contexeres florum Botanicarum nodos plusquam a Gordio
Aut feliciter enodasti,
Aut fortiter saltem dissecuisti.
Hinc merito cujus evolitas per ora virum.
I, perge, perge Floræ suprema mysta
De re literaria bene porro mereri,
Studia hæc ad metam evehere,
Perenne nomen, decusque tuum ultra supraque invidiam provehere,
Qui priscis palmam eripuisti
Invidiam æqualium & posterorum haut facile vitabis
Decepere ut de Demosthene olim antiquitas,
Quo longius eo melius jure dixerim:
Cujus unica laus admiratio,
Idque tui maximum Elogium.
Amico de his studiis, de Patria, de se B M.
D. D. C. L. M.

Iohannes Mauritius.

To my good Friend Mr. Iohn Parkinson.

MY Age of Verse is our, what then? shall I
Be silent, and not open in this cry
And generall applause? that have more cause
Then some that crowded in; nor shall the lawes
Of friendship draw me from the rigide way
Of bare and naked truth, and force me say,
In Court civility, more then what I thinke.
Such compliment is on the very brinke
Of flattery, and destroyes the very soule
And essence of true friendship, makes it a foole
Commerce of mutuall lordid ends, which is
The *Panacea* of humane miseries.
But whether now, my Muse? 'twas not my end
To treate of friendship, but to praise a friend.
This weary worke of thy unwearyed braine
Shall doe't for me, and save my further paine.
But soft, that's onely for the Authour, shall
I give nought to the Worke, which gives thee all
Whatsoere th'hall here from us, because 'tis such,
As like good wine, it doth require no bush?
It were indeed not needfull, if that all
Would enter in and taste, without a call,
And gentle invitation; as in trade
Chapmen passe by, nor enter if not made
And ply'd, yea rudely, with a violent hand,
To such thy Customers, which come and stand,
As 'were at gaze; I promise here good ware,
And cheape; all trees, all shrubs, all herbes, that are
In the voluminous *Dioscorides*,
Theophrastus, *Galen*, or *Hipocrates*,
Crateuas or th'acute *Arabians*, who
Receiv'd this Art first, and all th'other too,
After the generall *Deluge* of the *Goths*,
And swarme of other barbarous Nations, moths,
And cankers of good Letters: nor here wants
Whatsoere the diligent Moderns have of Plants,
Omitted by the ancients, out of which
Gleanings thou here hast made a pretty, rich,
And fruitfull harvest; neither dost thou spare
To insert whatsoere the other world doth beare.
Nor temperaments, or vertues dost thou misse,
Names, faculties, or properties; and this

With

With such a perspeuity the while,
Order, and method, that it does beguile
The readers paines so charmingly, that he
Thinkes it compendious, though so vast it be,
And calls for *London* measure, and he hast,
And I my purpose too, saying this at last;
If any in this subject, seeke more now,
Nature must adde to what thou hast done, not thou.

John Morris.

Ad Amplissimum doctissimum virum D. *Parkinsonum*, S.R. Magnæ Britanniæ Botanographum, quum absolutissimum Herbarium suum ederet.

INteres, quibus in divina potentia ludit
Mira modis, merito primus quis dixerit herbas.
Quis varias formas, vires, discrimina, causas,
Explicet aut cunctas usus distinguere possit?
Tentatum multis, quorum monumenta superstant,
Sudarunt Graij atque Itali, Germani, Galli
Angligenæ, Belgæ, nullis labor impiger illo
Gentibus insuetus: Lucem Parsonius *adfert*
Ingentem, posset jam perfecisse videri
In quem deficient alij pauciſſima restant.
Quid tibi pro meritis tantis, vir magne, precemur?
Alma Ceres tibi farra dicat, tibi dulcis vinæ
Bacchus, & omnimodos fructus Pomona ministret:
Cætera, quæ spondet jam Numen, Rex tuus, addet,
Posteritas famam, quantam meruisse fateatur.

* *Parkinsonius.*

Tui observantissimus,
I. D. Leers
Lugduni Batavorum.

To my old Friend and the Kings Herbariſt Mr. Iohn Parkinſon, in praiſe of his *Theatrum Botanicum*

PHœbus *hath fifty times laſh't through the* ſignes,
Since thou intend'ſt this Iubile *of lines.*
And now 'tis extant; and ſhall ſwiftly ſcow'r
Through darke oblivion to the worlds laſt houre.
From fragrant aſhes of Antiquitie
Phœnix-like *ſprung, that is the laſt ſhall dye.*
And if old Dodon *were alive againe,*
Heere *would be wonder, hence more knowledge gaine.*
Caſpar *th* Helvetian, *and* Mathiolus
The Tuſcan, *by thy Booke ſhall waite to us.*
Heere's more then growes in the Botavian *ground;*
And more then's in Patavian *Garden found:*
Or vernant Oxfords Flu-*vere Rivers ſide,*
By which brave Maudlens Chartwell *ſtill ſhall glide.*
Montpeliers *flow'ry meads do yeeld to thee;*
More in thy leaves, *then in their* beds *we ſee.*
Yet thy rich Worke *which we peruſe, and uſe,*
Th' unwary vulgar raſhly may abuſe.
This was not thy intent; yet thy good paines
Proſtitutes noble Phyſique *unto Swaines.*
Yet ſtill enjoy thy Ground, *and we thy* Booke,
On which Poſterity *ſhall ever looke,*
Lodge in the high-bed; and at thy beds feete
Thy Plants *in their moiſt pallets all ſhall meete.*
From them to Thee, *I will tranſplant that name,*
for ſuch muſt bee thy fame.
Keepe thy Heſperides; *may thy herbes with thee*
Still bloome; by Prelter *never blaſted bee.*
And ſeeing by thy hands the day is wonne,
No night of Age ſhall cloude bright Parke-in-ſunne.

Scripſit affectionis

The Classes or Tribes contained in this Worke, are these:

1 Plantæ Odoratæ. *Sweete smelling Plants.*

2 Cathartice sive Purgantes. *Purging Plants.*

3 Venenosæ, Narcoticæ, Nocivæ & Alexipharmacæ.
Venemous, Sleepy, and Hurtfull Plants, and their Counterpoysons.

4 Saxifragæ Plantæ, Nephriticæ sive Calculum frangentes. *Saxifrages, or Breakestone Plants.*

5 Plantæ Vulnerariæ & Ferruminantes, id est, Consolidantes.
Vulnerary or Wound Herbes.

6 Plantæ Refrigerantes & Incubaceæ. *Cooling and Succory like Herbes.*

7 Plantæ Calidæ & Acres. *Hot and sharpe biting Plants.*

8 Umbelliferæ *Umbelliferous Plants.*

9 Cardui & Spinosæ Plantæ. *Thistles and Thorny Plants.*

10 Filices & Herbæ Capillares. *Fearnes and Capillary Herbes.*

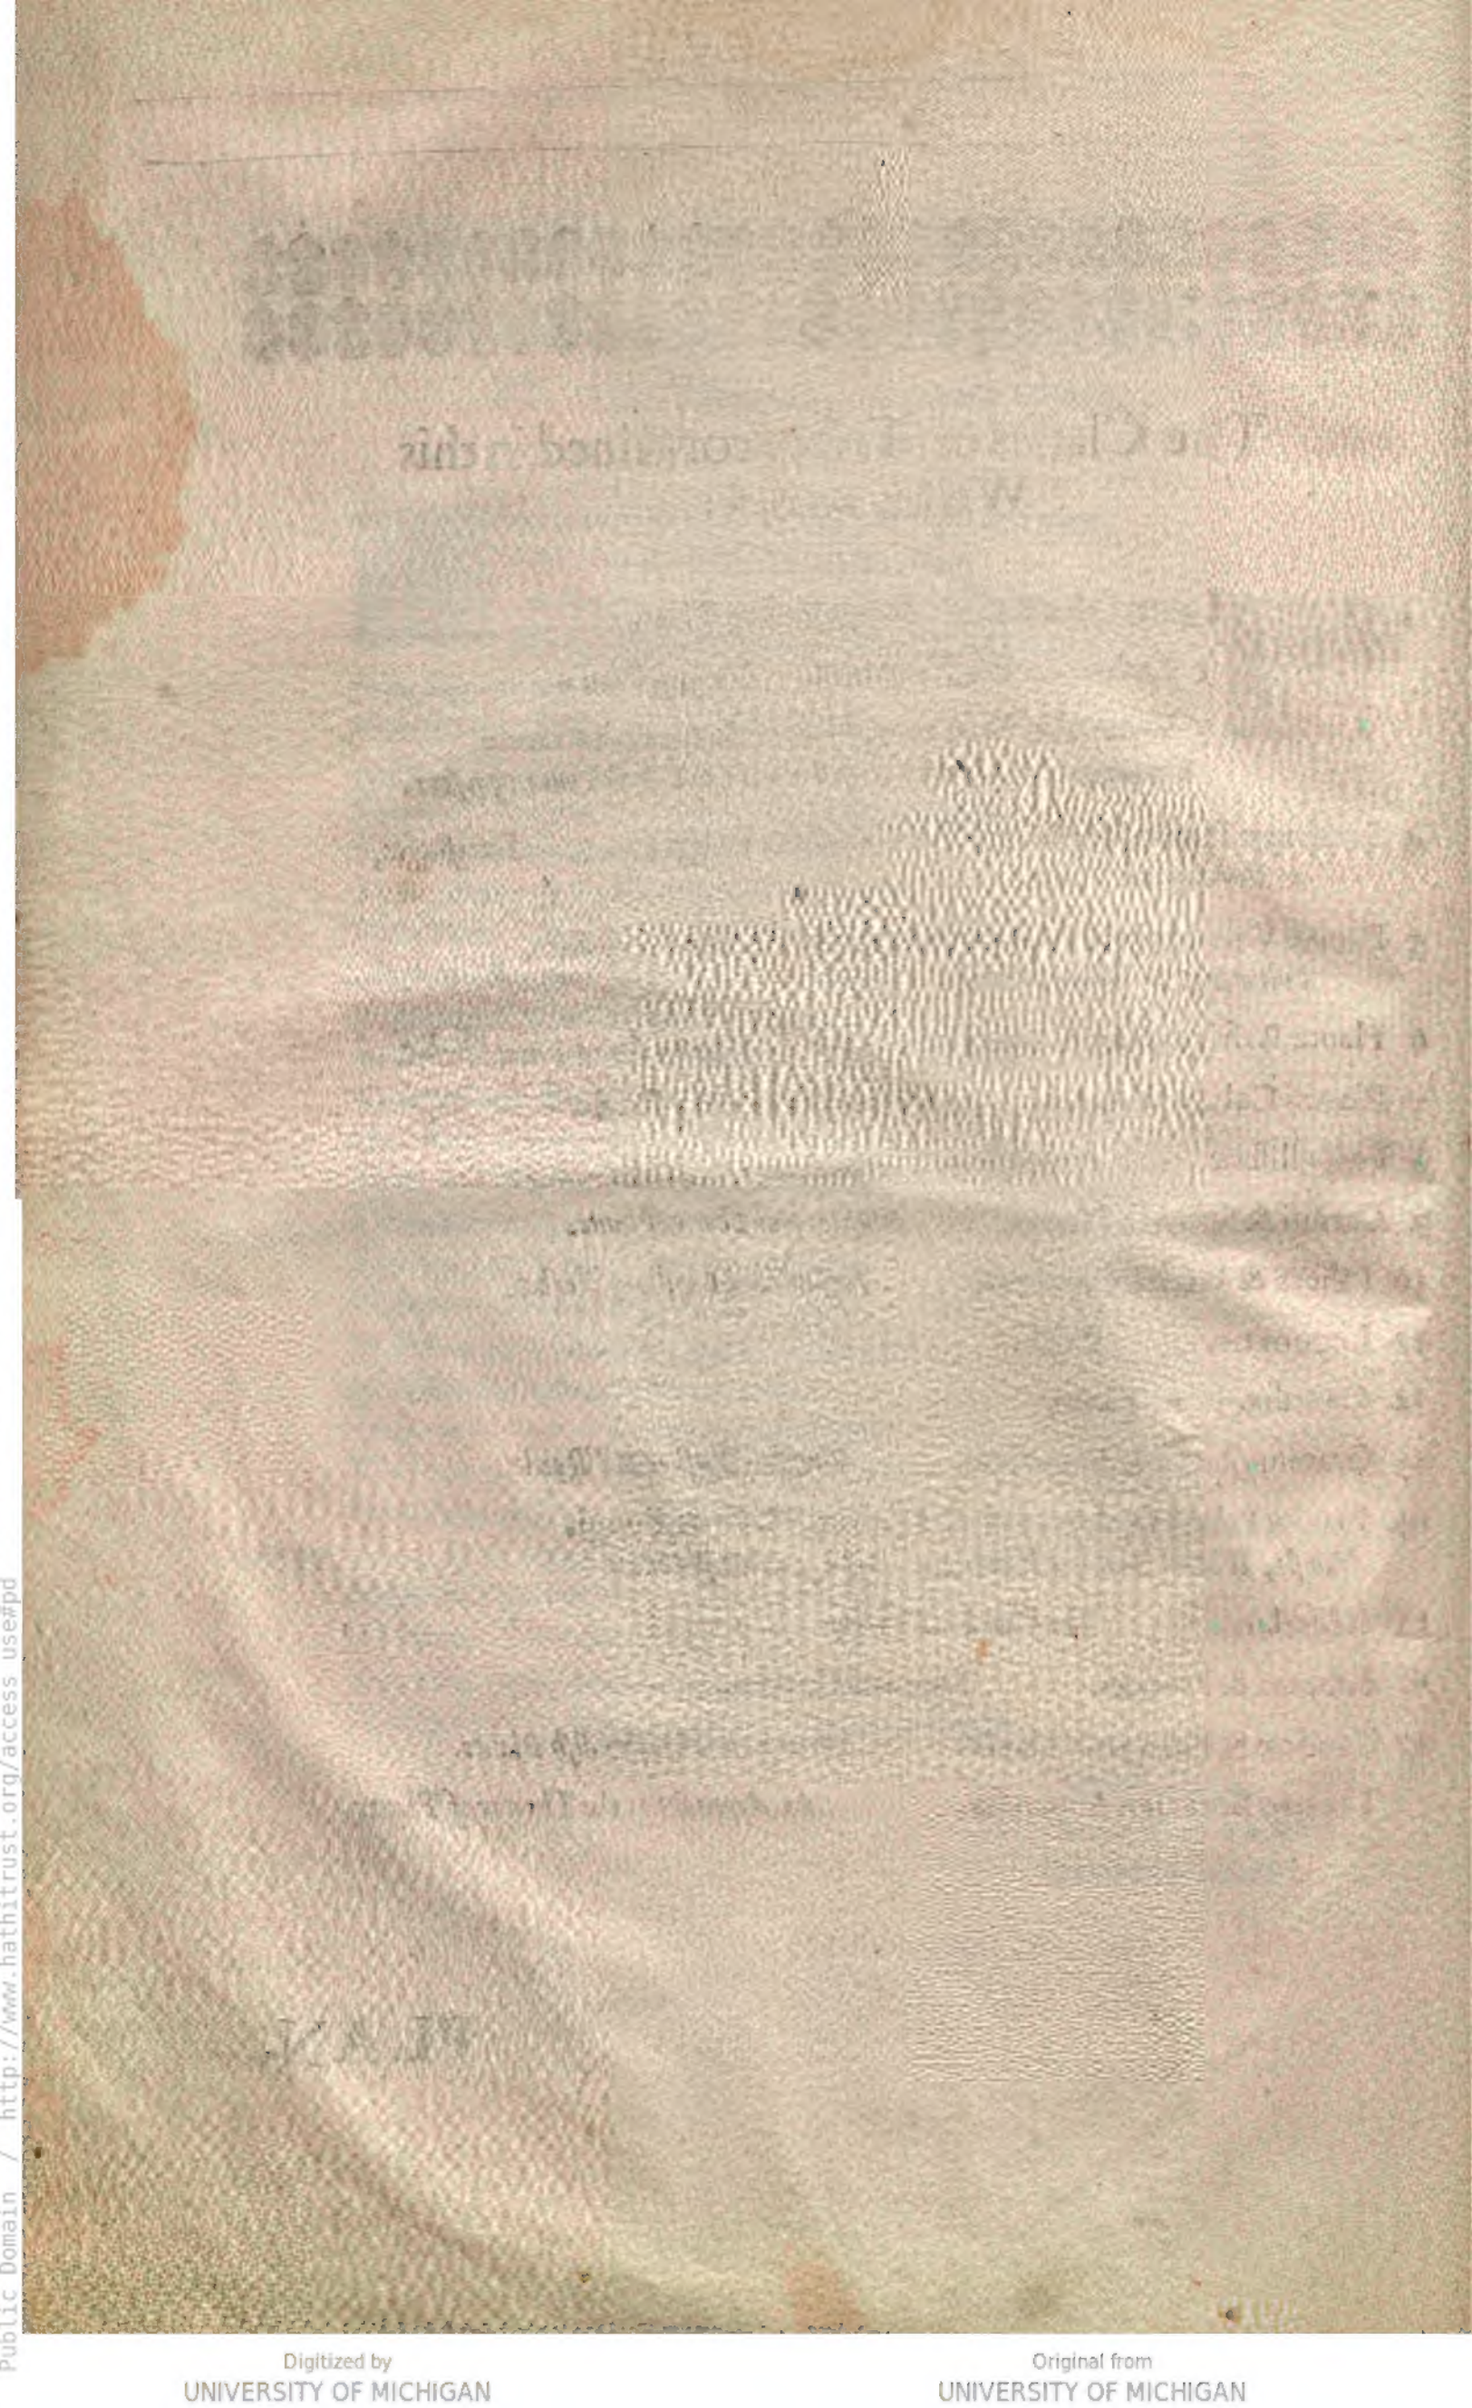
11 Legumina. *Pulses.*

12 Cerealia. *Cornes.*

13 Gramina, Junci & Arundines. *Grasses, Rushes and Reedes.*

14. Plantæ Paludosæ Aquaticæ & Marinæ, Muschi & Fungi.
Marsh, Water and Sea Plants and Mosses, and Mushrooms.

15 Miscelanea. *The Disordered Tribe.*



16 Arbores & Frutices. *Trees and Shrubbes.*

17 Exoticæ & Peregrinæ Plantæ. *Strange and Outlandish Plants.*

Theatro Botanico Appendix. *An Appendix to the Theater of Plants.*

THEATRUM BOTANICUM: PLANTÆ ODORATÆ.

CLASSIS PRIMA.

Sweete smelling Herbes. The first Tribe.

BEING a Parcell of pleasant Flowers I am fallen (*Adam* like) to a world of Herbes, like *Hesiod* and *Virgil*, (*Ye Gods who in Heaven are adored and duly*) namely such Herbes as are especially used to help the diseases of our bodies; In which world or field of Herbes, I have propounded to my selfe this methode; to distribute them into sundry Chapters of Herbes, that to a more ready, and to most convenient, shall be placed all those sorts of Herbes and Plants that are fit for each Chapter, that so they may be found out more easily together, and set in their Degrees.

Hyssopus. Hysope. CHAP. I.

THere are undoubtedly of Hysope, whereof the most are unknowne to many, whose descriptions, names, and properties, shall follow.

1. *Hyssopus hortensis.* Common garden Hysope.

The common garden Hysope is so well knowne to all that have a garden, or that have seene in a garden, that I shall not need to stand about the description of it, but only to declare briefly, that it is a small bushy plant, that sheetes up stemmes a foote high, or more, with many woodily branches, like unto Time, or the lesser sorte of sage, set with couples of small long and narrow greene leaves, a little rough, and of a strong sent, which being bruised betweene the fingers, smelleth very sweete, and almost like unto Time, but more pleasant: at the tops whereof doe grow many small hollow gaping flowers, set in long spikes, one above another, of a blue colour, which turne into small seede, which is small and blackish, the roote is long, white, woody, with many lively strings: the whole plant is of a hoate sweete taste.

2. *Hyssopus alba.* White Hysope.

3. *Hyssopus aurea.* Golden Hysope.

4. *Hyssopus versicolor.* Party coloured Hysope.

5. *Hyssopus rubra.* Red Hysope.

6. *Hyssopus angustifolia.* Narrow leafed Hysope.

7. *Hyssopus latifolia.* Broad leafed Hysope.

This Hysope groweth very like unto the former, but is somewhat greater in all the parts thereof, and the leaves broader, and not so much

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

much more thicke set with leaves of a darke greene colour: in the flower and other things it differeth not from the first.

6. *Hyssopus latifolia.* Broade-leafed Hyssope.

This also differeth not from the first here specified, but in having larger and broader greene leaves, upon more woody stalkes, growing lower and thicker.

7. *Hyssopus subpinnatus.* Iagged or dented Hyssope.

This difference of the dented leaves maketh me to set it downe as another species here as I have done.

8. *Hyssopus moschata sed de Cypro.* Muskie Hyssope.

Gesner in *Horto Germaniæ* remembreth this Hyssope to differe nothing from the ordinary Hyssope but in the sent, which is so gratious and pleasant, that it commeth neerest to the sent of Muske.

9. *Hyssopus Arabum flore albo vel rubro.*
White or red flowred Hyssope.

The red or white flowred Hyssope differ but a little from the garden Hyssope, are distinguished from it, in that they both doe usually beare red & white flowers, all on one side of the spike, yet sometime not constant in that forme, but change into the forme of the ordinary kinde.

10. *Hyssopus minor sive Hyspanica.* Dwarfe Spanish Hyssop.

This Spanish kinde is a smaller and lower sort, whose branches rise not so high as the garden Hyssope, but bend a little flowrewards, the leaves also being smaller and thicker, and of a fadder greene colour, and the heads or spikes are also shorter, but the flowers are purple like the garden sort. *Lobel* calleth this, *Hyssopus minor angustifolia.*

11. *Hyssopus Cornuta sive Cornuta Clusij.* Tufted Hyssope.

Tufted Hyssope is in leaves, flowers, and manner of growing somewhat like the common garden kinde, but a little smaller and lower, the leaves also are of a paler greene colour, and the top branches spreading a little broader, have shorter spikes of leaves and flowers growing as it were in tufts, which hath caused the name, and noted it for a difference.

12. *Hyssopus odoratissima.* Cold Hyssope.

Cold Hyssope hath the leaves curled or crampled at the edges, that seemeth to be composed of many: and herein consisteth the chiefest difference.

6. *Hyssopus latifolia.* Broad leafed Hyssope.

7. *Hyssopus folijs crassis.* Iagged or dented Hyssop.

11. *Hyssopus Cornuta sive Cornuta Clusij.* Tufted Hyssope.

8. *Hyssopus Arabum.* White or red flowred Hyss.

10. *Hyssopus minor sive Hyspanica.* Dwarfe Spanish Hyssop.

13. *Hyssop.*

Original from UNIVERSITY OF MICHIGAN

17. *Hyssopus montana* Mountaine wilde Hyssope.

Mountaine or wilde Hyssope is very like unto the garden kinde, for the manner of growing: but that the leaves which are set to it may at a reasonable distance, under and more low, and a little harder, and browner and rougher also, which the Herborists turn by bringing it into gardens, and there cherished, will by time put off that roughnesse, and become more milde and gentle, the rule whereof is much more certain, and nothing to be or [illegible] common kinde: the flowers and seedes are like the garden sort, both for forme and colour.

18. *Hyssopus angustifolia glabra.* Narrow leafed Hyssope.

Narrow leafed Hyssope is a base kinde, and hath many slender reed stalkes, whereon are set at distances, with the common Hyssope many small greene leaves, but longer and narrower than they, and ending in a longer point: the flowers like wise grow at severall joints, and grow in roundles, almost from the middle of the stalke up to the tops, of a blewish purple colour like the common sort, but much smaller and so is the seede also: the roote of this will take root and grow being laid in a shadie ground, the roote spreading much in the earth.

19. *Hyssopus folio rotundo.* Round leafed Hyssope.

This Hyssope hath divers hard woody stalkes, whereon grow slender small and almost round leaves, one against another, but pointed at the ends, the heads or tufts of flowers are like unto the common sort, of a sweete purple colour: the seede also differeth little from it.

Gerard hath set forth an Hyssope with the leaves of *Hemionitis*, or *Mesenteron*, which verily I doubt whether this kinde, yet I never saw to like of our with him.

The Place.

Parkinson saith that our common Hyssope, groweth on the hills of *Rome* about *Tivoli* and neere unto Mount *Baldo*: the dwarfe kinde in *Spaine*, and the mountaine wilde kinde, on the hils in many places of *Germany*, and in *Narbonne* with the hill *Pyrenæus* in the Country of *Languedoc*: the rest, with seede also when they may be gotten, are usually in the gardens of the curious.

The Time.

They doe all flower in the summer moneths of *June* and *July*, and their seede is ripe in the ending or middle of *August*.

The Names.

It is called in *Greeke* [illegible], for that it [illegible] (as you shall understand more at large hereafter) in Latine *Hyssopus*, of the *Arabicke* Ezob, *Ysop* and *Isop*, of the *Italians* and *Spaniards Hisopo*, of the *French Hyssope*, of the *Germanes Isop*, of the *Dutch Ysop*, and of us *Hyssope*, the names of every one of them, are sufficiently expressed in the order and description of them. But there is a great controversie among our later writers, what herbe should be the true Hyssope of *Dioscorides*, and other the Ancients: some suppose, for that our common Hyssope is not at, but is the true Hyssope of the Ancients, as all doe acknowledge except *Matthiolus*, who doth earnestly contend that our garden Hyssope is the same of *Dioscorides*, whose arguments are too weake to perswade any to be of his opinion, for the description of *Dioscorides* his Hyssope hath no face or true resemblance with ours, but bearing rubed heads like Cheesecome or Cockscombe, as he commends it, and runs to feather: the leaves also of the are like unto the *Origanum Creticum*, which are somewhat round like *Marjoram*, as you may see before. Dioscorides after, and are not narrow and long, as those of our Hyssope are: *Matthiolus Lobelius*, *Camerarius* setteth such a round leafed Hyssope, which he taketh to be the true Hyssope of *Dioscorides*, are now by on the leaves thicke of which, as those of *Origanum*, not dog the heads much differ from the common Hyssope. *Tragus* also proposeth another, that is our pot Marjerome to be the right. In that it sayes it sendeth leaves like *Origanum*, and rubed heads of flowers that are spread abroad like it also, this he hath, which I doubt he is deceived into the true kinde unlesse he hath, it may be referred unto an *Origanum*, but *Pollux* [illegible] *Cretici* of *Cato* and *Pena* as well for that the rubed heads are more like unto wilde Marjerome, than unto Cockscombe, or garden Marjerome, as *Cretica*, *Sardoa*, *Heraclea* and others do compare them all: as the leaves of *Dioscorides* his Hyssope are wholly like unto *Origanum Creticum* which sort of *Cretick* Marjerome I have heard to be *Dioscorides* meaning to be: and lastly, that neither *Cato* his Marjerome, nor *Pollux* his [illegible] are rightly interpreted by the ancient writers of *Dioscorides* and others, how learned soever they be usually esteemed of the learned, and therefore by many reasons would perswade us to believe, that our common Hyssope is not the true Hyssope as well for that the leaves are wider, and the heades of flowers like unto the *Origanum*, as for that the [illegible] and propertie by the experience of many, is not answerable to that of *Dioscorides*. Those who approve this Hyssope, which are not a few, for [illegible] which he hath in his Hyssope, yet *Serapio* declares he finds that with *Dioscorides*, that our Hyssope is unlike in all the parts thereof, unto the *Dioscorides* Hyssope, and therefore I think it should be not Hyssope. Also and therefore I think, we may well [illegible] this *Dioscorides* Hyssope [illegible] Others also would make *Origanum* to be the true Hyssope, which [illegible] like unto *Origanum* of the Ancients. *Bauhinus* in his *Pinax* would make our ordinary Hyssope, to be the Hyssope of the Hebrews, and by many arguments he gathers from the Scripture: in Saint *Johns* Gospell, the 19. chap. and 29. verse, where the Souldiers filled a Sponge wet in vinegar, to the end it as Hyssope [illegible] put it

to our Saviours mouth when he was on the Crosse. In that our ordinary Hyssope hath not so long a stalke as might reach unto so high a part as the Evangelists, *Matthew* and *Marke* say it was a reede, and it may bee that the Hyssope stalke was bound thereunto, for Saint *John* an eye witnesse of what was done calleth it as before. Now it is very likely that the Iewes had an other Hyssope, diverse both from the Greekes & Arabians, but rather that their Hyssope was the same of this, *Arabia* being their next neighbours, and as it should seeme, was so familiar to their Country, that it grew in mud walles as the Scripture saith that *Salomon* spake of it, which I verily thinke Rosemary doth not. This Hyssope is often mentioned in the Scripture, to bee used in the Iewes ceremonies, which was not without some mysticall signification; for as Saint *Paul* saith, all was done among them in types and figures, and to bee rightly understood and well applied, were worthie of much observation and good use. Now although the true Hyssope of *Theophrastus*, and the other Greekes, is not yet certainely knowne, yet absolutely this which is knowne, and generally received, may safely be used in the stead thereof, untill the true Hyssope may be knowne.

The Vertues.

Dioscorides saith, that Hyssope boyled with Rue and Honey, and drunke doth helpe those that are troubled with Coughes, Shortnesse of breath, wheesing, and the murnche diffillations upon the lunges, taken also with Oxymel, it purgeth grosse humours by the stoole, and with honey killeth the wormes in the belly, and taken also with fresh or new figges broiled, helpeth to open the belly, but more forcibly, if the roote of the Flowerdeluce and Cresses (yet some copies in stead of *Cardamum* have *Cardamomum*, which I never knew put into any purging medicine in our times, and *Macer* his verse doth intimate Cresses thus, *Cardama si jungas huic (vel forte alia) herba*, &c. be added thereunto: it amendeth and cherisheth the native colour of the body, spoyled by the yellow-faundice, helpeth the dropsie and the splene, if it be taken with figges and nitre: being boiled with wine, it is good to wash inflammations, it taketh away the blew and blacke spottes and markes that come by strokes, bruises, or falles, being applied with warme water; it is also an excellent medicine for those, that are troubled with the Quinsie, or swelling in the throate, to wash and gargle it, being boyled with Figges; it helpeth the tooth-ach, being boyled in vineger and gargled therewith, the hot vapours of the decoction, taken by a funnell in at the eares, easeth the inflammations of them. *Aetius* saith the singing noyse of them; *Pliny* saith, that it is an enemy to the stomacke, and provoketh eschaune being taken with figges: being bruised, and salt, honey, and cumminseede put to it, it helpeth those that are stung by serpents. *Galen* is very briefe herein and only saith, it is hot and dry in the third degree, and of thin parts. *Matthiolus* saith, that our Hyssope is of thinne parts, and that it cutteth & breaketh tough flegme, it rarifieth or maketh thinne that which is thicke or grosse, it openeth that which is stopped, and cleanseth that which is corrupt, the oyle thereof being annointed killeth lice, and taketh away the itching of the head, it helpeth those that have the falling sicknesse, which way soever it be applyed, but more especially being made into pilles in this manner. Take of Hyssope, Horehound and Calfetreum, of each halfe a dragme, of the roote of Peonye (the male kinde is most proper in this disease) two drammes, of Asafetida one scruple, let them all bee beaten as they should be, & made into seven pilles (or more if they be too great) with the juyce of Hyssope, and one of the greater, or two small ones, taken every night going to bed is appointed: the best Physitians of our times, assuredly doe account it, to be hot and dry in the third degree, and of thinne parts; for being sharpe and a little bitter withall, they apply it effectually, for all cold griefes or diseases of the chest and lunges, helping to expectorate tough flegme, that suffocateth or oppresseth them, being taken either in a *lohoc* or licking medicine, or in a Syrupe, or any other way, and in a decoction thus. Take an handfull of Hyssope, two ounces of figges, and two ounces of Sugar candy, boyle them in a quart of Muscadine, untill halfe a pinte be consumed, which being strained, is taken morning and evening, swalloweth much the more easily to be avoided, it helpeth also to provoke urine being stopped, or that is made by droppes: it helpeth to breake winde, and to cause womens moneth-tearmes, and easeth the shiuering fits of agues; the greene hearbe being bruised and a little sugar put thereto, doth quickly heale any greene wound or cut in the hand, or else where being applied thereto.

CHAP. II.

Thymbra sive Satureia, Savorie.

There are foure or five sorts of Savorye, two most usually to be seene in many gardens, but there are three others that are more rare.

1. *Satureia vulgaris*, Winter Savorie.

The common Winter Savory, is a small & low bushie herbe, very like unto Hyssope but not much above a foote high, with diverse small hard branches, & hard darke greene leaves thereon, as thicke set as Hyssope, & sometimes but with foure leaves set at a joynt, of a reasonable strong scent, yet not so much as the Summer kinde: the flowers are of a pale purplish colour, set at severall distances at the toppes of the stalkes, and leaves also under them: the roote hath divers small strings thereat, and abideth with greene leaves all the winter, and is more usually encreased by slipping then sowing.

2. *Satureia Hortensis*, Summer Savorie.

This also is a small tender herbe growing up with divers brittle branches, thinderly or sparsedly set with very long narrow leaves at each joynt, soft in handling, and of a stronger and quicker scent and taste: the flowers are small and purplish, set at the joynts with two leaves under them up to the toppes of the stalkes: the seede is of a darke colour, bigger then Tyme seede by the halfe: the rootes have fewer strings and perish every yeare, and must be new sowne every yeare.

3. *Satureia Spicata S. Iohan.* Rocke Savorie.

Rocke Savorie hath many slender, hard, and woody brownish stalkes about a foote long, whereon doe grow at severall spaces, many very small and narrow leaves, very like to the leaves of the true Tyme, but somewhat longer, of a sharpe quicke taste, and of a strong sweete scent: at the toppes of the branches come forth many spikes of heads of small leaves, & out of them thrust forth purplish flowers, which afterwards give a small brownish seede, more like Tyme then Savory, the whole plant will be sometimes of a sad purplish colour, dasht over with a white mealinesse, as for the most part all Sea plants are: this doth seldome endure a winter with us.

4. *Thymbra spicata Satureia Cretica legitima.* The true Savorie of Candie.

The true Savory of Candie bringeth forth from the ground like Tyme, with many purplish square branches, covered

soward over with a rough or harrie leaves from the lower ioynts of the stalkes come alwaies two branches, and euery leaues set at them, and so in like maniere all along the stalke thus euery ioynt one against another on the contrarie side, and are very like vnto the leaues of the true Tyme, but somewhat harrye, of a fweete scent and sharpe taste betweene Tyme and Savory; on the toppes of the branches at certaine distances one above another grow forth heads or tufts of greene leaues, from among which start forth many purplish flowers like vnto Tyme, standing in brownish husks: the seede is of a blackish brownie colour, very like vnto Tyme; the roote is somewhat long, hard and woody, with some small blackish fibers growing from it, and will as hardly winter with us as the last, although the lower branches that lie on the ground vse to take roote, which sheweth that in the naturall place where it feeleth no cold in winter, it spreadeth and increaseth.

5. *Satureia spinosa.* Prickly Satyar of Candy.

Prosper Alpinus in his Italian description of *Mount Baldus* maketh mention of this Savory, but without any description of further relation, wherein I suppose that there is small difference betweene it and the last, having that as in the *Cretan Origanum* the branches have small prickes on them as the rest: and therefore I cannot yet give you any further knowledge of it, hardly not seene it. *Bauhinus* also hath made mention of another, received from *Constantinople* for *Hyssope*, and so he saith is the *Satureia Hispanica* by *Dioscorides*, but because I do not thinke it to be a Savory, I forbeare to write.

The Place and Time.

All these sorts are seldome euer annoited in gardens, but they are to wilde heathes in diuers parts of *Europe*, especially in *Greece* very abundantly, and are nourished to their places, flourishing in the end of Summer, some not abiding the winter.

The Names.

It is called in *Greeke*, *θύμβρα*, *θρύμβη*, *θρύμβος*, *θρύμβον*, in Latine *Satureia*, also *Satureia hortensis*, *Cunila hortensis*, *Cunila sativa*, *Cunila Dioscoridis*, and some take *Satureia* to be *Thymbra*: some also call it *Thymbra* in Latine, and some take *Satureia* to be *Thymum*: the *Arabians* call it *Sauregia* or *Sadaria*, the *Italians Savorea* or *Cunila*, the *Spaniards Ayedres*, the *Frenchmen Sariette*, the *Dutch Kruyd*, and *winter Kruyd*, and we in *English Satorie*.

There is much question and doubt among our moderne writers, what herbe should certainely be the *Hyssopus* of *Scripture*, which in his proper place should at once well be familiarly knowne. Wherefore (with no further description thereof, than doeth not like vnto *Tyme*, but lesse and more tender, having heads of greene flowers, and that it groweth in rough and stonie places) *Dodoneus* giveth us one, *Lobel* another, *Cluisius* a third, and each entitle their

to be *Time* of *Dioscorides*, *Pliny* and *Theophrastus*, because it was sent for to *Troy* became he reuide it growing in Saint *Helens* Parke in that province, and *Columella* remde *Homer* to haue sent him the seede from *Candy*, who saith, that the *Candy* Herbe, call it to this day vsually *Thymbra* or *Thymus*, but it is certaine, that neither our winter Sauory, nor Summer Sauory doe agree with the 2 kindes of *Dioscorides*, for that neither of them like or tellethen Tyme, although they are very carefully diuers notions being put into brothes, meates, &c. *Dioscorides* saith of the garden *Thymbra*, which is he saith is much better then the wilde for of *Thymus*. The latter generally called with us Sauory sowed (Winter Sauory and by *Camerarius* prouinciall by *Lobel* Satureia sive *Thymbra hortensis*, *Matthiolus* Cunila, By *Bauhine* the Olisapon Apollo; but *Thymbra* by *Matthiolus*, by *Gesnerus* Satureia, *Cordus* Satureia, & *Ruellius* montana, by *Fuchsius*). The second is generally called *Satureia* [illegible] *Thymus*, or *Thymus Creticus* by most writers, but *Tabernamontanus* & *Lobelius* only call it *Cunila*, and *Thymbra creticus* [illegible] *Thymbra Dioscoridis*, and *Thymbra Sacerdotis* [illegible] but I somewhat doubt whether this agreeing this Tyme to be *Creticus* in his 7. booke and 8. chap. or some of the other sorts. And for the name *Cunila* it is by him referred to diuers other plants; for *Origanum*, *Herba Bona* is called by him *Cunila* [illegible] and *Cunila* and *Cunila Spuria* *Dioscorides* hath it also, as shall bee shewed hereafter). *Cunila* also other wise called *Pyrethrum*, is falsely called *Cunila bubula* by *Lobelius*, as *Pliny* the 20. booke 8. chapter of his 19. booke, and in the 25. chap. of his 20. Agains, in the 14. chap. of his 22. booke, he nameth an other herbe *Cunila pulicaris*, which in the fourth chap. of his 24 booke he seemeth to name *Pulmonaria*, whereof also *Dioscorides* maketh mention; but an other place he saith, that *Cunila* is called *Conyza* or *Columella* also called *Satureia* *Cunila*, but he maketh *Cunila* and *Satureia* to be two sundry herbes, &c. 8. chap. 4. *De re rustica*; as also in this verse, *Et Satureia Thymbra Cunila Thymbra saporis*: but *Pliny* in his 19. booke and 8 chap. maketh them to be both one. The third sort is called by *Lobel* and *Dodon*, *Thymbra vera & Italica*, *Lugdunensis* and *Tabernamontani*, *Thymbra altera Penæ*, *Bauhine* in his notes upon *Tragus* saith, that the *Lugdunensis* Dioscoridis of *Matthiolus* is the *Thymbra vera* of *Lobel* and *Pena*, which it is very probable to be both figure and discription answering well thereunto, as any that will compare them may see. The fourth is called by *Clusius*, *Thymbra Hispanica*, *Tragi Alpina*, *Thymbra Cretica*, and *Penæ*, *Thymbra Legitima Dioscoridis*, and so doe I. Bauhine also, no other that we know conuning reason thereunto:

The Vertues.

Our Sauory of both sorts is hot and dry in the third degree, especially the Summer kinde, which is both sharpe and quicke in taste, expelling winde in the stomacke and bowels, and is a present helpe for the rising of the mother procured by winde, prouoketh urine and womens courses, and is much commended for women with child to take vse vnduly, and of diuers others thereunto. Some that from *Satyrus* thinke *Satureia* to be derived, say it helpeth the naturall [illegible] *Satyrium*, and to helpe dull or decayed eyesight; others taking it to bee derived of *Satureo*, *Es*, it is familiar vse with many to procure a good appetite unto meate; and to take away all manner of [illegible] to the lungs, it easeth rough regme in the chest and lunges, and helpeth to expectorate it the more easily; it helpeth to quicken the dull spirites of the Lethargye, the juice being snuffed or cast up into the nostrills; the juice also is of good vse to be dropped into the eyes to cleare the dull sight, if it proceede of raw humor; olde rotten running [illegible] the juice also seated with a little oyle of Roses, and dropped into the eares, killeth them of the noyse and ringing in them, and dealeth also outwardly applyed with white flower in manner of a pultis, giveth ease to the sciatica, or hippe gowte, or paralyticall members, by heating and warming them, and taking away the paine: it taketh away also the stinging of bees, waspes, &c.

Chap. III.

Thymum & Serpillum, Tyme, and Mother of Tyme.

HAue ioyned both these sorts of Tyme in one Chapter, for the neere affinity they have together, both in name and nature, yet each by themselves they having many [illegible] apart.

1. *Thymum vulgare*, *Thymum sativum*. The true Tyme of the ancients.

The true Tyme is a very tender plant, having hard and hoary little branches, springing from a small woody stemme about a foote and a halfe high, whereon are set in seuerall joynts, and by couples many small whitish or hoary greene leaves, of a quicke taste and taller at the toppes of the branches stand small whitish with greene heads, some what like unto the heads of *Isopus*, made as it were of many leaves or scales, out of which doe [illegible] small purplish flowers, [illegible] having one onely seede as *Theophrastus* and some other of the old authors have set it downe, and therefore appoint the flowers only, to be sowne as if there were no seede in the heads thinking it to grow on the flowers alone, which was an error in them by reason not experienced, for we have found it otherwise.

2. *Thymum durius vulgare*. Our common garden Tyme.

Our ordinary garden Tyme is also a small low woody plant, with little branches and small hard greene leaves of them, well knowne to most, having small white purplish flowers, standing with some leaves at roundles [illegible] at the toppes of the stalkes; the seede is small and brownish then May sowne seede; the scarre is woody and abideth well divers winters, if they be not too violent, and the plants not growne too great or woody, which then will [illegible] therein.

3. *Thymum latius Creticum*. Hoary Tyme.

Among the seedes of the last recited Tyme, which I sowed in my garden, came up a hoary Tyme which is in forme like it, but for the branches are smaller, and the leaves whiter or more hoary, little also more slenderly [illegible] on the branches, the flowers, seedes and roots are like the former, and so are both sent and taller, but rather more quicke.

4. *Thymum latifolium*. Mallicke Tyme.

This Tyme groweth not so upright as the former, but rather lyeth and spreadeth upon the ground, bearing very many more branches, nothing so woody, the leaves also are not so hard but broader, the flowers are of a purplish white colour, standing in roundles as the two first sorts; this better endureth the winters, and [illegible] not seede, but is propagated by slipping; the taste and sent is not altogether so quicke as the ordinary garden kinde.

5. *Thymum inodorum*. Vnsavory Tyme.

This is a low small shrubby plant, very like unto the first kinde, with hard brownish and hairy more then the former,

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

leaues are set at diuerse many growing regular, two or three either ouer other or like vnto
a pale purplish colour, and grow like the former in form, at the toppes set round about the branches.

5. *Serpillum Matthioli.* French wilde Tyme.

This wilde Tyme groweth with many hard or woody stalkes, somewhat vpright, leaning a little downeward, couered with very small greene leaues, set with many leaues together in places, which are somewhat longer then the rest, lesse sweet & more strong and heady in taste, somewhat like vnto Southernwood, & lesse hot or biting in taste: the flowers grow in whorles or roundels, by spaces towards the tops of the stalkes, with some leaues at the ending of a purplish colour, very like vnto garden Tyme: both stalkes and leaues are of a whitish colour, and abide all the winter.

6. *Serpillum maius.* The greater wilde Tyme.

7. *Serpillum angust.* The greater wilde Tyme.

The greater wilde Tyme groweth more vpright then the former, with many

small part at a joynt like the other, but greater and not so darke a greene colour, but rather resembling Marjoram leaves; the flowres grow at the toppes of the stalkes, of a reddish purple colour like unto garden Tyme, but somewhat larger as the whole plant is, and of a small, but somewhat hot taste and taste.

There is another of this kinde, that beareth white flowers and whether greene leaves, else in other things like the former.

3. Serpillum latifolium thymi facies. Hungrish Mother of Tyme.

This Mother of Tyme groweth in most things like the ordinary sort, spreading on the ground in the same manner, but that the branches are more hoary or white, and the leaves somewhat rounder and rougher, or as it were hairie, smelling like unto Rosmarie or hard pitch, which hath no good savour pleasing to many: the flowers and other parts thereof are like the common Mother of Tyme.

4. Serpillum Pannonicum Clusij. Hungarian Mother of Tyme.

This small Mother of Tyme creepeth upon the ground, taking roote as it liveth, with many square stalkes set with leaves, two always at a joynt, but more thinly or sparedly growing on them, then the ordinary wild kinde, and are narrower and longer than they, and very smooth without: the flowers growe at the toppes of the branches, not unlike the common kinde, and hath little or no sent at all.

There is another of this kinde little differing but in the fashion of the leaves from the other.

4. *Serpillum Pannonicum Clusij.* Hungarian Mother of Tyme.

5. Serpillum vulgare minus. The ordinary small wilde or Mother of Tyme.

6. Serpillum vulgare maius. The ordinary Mother of Tyme.

This latter wilde Tyme spreadeth sundry hard brownish long branches roundе about the roote upon the ground, which take roote againe as they lye and spread, the leaves are small, and of a fine green colour, smelling like unto Tyme almost, but nothing so quicke, quite contrary to the smell or taste the flowres grow at the toppes of the branches of a purplish or white colour, for of both sorts some are so found.

7. Serpillum Limonium. Lemmon Tyme.

The Lemmon Tyme is somewhat like the common wilde kinde in the manner of growing, but standeth more upright, bushing thicke with branches, the leaves are small and of a darke greene colour like them, but have the sent of Pomecitrons or Lemmons: the flowres are more white then in the common sorts.

8. Serpillum Moschatum. Muske Tyme.

The Muske Tyme also growes somewhat upright, but with fewer stalkes and slenderer set with some what longer leaves, which are also of so sad a greene colour, whose sent is much necre unto the sent of Muske, and therupon tooke the name.

9. Serpillum aureum sive variegatum. Guilded or embroidered Tyme.

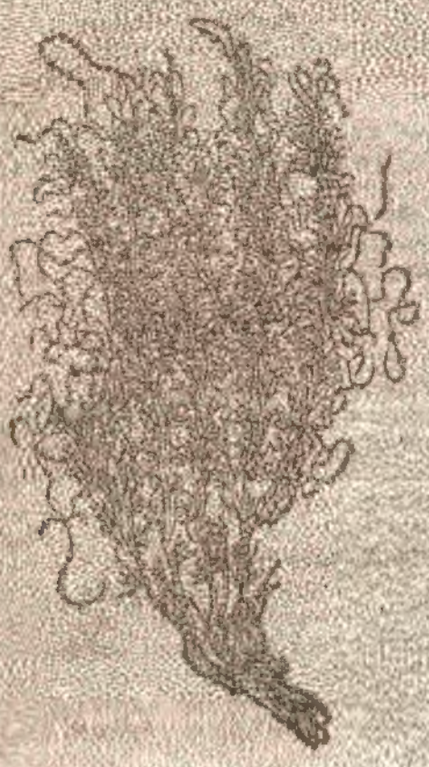
In the variable mixture of greene and yellow in the leaves of this Tyme, consisteth the chiefest difference of this sorte, from the common wilde kinde, for the greene leaves thereof are in some stayned in other edged with a gold yellow colour, which hath caused the guilded or embroidered name.

The Place.

The first or true Tyme groweth plentifully about *Hyblah* in *Sicilie*, where they use and know no other Tyme, as also in divers other parts of *Italie* and yet as *Clusius* saith all the rest of *Spaine*, neither use it nor know it, but use our common garden kinde, which groweth in old *Castile* very plentifully & in divers other places in *Spaine*; the fourth we plant in our gardens ordinarily by slippes not sowing: the fift in the Kingdome of *Valentia* in *Spaine* neere the seaside at *Alicant*: the first *Clusius* saith, hee found in old *Castile*, growing promiscuously with our common garden Tyme; and *Lobel* and *Pena* say it was found in *Narbon* in *France*: the seventh is planted in the gardens of the curi-

ous and

…ons, and the naturall place not well known to vs: the eight *Banhinus* saith, groweth in many of the dry grounds …about *Basill*: the ninth *Clusius* saith he found in *Hungary*: the tenth is common with vs generally in most coun…ties, and that with white flowers also. But we saithe, in Digswell pastures by Hatfield: and the eleaventh in …ties, and that with white flowers also. But we saithe, in Digswell pastures by Hatfield: and the eleaventh in many places in Kent, as Cobham, Cowlinge, Cowlifee and Longfield downes, and betweene Rochester and Strongstone, even in the high ways, where by the store thereof it is to bee knowne from the common: the two last are nourished up in gardens onely.



The Time.

The first time kinde flowreth late with vs, to wit, Aprill with the formost: the rest for the most part in July or thereabouts.

The Names.

Tyme is called in Greeke, θύμος, θύμον, θύμον, ἄνθος, ἡδύοσμον, ἄνθος ἡδύοσμον, ὀλίγον, καὶ τὸ ἄνθος αὐτοῦ, καὶ τὸ ἄνθος αὐτοῦ ἐπιπολῆς, καὶ τὸ ἄνθος αὐτοῦ ἐπιπολῆς ἐπιπολῆς, καὶ τὸ ἄνθος αὐτοῦ ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς: *Thymus*, the *Arabians Thymo*, the Italians *Thymo*, the Spaniards *Tomillo*, the French *Thym*, the High Dutch *Thymian*, the Low Dutch *Tijme*, the Germanes *Thymian*, and the rest kind *Quendel* or wilde *Thymel*, the Dutch *Tijme*, & we in English Tyme or garden Tyme, or as they are in these tides, *Serpillum* or *Serpillum* is called in Greeke, σέρπυλλον, σέρπυλλον ἐπιπολῆς, σέρπυλλον ἐπιπολῆς ἐπιπολῆς, σέρπυλλον ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς, σέρπυλλον ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς, σέρπυλλον ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς, σέρπυλλον ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς, σέρπυλλον ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς, σέρπυλλον ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς, σέρπυλλον ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς, σέρπυλλον ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς, σέρπυλλον ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς, σέρπυλλον ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς, σέρπυλλον ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς, σέρπυλλον ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς, σέρπυλλον ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς, σέρπυλλον ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς, σέρπυλλον ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς, σέρπυλλον ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς, σέρπυλλον ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς, σέρπυλλον ἐπιπολῆς, σέρπυλλον ἐπιπολῆς, σέρπυλλον ἐπιπολῆς, σέρπυλλον ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς ἐπιπολῆς

1. Cuscuta. The Dodder of Tyme.

2. Cuscuta Rubra.

inner as the property of the plants whereon it groweth, and the climate doth suffer, although *Matthiolus* and others, have thought it to grow without ouer creeping and spreading on the plant whereon it taketh hold, bee it high or low, clipping the very grasse if it meete with none else. (although *Ruellius* saith it groweth not on the ground, but on bushes) as upon some vines also in *Narbone* & *Pisa* (saith he) I haue seene, that strings haue no leaues at all upon them, but wholy also ouer-creeping themselues to the vine, & vpon a small plant, that it taketh away all comfort (as some would thinke) of the Sunne from it, and readily suffocate or strangle it: after these strings are risen up to that height, that they can receiue nourishment from the plant you shall learne by any appearance of strings from the ground, (they being broken off either by the strength of their rising, or withered by the heate of the Sunne, (and if they meete with no bushes or plants whereon to spread, they will soone perish of themselues, as I haue tryed my selfe by sowing the seede vpon stones by themselues, & obserued their springing) from whence diuers haue imagined that it might grow vpon Mosse vpon trees, or like Mistletoe, but I think rather as Tyme, by drawing nourishment insensibly from the plants whereon it groweth, & thereby partaketh of the nature of the same plants: vpon these strings of both I haue seene vpon what plants or herbs it euer they grew, vpon hard clusters of small heades or huskes, out of which start forth whyte flowers, which afterwards giue small pale coloured seede, somewhat Bar and ewise as hoppes seede: thus much I thought good to let all others vnderstand, by this experience and obseruation I haue had (hoping if I can strike this matter more obseruation I meane more to this purpose in Decades, or his chapters of Anatomies of Gardens) by the which I hope truely related, it may appeare plainely to all that read it, that Tyme, Sauory, or any other such like vse is vainely of those writers (seeking these strings of Tyme, but not their seede vpon their owne heade, rumbled or scattered of themselues vpon the ground, or comming among the seedes of other herbes that are sowne. The plantes whereon these lace doe grow are obserued by diuers to be Vines, as *Pena* and other that haue obserued them in *France* and in some places of *Turkey*, vpon trees and thornes and some other things. *Theophrastus* in the 3. chap. of his second booke of the causes of plants, doth set downe, that *Cuscuta* groweth on trees and bushes in *Syria*, which *Pena* affirmeth in *Cilicia* in the 1st chap. of his 2. booke, by which wordes (no doubt) they meant this plant, for it differeth not much from *Cassita*, as many others haue noted, as it is generally called, the Arabian name being *Chassitha* and *Epithymum*, the Greeke, are *Polemonium*, *Dyctamnus*, *Germander*, *Hyssope*, *Mother of Tyme*, *Marjerome*, *Sisely*, *Epithymum*, *Rosemary*, and others as *Dioscorides* hath recorded, and also very plentifully in many places of our west land upon Nettles, and upon Furze or Whins, and called *Fedderfat*, and *Dodder*, upon Tyme also more abundantly in some places: when it is ripe, they pull it vp by the least making it into bundles, and is called of the Country people, *Hellweede*, because they greatly vse to weede it from it, vpon Beanes also and other heades vpon Hampsted heath, and sundry such like places, the flowers & flowers being white, and vpon the grasse likewise in black heath in most, on the very ground, not rising in any sort high, being red.

The plant Tyme, and Names are sufficiently as I thinke expressed before, yet in particular *Pena* and *Lobel* thinke it to be the *Amaracus* of *Dioscorides*, but erroneously: for *Epithymum* is *Adarangue*, the with out of *Spaine*, *Arragon* and others, is the threads or lace growing upon Tyme: although *Dioscorides* calleth it the flower thereof: we doe generally call that *Epithymum* that groweth on Tyme, in English laced Tyme, in the Gardens called Sauory, and so of *Epithymo Romanum* and *Epithymo Creticum*, and so the rest, as I haue set downe before.

some laced Nettles, laced Brambles: but wee call those strings generally by the name of *Dodder*, especially that which groweth on Flaxe and Tares, which are red and most frequent with us.

The Vertues.

Epithymum by *Dioscorides*, *Pliny*, *Galen*, *Aëtius*, *Actuarius*, *Mesues*, and all others, is accounted the most principall and powerfull Dodder growing upon any herbe, (and that upon savory or Serpolle not to bee to esteemed) for all melancholicke diseases, and to purge blacke or burnt choller, which is the cause of many diseases of the head and braines, as also for the trembling of the heart, faintings and swoonings: it is helpefull in all the diseases or griefes of the spleene, and of that melancholy that riseth from the windines of the Hypochondria, which is that parte of the belly under the fourth ribbe, where the spleene lyeth, & by flying up to the braine causeth a kinde of frenzy or madnes: it purgeth also the reines and kidneys by Vrine; it provoketh them that have the Iaundise to vrine, the obstructions of the gall: *Galen* saith, it hath the properties of Tyme being hot and dry in the third degree, & as *Aëtius* holdeth from the Arabian authors, that it hath by the attraction or drawing quality, a strengthning property beside the purging, as it is also found in *Rubarbe*: and that it is a safe medicine for the obstructions as well of the liver as spleene, purging the vrines of fleigmaticke & cholericke humours, & likewise as *Mesues* saith, it helpeth chickens agues if a little wormeseed be put to it. The Dodder of all other plants & herbes in like manner partaketh of the nature of them where as they grow, be they hot or cold, and is thought to worke more effectually for those diseases, wherunto the herbe it selfe is applyed: *Lobel* saith, that in the west parts of this kingdom where he found these laces upon Nettles, the people had good experience, that it was a soveraigne remedy to procure plenty of Vrine where it was stopped or hindred, & my selfe also have understood it from those parts: but that Dodder which groweth upon Tares, being the most frequent about London, and wherewith our markets are onely in a manner furnished, and our Apothecaries shoppes stored from thence, taketh his propertie from the Tares whereon it groweth, and can have no effectuall qualities comparable to *Epithymum*: for as *Galen* saith, such Tares are hard of digestion and binde the belly, and that the nourishment of them engendereth thicke blood, apt to turne into melancholie, which qualities are cleane contrary to those of *Epithymum*, *Epilynthos*, or of other good herbes.

Chap. V

Majorana vulgaris & exotica. Common and Strange Marjerome.

There are divers sorts of sweete garden Marjerome, some growing onely in the summer; others abiding the winter, and one that groweth wilde: there are some other sorts called Marum, that I have intituled strange Marjerome, all which shall be comprehended in this chapter.

1. *Majorana vulgaris hortensis.* The ordinary garden sweete Marjerome.

Our common sweete Marjerome, that is commonly sowen in our country, is a small low herbe, little above a foote high, full of branches, and small reddish and soft roundish leaves on them, smelling very sweete: at the toppes of the branches stand divers thrid long and round scaly heads or knots; and therefore of some called Knotted Marjerom; of a whitish greene colour, out of which come here and there small white flowers, and after them small reddish seede: the roote is composed of divers small threads or strings which perisheth with the whole plant every yeere.

2. *Majorana vulgaris.* Sweete Marjerome.

Majorana tenuifolia. Marjerome gentle.

This Marjerome likewise hath divers small branches growing low, and not higher then the former, but having finer and smaller leaves, hoary and soft, but much sweeter: the heads are like unto the former, and so are the flowers and seede, the whole plant being more tender then the former, abiding but a Summer in like manner.

3. *Majorana odoratissima perennis.* Winter sweete Marjerom.

Wee have also another sweete Marjerom that abideth greene all the winter, if it bee not too violent, growing in the same manner that the first doth, whose leaves are a little smaller and greener then it, but with the like heads and knots: yet some take this to be but the ordinary Summer Marjerom, which by art & tending is made the more strong, and able to abide the winter.

4. *Majorana hirsuta seu Creticae Actuarii.* Winter or Pot Marjerom.

The Winter or pot Marjerom is a small low bushing herbe growing somewhat higher, but spreading the branches wider, whereon grow broader and greener leaves, set by couples with long smaller leaves likewise at the joyntes all along the branches: at the toppes whereof growe a number of small purplish white flowers, set together in a tuft, which turne into small round seede bigger then sweete Marjerome seede. The whole plant is of a small and fine scent, but much inferiour to the other, being also nothing so bitter

to those of the sweete Marjeroome, and roseing the truer and the more pleasing kind for meates, the stalke is white and shreddye perishing also in the winter, but abideth many yeares, and is to be encreased by slips rooted after the seede.

2. Yellowe sweete Marjeroome. Yellowe Marjeroom.

This Marjeroome is of the same sort with the last described, differing onely in the colour of the leaves which are in Summer wholy yellow in some, or but a little greene, or spotted with yellow and greene, more or lesse as nature will there play, the sent being small like the other. We have also received it parted with white and greene.

3. Wilde sweete Marjeroome. Wilde or field Marjeroome.

4. Majorana sylvestris. Wilde or field Marjeroome.

The wilde or felde Marjeroome sendeth forth sundry browne-nish hard square stalkes with small darke greene leaves set by couples on the same, very like those of the sweete Marjeroome, but harder and somewhat broader, at the toppes of the stalkes stand rough or double or deepe purpliesh flowery, which turne into small seede, like the garden Marjeroome seede, but blacker, the roote creepeth under ground, and encreaseth muche, dieing from yeare to yeare, the whole plant smelleth strong.

5. Maiorana vulgaris. Hearbe Mallicke.

The neerer resemblance that this Hearbe hath with Marjeroome, then with Tyme, (as some have esteemed it) doth make mee joyne it to the same chapter. It riseth up with greater & more woodie stalkes then any of the former Marjeroms, being two foote high in better in some places, where it liketh the ground and wyll branching it selfe on all sides towards the upper parts, leaving the stemme bare below if it be old, otherwise being young, thicke furnishing the branches from the bottome with small greene leaves bigger then the leaves of any Tyme, and neere the bignes of the leaves of the Marjeroome gentle: at the toppes of the branches, stand small flowers on a head, which afterwards turne into little cuts, of whose white hoarie matter like unto soft downe, with some leaves under and about them, which shale not long on the stalkes, but are blowen away with the windes, the seede is so small if it have any that I have not obserued it; the roote is threeadie, the whole plant is of a sweete resinous sent stronger then Marjeroome, and abideth our winters, if it bee carefully planted and regarded afterwardes.

8. Marum syriacum. Cretyng strong Marjeroome.

This strange Marjeroome hath diuers slender weake stalkes, lying upon the ground, and not standing upright as all the sweete Marjeroome & hearbe Mallicke do, therin resembling the wilde Tyme rather then Marjeroome, the leaves are many

and

1. Marum Syriacum. Creeping Strange Marjerome.

and smaller than those of Mother of Time, growing at several distances upon the branches, the flowers are small and purplish growing at the tops with leaves among them, the smell whereof is very sweet, and nearest unto Marjerome.

9. Marum Syriacum vel Creticum.

The Syrian or Candye Mallick.

This Candye or Syrian Marjerome hath sundry upright stalkes not so woody as the neare Mallick, but more tender and slender also about a foot and a halfe high, whereon are set divers small whitish greene leaves, very like unto the small fine sweet Marjerome, but somewhat rougher up to the very tops which beare smaller heads or knots then the sweet Marjerome, & white flowers out of them, all the heade is of a most fragrant sweet smell, enduring a long time after it hath beene dryed: it is very tender to keepe, and will not endure any of our cold nights that come in August or September but will quickly perish by them.

9. Marum Syriacum vel Creticum.
Syrian or Candye Mallick.

The Place and Time.

The sweet Marjeromes grow wild on the mountaines in *Spaine*, and in other places, and the wild Marjerome, in the borders of corne fields and pastures in sundry places of this Land: they are all nursed up in Gardens, their naturall places being not well known to us, saving that the tall *Isabel* saith he had out of Greece, and *Prosper Alpinus* saith he saw it in Candy. The former seven sorts doe flower in the end of Summer at the furthest, but the two last much later if they come any yeere to flower with us.

The Names.

Marjerome is called in Greek [illegible] in Latine *Sampsuchum* also, and *Amaracus* after the Greeke, of the Arabians *Marjorana*, or *Marjorame*, of the Italians *Maiorana* & *Persa*, of the Spaniards *Mejorana*, of the French *Marjolaine*, of the Germanes *Majoran* & *Meyran*, of the Dutch *Marioleyn*, and of us *Marjerome*, and sweet *Marjerome*, *Marum* called in Greek [illegible] and so in Latine. And more [illegible] *Marum* [illegible] *Mastiche*, *Mad* [illegible] [illegible] [illegible]

former he makes his *Amaracus Sampsuchus sorte Dioscoridis*, and *Bauhinus* in his *Pinax* entitleth our ordinary *Marum* or *Mastick Sampsuchus, sive Marum Mastichen redolens*, which two authors thought *Marum* hereto to argue with his *Sampsuchum* then Marjerome, because *Dioscorides* saith that his *Sampsuchum* is an herbe or shrub of branches creeping on the ground with hairy round leaves like the smaller or inner sealed *Calamint*, smelling very sweet, and in the composition of the *Oleum Sampsuchinum* bee advised to chuse that *Sampsuchum* that hath darke greene leaves, neither of which properties are in our Marjerome, nor yet in either of *Lobels* or *Bauhinus* their *Marums*, for although *Lobel* his *Marum Sapinum* creepe on the ground, yet it hath not hairy round leaves but small and long, and *Bauhinus* his and our *Marum* creepeth not upon the ground, but standeth upright as Marjerome doth. The next controverse is whether the *Marum* of *Dioscorides* be answerable to any of those hearbes, are called *Marum* by any of our moderne Writers: that none of them can be his *Marum*, thus I shewe plainely, that he saith his *Marum* hath whiter leaves by much then *Origanum*, and a sweeter flower, and neither the *Marum Sapinum* of *Lobel*, no not our ordinary *Marum* hath whitish leaves, or is sweeter then Marjerome. *Cupanum Sapinum* of *Lobel*, no not our ordinary *Marum* hath whitish leaves, or is sweeter then Marjerome. *Cupanum* therefore thought good to call our ordinary *Marum*, *Tragoriganum* rather then *Marum*, and saith that he had there it was sent him by the name of *Ambradachi*, and *Bauhinus* calleth the *Marum Syriacum* of *Lobel Majoranam Syriacam*, and yet by *Bauhinus* leave, his *Syriacum* or *Alpinum Cretense* commeth neerer to *Dioscorides* his *Marum*, then to his *Sampsuchum*: most Writers call the sweet Marjeromes *Amaracus* and *Sampsuchus*, and some *Majoranas vulgatior*, and the smaller or inner sort *tenuior*: but I doe not finde that any of them hath made mention of my living sweet sort, although both *Cornarius* and *Bauhinus* doe entitle the fourth *Majorana provincie*, as I doe the next before it, but they adde *Sylvestris* as *Tragi* and *Gesner* doe, and *Majorana major, vel latifolia* as other doe, and *Anglica*, and *Cameracina* saith he found a sort thereof about *Bononie*, going a simpling with *Ulysses Aldrovandus* that had larger and softer leaves: the first is called by many Authors *Origanum vulgare*, and by others *Origanum sylvestre*: *Lobel*, *Origanum Creticum majus*, and *Acroriganum*, *Cesalpinus Origanum Italicum*, and *Cornucopiæ Anglicum*: but I as you see number it rather among the Marjeromes, as a wilde kind thereof, as we usually call it in English, and as we doe the fourth and fift, this having leaves like Marjerome, but greater. *Pliny* as I said before calleth it *Cretis herbida*, and so doth *Dioscorides* his also. But take them here as wee usually call them, the seventh is commonly called *Marum* by most Authors, yet *Dodonæus*, *Gesner in horto*, and *Cornucopiæ* take it to be *Clinopodium*. *Anguinum* and *Lobel* to be *Heleniumodorum* of *Theophrastus*, *Clusius* to be *Tragoriganum*, and *Bauhinus* to be *Sampsuchus Dioscoridis*, it is called *Mastic* both by the French and us. The eight is called by *Lobel Marum Sapinum*, by *Cupanus Marum cum Scobe Mastiches*, *Sampsuchus Dioscoridis*, *Lobel in Adversariis* calleth it *Sampsuchus Orientalis*, *Tragoriganum*, and *Bauhinus Marum repens hirsutissimum*. The last is called by *Lobel*, *Marum Creticum* and by *Cesalpinus Dionysium*, and *Tabernæmontanus* but *Alpinus* calleth it *Eremos* finding it in *Candy*, and *Bauhinus* as I said before, *Majorana Syriaca vel Cretica*.

The Vertues.

Our common sweet Marjerome is hot and dry in the second degree, and is warming and comfortable in cold diseases of the head, stomacke, sinewes, and other parts, taken inwardly, or applied outwardly: it digesteth, lenifieth, attenuateth, openeth, and strengthneth: the decoction thereof, being drunke helpeth all the diseases of the chest, which hinder the freenesse of breathing: it is likewise profitable for the obstructions of the lives and spleene, for it not onely cleareth them of those humors did suffocate them, but strengthneth also and confirmeth the inward parts: it helpeth the cold griefes of the wombe, and the windines thereof, or in any other inward part: it helpeth the lotts of speech by the resolution of the tongue: the decoction thereof made with some *Rubies* of *Spaine*, and long pepper, or with a little *Anise* or *Origanum*: *Dioscorides* and *Galen Sampsuchum* to bee hot and dry in the third degree of thin parts, and of a digesting quality: the decoction thereof drunke is good for those that are beginning to fall into a dropsie, for those that cannot make their water, and against paines and torments in the belly, it provoketh also womens courses, if it be put up, being made into a pessary, and applyed with salt and vinegar, it taketh away the spreame of the Scorpions sting, being made into powder and mixed with hony, it taketh away the black markes of blowes or bruises applied thereto: it is good for the inflammations and weeping of the eyes, being mixed with fine flower, and laid unto them: the juyce thereof dropped into the eares easeth the paines in them, and helpeth the singing noyse of them: it is profitably put into those oyntments and salves that are made to warme and comfort the outward parts or members, the joynts also and sinewes, for swellings also and places out of joynt: the powder thereof snuffed up into the nose, procureth neesing, and thereby purgeth the braine, and chewed in the mouth draweth forth much flegme. The oyle made thereof is very warming and comfortable to the joynts that are stiffe, and the sinewes that are hard, to mollifie, supple, and stretch them forth. Our Marjerome is much used in all odoriferous waters, powders, &c. that are for ornament and delight. The great or gut Marjerome because it is more mild and lesse bitter than the former, is lesse used in Physicke, but more in meates and brothes to give a relish unto them, and to helpe to warme a cold stomack, and to expell winde: the wilde Marjerome is more hot than it, and therefore more effectuall to heat, warme, comfort, and strengthen both inwardly and outwardly in all things whereunto it is applyed. Heard Mastick more temperate in heat than Marjerome, and is used by our Apothecaries, in stead of the true *Marum Cretick* may well bee admitted until a truer may be knowne in the composition of the *Trochisci Hedichroi* which *Andromachus* thought fit to make a principall part of his Treacle, accounting it effectuall against all poisons, especially of vipers, and other Serpents. Our daintie women doe put it to still among their other sweet hearbes, to make sweet washing water.

Chap. VI.

Origanum, Organy, or bastard Marjerome.

Theophrastus, *Dioscorides* and *Pliny* do much vary one from the other in setting down the sorts of *Origanum* that were known to them in their times, for *Theophrastus* maketh but two sorts, a black that is hairie, and a white that beareth seed. *Dioscorides* maketh 5 sorts, three of *Origanum*, and two of *Tragoriganum*. *Origanum Heracleoticum*, *Onitis*, and *Sylvestre*, (which yet is not that which some with us call *Sylvestre*, and is set forth in the foregoing Chapter, for he beareth a white flower, and so doth not that.) *Pliny* is more confused, therefore thought not to be without error, for in divers places of his 20. and 21. bookes, he mentioneth severall

severall sorts of *Origanum*, and in one place maketh three sorts of *Heracleoticum*: but leaving these, I will shew you those sorts are knowne to us in these dayes.

1. *Origanum Heracleoticum vulgare*, Organie, or ballard Marjerome of Greece.

This ballard Marjerome riseth up with divers hard round, reddish greene stalkes, spreading forth into other smaller branches, whereon are set sundry leaves by couples at the joynts, being somewhat round, and of a whitish greene colour, very like unto Marjerome, but larger, whiter, and harder, or rougher in handling: at the toppes of the branches stand tushlike scaly heads or knots, as Marjerome hath, but longer, from whence come small whitish purple flowers, and afterwards small brownish seed. The whole plant riseth with us not much higher than Marjerome, but of a hotter and sharper scent and taste, yet somewhat pleasant withall.

2. *Origanum Creticum Matthioli.* White Organie of *Candy*.

This Organy differeth somewhat from the former, for it hath whiter and narrower leaves: the flowers also are white, and the heads more divided or separated into smaller tufts: this is rather more tender to keepe than the former, hardly abiding the sharpnesse of our winter, although it be as well defended.

3. *Origanum Creticum alterum*. The greater White Organy.

This hath larger and whiter leaves than the former, the umbels or tufts of heads are larger also, and more spread abroad than they, which beare white flowers in the like manner. This kind is somewhat more hardy, and will better abide a Winter, if there be any care used to preserve it. There is also another with somewhat longer leaves than this.

4. *Origanum Sylvester sive vulgare*. Wilde Organy.

This kind of wilde Organy (which is the ordinary kinde brought from *Candy*, and other places, and usually kept in our Apothecaries shops) riseth up with divers round hard stalkes, whereon are set somewhat broader, fatter, and rougher leaves than the former; the flowers stand at the toppes of the branches in manner of an umbell, that is in smaller heads, and more dispersed than the former, of a reddish purple colour, after which come small brownish seed: the root perisheth when it hath given seed, most especially with us.

1. *Origanum Heracleoticum Dodon.* Organy, or ballard Marjerome of Greece.

4. *Origanum Sylvester sive vulgare.* Wilde Organy.

The Place.

All these kindes of ballard Marjeromes have come to us from divers places, but which of them is more proper to this or that place, hath not beene truely signified vnto us; for some have named that *Creticum* which others have *Hispanicum*, so that it is likely to be naturall in both those places.

The Time.

They flower or at least beare their toppes or heads about the end of August, or middle of September with us, so that their seed scarcely commeth to maturity in our Country.

The Names.

It is called in Greeke [illegible] of some *Origanum*, of others *Hedyosmos*, and *Hedyosmos agrios*, and *Agrios* to distinguish it from the Garden Organy, which others have called *Hedyosmos hemeros*, or *Origanum hemeros*, or *Origanum* simply, as *Theophrastus*, *Dioscorides*, *Galen*, and others. The first is called *Origanum Heracleoticum*, by *Matthiolus*, *Lobel*, *Castor Durantes*, *Gesner*, *Dodonæus*, *Camerarius*, *Tabernæmontanus*, *Dalechampius*, and hath come to me by the name of *Creticum*, and also *Hispanicum*. *Bauhinus* saith, it is the *Cunila Gallinacea* of some, and *Dioscorides* calleth it *Cunila*. The second *Matthiolus* calleth *Cretic*, and so doe *Gesner*, *Castor Durantes*, *Bauhinus*, and *Lugdunensis*, who saith also that some call it *Italicum*, and came to me by the name *Italicum*. The third *Camerarius* calleth *Delphi*, whom *Bauhinus* followeth. The fourth is the common *Origanum* as I find we have it here, and is thought by *Bauhine* to be the *Cunila Rubula* of *Pliny*, whom *Dodonæus* followeth. *Dioscorides* saith that this (if it be but wilde kinde) was called also in his time *Cunila*. But to distribute how each of these sorts answere unto those of *Dioscorides*, I think it fittest to prefixe the text of *Dioscorides*, by which they may be compared. *Origanum Heracleoticum*, (saith *Dioscorides*) which is also called *Cu-*

rude, hath leaves like unto *Hyssop*, the toppes or umbels are not fashioned round, but as it were divided into many parts: the seed in the toppe branches is not great. That *Origanum* that is called *Onites*, hath whiter leaves, and doth more resemble *Hyssope*; it stareth and lieth in tufts, as it were joyned together, the force or vertue although it be like, yet is it therein far passed by much. Of the *Origanum*, which some call *Cretan Herbe*, and others *Dictame*, (as *Nicander Colophonius*) hath leaves like *Origanum*, and small branches not a foot high, bearing white flowers at the toppes in umbels like unto Dill: the roote is small, and of no use. These bee the words of *Dioscorides*, whereby comparing his first two sorts, we certainly thinke, that howsoever some Authors doe vary in their judgements concerning them, the first of them here set downe is the true (at least the truest hath beene knowne to be) *Origanum* creeping them, the first of them here set downe is the true (at least the truest hath beene knowne to be) *Origanum* creeping, the second like unto *Origanum* of *Dioscorides*. The two next that follow, the one of *Absinthium*, the other of *Centaurium*, are very forreine

Original from
UNIVERSITY OF MICHIGAN

ing thereon at severall distances, which are like unto the ordinary wild Tyme, or mother of Tyme: the flowers are green, standing in tufts, at the toppes of the branches. This smelleth somewhat like Pennyroyall.

The Place.

The first groweth in *Candy* and *Spaine* also, as *Clusius* saith. The second is not knowne (to my knowledge) by any, who sent it to *Matthiolus*) where it groweth. The third *Clusius* saith he found in the Kingdome of Granada in Spaine. The last, *Matthiolus* saith groweth in the Country of *Pergamum*.

The Time.

They all flower very late with us, and some so late, that we hardly see any flowers until October, if we see any at all.

The Names.

It is called in Greeke τραγόριγανον (and in Latine *Tragoriganum*) *quasi hircinum origanum, quia caprino odore est, & origano similis, parum quidem, quod non sentit.* The first is called by *Fuchs* and *Lobel* in their *Historia* & *Plantarum Icones*, by *Clusius Tragoriganum 3. Hispanicum*; by *Gaspar Bauhinus* in his *Pinax*, *Tragoriganum Creticum*; and it is likely to be the greater Tyme of *Candy*, that *Prosper Alpinus* setteth downe in his Booke of Egyptian plants. The second is called by *Gesner*, *Tragoriganum alterum*, and by *Fuchs Lobel*, which is that *Matthiolus* doth so refer unto *Matthiolus* for *Thymum Creticum*, and by that name of *Matthiolus*, *Durantes*, *Lugdunensis*, and *Tabernamontanus* doe call it and *Bauhinus*, *Tragoriganum Lugdunense*. The third is the second Spanish *Tragoriganum* of *Clusius*, bearing white flowers, whom *Dodonæus* and *Cruydeboeck* in his Epitome of *Matthiolus* reckoneth *Dissorides*, *Lugdunensis* and *Tabernamontanus* doe follow. The last is the *Tragoriganum* of *Matthiolus*, called *Tragoriganum Lugdunensis* and *Tabernamontanus* doe follow, and *Gesner* called *Tragoriganum Pergamenum*. So those you like wise how aptly these plants are called *Tragoriganum*, and how they disagree, it were not amisse to give you the text of *Dioscorides* thereon. *Tragoriganum* (saith he) is a small bush or shrub, with leaves and flowers like unto *Serpillum*, or *Origanum*, in some places it is found more leafy and greene, with broader leaves, and some wilder country. Another sort is found with slender branches, and small leaves, which some have called *Heraclium*. All these Authors have delivered us these hearbs here mentioned, under the name of *Tragoriganum*, supposing them to come nearest unto one or other of those of *Dioscorides*, both for their forme, facultie or scent, and tractable nature: and *Lobel* saith that among all the plants that are entituled *Tragoriganum*, hee could finde none that came neerer to those of *Dioscorides*, than those two sorts he alloweth of, and are the two first here set downe, the one called by the Venetians *Crocuffe*, and that other small low plant that *Matthiolus* setteth forth, under the name of *Marum*, which he saith he had from *Crocuffe*. But because they are more hot and dry than I suppose *Dioscorides* has to be, for he saith the drinke made of them is both mild and pleasant, or delectable, fit to be taken of those that have loathing stomacks; and moreover, that *Gesner* saith that *Tragoriganum*, besides the quality of *Origanum*, hath some alteration or binding property in it also, which in my judgement abateth of the heate of them, making it the milder, but although I cannot absolutely subscribe unto them herein, yet I deny not any of them their due praises, nor their first founders their deserving honours. *Bellonius* at the latter end of the 54 chapter of his first booke of observations, saith that those of *Candy* and *Cyprus*, doe call our Winter Savory by the name of *Tragoriganum*, which is *Tragoriganum*.

The Vertues.

Dioscorides saith they are heate or warme the parts whereunto they are applied, provoke urine, and are profitable to move the belly downewards, by purging choller. If the decoction thereof be taken inwardly, so also, doe a decoction made thereof with vinegar, helpeth those that are troubled with the spleene, and taken as wine, helpeth those that have taken the venemous *Dose* (which is the roote of the black Cranes-bill, or little, having as he saith, the taste and force of Basil) procureth women monthly courses, and given with honey in an Electuary, helpeth those that have a cough, and are short winded: the drinke thereof is milde and delectable, fit to be given to those that loath their meate, and have weake stomacks, or such as have sowre belchings, and for those vomitings that are procured by the tossings and sicknesse of the Sea, and also for the heart-burning. *Galen* saith it hath much like facultie of simple medicines, that it hath the same properties that the *Origanum* have, but with all, hath a little astringency. *Plinie* in a manner saith the same things, for he saith, it provoketh urine, dissolveth raw sowre or fowle things, and is especially good for those that have taken the potion of *Hyoscyamus*, (for so he termeth the *Dose* of *Dioscorides*) in drinke, and for the biting of a Viper: for sowre belchings of the stomack, the heart-burning, and for coughes. The vertue, and the nature of hearth.

Chap. VIII.

Diversum. Basill.

THere are divers sorts of Basill, the most whereof are very great strangers in our Nation, and entertained only for shew that are curious and industrious.

1. *Ocimum vulgare majus & minus*, The great and small common Basill.

The greater ordinary Basill riseth up usually but with one upright stalke, very thick and square, hard on all sides, whereon are set two leaves at every joynt, which are some what broad and rounded, set a little pointed, of a pale greene colour but fresh, a little snipt about the edges, and of a strong heady scent, somewhat like a Pomecitron, as many have compared it, and therefore called it *Citronum*: the flowers are small and white, standing at the tops of the branches with two small leaves at the joynt, in some places greene, in others browne, after which come black seed: the root perisheth at the first approach of winter weather, and is to be new sowne every yeare, if you will have it. The lesser kinde called *Minus*, small, fine, or bush Basill, groweth not to high, but is thicker spread with branches, and smaller leaves thereon, softer to touch, and of a more excellent pleasant sweet scent by much: the flowers are whites, and the seed black like the other. Which it giveth freely with us, which is more seldome, for it hath not beene knowne to give ripe seed in our Country often, because it neither springeth nor seedeth so early as the former. Unto these sorts of Basill I must adde the third, which is, as it were *Medius*, the meane betweene them, being greater than the small one, and lesser in leaves than the great, and not growing so high, in other things differing not.

Original from UNIVERSITY OF MICHIGAN

1. Ocimum maximum Cretanum. 2. Ocimum minimum 2. Ocimum minimum
The greatest Basil. The small Basil. The great Basil.

2. *Ocimum maximum Cretanum.* The greatest Cretan Basill.

This kinde of Basill differeth not in the manner of growing from the greater ordinary garden Basill; but brancheth forth like it, with leaves set by couples at the joynts, but much larger, and of a reddish colour in the hotter Countries, but not so in the colder, it hath deeper cuts about the edges of a very sweet scent, resembling a Citron pill, and therefore called *Cretanum*, the flowers are white like the ordinary Basill, and the seed black like it, perishing also after it hath flowred and seeded.

3. *Ocimum caryophyllatum maximum.* The great Clove Basill.

There is another also of these greatest Basils that differeth not from the former, either in growing, or largeness of leaves, or colour of the flowers, except that sometimes they are a little pale, but in the smell of the whole plant, it hath a stronger and quicker scent, more nearly resembling Cloves, then the former, and is thereupon named *Caryophyllatum*.

4. *Ocimum Anisatum.* Aniseed Basill.

This Basill is of the kind of our ordinary garden Basill, and of a middle kinde, whose leaves are neither so great as the greater, nor so small as the small kindes, but of a middle size betweene them both, the difference whereof consisteth chiefly in the smell, which is like the smell of Aniseed.

5. *Ocimum Indicum.* Indian Basill.

The Indian Basill hath a square reddish greene stalke, a foot high, or better, from the joynts whereof spread out many branches with broad fat leaves set thereon, two alwayes at a joynt one against another, as the Basils have but somewhat deeply cut in at the edges, and oftentimes a little crumpled, standing upon long reddish foot stalkes, of a darke purple colour, spotted with deeper purple spots, in some greater, in others lesse: the flowers stand at the tops of the stalkes, spike fashion, of a white colour, with reddish strikes and veines running downe them, set or placed in darke purple coloured husks: the seed is greater and rounder than any of the former, and somewhat long withall: the root perisheth like the rest. The whole plant smelleth strong like unto the ordinary Basill and Camfire put together.

6. *Ocimum Crispum.* Curld Basill.

This curled Basill is of the kinde of the Indian Basill, having such like large leaves cut in somewhat deeply on the edges, and curled or crumpled as they are sometimes, as also with swelling bunches like bladders or elvan, but wholly of a greene colour, without any spot on them, as the stalkes are also: the flowers hereof are likewise wholly white, without any spot in them: the smell hereof is somewhat strong, resembling the spotted Indian kinde, and is very likely to be but a degenerate kinde, risen from the seed thereof, being scattered in these colder Countries.

7. *Ocimum minus serpyllifolium.* Small leaved Basill.

This small Basill is much unlike to the any of the former Basills, of the small fine bush Basills in the bushing branches thereof, but rather somewhat resembling the wild Basill or *Clinopodium*, having fewer stalkes and branches, with small narrow leaves, a little hoary or hoderod, at the edges, two alwayes set together at a joynt, but more scattered on the branches: the flowers grow at the tops of the branches, somewhat like unto Basill of a white colour, but of a more dead or dull hew, the smell hereof is smaller than any of the other Basills.

1. Ocimum tuberosum. Tuberous Basil.

The Vses.

These plants were onely used in Cookery in times, as also in Hony, and other sweet waters they are sterrified, their naturall being much exhausted by the Indian and curld Basill are said to come first from the West Indies into Spain, and from thence into other places.

Original from UNIVERSITY OF MICHIGAN

The Time.

They all flower in the heate of Summer, and some of them later.

The Names.

There is some controversie among Writers concerning this plant, in three or foure particular matters: first, for the etymologie or derivation of the word: some thinking it to be derived from the Greeke word βασις, and the Latine *regia*, that is, *a royall or stately herbe*, from the speedy springing of the seed (which is usually within three or foure dayes, if it be a hot and dry time without raine, for moysture turneth it into a gelly, as any one may see, that will looke on it, after it hath taken wet) which is written with η. Secondly, as some thinke, from the Greeke word ὀσφραίνω, which signifieth, to smell, or give a savour, as commonly taken in the worst sence as to the best: and he would have the word to be *Ocimum*, of the sweet smell thereof. Thirdly, whether it should be *Ocymum*, as it is to be found in divers ancient Writers, or *Ocimum*. Fourthly, what *Ocymum* is of the ancient Writers, for by divers it is taken to be that kinde of greene called *Fœnugreum*, or *Tragopyrum*, in English Buckwheate, or else a kinde of medley of Corne or Pulse sowne together, as many ancient Writers have set it downe, as shall be shewed in his proper place, whereunto I shall refere you. And lastly, about the vertues as shall be shewed presently. It is called by the later Greeke Writers, βασιλικὸν *Basilicum*, because the smell thereof being so excellent, is fit for a Kings house. The first two sorts of these Basils are by all Authors so called, as I doe. He second is the same *Cretan* that *Prosper Alpinus* saith groweth in the Gardens of *Alexandria* in *Egypt*. The third is so called by *Lobel* and others. The fourth is onely set forth in the great Booke of the Bishop of *Eystet* his garden: the fift is called *Hispanicum*, by *Camerarius* and *Tabernamontanus*, and *Indicum*, by *Clusius* and others. The last is as is said in the description, a degenerate kinde of the last before it. The last is so called by *Fuchsius*, as I have expressed. The Arabians call it *Berandarse*, and *Radobreg*, the Italians *Basilico*, the Spaniards *Albahaca*; the French *Basile*, the Germanes *Basilgen*, and *Basilgram*; the Dutch *Basilicon*, and we in English Basill.

The Vertues.

Basill in all Countries for the most part is of little use in Physick, but rather used as a sweet smelling herbe to sweeten or perfume any thing, or else used outwardly to comfort and warme cold members. *Dioscorides* saith that being eaten in any plentifull manner, it dulleth the sight, maketh the belly loosible, stirreth up wind, provoketh urine, withstandeth the sullie, and is of hard digestion. *Galen* also saith it is accounted among those things that are hot in the second degree, but because it hath an excrementitious moysture joyned with it, it is not fit to be taken inwardly: and in another place, that it is unwholsome for sawce, or meate, hurtfull to the stomack, breeding ill juyce, and hard to be digested. It is held by *Crysippus* (as *Pliny* saith) who inveied bitterly against the use thereof, to be hurtfull both for the stomack, urine, and eye-sight: and besides, causeth a kinde of madnesse and lethargie, and other diseases of the liver, &c. And that those of *Affrica* say, that if any have eaten Basill, that day he is stung by a Scorpion, that he cannot be saved: which saying is quite contrary to that of *Dioscorides*, that saith, from those of *Affrica*, that he shall have no paine or danger, that is stung by a Scorpion, if he have eaten Basill before. *Pliny* setteth downe, that in his time it was defended from such calumnies as *Crysippus* cast upon it, and was commended to be profitable against the sting of Scorpions, and some other venemous Serpents, and found to be helpfull and wholsome for those are given to swouning, used with vineger, and smelled unto: used with oyle of Roses, or Myrtles and Vineger, is good against the paines of the head, it is probably applyed to those are troubled with the lethargie, the jaundise and dropsie. It is good to be put into the eares of young children with a little goose-greace, to helpe them of paines thereof: the juyce or the seed bruised put into the nostrils, procureth neesing: it is good also for the trembling of the heart, it provoketh Venery, and therefore was given to hurtfull to make them apt to breed. Some of the ancient Writers likewise have set downe, that the seed is good to kill the wormes of the belly, to lessen the spleene, and that broiled and mixed with Oxegall, it taketh away the foule markes and scarres of ulcers, and other soares. And used with honey, it taketh away the discolourings and spots of the face. The Sicilian Authors and Moslus chiefly have used the seed among other Cordiall spices, for the comforting of the heart in the trembling thereof, and the expelling of Melancholy or sadnesse, that riseth without manifest cause. And for these causes chiefly the seed is used by our later Physicians for the most part: the fragrant smell of this herbe is comfortable to the senses, reviving them as it were, when they are dull or distempered may evidently declare a singular efficacy to be therein, and therefore not to be slightly regarded. *Theophrastus* in his sixt booke, and eighth Chapter *de causis plantarum*, saith that Basill growing in a place too much exposed to the heate of the Sunne, changeth into *Serpillum*, or wild Tyme, by the over much dryneste thereof, for the leafe becommeth smaller, and the scent the stronger thereby: but these Metamorphoses or changes of herbs one into another, is very frequent both with him, *Pliny*, yea, and *Galen* too, as well as divers others of the ancient Writers, which shewe him what errours men of judgement and learning have beene contented and confident in. Let me yet before I leave, relate unto you a pleasant passage betweene *Francisco Alarcho*, an Advocate of the State of *Genua*, sent in Embassage to the Duke of *Millan*, and the said Duke, who refusing to heare his message, or to agree unto the conditions proposed brought an handfull of Basill and offered it to him, who demanding of him what hee meant thereby, answered him, that the properties of that herbe he was, that being gently handled, it gave a pleasant smell, but being hardly wrung and bruised, would breed Scorpions: with which witty answer the Duke was so pleased, that he confirmed the conditions, and sent him honourably home. It is also observed, that Scorpions doe much resort and abide under those pots or vessels wherein Basill is planted.

Chap. IX.

Clinopodium. Field Basill, & *Acinos.* Wild or Rough Basill.

Have you see joyned both these together for the affinity, both of their name and nature unto the former Basils, and herein one themselves, for their divers of our later Writers doe confound them, the one calling that *Acinos*, that another doth *Clinopodium*.

1 *Clinopodium minus sive vulgare.* Field Basill, or Bedstraw flower.

That *Clinopodium* that is taken by the best Writers and other Herbarists in these dayes, is come nearest unto the description

description of *Dioscorides*, is a small low herb not above a halfe a foot high, having divers hard round branches, rising from a small woodie root, with two small leaves set at every joynt, being somewhat like the small or fine Basill, a little dented about the edges; and in some places, and places a little hairie and rough, and in other lesse or not at all: the flowers grow at places with the leaves, like as Horehound doth, standing in small greene rough cuppes, which are of a purplish colour, and parted as it were into foure equall short pieces at the end, like the foure square foote of a Bed-stead, and not hooded or open with severall leaves, like other hooded flowers: the seed is small and round, growing in small swollen huskes: the plant hath some small heate, but more dryeness in the taste thereof, sweet also in scent, betweene Basill and Calamint.

2. *Clinopodium Austriacum.* Austrian wild Basill.

The Austrian wild Basill hath divers slender hard foure-square stalkes, not a foote high, whereon are set two greene leaves at every joynt, somewhat like the former Field Basill, but smaller, being a little dented about the edges, which is forgotten in the figure: the flowers stand at the toppes of the stalkes, somewhat like unto the flowers of the former, but much larger, and of a violet purple colour, somewhat faded for the most part, (but some plants are found with white flowers) hanging downewards, and bending also backwards for the most part, in like manner as the former: the seed is enclosed in such like swollen huskes, blacke and round, three or foure together, like Calamint, or somewhat resembling the other: the rootes are many, hard and blacke, with divers fibres annexed unto them.

3. *Clinopodium Alpinum.* Mountaine wild Basill.

The Mountaine wild Basill groweth with divers low and creeping foure-square rough branches, having two small rough leaves at every joynt, and some smaller also between them, growing all along the stalkes: the flowers are many growing in a head together, with the leaves among them;

2. *Clinopodium Austriacum.* Austrian wild Basill.

3. *Clinopodium Alpinum.* Mountaine wild Basill.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Original from UNIVERSITY OF MICHIGAN

at the toppes of the branches, very like unto the flowers of the first, but of a darke red colour: the roots are many small blackish strings, which shoot forth under ground new sprouts, thereby creeping about and increasing plentifully, abiding with his greene leaves, which perish not.

4. *Acinos sive Clinopodium maius.* Great wilde Basill, or Stone Basill.

4. *Acinos sive Clinopodium maius.* Great wild Basill, or Stone Basill.

This wild Basill hath foure square hard, hairie, and hoary stalkes, a foote high, or more, set with two hairie greene leaves at a joynt, being covered also as the stalke, with an hoary downe somewhat larger than any of the former, resembling neere unto the bignesse and fashion of the leaves of *Origanum*: the flowers grow in rundles, in more plenty than the former, of a purplish colour, and sometimes white, the husks wherein are somewhat larger and rougher: the roots are a tuft of many strings set together at the head, which shoot forth suckers round about.

Of this kinde there is also another, whose stalkes are lower, the leaves lesser, and the husks of the flowers smaller than the former, not differing in any other thing from it.

5. *Acinos Anglica Clusij.* Our English wild Basill.

The English wild Basill hath a few slender foure-square branches, not a foote long, lying on the ground, whereon grow divers small grayish greene leaves, two alwayes at a joynt set together, which are not much unlike the first Field Basill, but smaller, shorter, and fuller of ayre, and not dented about the edges at all, very like unto the last wild Basill, but smaller, of a certaine sweet scent, but not heady: from the middle of the branches up to the toppes, grow the flowers in rundles or spaces about the stalkes, being very like unto the first Field Basill, but of a more bluish purple colour, with a white eye or circle in every flower, and after they are past, come three or foure small seeds like the first in the husks where the flowers stood: it perisheth every yeare in my garden, and rayseth it selfe from its owne sowing.

6. *Acinos latifolia Columnæ.* Broad leafed wild Basill.

The great leafed wild Basill riseth from a bushy roote, with a rough or hayrie stalke, spreading forth into divers other branches, whereon grow larger leaves below, and smaller upwards, two together, at the setting on of the leaves, which are also rough or hairy, very like unto the leaves of the greater Basill but somewhat smaller and longer, indented about the edges, and each of them standing on a long stalke, towards the tops the flowers grow much, and are many, spike fashion, of a purplish colour, very like unto the flowers of the garden Basill, after which come the seed vessels, containing within them small round blackish seed.

6. *Acinos latifolia Columnæ.* Broad leafed wild Basill.

The Place.

The first groweth most usually in the borders of fields, even among the corne, as at *Sutton* in *Kent*, not farre from *Dartford*, at *Thetford* in *Norfolke*, and in other dry sandy and untilled grounds: The second groweth upon the hills that are neere the baths at *Baden* in *Austria*, as *Clusius* saith, and upon Mount *Baldus*, as *Pona* of *Verona* saith. The third also groweth upon Mount *Baldus* in *Italy*, as the same *Pona* setteth downe, in the description of the herbes growing thereon. The fourth is found sometimes in the corne fields of our owne Country, but more often in the more open Woods, and in Copses that have been felled in many places of *England*. The first *Clusius* saith he found likewise in *Kent*, while he stayed a while at the Lord *C. Oxon.* attaying for his passage over Sea, but it is found in divers other places of *Kent*, and other parts besides. The last *Fabius Columna* saith, groweth plentifully at *Naples* in their Gardens.

The Time.

They doe all of them flower about the beginning of June, and their seed is ripe in August, and sometimes sooner.

The Name.

Clinopodium is called in Greeke [illegible] quod [illegible] (alys ut Plinio placuit) pedum lecti præbeant, in English Bedstaffe flower, because the branches lay some (but *Pliny* saith, the round compasse of the flowers) doe resemble the feet of a bed, whereupon I have

to

so entituled the first, as most agreeing therewith by *Dioscorides herba ocimastra tenuifolia, acinos similis*. *Acinos* is a sweet herb fit for Garlands, and is like unto Basill. *Pliny* saith *Acinos* that is called *Basilicon* never flowreth, therein confounding the *Basilicon* of *Theophrastus*, which he saith never flowreth with *Acinos*, but *Dioscorides* saith no such thing, and therefore *Pliny* was much mistaken herein, as he was in many other things. The first is called *Ocimum Sylvestre*, and *Clinopodium minus* or *vulgare* by *Lobel* and *Clusius*: and *Acinos* by *Tabernæmontanus* in *Iconibus* and by *Dodoneus* *Clinopodium* of *Turner*, and *Angelliara* *Clinopodium magis* of *Camerarius*, *Pulegium sylvestre* of *Gesner*, *Clinopodium alterum*, or *pseudo-clinopodium* of *Matthiolus*, *Ocimastrum* of *Fuchsius*. *Bauhinus* calleth it *Clinopodium arvense seu sativum*. It is the *Basilicum* 3. of *Dodon.* who calleth it also *Calamintha sylvestris*, but of all other most improperly; in English, Field Basill, because it is chiefly found in the Fields, the Country people call this as well as the first where it groweth, Horse Time, and Poley mountaine. The second *Clusius* calleth *Clinopodium Austriacum*, and saith he might as well call it *Acinos Austriacus*. *Bauhinus* calleth it *Montanum*, in English Austrian wild Basill. The third, *Pona* calleth *Clinopodium Alpinum*, having found it onely upon *Mons Baldus*, not farre from *Verona*, but why *Bauhinus* should call it *Teucrium Alpinum canis arvensis facie* to his Chapter of *Teucrium*, having called it *Clinopodium Alpinum hirsutum*, among the other sorts of *Clinopodium*, I see no reason in English mountaine wild Basill. The fourth is the first *Clinopodium vulgare* of *Matthiolus*, and called *Clinopodium montanum magnum* of *Camerarius*: *Lobel* and *Dalechampius* call it *Acinos*, and *Cordus* *Basilica Pauli*, it is the first *Calaminth* of *Turner*, *Pulegium montanum* of *Lonicerus*, and *Polemonium* of *Gesner*. *Bauhinus* calleth it *Clinopodium Officinarum latifolium*, in English great wild Basill. The fift is thought by *Clusius* to be the true *Acinos* of *Dioscorides*, *Bauhinus* calleth it *Clinopodium minus foetidum*. The last is called *Acinos* of *Fabius Columna*, in his *Ekphrasibus*, and which is generally called *Periclimenos* of the Neapolitans, because it hath such like roughnesse and hairynesse, although not clinging as nettles have, and is an annuall plant to bee new sowne every yeare. But it is much to bee doubted whether any of these bee to be the right *Acinos* or *Clinopodium*, that *Dioscorides* and *Theophrastus* have set forth, in regard their temperature and qualities doe not agree as you shall heare presently, although *Fuchsius* and *Lobel* thinke their *Clinopodium* to be the right. The Italians call it *Clinopodio*, the Spaniards *Albahaca Salvage*, the French *Basilic Salvage*, the Germanes wild *Basilich*, the Dutch wild *Basilicon*, and wee in English wild Basill, Field Basill, or as before said,

The Vertues.

Of these hearbs I know no author hath set downe any tryed remedy found by them, for in regard that *Galen* saith *Clinopodium* is of thin parts, and may be accounted to be in the third degree of heate and drynesse, being somewhat sharpe in taste, and a little bitter withall, neither of which as saith *Dioscorides* can be found in these, yet because they doe so nearely in face and shew resemble the true plants, they may heare their names untill they gaine more and that the vertues are found out, whereunto they may be applyed. *Dioscorides* saith that his *Clinopodium* is applyed to those that are troubled with convulsions or crampes, ruptures or burstings, or strangury, that it is a remedy against the sting or byting of venemous Serpents, and that it bringeth downe the courses of women, and expelleth the dead child, and taketh away those wates that are long, and hang downe, if it be drunke for certaine dayes together. It slayeth the loosenesse of the belly, if it be given after it hath been boyled to the thirds in wine, as them that have no feavers and in water to them that have a Feaver. Of *Acinos* *Dioscorides* writeth, that being drunke it slayeth both the fluxe of the belly, and the courses in women, and healeth hot swellings, and those are called Saint *Anthonies* fire. Where you may obserue that *Acinos* should not be *Clinopodium*, both in regard *Dioscorides* maketh them two distinct plants, and besides giveth them contrary qualities, for *Acinos* he saith slayeth the loosenesse of the belly, and the overmuch flowing of womens courses, whereas he saith *Clinopodium* procureth the courses, and expelleth the birth, yet he saith also that it slayeth the loosenesse of the belly and as *Galen* saith, is hot and dry in the third degree, and of thin parts.

Chap. X.

Polium, Poley, or Polemountaine.

Although *Dioscorides*, *Galen*, and *Pliny*, have remembred but two sorts of *Polium*, yet our later Writers have found out divers other sorts, which they referre thereunto, some of them grow naturally neere the Sea, and therefore called of some *Polium maritimum*, others not only neere the Sea, but upon the hills also, and therefore may as well be called *montanum*, as *maritimum*, and others farre off from the Sea, upon hills and mountaines, and therefore called more properly *Polium montanum*, as shall be shewed in this Chapter following.

1. *Polium montanum vulgare*. Our ordinary Poley mountaine.

This kind of *Polium*, or Poley mountaine, that is most frequent in our gardens, is a small low plant, having diuers woody, hard, round and hard branches rising from the roote, which is somewhat long and hard, with a few fibres entring therein, and above a span high, whereon are set diuers long and small hoary leaves, overlayed as it were with a yellowish white downe, somewhat dented about the edges, and somewhat broader or greater than any of the other that follow, two and two set together on the stalkes as they grow up, at the tops whereof grow forth whitish or hoary tufts with heads, thrusting out many small pale coloured flowers, and in some places more yellow, standing in hoary husks: the seed is small and blackish: the whole plant smelleth sweet, somewhat strong and quick withall, the branches whereof being slipt and set will grow very well, thereby sufficiently to be encreased, because in our Land it rarely giveth perfect seed to sow of: yet *Clusius* saith, that he had some plants raised from the seed of his Garden, that brought forth flowers more pale than the mother plant, and some more white, especially on the outside: but *Bauhinus* in his *Pinax* addeth, that it gave some plants whose flowers were of a whitish purple colour, and then are accounted the fourth sort of *Clusius*, to which I am sure is not to be found in *Clusius*, which in this place maketh no mention of any with a purple flower raysed from seed.

2. *Polium montanum minus*. Small Spanish upright Poley mountaine.

This second or small Poley mountaine, riseth up with many small slender branches standing more upright than the

1. Polium montanum vulgare.
Ordinary Poley mountaine.

2. Polium montanum minus.
Small Spanish upright Poley mountaine.

the next, and not leaning downewards to the ground like it; nor much higher; whereon are set many hoary leaves, smaller than the next that followeth, and some small ones together with them, a little dented about the ends only, and as hoary as rather more than it: at the toppes whereof stand longer and smaller heads of whiter flowers than the next, comming forth of hoary cuppes, larger and more spread than it also; the seed is blackish and small, yet greater than the former, although the plant be smaller; the roote is hard and woodily like the former; the smell hereof is much more sweet than it.

3. *Polium montanum Monspelicum.* Small French Poley mountaine.

This third and small Poley mountaine is very like the former, but that the branches stand not so upright, but leane more downewards, the leaves likewise are not fully so large, but as white and hoary, dented a little more about the edges: the hoary heads of flowers which are white, are smaller, and more closely compact. In other things this differeth not from the last.

4. *Polium montanum supinum.*
Creeping purple Poley mountaine.

5. *Polium montanum supinum album.*
The smaller creeping white flowred Poley mountaine.

5. Polium

4. *Polium montanum Cretense.* Creeping purple Poley mountaine.

Creeping Poley mountaine hath divers small weake hoary branches lying upon the ground, which as they spread take roote at the joynts, being not a foot long, whereon doe grow many small and long leaves, as white and hoary as any, a little dented also about the edges, but not easily to be seene, unlesse one marke them well, and in the younger growme not at all: at the toppes of the branches grow smaller heads of hoary husks, out of which come purplish flowers, and after them small and blackish seed like the former.

Of this kinde there is another found, bearing white flowers, not differing in any other particular from it. *Flore albo.*

5. *Polium montanum repens flore candido.* The smallest creeping white flowred Poley mountaine.

This small kinde hath many small weake branches, not halfe a foot long, lying creeping on the ground, shooting forth fibres at the joynts as they spread, in the same manner as the last doth, whereon are set in the same order, two leaves one against another, all along the branches, being smaller, harder, narrower, and greener than any of the rest, without any denting at all about the edges: at the ends of the branches come forth three or foure small white flowers, like unto the other for forme and fashion, but much smaller: the seed is not unlike the other: this hath little or no scent at all.

6. *Polium montanum angustifolium.* Spike leafed Poley mountaine.

This Poley mountaine from a hard woody roote, spreading out many small shorte slender weake branches, not fully able to stand, but rather lying downe, whereon are set many small long leaves, two together, one against another, all the former, which are somewhat greene on the upper side, and hoary underneath, somewhat like unto the leaves of Rosemary or Lavender, and not a white input about the edges, at the toppes of the branches stand forth many flowers, not differing as in many of the former, but loosely spread, which are of a white colour, not differing in forme from the other, but comming forth of a grayish husk, not so hoary as some of the former: the seed is black like the rest. This kinde hath a small sweet scent, nothing so pleasant as most of the others: *Lobel* saith it hath little or no scent at all: *Matthiolus* saith that it smelleth well, though not so pleasant as the former, and that it is of lesse vertue and efficacy than it.

7. *Polium lanifolium incanum Creticum.* Candy Poley with hoary broad leaves.

The branches of this Poley are round and hoary, about a foote high, spread into other smaller branches, set with two leaves at each joynt, which are somewhat broad and round and dented at the edges like Lavender, or the Ice leafed Chickweed, of a yellowish greene on the upper side, and hoary underneath, without any manifest talke: the flowers have not been observed.

8. *Polium angustifolium Creticum.* Upright narrow leafed Candy Poley.

This Candy Poley groweth almost two foote high with upright hard round woodily stalkes, whereon are set small and long leaves almost round pointed, very like unto the common *Polium*, but much smaller, & not dented about the edges at all: the flowers and seed are like the common sort, the whole plant is very sweet.

9. *Polium montanum pumilum tenuifolium Africanum.* The small African dwarfe Poley.

This small creeping Poley, hath many very small and hoary white leaves, set together as a fringe all along the stalkes by allowances, the flowers are small and yellowish growing at the toppes: the roote is somewhat woody as all the rest of the plant is, and somewhat sweet also.

The Place.

The first as I have said the most common in this Land, *Clusius* saith he found in the Kingdomes of *Granada* and *Valentia*. The second *Clusius* saith he onely found growing upon the hills in *Spaine*. The third he likewise saith groweth as well in the Kingdome of *Valentia* in *Spaine*, as at *Montpelier* in *France*. The Fourth groweth also in a Province of *Spaine* and divers places of *France* also, upon the Adriatick shore. The fift groweth neere *Rome* in *Italy*, and on the hills in *Istria*, neere the Lake *Lucrinus*. The last groweth in divers places of *Germany*, as upon the hills of *Misenia*, the hill neere *Tenna*, and neere *Norimberg* side in *Comerania* saith *Camerarius*. The seventh as *Bauhinus* saith came to him from *Alexandria* in *Egypt* out of *Candy*, where the eight also groweth all along the Sea side, and upon many *Rocks* also, as *Prosper Alpinus* saith: the last was gathered neere *Tunis* in *Barbary*, by *Bauhine*, and brought to Doctor *Lyster* and us.

The Time.

They are most of them green in July and August, yet some later than others.

The Names.

Polium is called in Greeke [illegible] of [illegible] which signifies a white head, because it is like unto the hoary haires of a mans head: but this is referred to the toppes or heads of the plant, as we have said, & not to the leaves as *Pliny* would have it: although the leaves also are somewhat white and hoary, as I have said before, & therefore all other Nations call it according to their dialect. The first is called *Polium montanum vulgare*, and *Polium montanum latifolium* by *Lobel* and *Pena* in their *Adversaria*, as also in his observations

2. *Polium vulgo Hispanicum Cordi.*
Ordinary narrow leaved Candy Poley.

3. *Polium montanum vulgo hujus temporis Africum.*
African mountaine Poley.

ferent names, for they answer one another, so that by the name of *Lobel* (where I name him alone throughout all this booke) I doe not drowne the name of *Pena*, nor the name of *Lobel*, when I name *Pena* alone: but for brevities sake name one in stead of both. It is the first of *Dodoneus* in his History of *Pemptades* in Latine, which I use often, hereafter. And the second of *Clusius* in his History of more rare plants, which I chiefly meane, when I cite him alone, shall that worke be, because both his Spanish and Pannonick observations are included therein. Unlesse I recite his particular observations. The second is the second kinde of *Clusius*, in his Spanish observations, and the first with *Matthiolus*. The third is the first with *Clusius*, and the second with *Dodoneus*, called *minus*, and *media* or *minor* of *Lobel*, and *montanum album* of *Bauhinus* in his *Pinax*. The fourth is the fifth and last kinde with *Clusius*, the one with a purple, the other with a white flower, and called of *Lobel* also *Creticum*, of *Bauhinus* in his *Pinax*, *Marrubium spinosum sativum*. The fift is the eight sort with *Clusius*, the fourth with *Dodoneus* called *repens*, and so like wise by *Bauhinus*, and *montanum supinum minimum* of *Lobel*. The sixt is the seventh with *Clusius*, and called *Polium montanum femina lavendulæ folio* of *Lobel*, and is the second of *Matthiolus*, and called *Polium Lavendulæ folio* of *Bauhinus*. *Bauhinus* first mentioned the seventh, and *Pena* in his Italian *Lobel* the eighth, and taketh it to be the second *Polium* of *Dioscorides*, the last is not mentioned by any Author before. *Fuchsius Cordus*, as I shewed you in the first Chapter, would faine make *Polium* to be the true Hisope of *Dioscorides*, but I know not that any doth consent unto that opinion, for by the judgement of the best, this hearbe is the true *Polium* of all the ancients, as well in face as qualities, and therfore cannot be Hisope, besides, the taste hereof is very loathsome to the stomack, which *Dioscorides* also remembreth, but Hisope as he saith doth helpe to expectorate flegme &c. and no pectorall hearbe that I know doth trouble the stomick by the loathsome vttermesse thereof, as this doth.

The Vertues.

The decoction of this hearbe drunke while it is warme, as *Dioscorides* saith, killeth those that are stung or taken by venemous creatures, yea as he saith the fumigation or smoke thereof driveth them away, and so doth the hearbe being strowed or layd in Chambers: and although it trouble the stomack, and cause some paine in the head, yet it helpeth the laundise, and those that are hydropick, or are troubled with the diseases of the spleene, it moveth the belly, and bringeth downe the feminine courses, and doth consolidate or soder, or close the lips of cuts or wounds. *Galen* thus saith of *Polium*, in his eighth Booke of simples. It is bitter in taste, and sharpe or quick on the tongue also, and therefore it openeth the inward parts from all obstructions, and provoketh both urine and the feminine courses: being greene and applyed to great cuts or wounds, it closeth them, especially that greater kinde: and being dry, it healeth grievous sores of ulcers, and this the lesser kinde doth best performe. The lesser *Polium* which we use in Antidotes, or Counter-poysons (as Mithridatum, Venice Treakle, and such like) is the more sharpe and bitter, and is accounted to be dry in the third degree, and hot in the second.

CHAP. XI.

Dictamnus, Dittany, & *Pseudodictamnus*, Baſtard Dittanie.

HAve thought good in writing of the true Dittany, to make mention of the Baſtard kindes thereof, in the ſame Chapter: both becauſe the face of them, that is the forme and colour of the leaves are very like, and that other good Authors doe the like, reckoning them as kindes thereof.

1. *Dictamnus Cretica.* Dittany of Candy.

1. *Dictamnus Cretica.* Dittany of Candy.

Dittany of Candy hath divers hard and brownish, yet somewhat hoary ſtalkes riſing from the roote, ſet full of leaves, two ſtanding together one againſt another, all along the branches, which are broad and thick, and almoſt round, ſo hoary, white, and covered over with a woolly downe, that they have no ſhew of greeneſſe in them, as moſt other hoary or woolly hearbes have; at the toppes of the branches come forth leafy heads, made as it were of many thin leaves like unto ſcales, purpliſh on the outſide, and pale on the inſide, from among which come forth gaping flowers, of a pale purpliſh colour, and after them ſmall brownish ſeed: the roote conſiſteth of many blackiſh ſtrings or fibres, from a harder long root: the whole hearb is of a quick or fry ſcent, eſpecially if it be freſh, and likewiſe of a hotter taſte, being new, then old, for it much decayeth in keeping: this is very tender, and hardly to be kept a winter in theſe colder Countries, ſo that it ſeldome commeth to ſhew any flower, but if you doe tranſplant ſome of the branches by ſlipping and ſetting them in Auguſt, they will better endure the following winter, with a little covert, and may happen to give flowers the yeare following.

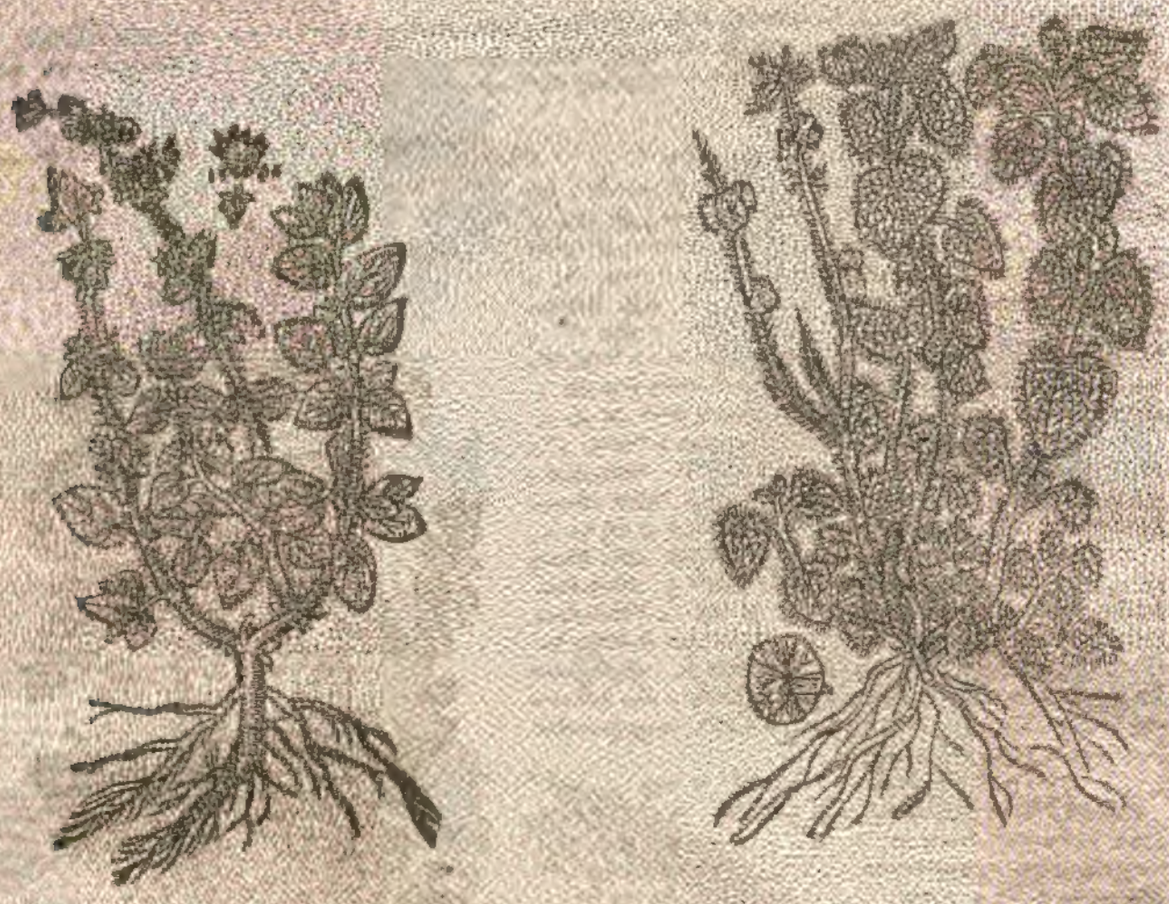
2. *Pſeudodictamnus.* Baſtard Dittany.

Baſtard Dittany riſeth up much higher than the former, the branches are a foote and a halfe long many times, as I have obſerved in mine owne Garden, whereon are ſet ſuch like hoary and round leaves, as the true hath, but neither ſo thick in handling, nor ſo thicke ſet on the branches, but more ſparingly, yet two alwayes together one againſt another: from the middle of theſe branches to the toppes of them, come forth the flowers round about the ſtalkes at the joynts with leaves, which are gaping like the former (and as Penny-royall, Mints, Calamint, and divers the like hearbs have) of a delayed purpliſh colour, ſtanding in hoary huskes, after which come the ſeed, which is greater and blacker than the former, the root hereof is not ſo black, but more hard and woodily, ſhooting downe deepe into the ground, with divers ſproyes ſpreading from it: this hearbe is ſomewhat hot and ſharpe, but not by halfe ſo much as the former: this doth well endure without in our Gardens, if the Winter be not too violent ſharpe and long, or if there be ſome care taken of it at ſuch a time: it groweth very well alſo of the ſlips being put into the ground about the middle of Aprill, and a little defended from the heate of the Sunne, for a time after the ſetting, and now and then watered in the meane time.

3. *Pſeudodictamnus alter Theophrasti Eryx.* Another Baſtard Dittany.

This other baſtard Dittany riſeth up with many ſquare hoary ſtalkes more than a foote high, ſet with two leaves at a joyne like the other, but ſomewhat larger and longer toward the toppes whereof with the leaves come forth hoary huskes, like unto thoſe of *Moluccella ſpinoſa*, the great Aſſirian Balme, but ſhallower, out of which ſtarre gaping flowers of white and red: the ſeede ſpreadeth many ſtrings: this ſmelleth reaſonable ſweet, and abideth the Winter as the other, and is in like manner encreaſed by ſlipping.

As for your hearbe which is called by many *Dictamnus albus*, and *Dictamnum album*, and by *Matthiolus*, *Bauhinus*, and others, placed with theſe kindes of Dittany together, although they doe all acknowledge that it hath ſmall reſemblance unto them, and is called *Eryngium*, which hath ſome diverſitie therein, as I ſhall ſhew you in another place.



The Place.

The firſt groweth in Candy, both hereof and the other, which have been thought by the elder Writers, to be the onely place in the whole world, where the true Dittany did grow, and that not generally through the whole Ile, but in one corner of Mount *Ida*, called *Dicte*, which turned to the ſtore of all parts, as *Theophraſtus* at large hath ſet downe, in his ninth Booke, and following him *Virgil*, *Pliny*, and others: but this knowledge whereof was utterly loſt, and periſhed with our fore-fathers, and but ſmall a matter of ſome few years recovered and reſtored to us againe: for *Mesuaeus* of *Perſia* writeth, that he was not knowne, as he ſetteth it downe in his ninth Booke and third Epiſtle: his words are theſe, *Dictamnum non invenitur hodie ab illis ſylvis deperiit omnino deperiens*: but *Clusius* ſaith in his Appendix (where he writeth of Exoticks) that it was ſignified unto him, that it was found *Mas in the Ile of Candy*, having leſſer and whiter leaves than that of *Candy*, and exceeding ſweet;

Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

2. *Pseudodictamnus* Baſtard Dittany.

3. *Pseudodictamnus alter Lobel.* Another Baſtard Dittany.

withall. The firſt Baſtard Dittany groweth in many places, as *Dioſcorides* ſaith, and as *Lobel* ſaith he underſtood by ſome Italians on *Mount Argen* neere *Piſa* and *Liverne* in the Florentine Dominions. It is ſufficient frequent in many places of *Italy* in their Gardens, for we have had the ſeed thereof among others very often from thence, and abideth well in our Gardens alſo: the laſt, as *Pona* in his Italian *Baldus* ſaith, groweth in the Iland *Corfou*, and brought from thence to *Signor Contarene* to *Padoa* to furniſh his Garden.

The Time.

The true Dittany (as I find) hardly flowreth with us at all, and when it doth, it is very late, not bringing any ſeed, but *Dioſcorides* (as it is found in the old Copies extant) writeth that it beareth neither flower nor ſeed, even as he had ſaid before of *Nardus montana*, but *Matthiolus* defendeth him, ſaying, that it was moſt likely to be the ſlippe or errors of the Writers that ſet downe *oten* for *rarenes* that is *fert* or *profert*, for *confert*, as thus, *nec flores, nec fruſtum, vel ſemen fert*, or *profert*, for *nec flores, nec fruſtum, vel ſemen confert*, for *Theophraſtus* ſaith, *lib. 9. cap. 16. Flus foliorum non ramorum nec fruſtus eſt*, and *Virgil* and others (although *Pliny* following the corrupted text of *Dioſcorides*, ſaith it beareth no flowers, nor ſeed, nor ſtalke, whereof it is a wonder, having borrowed ſo much out of *Theophraſtus*, which acknowledgeth it) doe remember the flowers of Dittany, and ſo doth *Galen* alſo in the *Emplaſtrum de Dictamno*, whereof *Damocrates*, as he ſaith gave him the receit. The firſt Baſtard Dittany flowreth with us all the latter part of the Summer, but ſeldome giveth us any good ſeed. The laſt hath not as yet beene ſeene in *England*.

The Names.

It is called in Greeke *ὀρίγανον ἡ Ῥιζοτόμος ἡ Ῥιζίον ἡ ἴδαιον*, by *Dioſcorides* *ἑλατικὸν*, by *Theophraſtus* *ἀλεκτορίς* ſome alſo *Δίκτυμνος* and *Δίκταμνος*, in Latine alſo *Dictamnus* and *Dictamnum*, *Cornarius* *dicit quidem, quod viteo ſuo ſanare ſolitæ ſint parturæ, promittat aut dolores pronos ſedat Dioſcorides & Theophraſtus*: the firſt is called by all Writers *Dictamnus* or *Dictamnus Cretica*, or *Dictamum*, or *Dictamnum Creticum*: the ſecond likewiſe is called by all Writers *Pſeudodictamnus*, or *Pſeudodictamus*, or *Pſeudodictamnum*: *Anguillara* ſaith it is called by the Greekes now a dayes *Calicunthia*: *Pona* would make it to be the Gnaphalium of *Dioſcorides*: the laſt is onely ſet out by *Pona*, who taketh it to bee the *Dictamnum alterum*, of *Theophraſtus* and *Dioſcorides*. The Arabians call it *Muſcaramſe Aargon Arabe* or *Burl*, the Italians *Dittamo*, and other Nations much thereafter according to their Dialect, and we in *English* Dittany, but not Dittander, as ſome too fooliſhly would make it.

The Vertues.

It is availeable as *Dioſcorides* ſaith, for all the purpoſes that the planted or garden Penny-royall is uſed, but with farre more efficacy, for it not onely expelleth the dead child being drunke, but being applyed unto the place (as in a Peſſary) for the fumes thereof taken hot, or burnt, and taken underneath: the juyce hath a purging quality applyed with Barley meale: it draweth forth thornes out of the feete, or any other part of the body being applyed to the place: for as it is reported that the wild Goates in *Candy*, being wounded by the Hunters with arrowes, doe by eating this hearbe drive them forth, and are thereby cured. It is held to be very profitable for thoſe that are troubled

with

with the fulsome by letting the swelling thereof. It hasteneth on the birth, and as *Theophrastus* saith, causeth speedy delivery, or at least easeth much of the paines in travaile: and the juyce thereof drunke in Wine is a present remedy for those that are bitten by any venemous Serpent. The heard is so powerfull against the poyson of all beasts that are venemous, as that it doth drive them away by the very smell, and killeth them if they touch it where it is lying: the juyce thereof is also a present remedy for all wounds made with Iron, if after the jutting of it into the wound, some of it also be taken in drinke. The bastard Dittany is used for all the purposes that the former is, but with much lesse effect. *Pliny* setteth downe in a manner all that is formerly said in severall places of his books: that it procureth the monethly courses of women, and is so effectuall to expell the dead birth, that it is dangerous to bring it into the chambers of women that are with child.

CHAP. XII.

Pulegium. Penny-royall.

There are divers sorts of Penny-royall, some that grow wilde in many places of this Land, yet are nurtured every where in Gardens; the other more rare, and therefore preserved onely by those that are curious.

1. *Pulegium vulgare.* Common Penny-royall.

1. *Pulegium vulgare.* Common Penny-royall.

This common Penny-royall is so well knowne to all, that I shall not need to spend much time in the description of it, having many weake round stalkes divided into sundry branches, rather leaning or lying on the ground, than standing upright, whereon are set at severall joynts small roundish darke greene leaves: the flowers are purplish that grow in Gardens for the most part, yet some that grow wilde are white, or more white than purple, set in rundles about the toppes of the branches: the stalkes shoot forth small fibres or rootes at the joynts as it lyeth upon the ground, fastning it selfe therein quickly, and overspreading any ground, especially growing in the shade or any moist place: and is increased by breaking of the sprouted stalkes and thrust into the earth.

2. *Pulegium regium vulgare majus.* Great Penny-royall.

There is a greater kinde than the ordinary sort, found wild with us, which so abideth being brought into Gardens, and differeth not from it, but in the largenesse of the leaves and stalkes, in rising higher, and not creeping upon the ground so much: the flowers whereof are purple, and growing in rundles about the stalkes like the other.

3. *Pulegium duplex sive coronatum.* Thick or double Penny-royall.

This sort differeth little from the former, the leaves are somewhat smaller and thicker set on the stalkes, and the branches grow closer together.

4. *Pulegium mas flore albo.* White flowred Penny-royall.

This Penny-royall groweth more upright with his stalkes than the former, and sometimes a foot higher also, having leaves thereon set by couples like it, and in some places other smaller leaves likewise growing with them, the flowers also grow in rundles or wharles round about the stalkes at severall joynts, but are wholly white, and so abide being planted in gardens, the smell whereof, the taste and use is altogether like the other: the rootes likewise creepe under ground, as the former.

5. *Pulegium angustifolium sive Cervinum.* French or Harts Penny-royall.

This fine Penny-royall hath creeping rootes under ground, but shoot forth longer sprouts than the former, from whence spring forth many tall upright hard stalkes, whereon are set at equall distances many small long and narrow leaves, all along the branches up to the toppes: the flowers grow round about the stalkes at the joynts with the leaves in many spaces up to the toppes, of a pale purplish colour: the smell and taste hereof is much more pleasing and stronger also.

6. *Pulegium folio Nummulario.* Round leafed Penny-royall.

This round leafed Penny-royall groweth almost as upright as the last, with smaller stalkes, having the leaves set by couples at each joynt, and are small and round like unto those of Hearb two pence, but farre lesse: the flowers stand in rowes compassing the stalkes on the other side, of a pale bluish colour: the smell hereof is much more pleasant than the common sort.

The Place.

The first is found in many moist and watry places of the Land, and for the use kept in Gardens. The second is found wild in divers places of the highway betweene *London* and *Colchester*, and thereabouts, more abundantly than in other Countries, and from thence brought and planted in many Gardens of *England*. The third hath

Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

1. Pulegium mas latifolium. Broad leaved Pennyroyall.

3. Pulegium angustifolium sive Cervinum. French or Hairy Pennyroyall.

hath beene also found in some places of our Land, and brought into Gardens. The fourth *Dioscorides* saith he found not onely upon a plaine in *Pamphylia*, on the borders of the high-way betweene *Rodes* and *Tarsus*, but in divers other places also. The 5th groweth in abundance in the corne fields and moorish grounds about *Montpelier*, where they use almost no other sort, although they have them in plenty also. The last grew in the Garden of *Padua*, but where naturally, we have not understood.

The Time.

They doe all flower in the later end of Summer, about the moneth of August and sometimes later.

The Names.

It is called in Greeke, [illegible] *halaxi, quoniam deos facit, a genere cervi pulegium halaxon vocant, vel ut scribit Plinius, Plinius & Dioscorides ab herbivoris, quod pulmonibus pituitam magnam facientibus accommodetur*, exactly from blearing, because it causeth Sheepe and Goats to bleat when they are eating of it; but *Pliny* saith rather from the effect of causing thick flegme to be expelled out of the lungs which stuffed them: in Latine *Pulegium* and *Pulejum* also, *quod flos eorum ac herba vestes pulices necare dicitur*, because it killeth fleas being latned. The first is well knowne every where, but the second being not knowne in other Countries, as I thinke hath no other name then that which is set downe in the title. The third is as little knowne out of our Country as the former. The fourth is the *Pulegium mas Plinij*, which in Italy hath white flowers, as he calleth the ordinary *Pennyroyall*. The fift is called by Gesner *Mentastrum*, and by *Gesner Pulegium Cervinum*, and of *Dodonæus Pulegium alterum foliis oblongis*, of *Lobel Pulegium Montanum sive Cervinum Monspelianis*, *Bauhinus* calleth it *Pulegium angustifolium*: the last *Bauhinus* onely maketh mention of in his *Pinax* and *Prodromus*. The Arabians call it *Abuneya*, *Abuneya*, the Italians *Puleggio*, the Spaniards *Poleo*, the French *Pouliot*, the Germanes *Poley* and *Harte Poley*, the Dutch *Poleye* and were in English Penny-royall, Pudding grasse, and Pollioll-royall, and in the West parts of about *Exeter* Organs.

The Vertues.

Dioscorides saith that Penny-royall rarifieth or maketh thin thick flegme, it warmeth the coldnesse of any part whereunto it is applied, and digesteth raw or corrupt matter, being boyled & drunk, it provoketh womens monthly courses, expelleth the dead child and after-birth: and letteth the disposition to vomit taken in poiset, that is water and vineger mingled: it allayeth the gnawing of the stomach, being mingled with Honey and Aloes and drunke, it causeth flegme to be avoyded forth of the lungs, and helpeth strangury, which place is observed by *Cornarius* in his third Booke, and 31. Emblame to be erroneous, for who ever used Aloes in any medicine that was to expectorate flegme, but in stead of *aloe succo* it should be written *oleo succo*, and in *Pliny* expelleth it in *lib.* 20. *cap.* 14. *Herbarum nemo melle & sale bibendum dat, pulmonum vitio exercebitis facit*, with honey and salt, it is a safe and good medicine for the lunges: it avoydeth melancholy by the stoole: drunke with wine it helpeth such as are bitten or stung with venemous beasts: applyed to the nostrils with vineger, it revyveth those that are fainting or sounding: being dryed and burnt, it strengthneth the gums: it is helpfull to those that are troubled with the gowt, applyed of it selfe to the place untill it wax red: applyed in a cerot or a plaister, it taketh away spots or markes in the face: it much profiteth those that are spleenetick or livergrowne being applyed with salt: the decoction helpeth those that have itches, if the places affected bee washed therewith: being put into baths for women to sit therein, it helpeth the swelling and hardnesse of the mother, and when it is out of its place. Some copies doe adde that if the greene herbe be broiled and put into vineger, it cleanseth foule ulcers, and causeth the matter to digest, it taketh away the markes or bruises that appeare about the eyes, which we call blacke and blue eyes, and all discolourings of the face by the fire, yea and the leprosie, being drunke and applyed outwardly: being boyled in wine with

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

with honey and salt it helpeth the toothach: it helpeth the cold griefes of the joynts, taking away the paines, and warming the cold parts, being salt bound to the place after a bathing, or having beene in a hot house. *Pliny* addeth hereunto that Mints and Penny-royall agree very well together in helping faintings: the Fwonings being put into vineger, and put to the nostrils to be smelled unto, or a little thereof put into the mouth. It easeth the headach, and the paines of the breast and belly, stayeth the gnawing of the stomack, and the inward paines of the bowels, being drunke in wine provoketh urine, and womens courses, and expelleth the after-birth and dead child: it helpeth the falling sicknesse being given in wine: put also into unwholsome and stinking waters, that men must drinke (as at Sea sometimes it maketh them the lesse hurtfull: it letteth the farmesse of the body being given with wine. But here *Pliny* is supposed to have mis-interpreted the Greeke word translating it *Corpulentiae corporis* for the thought to be *Crapula*, that is *surfeits*, which *Hippocrates* in *Aphorismis* 56. *lib.* 7. saith is taken away by drinking it with a small proportion of wine and water) it helpeth crampes or the convulsions of the sinewes being applyed with honey, salt, oile, & vineger. It is very effectuall for the cough, boyled in milke, and drunke, and for the ulcers or sores of the mouth. Thus saith *Pliny*. *Galen* saith that being sharpe and somewhat bitter, it heateth much, and exsiccateth also. And in that it heateth much may be knowne by this, that it maketh the place red where it is applyed, and rubefieth it: And that it dryes excessively, is sufficiently seene by this, that it doth easily purge and rough flegme to be avoyded forth of the lungs and brest, and that with ease: as also that it procureth the feminine courses. *Matthiolus* saith (and so doth *Calfar Dicarcus* also) that the decoction thereof drunke helpeth the jaundise and dropsie, and all paines of the head and sinewes that come of a cold cause, and that it helpeth to cleare and quicken the eye-sight. It was used by *Dioscorides* saith, in stead of *Ballamus Orientalis* (for it should seeme in his time also the true *Dictamnus* was not knowne, which was in *Anno* 1585.) who saith that bruised, and with vineger applyed to the nostrils of those that have the falling-sicknesse, or the lethargie, or put into the mouth, helpeth them much, and applyed with barley meale it helpeth burnings by fire; it bringeth the loosed matrix to its place, and dissolveth the windinesse and hardnesse thereof, easeth all paines and inflamations of the eyes, and comforteth and quickneth the eye-sight being put thereto, as also put into the eares easeth the paines of them.

CHAP. XIII.

Mentha, Mintes.

There are many sorts of Mints, some chiefly nourished up in Gardens, others growing wilde, either on the mountaines (which for their rarity and diversitie are brought also into Gardens) or the Wet and overflowne marishes, or the Water it selfe.

1. *Mentha Romana vel spicata sive Cardiaca.* Hart Mint, or Speare Mint.

This Mint hath divers round stalkes, and longer and narrower leaves set thereon, than the next Mint, and groweth somewhat lower and smaller, and of a darker greene colour than it; the flowers stand in spiked heads at the toppes of the branches, being of a pale bluish colour, the smell or scent hereof is somewhat neere unto Basill. It encreaseth by the root undergrounde, as all the others doe.

2. *Mentha crispata.* Crosse Mint.

The Crosse Mint hath his square stalkes somewhat hoary, and the leaves thereon hairy also, rougher, broader, and rounder than the former, which stand on all sides thereof one against another, two at a joynt, so that they represent a crosse, whereby giving it the name: the flowers stand in spiky heads, of a purplish colour, somewhat deeper than it.

3. *Mentha fusca sive vulgaris.* Red or Browne Mints.

This Mint hath square brownish stalkes, with somewhat long and round pointed leaves, nicked about the edges, of a darke greene, and sometimes reddish colour, set by couples at the joynts, and of a reasonable good scent: the flowers are reddish, standing by spaces about the tops of the stalkes: the roots alone creeping in the ground as the rest doe, and will as hardly be extirped as the rest.

4. *Mentha Crispa, Calpeana*, Curled Mint.

The greatest difference in this kinde of Mint from the last, consisteth all in the leaves, which are almost as round as the last, but verie much crumpled, or as it were curled: then in the flowers which are purplish, standing in tuftes about the spikes at distances, and to the smell hereof which commeth nearest unto Balme.

5. *Mentha Cretica Romana sive Germanica speciosa.* The great Cretan Mint of Germany.

This brave Mint creepeth with his roots as the others doe, having divers high stalkes rising from them, which

1. *Mentha Romana sive spicata sive Cardiaca.*
Hart Mint, or Speare Mint.

1. Mentha Crispa. Crisp'd Mint. 2. Mentha Crispa. Crispe or Curld Mint.

1. *Mentha Crispa Dioscoridis aut Germanica spicata.* The great Curld Mint of Germany.

Mentastrum variegatum sive Piperitum. Party-coloured Mints.

stone divide themselves into branches with two leaves at every joynt, somewhat broad and large, but more deepely cut in at the edges, and as it were curld or crumpled together, especially the lower leaves, for those that come up with the stalke are not so much torne or cut in on the edges, but are a little deeper dented than the former: the flowers stand in somewhat larger and rounder spiky heads than others, of a pale purplish colour: the scent whereof is pleasant, but not so quicke or hot as some of the former.

6. *Mentastrum hortense sive Mentha sylvestris.* The Manored wild Mint.

This wilde Mint that is nurled up in Gardens hath creeping roots as other Mints have, and square stalkes which are hoary, and a little hairy also, whereon are set larger and rounder leaves than in the former, of an hoary white colour covered as it were with downe: the flowers stand at the toppes of the branches, in longer and more slender spiky heads than any of the former, and are of a pale purplish colour: the scent hereof is more strong, full, and heady, but nothing so pleasant as the others.

Of this kinde is the party coloured Mints which are kept in Gardens, having divers leaves parted, white and greene, some more or lesse than others.

7. *Mentastrum folio longiore.* Long leafed Wild Mint.

This Wild Mint hath square brownish stalkes, and somewhat broad, but longer leaves growing on them than the last, and nothing hoary at all, but rather of a dull greene colour: the flowers stand at the tops of the branches in rounder tufts, of a pale purplish colour: the scent hereof is somewhat more pleasant than the other.

8. *Mentastrum montanum sive Pannonicum.* Hungarian Wild Mint.

This Hungarian kind hath square stalkes, and somewhat large leaves set thereon by couples at every joynt, as the other

there are, which are more green than the last, & dented about the edges: also the flowers are more white than the last standing about the stalkes at several spaces, and ending in small long spikes: the root is hard, shooting forth many strings, more like unto Nep than Mint, as the whole face thereof doth resemble, according to the minde of *Clusius*, and is of an hot and sharpe taste, smelling somewhat like the wild Mints.

9. *Mentastrum tuberiferum Clusij.* Clusius his knobbed Wilde Mint.

This kinde of wild Mint hath square hairy greene stalkes full of joynts, with two leaves set thereat, which are long rough dented about the edges, and somewhat hoary, in of a whitish greene colour, and of an unpleasant smell, the toppes of the branches do end in spikes of hairy leaves, among the which the flowers stand at distances, with two leaves at a space, of a whitish colour, after which followeth small black seed, the root is somewhat like a reddish foot-brownish on the outside, having certain tuberous heads joyned thereunto, which being separated, will grow into plants.

10. *Mentastrum gracilius radice.* Wilde Mint with jointed roots.

This kinde of Mint hath his roote somewhat thick, and set with joynts or knees at certaine spaces, and shooting foorth fibres thereat; the stalke riseth not a foot high, being somewhat hard, rough and square, whereon are set at the joynts two long darke greene leaves being soft in handling but a little wrinkled and dented about the edges: the flowers stand at the tops of the branches in thort tufts or spikes, like unto Nep, of a pale purplish colour: after which come small round sweet smelling seed like unto the whole plant.

11. *Men-*

Original from UNIVERSITY OF MICHIGAN

31. *Mentastrum hirsutum.*
Hairy wild Mints.

This wild Mint hath square hairy stalkes with many branches rising from the roote, higher and greater than the ordinary wilde Mint, having fourie long leaves set thereon at a joynt, and many purplish flowers at the tops.

32. *Mentastrum rotundifolium minus.*
Small round leafed wild Mints.

The leffer sort hereof is square, hairy, and reddish, about a foote high, having two leaves at a joynt, somewhat long and round, soft, hairy, and dented about the edges, of a dark green on the upper side, and hoary under-neath: from the joynts also come branches set with the like leaves, and round heads of flowers at the toppes of a purplish colour: the scent hereof is not very pleasant, but rather strong and heady.

The Place.

The first foure sorts are onely found planted in Gardens with us, and the fift found full wilde both with us, and elsewhere, but for especiall respects brought into gardens. The other sorts were likewise wild by nature in their places, but now are therefore with the lovers of plantes in many places.

The Time.

All the sorts of Garden, as well as wild Mints, flower not untill the beginning of August for the most part, but the garden Mints for the most part seldome doe give any good seed, but recompence the defect by the increase of the root, which is so plentifull, that being once planted in a garden, they are easily rid out againe, every small piece thereof being left in the ground increasing full enough.

The Names.

Mentha was called by the old Grecians μίνθη as *Pliny* recordeth, but of the later Greekes *Μέντα ab odoris bonitate & jucunditate*, because it is so sweet. The Arabians call it *Nabarandin*: the Italians *Mentha*: the Spaniards *Yerua buena*: the French *Menthe*: the Germanes *Munze*: the Dutch *Munt*, and so doe we. The first of these garden Mints is called *Romana angustifolia sive Cardiaca*, and called by *Bauhinus Acorus hortensis verticillatus crinitus odore* (but how truely I cannot see, because it beareth spiked heads) who saith also, it is the *Quinquedon serpens* that *Gerard* hath set out, for that no other *Quinquedon* of any other Author agreeth thereunto. The second is called *Cretica* of *Lobel*, & *rotundifolia altera spicata flore*, in English Crosse Mint. The third is usually in our gardens by the name of red Mints: the fourth is called *Mentha crispa*, and *Balsamita & Cameorium*, and *Sisymbrium hortense* of *Matthiolus*, and called by *Bauhinus Mentha crispa verticillata*, and is the *vulgata serpentea mentha folio Pulegij flore* of *Lobel*, in English Curld or Crispe Mint. The fift is the best and sweetest Curld Mints which *Lobel* shewed, but did not set forth. The sixt is that kinde of wild Mints which is planted in gardens, and called of some Horse Mint; from whence hath come our white or party coloured Mints to be seene in many gardens; and as I thinke is called by *Lobel Sisymbria Mentha agrestis*, for it answereth very well thereunto, although *Lobel* saith, it is all one with the *Mentha crocata*. The seventh is called by *Lobel Mentastrum aliud & Mentastrum Camerarij* of *Lugdunensis*, it is the *Sysimbrium sylvestre* of *Matthiolus*, very well set forth in his small leaves. The eighth and ninth *Clusius* hath set forth, calling the eighth *Mentastrum*, or *Pennyroyall*, and the other *Mentastrum tuberosa radice*, but referreth it rather to a kinde of *Cattoria tuberosa*, and by that name I have often received it among other seeds from *Italy* and other places, whereunto it doth most fitly agree. The tenth *Bauhinus* hath written of, and for the description thereof in his *Prodromus* by the name of *Mentha pensilis radice*, and lately hee received it both by the name of *Mentha tuberosa*, and *Nepeta angustifolia odorata*, from several places. The eleventh is called by *Lobel Calamintha agrestis Dioscoridis*, & *Mentastrifolia aquatica hirsuta*, by *Lugdunensis Mentastrum spicatum*, by *Camerarius Mentastrum aliud hirsutum*, and by *Bauhinus Mentha palustris folio oblongo*. The last is called by *Bauhinus Mentha rotundifolia palustris minor*.

The

The Former.

The garden Mints in generall, yet the two former sorts, that is the Square Mint, and Hart Mint, are more usually taken for all the uses whereunto Mints doe serve; *Dioscorides* hath it hath an heating, binding, and drying quality, and therefore the juyce taken with vinegar stayeth bleeding. It stirreth up venery or bodily lust, and as hee saith killeth the round wormes, which hath not usually beene knowne to take effect with any. Two or three branches thereof taken with the juyce of Cypres Pomegranats stayeth the hickock, vomiting, and allayeth choller & dissolveth impostumes being used to wash halfe meate: it is good to represse the milke in womens breaste when they are swolne therewith, or otherwise, for such as have swollen, flagging, or great breastes, applyed with salt, it helpeth the tyning of a wild Hogge, with Meade or honied water it easeth the paines of the eares: applyed to the privie parts of a woman before the act of generation, hindreth conception, which is contradicted as you may read a few lines before, and rubbed upon the tongue, taketh away the roughnesse thereof. It hindreth not milke to curdle in the stomake, if the leaves hereof be fryed or boyled in it before you drinke it. Broth, it is very profitable to the stomack, and in meates is much accepted. It is not especiall nie to stay the loosenesse of the belly when they come too fast, as also to stay the whites, for which purpose no other hearbe is more safe and powerfull. For by taking it often it hath cured many. Applyed to the forehead or the temples of the head it easeth the paines thereof. It is also good to wash the heads of young children therewith, against all manner of breaking out therein, whether sores or scabs, and healeth the chaps of the fundament. It is profitable also against the poison of venemous creatures. The distilled water of Mints is available to all the purposes aforesaid, yet more weakely: but if a spirit thereof bee rightly and chimically drawne, it is more powerfull than the herbe it selfe. A graine full of the spirit and strength of a great deale is to bee put into a small proportion; foure ounces thereof taken as *Dioscorides* saith, doth stay bleedings at the nose, which may be thought incredible to a great many. It is much commended for the weakenesse in venereous causes, although *Pliny* in his 20. book, 24. chap. doth write to the contrary: but I have in the first booke of Simples, doth render a reason of the facultie hereof very worthily, where he saith, some doe call that *Mentastrum*, Forest Mint, which they others is called *Mentastrum Hortense*: but there is another Mint which is more sweet, which they call *Calaminthe*: both of them are sharpe in taste, and hot in quality, yea even in the third degree of heat, but *Mentastrum* is weaker and lesse heating, so that I may well say that the one seemeth to be as it were the tame, and the other the wild: wherefore by that humidity it hath gained by manuring, it provoketh to Venery, which thing is common to all hearbes that have in them an humidity halfe digested and windy: by reason of which temperature being mingled with Barley meale it is used to ripen impostumes, which you cannot doe with *Calaminthe*, because it heateth and digesteth more, then such things as should ripen impostumes doe require. It hath also in it a little bitternesse, and some tartnesse, by reason of the bitternesse it killeth the long wormes of the belly, and by the tartnesse it stayeth the vomiting of blood; while it is fresh, if it bee taken with *Oxymeli* (which some take to be Sower milke, and others to be *Posca*, that is vineger and water mingled together.) It is of as great vertue in any beare whatsoever: there are *Calaminthe* which *Hippocrates* in *Sethi* saith it helpeth a cold liver and strengthneth the stomack and belly, causeth digestion, stayeth vomiting and the hickock, is good against the gnawings of the heart, and stirreth up the appetite, it taketh away the obstruction of the liver, and stirreth no bodily lust; but thereof too much must not be taken, because it maketh the blood thin and wheyish, and turneth it into choler, yea, and causeth the blood which is of very thin parts, after it is separated, to become thick and melancholick: and therefore cholerick persons must abstaine from it: it is a safe medicine for the tyning of a wild Hogge, being pouted with salt and laid on: the powder of it being dryed and taken after meate, helpeth digestion, and those that are splenetick, taken with wine it helpeth women in their hard and sore travels in child-bearing: it is also thought to be good for bleare eyes applyed to them; and that the decoction of them being drunke doth helpe the bleedings at the mouth speedily, or presently. It is good against the gravell and stone in the kidneys and bladder. It is also comfortable for the head and memory, not onely to be smelled unto, but chiefly to be applyed unto the head and temples, and easeth the head-ach: the decoction thereof cureth the gums and mouth that is sore, if it bee gargled therewith, and mendeth an ill favoured breath, as also with Rue and Coriander, causeth the uvula or palate of the mouth that is downe, to returne to its place againe, the decoction thereof being garoled and held in the mouth. *Aristotle* and other in the ancient times forbade Mints to be used of Souldiers in the time of warre, because they thought it did too much increase Venery, that it tooke away, or at least abated their animosity or courage to fight. Divers have held for true, that Cheeses will not corrupt, if they be either rubbed over with the juyce or the decoction of Mints, or they laid among them. And some againe, that if the juyce of Mints be put into the milke whereof you meane to make Cheese, that although yet put runnet thereto, it will never draw to curds whereby to become Cheese. The vermes of the wild Mints are more especially to dissolve winde in the stomack, to helpe the chollicke and those that are short-winded, and are an especiall remedy for those that have venemous dreames and poisons in the night, used both inwardly and outwardly: the juyce being applyed outwardly to the testicles or cods, the juyce thereof dripped into the eares easeth the paines, and destroyeth the wormes that breed in them; they are good against the venemous byting of Serpents, and as it is said, killeth them by the fume thereof, or in the scent of those being fled in any place. the juyce laid on warme helpeth the Kings-evill, or kernels of the throat, the decoction of the distilled water letteth a stinking breath, which proceedeth from the corruption of the teeth, and snuffed up the nose purgeth the head. *Pliny* saith, that in the time of Great Pompey, it was found out by experience of a certaine Captaine of his, to heale a Serpents biting by eating the leaves, and applying some of them to the face, and to help the fourth or daies ague if the head be bathed with vinegar.

Chap. XIIII.

Calamintha, Calamint, or Mountaine Mint.

Although diverse Authors doe confound Calament (called in Carmint) with Nep, which is more properly called Carmint, yet I thinke it better to intreat of them a part, then to joyne them both in one Chapter.

1. *Calamintha vulgaris.* Common Calamint.

2. *Calamintha valgaris.* Common Calamint.

The ordinary Calamint that groweth usually abroad in the dry grounds with us, is a small hearbe seldome rising above a foot high, with square hoary, and wooddy stalkes, and two small hoary leaves set at a joynt, about the bignesse of marjerome, or not much bigger, a little dented about the edges, and of a very fierce and quick scent, as the whole hearb is: the flowers stand at severall spaces of the stalkes, from the middle almost upwards, which are small and gaping like unto those of Mints, and of a pale bluish colour, after which follow small round blackish seed: the root is small and wooddy, with divers small strings spreading within the ground and dyeth not, but abideth many yeares.

There is another of this sort which is like unto it in all things, but somewhat lesser, differing chiefly in the flowers which are not so large by the halfe, which causeth it to be a differing species.

Mints wilde.

3. *Calamintha montana praestantior.* The greatest Calamint, or Mountaine Mint.

This sweet Calamint riseth up to be a foot and a halfe high, with his square hard and hoary stalkes, which are many, and slenderer than those of the wild Mints, whereon are set at every joynt two small and somewhat round leaves deeply dented about the edges, yet larger than those of the former wilde kinde, being somewhat hairy, and not so hoary, but rather of a sad greene colour, of a very sweet scent, not flying or heady as the other: the flowers are gaping, and like the other, but larger, and of a purple colour, after which commeth the seed, which is blacke, small, and round, somewhat like unto Parsley seed, the root is wooddy, but abideth and shooteth forth new branches every yeare.

4. *Calamintha altera odore Pulegij folijs rotundioribus.* Spotted Calamint.

This spotted Calamint differeth not much from our ordinary wild Calamint, but that it groweth not so great and high, having square hard hoary stalkes, and hoary leaves thereon like it, but spotted here and there, and of a strong scent like unto Penny-royall: the flowers grow in the same manner, but smaller, and of a pale purplish colour.

4. *Calamintha minor sativa.* Small Calamint.

This hoary small Calamint hath small low and slender hoary stalkes not above a foot high, whereon are set two leaves at a joynt, as in the other sorts, but smaller and more hoary, even smaller than the least both of all: the flowers are very small, but like the last, and of a lesse heady scent.

5. *Calamintha arvensis tricocca flore aquatico Belgarum Lobelij.* Field Calamint with whorled coronets.

This small Field Calamint sendeth forth divers square hoary stalkes full of joynts, and two small and almost round hoary leaves set thereat up to the toppes, somewhat like unto the leaves of Penny-royall, of a quicke and sharpe, yet sweet scent like thereunto also: towards the toppes of the stalkes and branches stand with the leaves many purplish flowers divers set together in a whorle or coronet: the root is small and abideth long, not perishing after seed time.

The Place.

The first groweth on heaths and upland dry grounds in many places of the Land: the second on the Eocanean hils neere *Padua*, and on the hills neere *Florence* in *Italy*, and on the Rocky shadowie hilles of *Savoy* at *Pont de Beauvoisin* in *France*, as also in *Germany*, and other places, and in *England* also, as *Lobel* saith he hath observed. The third *Pena* saith he found on certaine Hills in *Lombardy*, and in sundry places of our owne Land, yet seldome seene. The fourth *Camerarius* saith he had the seed from *Candy*. The last groweth in divers fields of our owne Land, as well in moist medowes, as plowed grounds.

The Time.

They doe all flower in July, and their seed is quickly ripe afterwards.

The Names.

It is called in Greeke *καλαμινθη quasi bona aut utilis Menthe*, a good or profitable Mint. The first is called *Calamintha vulgaris & montana Matthioli* by most Authors: and the lesser of this sort *Bauhinus* calleth *Calamintha vulgaris minor flore albo*. The second is called of *Lobel*, *Camerarius*, and others *Calamintha montana praestantior*, as the best of all the sorts of Calamints, in English as it is in the title. *Gerard* giveth the figure of this for *Serpillum*, or *Satureia agrestis*.

1. *Calamintha mentæ sapore latiori.*
The greatest Calamint, or Mountaine Mint.

4. *Calamintha minor incana.*
Small Calamint.

3. *Calaminthe arvensis verticillata seu aquatica tertia.*
Field Calamint with whorles of flowers.

agrestis, for hereunto that figure is nothing like. *Bauhinus* calleth it *Calamintha magno flore*. *Pona* in the description of *Mount Baldus* in many places doth take it to be the *Multisepti genus Fuchsij*. The third is called by *Lobelius* is it in the title. *Matthiolus* and *Camerarius* call it *Calamintha altera*, and say that the Italians doe call it *Nepetella*. *Cordus* upon *Dioscorides* calleth it *Nepeta agrestis*, and *Bauhinus* also calleth it *Calamintha Fuchsij altera sive Nepeta*, *Gerarde* giveth the figure of *Calaminthe montane prestantior* for this in English Spotted Calamint, for a distinction from the others, although it hath but sometimes small shew of spots with us. The fourth is called by *Lobel Calamintha secunda minor*, and by *Camerarius Calamintha Cretica*, but by *Bauhinus Calamintha vulgaris folijs*, in English Small Calamint, because it is the least of all the rest. The last is called by *Lobel Calamintha aquatica Betonicæ aut Polygonum quasi multicaula*. *Calamintha aquatica Matthioli* by *Lugdunenses*. *Calamintha arvensis* by *Gesner*, *Camerarius*, & *Tabernamontanus*: by some *Mentha aquatica acuto & Pulegium sylvestre*, and by *Bauhinus Calaminthæ arvensis verticillatæ*.

The Vertues.

Calamint is very hot and dry, the herbe onely is used, the root is unprofitable. The decoction thereof drunke, bringeth downe womens courses, and provoketh urine. It is profitable for those that are bursten, and those that are troubled with convulsions or cramps, with shortnesse of breath, and with cholerick torments and paines in their bellyes and stomacks, it helpeth the yellow-jaundise also, and stayeth vomiting being taken in wine, taken with salt and honey it killeth all manner of wormes in the body. It helpeth such as have the leprey, either taken inwardly drinking Whey after it, or the greene herbe applyed outwardly: if it bee applyed in woolle as a pessary to the privie parts of a woman, it drayeth downe the courses, and easeth paines of the mother, but killeth the birth: and therefore to bee refused of women with child. It driveth away venemous Serpents, being either burned or strewed in the chamber. It taketh away black and blue spots and

strikes

marble in the face, and perfect black leaves to become well coloured, if the greene heard and rust the dry be boyled in wine, and laid to the place, or the place washed therewith being laid to the huckle-bone or haunch where the paine of the Sciatica refteth, by continuance of time it so healeth the place, that it draweth forth and spendeth the humours that were the cause of the paine. (This was a cure held in *Dioscorides* time, but our Physicians and Chirurgions doe not esteeme it now adayes.) It killeth the wormes of the eares if the juyce be dropped into them, the leaves boyled in wine and drunke provoketh sweat, and openeth the obstructions both of the lives and spleene: it helpeth also them that have a tertian ague (the body being first purged) by taking away the cold fits that goe before: the decoction hereof with some sugar put thereto afterwards is very profitable for those that be troubled with the overflowing of the gall, and that have an old cough, that are scarce able to breath by the shortnesse of their winde, that have any cold infirmity arising in their bowels, and are troubled with the hardnesse of the spleene, for all which purposes both the powder called *Diacalamintha*, and the compound Syrupe of Calamint, which are to be had at the Apothecaries are most effectuall.

Chap. XV.

Nepeta. Neppe or Calamint.

THere are divers sorts of Neppe, some vulgar, and others more rare, which I intend to bring to your knowledge, which are these.

1. *Nepeta major vulgaris.* Common Garden Nep.

The Common garden Neppe shooteth forth hard four-square stalkes with an hoarinesse on them, a yard high or more, full of branches, bearing at every joynt two broad leaves, for forme and largenesse, somewhat like unto Balme but longer pointed, softer, whiter, and more hoary, naked also about the edges, and of a strong sweet scent, not offensive to any, but very pleasing to Cats, who will rub themselves thereon all over: the flowers grow in large tufts at the toppes of the branches, and underneath them likewise on the stalkes many together, of a white, a purple colour: the roots are composed of many long strings and fibres, fastning themselves strongly in the ground, and abide with greene leaves thereon all the Winter.

2. *Nepeta media.* Middle sized Neppe.

This other Nep hath likewise square hard stalkes, not so great as the former, but rather more in number, and sometimes as high: the leaves are smaller by almost the halfe, harder, greener, and nothing so strong in scent, set by couples upon the stalkes, as hers branch not in that manner: the flowers are fewer, smaller, and growing only by spaces along the stalkes to the toppes, of a faint purplish colour, gaping like the other, and after them such like small round seed in the huskes: the roots are greater, longer, and more woody, abiding many yeares in the ground, but holding the greene leaves thereon in the winter.

3. *Nepeta minor.* Small Neppe.

This small Neppe hath divers square hard and hoary stalkes rising from the root, which dye not after seed-bearing, but shoote fresh branches not above a foote high, with two small long and narrow leaves, hoary or dented about the edges, and hoary also, of a stronger scent than the common, and of a hotter taste, the stalkes shoote forth into many branches, at the toppes whereof stand many small gaping white flowers, spike fashion like the ordinary, after which come small blacke seed like the other.

Cupre Lusitanus in his *Pendroma Botanicum* setteth downe a small Neppe, which he saith doth differ from this of *Belon*, but the description thereof doth so nearely resemble it, that I am more than halfe perswaded it is the very same.

4. *Nepeta Cervariæ facie, Alpina.* Small Mountaine Neppe, or Calamint.

In the same place he setteth downe another smaller Neppe, smaller than the former, with square brownish stalkes of a foote height, branching forth, whereon are smaller leaves set then the former, being somewhat broad, almost three square and hoary, the flowers are small and whitish, set or placed spike fashion at the tops, like unto the common kinde.

5. *Nepeta peregrina latifolia.* Strange Neppe with broad leaves.

This strange Neppe hath a square hoary stalke, spreading into branches on all sides from the bottome to the toppe, set with two leaves at every joynt, which are broader than the next that followeth, but yet are not much broader, but longer than the ordinary Neppe, dented about the edges, and of an hoary green colour: the flowers stand in spaces about the toppes of the stalkes almost of a pure white colour like to some unto the comuon Neppe, but longer: after which commeth the seed which is blacke like it also: the smell of the whole plant is stronger and sharper, but more pleasing than it.

6. *Nepeta*

5. *Nepeta peregrina latifolia.*
Strange Neppe with broad leaves.

6. *Nepeta peregrina angustifolia.* Strange Neppe with narrow leaves.

This other Neppe is of the same kind with the former, and differeth from it onely, in that the leaves are smaller and narrower, but neither in colour or smell, or any other thing differing.

The Place.

The first and second growe wild in other Countries, but are nurfed up onely in Gardens in ours, as all the reft are: the third, the fift and the fixt doe grow in *Spaine*: for from thence the feed came that brought fourth theſe goodly plants. The fourth *Bauhinus* faith groweth upon ſome hilly grounds about *Naples*, from whence hee received feed.

The Time.

They doe all flower in July, or thereabouts, with the ordinary ſort.

The Names.

The ordinary garden ſort is called of ſome *Catmia*, and *Catteria*, and of others *Mentha Cataria*, and *Mentha felina*, becauſe as I ſaid before, Cats delight both to ſmell and eate thereof, and gladly rub themſelves againſt it, but of moſt with us *Nepeta*. *Gerard* ſaith that our *Nepeta* is called *Pulegium ſylveſtre*, but hee is therein much miſtaken, for *Dioſcorides* ſaith that the Latines did call that in his time *Nepeta*, which he calleth his ſecond *Calamint*, and was called alſo of ſome *Pulegium ſylveſtre*, but *Dioſcorides* his 1. Calamint is not our *Nepeta* uſed in theſe dayes, as any of judgement may ſome perceive, that readeth and marketh *Dioſcorides* his deſcription thereof. And *Matthiolus* alſo ſaith *Braſſavolus* who fell into the ſame errour, he being chiefly deceived by the miſtaking of the name; for the Italians call that mannred kind of Calamint *Nepitella*, as *Matthiolus* ſaith, which was derived from the *Nepeta*, and *Braſſavolus* would fallen it upon this hearbe which they call *Herba Cataria*. The firſt of theſe is the *Herba gattaria* of *Matthiolus*: *Cæſalpinus* in lieu thereof hath invented a kinde of Calamint, *Tragus*, *Cordus*, and others call it *Nepeta*, *Lobel Cataria* and *Mentha Cataria*, and generally with us *Nepeta*, in Engliſh Nep, or Cat Mint; the ſecond I doe not finde mentioned by any Author, but it is continued in my Garden to this day under that name. The third *Lobel* calleth *Cataria tenuifolia Hiſpanica* and *Cunradus Nepeta minor*, *Bauhinus Mentha Cataria minor*, in Engliſh ſmall Neppe or Catmint. The fourth he calleth *Mentha Cataria minor Alpina*, in Engliſh ſmall mountaine Nep or Cat Mint. The fift is called by *Lobel Mentha Cataria peregrina latifolia* of *Lobel* ſecond *Mentha ſylveſtris ſpuria longifolia*, of ſecond *Cattaria ſylveſtris*, and of *Bauhinus* in his garden of the Biſhop of *Eyſtet*, *Nepeta peregrina*, Engliſh ſtrange Neppe with broad leaves. The laſt is called by *Lobel Mentha Cattaria peregrina angustifolia*, of *Dodonæus* *Cataria ſylveſtris longifolia*; of *Gerard Sel-heal* in *Bohemia*, for the ſignie thereof alſo ſometimes, and not ſeldome any *Cattaria*, of *Bauhinus* laſtlie *Mentha Cataria angustifolia minor*, in Engliſh as of his in the ſide.

The Vertues.

Neppe is generally uſed for women to procure their courſes when they are ſtayed, to uſe inwardly, or outwardly applie them in the decoction of it, with other hearbes convenient for the purpoſe, or with it alone, or rather

Original from UNIVERSITY OF MICHIGAN

ouer the hot fumes thereof: for it not only warmeth and comforteth the coldnesse, but dryeth the ouermuch moisture of the mother, which may be one cause of barrennesse, and by the frequent use of it, to cause them to be more fruitfull that were barrein, and also for the wind and paines of the mother, or rising of it. It is also used in paines of the head that come from any cold cause, as catarrhes and thin rheumes, and for swimmings and giddinesse thereof. It is also of especiall use for the windinesse of the stomack or belly. It is effectuall for any cramps or cold aches to dissolue the cold and wind that affecteth the place, and to bring warmth and comfort thereunto afterwards. It is used for colds or coughes, and shortnesse of breathing. The juyce thereof drunke in wine is profitable for those that have caught harme by any bruise by any accident. The greene herbe bruised and applyed to the inflammation, there abiding for the space three houres, easeth the sharpe paines of the piles, the juyce also is effectuall for the same purpose, being made into an ointment and applyed. A Decoction thereof also is commended to wash the head, to take away the scales thereof, and may be effectuall for other parts of the body also. *Lobel* saith the two greater sorts of strange Nepps are more effectuall to all the purposes than the ordinary kinde is used for. The vertues of the former two lesser sorts are not certainely knowne, but are thought to conduce to the like effects.

Cap. XVI.
Melissa. Balme.

BEsides the ordinary which usually groweth in all our gardens, there are some other sorts of Baulme, as they are enstiled by divers Authors for the sweet scent of them comming neerest, is that of our ordinary Baulme of all which I meane to entreate in this place.

1. *Melissa vulgaris.* The common garden Balme.

1. *Melissa vulgaris.* The common Garden Baulme.

The common garden Balme hath diuers square greene stalkes, with round hard darke greene leaues pointed at the ends, and a little dented about the edges, set by couples at the ioynts, of a sweet smell, commonly nearer to a Citron or Lemon, the flowers are small and gaping, growing at the toppes of the stalkes, of a pale Carnation colour, almost white: the roote is fasten thenselues strongly in the ground, and endureth long, the leaues and stalkes dyme downe yeerely.

2. *Melissa Turcica flore cæruleo.* Turky Baulme with a blue flower.

This Baulme riseth up with one square brownish greene stalke, two foote high at the least in any good ground and higher sometimes, spreading with two branches from every ioynt where the leaues are set, up almost to the toppe: the leaues are narrower and longer than those of the ordinary Baulme, and more dented in about the edges, of as sweet a Lemon scent, or rather more than it, rough also, and of as sad a greene colour: the flowers are gaping or hooded, growing at the toppes of the branches, at certaine distances, of a blue or purplish blue colour, standing in rough sharpe pointed huskes, after which commeth the seed which is black and roundish, with a white spot in every of them, plainely to be seene while they are fresh, but not so easily discerned when they are dry. The root perisheth every yeere, and must be sowne a fresh in the spring time, if any desire to haue it.

3. *Melissa Turcica flore albo.* Turky Baulme with a white flower.

This other Baulme differeth not from the former, either in crowings or height, or forme of leaues and flowers, or in the good smell thereof, or in the duratility, for it is equall therein all these properties: the onely difference is, in that the leaues hereof are of a freshet greene colour, and that the flowers are of a perfect white colour; the seed whereof doth not degenerate as in many other herbes it vseth, but keepeth constantly his kinde, for any thing I could obserue in these twenty yeeres and vpwards, since I first had it and sowed it.

4. *Melissa polyanthum Fuchsij.* Vnpleasant Baulme.

Vnto the kindred of Baulmes I thinke good to adioyne this plant more for the formes sake of the leaues from whence *Fuchsius* first gaue it the name, then for any other correspondence it hath therewith, but as it is at this time, take it with this description. It hath diuers hairy square browne stalkes, rising from the roote halfe a yard high, whereon are set two leaues at seuerall spaces, at the contrary sides of them, euen vp to the toppes of the stalkes, which are broader and somewhat longer than the ordinary Baulme, and of a sad greene colour, betweene which leaues at euery ioynt with them, from the middle of the stalke vpward on each side thereof, commeth forth larger flowers, and longer than in Baulme, more like vnto those of the yellow *Lysimachia*, or dead Nettles, as some compare them, or vnto those of mountaine Calamint, as others doe, of a pale purplish colour on the lower part and

3. *Melissa Turcica flore albo.* Turky Baulme with white and with whiteflowers.

4. *Melissa platyphillon Fuchsij.* Purple stem'd Baulme.

and whitish above, this hath no such good scent therein as the Baulme hath, but is rather of a stronger unpleasant scent, for which cause I have so entituled it.

5. *Melissa Matthioli sive Syriaca laevis.* Great Affirian Baulme.

This herbe *Matthiolus* and others make a kinde of Baulme from the forme of the leaves chiefly: it riseth from seed with a round hollow stalke out of the ground, to bee two foote high or thereabouts, branching forth diverslie on all sides up to the toppe, whereon are set shorter and rounder leaves, at the end of long foote stalkes, somewhat lesse dented about the edges then in the common Baulme, and not at all sharpe on the edges, as in the next: at the joynts of the stalke from the middle thereof upwards, come forth round about it, certaine hard whitish skins small and round at the bottome, and wide open at the brims like unto a bell, having five corners for the most part: from the bottome of each of these commeth forth one flower somewhat small, and like unto the flower of common Baulme, almost white, or with a small shew of bluish therein, and after they are past, in the bottome of the same skinny bells grow the seed (but seldome one of ten commeth to be ripe with us) which is whitish and cornered: the smell hereof is nothing like Baulme, but rather sullome, the taste thereof is bitter: the roote perisheth every yeare.

6. *Melissa Melissa superior sive Syriaca superior.* Prickly Affirian Baulme.

This other Affirian Baulme riseth a little higher, and groweth somewhat greater than the former, but after the same fashion; the leaves hereof are somewhat longer and sharper on the edges, the stalkes likewise in which stand these skinny bells, at the corners of them are sharpe pointed, and of a paler white colour: the flowers and seed are all alike, and perisheth likewise at the first approach of any cold night: this hath a little better scent to commend it than the former.

7. *Cardiaca.* Motherwort.

As these three last had little likenesse with Baulme, more than in the forme of the leaves, and the properties as you shall heare anon; so this, besides the properties answerable to the rest in comforting the heart, hath no shew of alliance, no not in the leaves: but because some have put it to the kindred of the Baulmes, and others to Nettles, and others to Horehound, I have thought it best for the vertues sake (wherunto most of the Nettles or Horehounds are answerable) to set in the end of the Baulmes, and to be as it were a bridge to passe from them to the Horehounds, whereunto in face it hath the more resemblance. It hath a hard square brownish rough strong stalke, rising to bee three or foure foote high at the least, spreading into many branches, whereon grow leaves on each side without any foote stalkes, set at every joynt, which are somewhat broad and long, as it were rough or crumpled, with many great veines that shew themselves therein, of a sad greene colour, and deeply dented in about the edges, and almost come or divided: from the middle of the branches up to the toppes of them, which are very long and small, grow the flowers round about them at distances, in sharpe pointed rough hard huskes, which are more purple or red than in any of the former Baulmes, or in any Horehound, but in the same manner and order, and resemble as the Horehounds: after which come small round blackish seed in great plenty: the roote

1. Melissa Officinarum sive vulgaris & vera. Great Allrian Baulm.

6. Melissa Moldavica, sive Dracocephalum. Purple Allrian Baulm.

3. Cardiaca. Motherwort.

tendeth forth a number of long strings, and small fibres, taking strong hold in the ground, of a darke yellowish, or brownish colour, and perisheth not at the other, but abideth as the Hoorehound, the smell like wife is not much differing from it.

The Place.

The first is onely to be found in gardens, the two next growes naturally in *Moldavia*, which is under the Turkish Dominion. The third in the foote of divers hills both in *Germany* and *Narbone* in *France*. The fourth and fifth as *Matthiolus* thought in the *Molucca* Ilands which are in the East-Indies, but herein he was much mistaken, for he saith they came from *Constantinople*, others and that more truely say, that *Mercurialis Leonicus* an Italian sent them to *Vienna* out of *Syria*. The last groweth among rubbish, and by the sides of walls and hedges in many places beyond the Seas, but not with us that I have knowne or heard, but onely in Gardens where it hath beene once sowne or planted.

The Time.

The three first and the last flower somewhat earlyer in the Summer, than the two *Allrian* kindes, which flower very seldome before the middle of August, so that it hardly growth any good seed, although the two former and the last doe plentifully.

The Names.

Baulme is called in Greeke [illegible] *Melissophyllum*, or *Melissophyllon*, of the [illegible] *delectantia* in Latine *Melissa* & *Citrago*, & also *Citrea*, for [illegible] good reason & greatnesse, & whose [illegible] of the effect being good for Bees. The first is called *Melissa*, or *Melissophyllum* generally by all writers, the second and third are called *Melissa Moldavica* & *Tetrahit* the most Writers; *Fuchsius* calleth it *Melissa Turcica peregrina folio oblongo*; the third *Cardia* and *Fuchsius* take to bee the

vum *Melissophyllum*, & thereupon it is generally called *Melissa* or *Melissophyllum* Fuchsio by most writers, although it have neither smell of Balme, nor good to purposes wherein Balme: *Lugdunensis* saith it is the *Gallorum prestantior* which *Lobel* and *Lobel* have described and set forth more exactly, in he is therein much deceived, for *Fuchsius* saith his hath blacker and larger leaves than Balme, & that *Cordus* hath two like and whiter: only *Ruellius* and *Clusius* referre it to the *Lamia*, *Basilicum* calling it *Lamium Mas vulgare Fuchs*, and saith withall, that the saying thereof may be referred to the variable sorts of the *Lamia Peregrina* of *Clusius*: it is called in English as it is in the title, until a more exact name may be given it, for I cannot conform to *Ruellius* and *Clusius*, to call it *Lamium*, seeing by many Authors call it *Melissa*. The fourth *Matthiolus* calleth *Melissa Constantinopolitana* or *Melissophyllum Constantinopolitanum & Ierae* is added by *Dodonæus*, for hee maketh no mention of any prickles in that, which grew in the Emperours Garden, but that which *Alpinus* Physitian of *Padua* sent him as he saith, the leaves were prickly: allowably that kind that I have had growing in my garden at several times, had no prickles either on stalke or leafe, although *Bauhinus* saith hee never saw any that was without some sharpe thornes, and therefore it should seeme, that *Lobel* maketh the one kind lesse sharpe or thorny than the other, and calleth it *Cordus Melissa sine Melissa minus aculeata & Melissa Syriaca*. *Bauhinus* calleth it *Melissa Melanorhiza vera*, as he doth the fifth *Melissa Cretensis* sorte, making the one to be sweet, and the other stinking. *Lobel* calleth it *Melissa Apium Syriaca*, and saith moreover that it is called *Mandelon* of the Turkes: *Crispinus* would referre both these kindes unto the *Alysson* of *Dioscorides* and *Plinie*; and *Bauhinus* saith they are like to the *Alysson* of *Galen*. They have their English names over their heads. The tall is called *Cardiaca* of most of our later Writers, for it is likely it was not knowne to them of ancienter ages, yet *Dodonæus* formerly tooke it to be a *Sideritis*. *Tragus* takes it to be a wilde Balme. *Brunfelsius* takes it *Marrubium nigrum*. *Angullara* to bee *Elenium* or *Brance ursine*. & *Bauhinus* calleth it *Marrubium foetidum primum Theophrasti*: *Calepinus* thinketh that it is the *Alysson* of *Galen* and *Plinie*. We doe call it Mother-wort in English, as truely from the effects to helpe the Mother, as they call it *Cardiaca* from the effects to helpe the heart, as you shall heare by and by: the Arabians call Balme *Badrenegi*, *Bedrenegi*, *Cedronegi*, *Trionegi* or *Trionesi* and *Marmarei*: the Italians *Melissa*, *Cedronella* and *Arancetta*: the Spaniards *Toronjil* or *yerva Cidrera*: the French *Melisse* & *Pouriade*: the Germanes *Melissen*, *Rosenkraut* and the Dutch *Melisse* or *Hoenigbloem Camille* or *eyen*, and we in English Balme, from the singular effects therein, in honour of the true naturall Balme.

The Vertues.

The Arabian Physitians have extolled the vertues of Balme for the passions of the heart in a wonderfull manner, which the Greekes have not remembred: for *Serapio* saith it is the property of Balme, to cheare the minde and heart, to become mercy, to revive the fainting heart falling into swoonings, to strengthen the weakenesse of the spirits and heart, and to comfort them, especially such who are overtaken in their sleepe, therewith taking away all motion of the pulse, to drive away all troublesome cares and thoughts out of the minde, whether those passions rise from melancholy or black choller, or burnt flegme, which *Rasis* confirmeth in his booke of medicines proper for the heart, where he saith that it is hot and dry in the second degree, that it maketh the heart merry, and strengthneth the vitall spirits, both by the sweetnesse of smell, subtilty of parts, and vertue of parts, with which qualities it is helpfull also to the rest of the inward parts and bowels. It is to good purpose used for a cold stomack to helpe digestion, and to open the obstruction of the braine. It hath a purging quality therein also saith *Avicen*, and that not to weake, but that it is of force to expell those melancholly vapours from the spirits, and from the blood, which are in the heart and arteries, although it cannot doe so in the other parts of the body. *Dioscorides* saith that the leaves drunke in wine and laid to, is a remedy against the sting of Scorpions, and the poison of the *Phalangium*, or venemous Spider, as also against the byting of Dogges, and commendeth the decoction thereof, for women to bathe or sit in to procure their courses, and that it is good to wash the head therewith when they are full of paine, and that it is profitable for those that have the dropsy also. The leaves also with a little Nitre are taken in drinke against a biting of *Mad-stones*, it helpeth the griping paines of the belly, and is good for them that cannot take their breath unlesse they hold their necks upright, being taken in a Loloc or licking Electuary: used with salt it taketh away wormes, kernels, or hard swellings in the flesh or throte, it cleanseth foule sores, and is an helpe to calle the paines of the gowt. *Galen* saith in his seventh booke of Simples, that Balme is like unto Horehound in qualities, but weaker by much, and therefore few will use Balme when Horehound is so plentifull, and neere at hand to be had every where. *Pliny* saith in *lib.* 20. *cap.* 17. that in *Sardinia* it is poyson, wherein it is very probable that he was much mistaken, and for *Medicinable herbs*, which is called of him *Apium rusticum*, and of *Apuleius Apium silvestre*, he reckoneth that *Apium* or Balme the juice thereof sliced with a little honey is a singular remedy for the dimnesse of the sight, and to take away the mistinesse of the eyes. It is of especiall use among other things for the plague or pestilence, and the water thereof is used for the same purpose. It is also good for the liver and spleene. A Taule or Caudle made with egges, and the juice thereof while it is young, putting to some Sugar and Rosewater unmixt, is often given to women in child-bed, when the afterbirth is not throughly scoured, and for their swoonings upon, or after their hard travels. It is used to destroy young other wormes and contumacies or sores or scabbednesse or leprosies in the Summer time, to comfort the spirits and brewes, which our Forefathers aged did in much more use than now adayes. The heade boyled and boyle in a little wine and oyle and laid warme on a Bile will ripen and breake it. There is an ordinary *Aqua vitæ* or strong water stilled, and called *Balme water* used generally in all the Land, which because it hath nothing but the simple herbe in it which it is named, I will commend it the better receit unto you. Take two pound of Balme while it is young and tender, of Sage and Isope, of each one pound: bruise them well in a stone morter, and put them into a pot or Limbeck, and cold drawne of Annifeeds four ounces, of Cloves of Nutmegs, of Cinamon, of Ginger, of Cubebes and of Galanga, of each one ounce: being all a little bruised and put into two gallons of good Sacke if you will have it excellent good, or else into foure gallons of Ale and so distill it as *Aqua vitæ* is distilled, and let it distill as long as you shall finde any strength in the water, yet so that the latter water bee not so weake, to make all the rest white: when it commeth out a round drop hanging it will last as you let it fall, and after it hath rested so one moneth, you may use it as you shall require. It is of especiall use in all passions of the heart, swoonings and faintings of the spirits, and for many other purposes, whereunto the herbe is here declared to be available.

The

The herbe is often put into oyles or salves to heale greene wounds, and it is very probable the name of Baulme, was given to this herbe, from the knowledge of the healing properties of the true and naturall Baulme. It is also an herbe wherein Bees doe much delight, both to have their Hives rubbed therewith to keepe them together, and draw others, and for them to suck and feed upon; and is a remedy against the flinging of them. The Turkey Baulme is of as good effect to all the purposes aforesaid, as the ordinary. The Affrican Baulme is of excellent vertue to expell any poison or venome, as also against the plague or pestilence used inwardly and outwardly, it killeth the wormes, and helpeth the jaundise, and the paines of the Mother, for it openeth obstructions, warmeth the cold parts, ratifyeth and clenseth. Motherwort is held of the later Writers, to bee of much use for the trembling of the heart, and in faintings and swoonings, from whence it tooke the name *Cardiaca*: the powder thereof to the quantity of a spoonefull drunke in wine, is a wonderfull helpe to women in their sore travels, as also for the suffocations or risings of the Mother, and from these effects it is likely it tooke the name of Motherwort with us. It also provoketh urine, and procureth the feminine courses, clenseth the chest of cold flegme oppressing it, and killeth the wormes of the belly. It is of good use to warme and dry up the cold humours, to digest and disperse them that are settled in the veines, joynts, and sinewes of the body, and to helpe crampes and convulsions, &c.

CHAP. XVII.

Marrubium. Horehound.

HOrehound is divided into two sorts by *Dioscorides*, *Theophrastus*, and *Pliny*: that is, into black Horehound, which they call *Ballote*, our stinking black Horehound, and into white, which is the ordinary Horehound that is in use in our Apothecaries shops, & with all others: but there are some other sorts found out, which doe well agree with them in the outward face, and peradventure in the vertues also, whereof I meane to intreate in this place, referring some of the other herbs unto that *Classis*, that is proper for them, where they shall be remembred.

1. *Marrubium album vulgare.*
Common Horehound.

1. *Marrubium album vulgare.* Common Horehound.

Common Horehound groweth up with square hoary stalkes, halfe a yard or two foot high, set at the joynts with two round crumpled, or as it were rough leaves, of a fullen hoary greene colour, of a reasonable good scent, but of a very bitter taste, the flowers are small, white, and gaping, set in rough hard prickly huskes, round about the joynts with the leaves, from the middle of the stalkes upwards, wherein afterwards is found small round blackish seed: the root is blackish, hard and wooddy, with many stings thereat, which dyeth not, but abideth many yeares.

2. *Marrubium Hispanicum Candidum.* White Spanish Horehound.

This Spanish Horehound hath divers foure-square stalkes, more white and hoary than the ordinary Horehound, whereon are set the leaves by couples, which are somewhat longer, thicker, whiter, & more woolly also than it, & a little dented about the edges: the flowers grow towards the toppes of the stalkes in candles, at the severall joynts with the leaves, which are of a pale purplish colour like the common sort, standing in the like rough huskes: the seed is blacke like it also, and so are the rootes: the whole plant is of a stronger and better scent than ours. *Cesard* hath set forth this Horehound, and is the second with him: but his description doth wholly answere to his fourth, which is the Horehound of *Candy*.

3. *Marrubium Creticum.* Sweet Candy Horehound.

Candy Horehound hath more crooked and slenderer stalkes than the last, being rouud and not square, whereon doe grow sometimes broader, and at other times and places, smaller, longer and narrower leaves than it: for these are accounted but one kinde, more dented about the edges, set by couples, more white or hoary than the former Horehounds, as the stalkes are also, which branch forth into many slender branches, having flowers at spaces like the former, but smaller and set in smaller and sharper huskes, which are purplish also like it: the seed is like it also, and the root bringeth forth with many fibres: the scent of this is much better than ours, and equall, if not beyond the other.

4. *Marrubium Creticum angustifolium inodorum.* Vnsavory Candy Horehound.

This Candie differeth from the last onely in these particulars: it hath shorter, narrower, and rounder pointed leaves than the former, and is without any good smell.

5. *Marrubium album villosum.* French Horehound.

This small Horehound riseth not up above a foot high, with his wooddy round, white, hoary stalkes spreading into divers branches, whereon are set thick leaves in the same manner as the former, but smaller and rounder, a little notched at the edges, and so white, smooth and woolly underneath, as no Cotton weed is more, but some-

what

what blackish and rugged on the upper side: the flowers stand at distances at the toppes of the branches, of a pale purplish colour, in the like rough huskes.

β. *Marrubium album Creticum.* Candi White Horehound.

Candi Horehound hath hard round white woolly stalkes: the leaves are smaller than the laſt, a little crumpled and curled at the edges, and a little dented alſo, of a grayiſh colour on both ſides, but not ſo woolly as the laſt: the flowers ſtand in the ſame manner as the reſt, in prickly huskes, but whiter than any of the former.

γ. *Marrubium nigrum Hiſpanicum, ſeu Ocimaſtrum Valerianæ Clusio.* Spanish black Horehound.

There are two other ſorts of hearbs, which although they be no Horehounds, yet for their likeneſſe are referred by others thereunto, as not knowing better unto what other tribe or family they ſhould be joyned. The firſt of theſe riſeth up with ſquare hairy ſtalkes a foote high, the leaves grow by couples at the joynts, ſomewhat long and round pointed, thinner and fuller of veines than the wild blacke Horehound, like unto the middle ſort of Balth. Cluſius, but *Lobel* ſaith like unto black Horehound, but longer, and of no ſcent at all (ſaith *Clusius*, but *Lobel* ſaith of the ſmell of *Stachados* or *Coſtmary*.) The flowers grow at the toppes of the ſtalkes in whorles or rondels of a white colour (ſuch *Clusius*, ſtanding in prickly huskes; but *Lobel* ſaith of a purpliſh colour (if that of *Lobel* be the ſame with this of *Clusius*, whereof I am in ſome doubt, in regard both the ſmell of the leaves, and the colour of the flowers, which are two eſpeciall parts of the plant, are ſo differing one from another) the ſeed is black like the other, and growing in the like prickly huskes; the roote is ſmall, and with long ſtrings like unto the wild Nettle, or the white Archangell.

γ. *Marrubium nigrum Hiſpanicum, &c.* Spanish black Horehound.

δ. *Marrubium nigrum Gallicum, &c.* Black French Horehound with long leaves.

δ. *Marrubium nigrum Gallicum, ſeu Stachys Prima Rondeletij & Matthioli.* Blacke French Horehound, with long leaves.

This other plant that is referred by ſome to the black Horehounds, hath many ſquare rough ſtalkes, riſing to the high

Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

height of a cubit or two foote, spreading into divers branches, set with two long and somewhat broad leaves at every joynt, longer, and broader, than Sage leaves, and longer pointed, dented about the edges, of a dull over-worne greene colour, which in the Winter time remaining withered on the branches without falling away, are to be seene full of holes, as if they had beene eaten with wormes, all the ribbes and veines abiding as they grew until the frosts doe cause their stalkes to fall away: the flowers are of a purplish colour greater than any of the Horehounds and more gaping; after which come the seed in hard prickly huskes like unto Horehound: the roote is thicke, spreading with many blackish strings, whereby it taketh strong hold in the ground, and dyeth not, but shooteth a fresh every yeare, this hath no scent either good or ill to be found in it.

The Place.

The first is found in many places of our Land in dry grounds, and waste greene places: the second came from *Spaine*, and being sowne of the seed, abideth. The third in like manner was sowne of seed that came from *Candy*, as the fourth was also. The fift was found growing about *Paris* in *France*. The sixth in *Germany*. The seaventh in *Spaine*, and the last about *Montpelier* in fat grounds, and sometimes in the wheate fields.

The Time.

They doe all flowre in July, or thereabouts, and their seed is ripe in August.

The Names.

Horehound is called in Greeke πράσιον and in Latine *Prasium & Marrubium, ἐνίοις αὐτὸ μίσγουσι Πένε, Prasium* τὸν καὶ ἕτερόν τινα τοιοῦτον ὅμοιον, ἐπωνυμίαν δεδῶκε *Marrubio* ἀπό τινος ἥδιος ὀσμῆς ἣν ἀπολύει τρίβεται, ὃν καὶ ἑτέραν *Plinie* hath committed many faults in translating the Greeke word *Prasium*, setting downe *Prasium id est perrinum* for it. The first is generally called *Marrubium* by most of our moderne Writers: but *Prasium* by *Angullara*: the second is called by *Lobel Marrubium candidum alterum Hispanicum*, Of *Clusius Marrubium alterum Pannonicum*, and of *Camerarius Marrubium Creticum*. Of *Dodonæus Marrubium Candidum*, and of *Bauhinus, Marrubium album tenuifolium pergrecum*. The third is called by *Lobel Marrubium Gyrenaicum assantiore folio*. Of *Camerarius Marrubium Creticum aliud*. *Marrubium Creticum* of *Dodonæus, Lugdunensis*, and others. Of *Bauhinus, Marrubium album asperius folium peregrinum*. The fourth is called in the great Booke of the Bishop of *Eystet* his garden, *Marrubium Creticum angustifolijs incanum*, and by *Bauhinus Marrubium album peregrinum tenuifolium & obtusis foliis*. The fifth is called of *Bauhinus Marrubium album villosum*, and maketh a doubt if it should not be *Prasium* of *Dioscorides*, in English French Horehound, or white hairy Horehound. The sixth is also called by *Bauhinus Marrubium crispum*, in English Crispe or Curld Horehound. The seventh is called by *Clusius Origanum Creticum Clusij*, because as he saith, the learned at *Valentia* in *Spaine* did so call it: by *Lobel Marrubium Hispanicum vulgare Stachydis*. Of *Tabernæmontanus* and *Gerard Marrubium Hispanicum*; and of *Bauhinus Marrubium peregrinum latifolium*. The last is called by the Apothecaries of *Montpelier*, *Herba Veneris & Rondeletij*; others call it *Sideritis Montpelensium, & Persicaria Montpelensium*, as *Lugdunensis* saith, and so saith *Cordus* also. *Lobel* maketh a question or query if it be not the *Ballonia* of *Theophrastus*, rather than the *flos Africanus* which usually carrieth that title. *Bauhinus* calleth it *Marrubium nigricans folium*, in English, Black French Horehound, until a fitter may be given it.

The Vertues.

The second and third sorts of Horehound, because they are nearest unto the first, or white kinde, are found to bee as effectuall for the purposes whereunto the wild is assigned, having the same properties, and as *Dioscorides* saith, a decoction of the dryed hearb with the seed, or the juyce of the greene hearbe taken with honey, is a remedy for those that are purfie and short winded, for those that have a cough, and for such as by long sickenesse, or thinne distillations of rheume upon the lungs are wasted and fallen into a consumption: it helpeth to expectorate tough flegme from the chest, being taken with the dryed roote of *Iris*, or *Orrice*: it is given to women to bring downe their courses, and to expell the afterburth, as also to those that have sore and long travels: It is also given to them that have taken poison, or are bitten or stung by any venemous serpents or beasts, but it harteth the bladder and the reynes: the leaves being used with honey doe purge foule ulcers: they running or creeping sores, and the growing of the flesh over the nailes: it helpeth also the paines of the sides: the juyce thereof with wine and honey helpeth to cleare the eye-sight, and snuffed up into the nostrils helpeth to purge away the yellow jaundise, and either of it selfe, or with a little oyle of Roses being dropped into the eares, easeth the paines of them. *Galen* saith that by reason of the bitternesse, it openeth the obstructions both of the liver and spleene, purgeth the breast and lungs of flegme, and procureth womens courses, and used outwardly, it both cleanseth and digesteth. A decoction of Horehound, saith *Matthiolus* is available for those that have bad livers, and for such as have itches and running tetters, the powder thereof taken, or the decoction killeth the wormes; the greene leaves bruised and boyled with old Hogs lard into an oyntment, healeth the bytings of Dogges, abateth the swellings of womens breasts, and taketh away the swelling and paines that come by any pricking of thornes, or any such like thing. Vsed with vineger it cleanseth and healeth tetters. It saith *Matthiolus*, you boyle two ounces of fresh Horehound in three pints of good white wine, with the roots of *Angelica*, *Elecampane* and *Agrimony*, of each one dram and a halfe; of *Saxifrage* and *lignum aloes*, of each one dram, until halfe be consumed and strained, hereby is made a most excellent medicine to helpe the yellow jaundise, that commeth by the obstruction of the vessels, and overflowing of the gall, if two ounces thereof (having a little Sugar put to it to sweeten it) be taken fasting, for nine dayes together: but he counselleth, that if they that shall take this medicine have an ague, the decoction must bee made with water, and not with wine: the decoction thereof is a singular helpe for women that are troubled with the whites, if they sit over it while it is warme: the same also healeth any scabs, whether they be dry or moist. If the places be bathed therewith, being stamped and put into new milke, and set in any place overpestered with flies, it will soone destroy them all. There is a Syrope made of Horehound to be had at the Apothecaries much used, and that to very good purpose for old coughes to rid the tough flegme; as also for old men and others, whose lungs are oppressed with thinne and cold rheume to helpe to avoid it, and for those that are asthmatick, or short-winded. The other sorts are not used, or their properties are not expressed by any.

Chap. XVIII.

Stachys. Base Horehound.

We shall needs adjoyne these Base Horehounds unto the former, for the neare affinity that some of them especially, have both in face, smell and vertues, referring the *Stachydes* to another place, which some have joyned with these.

1. *Stachys Dioscoridis.* The true Base Horehound.

This kinde of wilde Horehound hath divers soft woolly greene leaves lying upon the ground, and abiding all the Winter, some what broad and long, of about two inches in breadth, and three in length, smooth, and not at all dented, or very little about the edges: from the middle whereof riseth sometimes but one stalke, and sometimes more, carrying divers such like leaves thereon, but lesser, set by couples: about the middle of the stalkes and so upwards come forth divers purplish flowers, standing in softer huskes than the former Horehounds have, at the joynts with the leaves, compassing the stalkes, the tops whereof are small and long, ending as it were in a spike, after which come blackish round seed: the root is made of divers blackish stringy which perished not after it hath given seed: the smell hereof is small with us, and not so pleasant as others say it is, for any thing that I ever could observe. *Cordus* and *Lobel* say that there is of this kind that beareth yellow flowers, which yet I never saw.

2. *Stachys Germanica.* Great Dutch Base Horehound.

This great base wilde Horehound hath greater and longer hoary leaves, some what like unto great Sage leaves, for the colour on both sides; but larger and a little dented about the edges; the stalkes are square and hoary, set with such like leaves at the joynts, & purplish flowers with them round about the stalkes towards the tops, which are greater as all the rest of the plant is, and hath a stronger and worse scent than the other.

3. *Stachys sive Phlomis Insularis Cretica.* Candy Base Horehound.

Base Horehound of Candy hath divers very hoary foure-square stalkes rising from a small woody roote, whereon are set two small long and narrow leaves at the joynts, compassing the stalkes, without any foote stalke, of an hoary ash-colour, somewhat hairy and hard in handling, but those that are next the ground are much longer, every one with a long foot-stalke, which together with the leafe is an hand-breadth in length, which as they are some what in breadth, of little or no scent at all for the most part, yet some have been observed to be sweeter than others of this kinde; the flowers are small and purple, standing in prickly huskes round about the stalkes at severall distances: after which commeth the seed which is small, blackish and round.

4. *Phlomis Stachys Alpina.* Mourning Base Horehound.

The Mourning Base Horehound hath a hard brownish yellow roote, spreading into many long and thick strings, sendeth forth divers rough hairy and hoary leaves, covered with a soft white woolly downe, some what like unto Horehound, but thinner, being three inches broad, and foure inches long, with long foot-stalkes, and a little dented about the edges, of a little hoary smell; among which rise up foure square hairy stalkes, a cubite and a halfe high; at the joynts whereof grow two such like rough wrinkled leaves, but longer than those below, whereat likewise spring forth small branches on both sides; at the toppes of the stalkes and branches stand the flowers in tuftes, of a whitish ash colour, placed in some what rough huskes, wherein after the flowers are past, grow the seed, which is small, blackish and round. This kinde hath been observed to grow higher with larger leaves, and withall more hoary than that is to the former.

5. *Stachys Lusitanica.* Portugall Base Horehound.

This small and low Base Horehound lyeth for the most part, or at the least leaneth to the ground, having many small round hoary white branches, not above halfe a foote long, set with two very small long, hoary and woolly leaves at the joynts and at the ends, and not dented at all, of a very sweet and pleasant smell, especially in the hot Country where it groweth: the flowers grow at the toppes compassing the branches, to hide under the leaves, that they can scarce be discerned: the roote is small and long, with some fibres thereat.

6. *Stachys spinosa.* Thorny Base Horehound.

Thorny Base Horehound hath many small and long hoary white leaves lying upon the ground, some what like unto the former small ones, without any foote stalke at them, and without any denting at the edges, which do abide the first rigour of the cold in Winter; but in the Spring following, there shooteth forth divers small and slender stalkes, halfe a foote high, as hoary as the leaves, on which are two always set at the joynts, much smaller than the lower: most of the stalkes breake out at the severall joynts with the leaves into divers other small branches,

3. Stachys germanica.
Great Dutch Base Horehound.

5. Stachys Lusitanica.
Portugall Base Horehound.

6. Stachys Syriaca. Thorny Base Horehound.

ches, ending all of them in sharpe thornes, whereof the middlemost is the biggest and strongest: the flowers are of the bignesse, forme, and colour of the flowers of Spanish Germander, or rather of Sage, but somewhat paler, and the upper part thereof somewhat more bowed downeward, standing thinly scattered on the branches; very quickly fading and falling away: it seldome beareth seed, in regard it flowreth so late with us, but when it doth, it is black, and somewhat uneven or rugged, and not round: the roote is very great for the smalnesse of the plant, and woodily, dispersing it selfe into many sprayes under ground: the whole and every part thereof, hath no good scent to commend it.

The Place.

The first groweth plentifully in *Italy*, as *Matthiolus* saith: and in the fields about *Rome*, as *Caluo Durantes* saith: and in *Germany* also, as others have set it downe. The second is naturall of *Germany*, as *Tragus*, *Lonicerus*, *Camerarius*, *Thalius*, *Gesner*, and others doe set it downe. The third from the seed that came out of *Candy*, did the plant spring. The fourth groweth upon a small hill in *Germany* called *Wolfenfall*. The fifth groweth in *Portugall*, as *Lobel* first reporteth it. The last and last *Honorius Belling* found in *Candy*, and sent the seed to *Clusius*, who saith that hee had the figure and some seed thereof also sent him from *Iacobus Plancius*, who had not thought that *Clusius* had seene any such plant before.

The Time.

The foure first doe all flower about the middle or end of July, but the other two are very late, not flowring for the most part untill September, whereby no hope of seed could be expected.

The

The Names.

The first *Matthiolus* in his latter Edition calleth *Stachys*, and judgeth it to be the true *Stachys* of *Dioscorides*, although in the former editions he had set forth the second with an opinion that it had been the right and *Brodaeus*, *Lugdunensis*, *Tabermontanus*, and *Gerard* call it *Stachys*, also *Camerarius* calleth it *Stachys minor*. *Gesner* calleth it *Stachys floribus spatiosis*. *Lobel* calleth it *Stachys sylvestris*, & *Stachys floribus pleno verticillatis*. *Cesalpinus* calleth it his *Salvia sylvestris tertia*, and *Bauhinus Stachys Italica minor*, in English the lesser, or Italian base Horehound. The second is called by *Matthiolus Pseudo-Stachys*, and so doth *Lugdunensis*, but diverse others call this *Stachys*, and judge it contrary to *Matthiolus* his last opinion to be the true *Stachys* of *Dioscorides*. *Gesner* calleth it *Stachys Germanica*, and *Camerarius major sive Germanica*. *Cesalpinus* calleth it *Salvia sylvestris*. *Thalius* in *Hercynia sylva*, *Marrubium montanum album*, *Fabius Columna*, *Sideritis Heraclea*, and *Bauhinus Stachys minor Germanica*, in English Great Base Horehound. The third is called by *Bauhinus Stachys*, and *Pseudo-Stachys Cretica*, and saith it was sowne for *Marrubium Creticum*. The fourth is called by *Lonicerus Spartium sive Theophrasti*. *Cesalpinus* calleth this *Salvia sylvestris major*. *Tabermontanus* and *Gerard* call it *Salvia Alpina*, and *Bauhinus Pseudo-Stachys Alpina*, in English Mountaine Base Horehound. The fift *Lobel* calleth *Stachys Lusitanica*, and *Lugdunensis* doth the like, in English *Portugall* Base Horehound. The last from *Candy*, was sent unto *Clusius* by the name of *Conyzoides*, which signifyeth Afes Time, wherunto it hath no correspondency. *Clusius* fift called it *Stachys spuria*, and *Bauhinus Stachys spuria Cretica*, in English Thorny Base Horehound.

The Vertues.

Dioscorides and *Galen* both speaking of this kinde of Horehound, called *Stachys*, say it is of a hot and sharpe quality, a little bitter, and in the third degree of heat; and therefore the decoction thereof is profitable to procure womens courses, and to expell the after birth, and that it causeth abortion in women, that is, to miscarry in child-bearing, or to come before their time: it also provoketh urine being stopped, if the parts be fomented with the decoction thereof, or the party doe sit over the warme fumes.

CHAP. XIX.

Salvia. Sage.

I Have to shew you here many differences of Sage worthy of observation, because other Authors have recorded some of them to other hearbes.

1. *Salvia major vulgaris.* Ordinary Garden Sage.

Our ordinary Sage is reckoned to bee of two sorts, white and red (yet I thinke they both rise from one and the same plant slipped and set) both of them bearing foure-square woodily stalkes, in some whiter greene, in others redder, as the leaves are also, standing by couples at the joynts, being somewhat long and broad, rough and wrinckled, of a strong sweet scent: at the tops of the stalkes come forth the flowers set at certaine spaces, one above another, which are long and gaping, like unto the flowers of Clary or dead Nettle, but of a bluish purple colour, after which come small round seed in the husks that bore the flowers: the roote is woody, with divers strings at it: it is more usually propagated by slips, pricked or thrust into the ground in the Spring time, than of the seed. Of this kinde are the two sorts of party-coloured Sage, the one white and greene: the other whitish red and greene in most of the leaves.

1. *Salvia major vulgaris.* Ordinary Garden Sage.

Tradescant.

2. *Salvia maxima foliis latifolia.* Great white Sage.

This great Sage differeth not from the common or ordinary great Sage for the manner of the growing, or the colour of the leaves, or sweetnesse of the whole plant, the chiefe differences consist first in the leaves, which are much larger, and a little dented about the edges, and sometimes much more, insomuch that in some curled: diers of the leaves being foure inches long, and three inches broad: and in the flowers: some plants bearing purplish flowers like the ordinary, and others make white flowers which is the more rare.

3. *Salvia major Cretica Lusitanica, & Angustifolia durior, & non serrata, foetidior & non petiolata.*

Great Sage of Candy with broad and narrow leaves, and brownish stocks and apples, and not deare none.

This great Sage hath many soure hard hoary stalkes, especially when they are old, long running almost round whereby it may be discerned from greener and smaller in the hot Countries changeable, whereas they set two leaves at a joynt, one against another, and more like unto ordinary Sage but larger, in others some what smaller and narrower, in many plants of both sorts there will bee small peeces of leaves growing on both sides at the bottom of the leaves, and in some plants or places there will be more of these peeces or eares to

bee

bee seene, (which hath caused severall Authors to give severall figures) which are very hoary underneath, and more greene on the upperside, having as it were the hoarynesse rubbed off from them, of a much stronger scent than the common; the stalkes branch forth on all sides, towards the toppes whereon stand the flowers at distances, like unto the flowers of ordinary Sage, but of a pale or whitish purple colour; after which come great heads of seed standing in the same huskes or cuppes that bore the flowers before, which are so much swollen, that they seeme to be berryes, with three or foure great seeds in them. These kindes likewise bear (in the hot Countries of *Egypt, Candy*, &c.) at the joynts, and sometimes betweene the joynts of the stalkes, certaine excrescences like unto small Apples or berryes bigger than Filbeck nuts, of an inch thicknesse at the least, and covered with much downe or cotton, somewhat rough in handling, of a taste not so hot, but more binding than the Sage, and not unpleasant, which the people usually eate with bread, but in other colder Countries it never beareth any.

1. *Salvia primifera.* Sage bearing Apples. 4. *Salvia minor vulgaris.* Sage of Vertue.

Plant also.

4. *Salvia minor, flore pleno.* Small Sage, or Sage of Vertue.

This lesser Sage groweth like unto the full great white Sage, but that the branches are long and slenderer, the leaves also whitish, and never red, and much smaller or narrower, having for the most part at the bottome of each leafe, on each side a small piece of a leafe, which maketh it seeme like fingers or eares; the flowers also are of a bluish purple colour, but lesser. Of this kinde there is one that beareth white flowers, differing in nothing else from the other.

5. *Salvia minor auriculis odoratissima Hispanica.* The sweetest small Spanish Sage with eares.

This Spanish small Sage is in most things so like the ordinary small Sage with eares, called Sage of Vertue, that unlesse it bee well heeded or marked, it will bee thought all one with the other; but herein consisteth the difference, it seldome groweth to be so great, the leaves are somewhat smaller and greener, or not so white, it is more tender to keepe, and doth quickler perish in the Winter, unlesse it be better defended than the other; and the smell hereof is farre more milde, sweet, and pleasant, yet somewhat quicker withall than the former, which is easily discerned by any that can judge of scents; and lastly, some kinde hereof beareth white flowers, an other blue.

6. *Salvia Cretica angustifolia non auriculata.* Small Candy Sage without eares.

This small Candy Sage riseth up with divers hard stalkes, of a brownish colour, having the leaves set thereon by roughs, which are much narrower than in any other Sage, and without any eares at all set unto them, of a whitish greene colour like the small Sage, and a little dented or crumpled about the edges; this branches forth plentifully, bearing purple flowers at the toppes in spikes, without any leaves among them, the roote is hard and woodily, spreading under ground diversly.

7. *Salvia minor altera flore rubente.* Small red flowred Sage.

This small Sage differeth little in the forme of growing or bignes, nor colour of the leaves from the ordinary small Sage, but that it hath not eares so frequently with the leaves as it hath; the chiefest difference from all others is that the flowers are red, and that both smell and taste are like unto Woormewood.

8. *Salvia lanuginosa angustifolia.* Small woolly Sage.

This woolly Sage hath divers rounds stalkes a foote and a halfe high, so hoary and woolly, that they are soft therewith, though underneath they be woodily, which spread into many branches, with leaves set thereon like the other, which are thick, narrow, short, and very hoary, white and rough, of two inches long, and halfe an inch in breadth, smelling like unto Tansye: the flowers stand in spikes at the toppes of the branches, of a purplish colour, like unto the flowers of dead Nettle or Archangell, with many small long threads in the middle.

9. *Salvia folio subrotundo.* Round leafed Sage.

This Sage hath many square hoary stalkes with leaves set thereon in such manner as the others are, which are rough or crumpled like the leaves of ordinary Sage, but dimmer, and much whiter, round also like unto the leaves of Violets, or round rooted Birthwort, yet ending in a point: in other things it differeth not from the ordinary common Sage.

10. *Salvia fruticosa lutea angustifolia, sive Phlomis Lychnitis Dioscoridis Clusio.* The greater yellow wilde Sage with narrow leaves.

This kinde of Sage (for thereunto I thinke it fittest to referre it, and not to any Mullein as others doe, for which I shall shew you the reason precisely hereafter) hath many very hoary and woolly leaves, the lower sides especially more than the upper, longer and narrower also than those of the small Sage, among which rise up square hoary and hairy stalkes about a foote high, whereon doe grow such like long hoary leaves as grow below, two always set together one against another at the joynts, where the flowers stand at spaces, about the toppes of the stalkes with two leaves under them, broad at the bottome, and compassing the stalkes, being shorter than the rest: the flowers are large, open and gaping, like unto Sage, or somewhat more like unto those of the dead Nettle, or Archangell, of

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

of a yellow colour comming forth out of hoary woolly huskes, covered with pale coloured leaves, the toppes by reason of the length and weaknesse bending a little downewards; after which come brownish seed inclosed in woolly huskes: the root is blackish and woodily.

Salvia frutex alba latifolia flore Verbasci, sive Salvia graveolens, Matthioli. French or yellow wilde sage with broad leaves.

Although divers Authors doe account this heardie a *Mullein*, and so doe number it among the kindes thereof, yet I thinke it more proper to put it among the Sages: for *Lobel* and *Pena* in their *Adversaria* say, that it is called wilde Sage in the Gardens of *Italy*, *France*, *England*, and the *Netherlands*: and in regard that the leaves and flowers both of this, and the precedent doe rather reserable Sage than *Mullein*, this the greater Sage, and the former the lesser. I see no reason why these should be called Mulleins, or referred unto them rather then unto Sage, seeing none of the Mulleins that are properly so called, have hooded or gaping flowers like unto Sage, Snapdragell, and the like: but all of them are compoted of five leaves laid open like unto the Starr-mosse, and many other such like flowers. Take therefore the description thereof here in this manner. It hath divers square woodily hoary stalkes, whereon grow at severall spaces, rugged, hoary, broad, and almost round pointed leaves many set together, very like unto the great Sage but greater: the flowers grow likewise in tandlets or spaces towards the toppes of the stalkes, very like also unto the flowers of Sage, or Archangell, but of a yellow colour: the seed is greater than of any Sage: the cods whereof brownish, and round like the last: the root is woodily, with divers strings and fibres fastned unto it: the whole plant smelleth somewhat strong and heady. *Clusius* setteth downe another sort hereof, which like saith is more sweet, but I marvaile where he had any relation of another, there being but one sort that ever I could heare of, or know.

Salvia minor lutea Cretica, Small yellow Sage of Candy.

This small Sage groweth with three or foure stalkes that are hard, square, and hoary, about a foote or more high, parted here and there into small branches, at whose joynts stand two, and sometimes three or more rough small hoary leaves, very like unto the small Sage leaves, and at them likewise towards the toppes of the stalkes stand divers small gaping flowers very like unto those of Sage, but of a gold yellow colour: the seed is small, blacke, and longer than the rowe: the wood is woodily and slender, the whole plant is of little sweet savour, but somewhat like unto the precedent, called the *Salvia foetida folio rotundo*, and differing in the smallnesse from the other *Salvia* [illegible] which is many times bigger and would seeme to be a *Virga aurea* than a *Verbascum* (strictly according to the truth whereof I know not hardly, nor saying some *Salvia* [illegible] *Matthioli*, but *Matthiolus* saith hath not [illegible] and leaves [illegible] and leaves [illegible] like the rest should runne, but I suppose it is most like unto a small Sage, or Verbasco. Therefore referre it, because it *Verbascum* hath gaping flowers.

The Place.

The first groweth in *Spaine* and *Narbone*, &c. and so doe the fourth and fift. The second groweth well in *England*

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Original from UNIVERSITY OF MICHIGAN

with many that have it, and is likely to be that sort which *Clusius* saith he found in *Austria* with white flowers and may also be found in the *Alpes*, but that the figure doth better represent an *Horminum* than Sage. The third is said to naturall to the hot Countries of *Egypt*, *Candy*, &c. but will not abide with us, nor ever beare their impes. The fourth is in many of our gardens, and as *Lobel* saith, groweth plentifully in *Spaine*, and so doth the rest. The first came out of *Spaine*, and is the sweetest of all other, yet it differeth as I find, from the former small Sage, which groweth in *Spaine* likewise abundantly. The first was raised from the seed that came out of *Candy*, where of *Clusius* maketh mention, that he received the figure thereof set forth to the life in colours, from *Jacobus Plateau*, as it grew with him. The fourth *Dodonæus* saith he first saw in an *Apothecaries* Garden in *Basill*, and after wards in the Duke of *Wirtenberg* Garden at *Mont Belgard*, but from whence it was brought to them he doth not declare. The eighth *Matthiolus* saith he received from Doctor *Nondesperus*, and saith no more. The ninth hee saith the wife they had from an Apothecarie at *Vendosme*; the two next throughout *Spaine* and *Portugall* plentifully; and the eleventh hath *Monardes* also set forth in *Candy*. All these forts will grow by the slippes taken from them, and planted in March or April.

The Time.

Most of these fourth sort doe flower in July, or about the time of the ordinary Sage, yet some of them flower not untill August. All of them also doe beare seed, but the small ordinary Purple Sage, or Sage of vertue, which although I doe acknowledge to give seed in some places, and in some yeares, yet doth commonly, and with many it doth not, nor the lesser small Spanish kinde.

The Name.

Sage is called in Greeke ἐλελίσφακος. The pale ash-coloured dry and withered deformity of the leaves of Sage, especially on the dry and barren hills in the hot Countries where it groweth naturall, was the cause to give it that name, as if you should call it, scorched or consumed by blasting, for σφάζω doth signifie *strangulare*, and *contrahere* to be drawne together, or wound within it selfe, and ἐλέλιξ or rather ἕλιξ doth signifie that disease in plants, which the Latines call *siderari*, blasting, that is, when the heate or tree by the extreame heate of the Sunne in the Dog-daves, or otherwise piercing into it, and drying up the moysture that nourished it, seemeth to grow faint and dye or as it were scorched. It might saith *Pena* be fully so named, from the helpe this herbe giveth to those parts of a mans body, that receive to be as it were dead by some blasting, in restoring the naturall heat and vigour to the parts in which quality it excelleth, giving a friendly and beneficiall comfort to the vitall spirits, and therefore the Latines called it *Salvia, quia salvat hominem & incolumem efficit*, because it maketh men safe and sound in health. And the Latine versifyer from hence tooke his occasion to say, *Cur moriatur homo cui Salvia crescit in horto*. And Sage in English, from the property in comforting and strengthening the head and memory, to make men sage or wise of the French word *Sauge* or from the Latine *Salvia*, to say safe, and altered into Sage. *Pliny* in his 21. Booke, 19. Chap. hath finely cured in mistaking the Greeke word σφάκος, and construing it σφάγος, which is *Lana*, for there [illegible]

that *Ælius Iohnson*, with the Greekes is *phaceæ* with others. The one is more gentle than the manured lentell, with a lesser, dryer, and sweeter leafe; and the other kinde that is wilde, is of a more grievous scent, &c. too much here to recite and set downe, and to little purpose. The first is generally called *Salvia major & latifolia*, by almost all Authors: the second *Clusius* saith he first saw in *Austria*, and *Bauhinus* that he had it first from *England*, and called it *Salvia latifolia ferrata*: the third is called *Salvia pomifera & baccifera*, or *baccarum Cretica*, or *Creticæ*, to shew the kinde. *Lobel* calleth it *Conifera*, *Mentha silvestris Salvia folium instar galla ferens*, and *Anguillara Salvia Græca*, which he saith they vilely call *Herba sancta Philosophica*: the fourth is called *Salvia mobilis* by *Gesner & alijs*, by *Matthiolus* and divers others, *angustifolia*, and *tenuifolia* by some others, *aurita* also, or *auriculata*, or *punctata* by others: the fift *Conyza minor* called *Salvia Hispanica odoratissima*, but *Bauhinus Salvia folio tenuiore*, the old *Gerard* called it *Salvia Indica*, but his Corrector confoundeth it with the seventh following as you shall heare: the sixt *Clusius* setteth forth with this title, *Salvia Cretica angustifolia*, and *Bauhinus Salvia angustifolia serrata*: the seventh *Bauhinus* onely hath remembred unto us by the name of *Salvia minor altera*, and I adde thereunto *flore cœrulæ*, to make it the better knowne, for it is scarce knowne to many: this is that Sage that I said before Master *Johnson* that corrected *Gerard* hath erred exceedingly in confounding this with the fift, which is the same that Master *Cowper* shewed him and gave me, whose scent is farre sweeter than the small Pigge Sage, and much differing from the scent of Wormewood, if he had so duely conformed his smell thereof, as hee did his sight of the flowers: the eighth *Bauhinus* also giveth the name of *Salvia angustifolia longifolia*, and in English small woolly Sage: the ninth likewise hath his name in the title, *Bauhinus* giving the Latine, and I the English: the tenth is called by *Clusius Phlomis Lychnitis*, and referreth it to be *Lychnitis* called also *Thrysallis* by *Dioscorides*, and by the Cathilians in *Spaine Candelera*, and thola of *Granada Mexchera*: *Lobel* calleth it *Verbascum sylvestre folijs salviæ tenuifolia*, and *Bauhinus Verbascum angustis salviæ foliis*, who saith it is also called of some *Angrarabi*: but *Gesner in horto Germaniæ* calleth it *Salvia sylvestris Monspeliensium*, and therefore I have placed it in the number of the Sages, and altered the title in Latine, and call it thereafter, in English, the greater yellow Sage with narrow leaves: the eleventh is called by *Matthiolus* also *Verbascum sylvestre*, being his fourth, and from him *Anguillara*, *Castor Durantes*, *Clusius*, and others do call it *Verbascum 4*, *Matthioli*; *Camerarius Verbascum sylvestre folijs salviæ*, and *Lobel Verbascum frutescens lignosum & flore luteo*, who saith as I shewed you in the description, that it is called a wilde Sage in *Italy*, *France*, the Low-Countries, and *England*, for we call it French Sage, and why then he and they should call it as the next going before this, *Verbascum Mullein*, I see no cause more than that the leaves in both are woolly like Mullein, and may serve as a wicke for Lampes, as the Spaniards doe with the last before this, and as Mullein leaves may doe, but that is not a sufficient cause in my judgement, to make them of the tribe of Mulleins, other things not concurring as the flowers whereof I have spoken before. Let others of knowledge bee judges hereof. It is called in English, as I said, French Sage, and woodly Mullein, and this may as fitly bee called the great yellow wilde Sage with broad leaves, as the former is called the greater yellow wilde Sage with narrow leaves. The last is called *Verbascum salutifolium* by *Prosper Alpinus* in his Booke *De plantis exoticis*, but because the flowers of this are more like a Sage than a Mullein, as in the former I have rather referred it to these than to them. *Bauhinus* would seeme to make our ordinary Sage to bee the *Sphacelus* of *Theophrastus*, that *Dioscorides* maketh no mention of *Sphacelus* I set downe in his 6. Booke and 2. Chapter: whereof he speaketh in this manner, *Sphacelus & Salvia*, differ one from another; as if you would call the one the tame mannred Sage, and the other the wilde: the leafe of *Sphacelus* is smoother and narrower, and lesse unfeemely, or not so ill-favoured: but Sage is more rough. *Lugdunensis* doth make the ordinary small Sage to be it, and *Matthiolus* seemeth to lay the same: *Cuilandus*, as is set downe in the Chapter going before, thinketh the great *Stachys* to be it. *Dodonæus* judgeth the *Salvia agrestis*, or *Sclarea*, Wood Sage to be it, and some others thinke *Colus Iovis*, or *Jupiters* distaffe, a kinde of wild Clary set downe in the next Chapter to be it. So that among such variety of opinions among learned men, it is very hard for me to set downe which is the truell: yet I will make bold to lean them all a little, and lastly shew you my judgement. Well, for *Bauhinus* that seemeth to judge our ordinary Sage to bee the *Sphacelus*, which if it should be so, I would faine have him set downe, what sort should be his Sage, that must be by *Theophrastus* judgement more rugged than *Sphacelus*, for I thinke none of the Sages is more rugged than the ordinary. For *Dalechampius* and others that thinke the small Sage to bee *Sphacelus*, and say it is peculiar to the *Sphacelus* to have eares; surely I thinke that if *Theophrastus* had meant that Sage, he would not have forgotten to specifie the eares, which is such a manifest distinction from the other, and from all other herbes almost, that he might to me have put it out of all question, if he had but so set it downe, besides his *Sphacelus* hath a smoother leafe, and not so ill favoured as the Sage, but the leafe of the small Sage, is almost as unsightly for the smallnesse as the greater: for *Cordus* that taketh the great *Stachys* or bafe Horehound to bee *Sphacelus*, the greatnesse of the leaves and whole plant, and the resemblance more neare an Horehound than a Sage, will make any the more to decline from this opinion; for it seemeth by *Theophrastus* that *Sphacelus* should be a kinde of Sage, in that it should not otherwise differ from it, but in the smelnesse, smoothnesse, and smalnesse of the leafe. For *Dodonæus* who would make the *Sclarea* or *Salvia agrestis* to be *Sphacelus*, and strengtheneth his opinion with these reasons, that the leafe of the *Sphacelus* is more narrow or small, (for so I translate the word *contractior*) and lesse unfeemely than Sage, such as the woodly Sage doth, and maketh the Greeke word *ἀκοσμία* to signifie a more grievous smell, as well as a more rugged or crumpled leafe, that he might make the wood Sage to bee answerable unto *Sphacelus*, and to be lesse grievous in smell, as well as lesse rugged in some to the Sage: that although it be called *Salvia & agrestis* with him, and *sylvestris* with *Tragus* and others, yet it is also referred by the best Authors unto the second *scordium* or *scordios*, water Germander or *Pliny*, and of *Tragus* [illegible] called *Scordonia*, of the Iland of Candicke, whereof this wood Sage hath a smack, which [illegible] describeth to have larger, but shorter leaves than Sage, both which I thinke cannot agree unto *Sphacelus*, for it is said to have smaller leaves than Sage, and the smell hereof cannot be said to bee lesse grievous than that of Sage. Now for those that would have *Cretan Sage* to be *Sphacelus*, their opinions have farre lesse shew of reason, as any of the other going before, for the forme and largenesse of the leaves and stalkes to greater than Sage, and so differing from any good sort, drawing neerer unto a wild Clary, (whereof good Authors make it a kinde) than to any Sage. Now to shew you my opinion, which of these come neerest to the truth, I must first lay before hand (as the words of *Theophrastus*, which you may read in the same Booke and Chapter within a few lines after it, for in describing the next herbe *Marrubium*, Horehound to be of two kindes: when hee hath

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

shewed you the fifth leafe of the second, *diuersa rotundior, paullulum incisa minusque pinnata Aphaca, &c.* which is the other kinde, but a roundler, eafie than the former, and of an exceeding foule unfeemely, or ill-fauoured forme or faſhion (for the word *Species* may be referred to both) like unto *Sphacus*. So that it feemeth that the leaves of the other Horſe-ſtone-bloud be ſomewhat like as the *Species*, which words ſeeme to contradict the former concerning *Sphacus* to be rounder, ſmaller, and leſſe unſeemely than Sage, for thereby the leaves of *Sphacus* ſhould have a greater forme and colour than Sage; and herein they ſhould be worſe, or as I ſaid in shew as Horſe-hound, which all know to be of no good colour or ſhew; to reconcile theſe exemptions it is neceſſary, ſeeing an Author of ſo great learning and judgement, ſhould not vary in his owne writing (but rather to be obſerued or remembred by any Author that I have read) therefore it is the beſt way to ſay, that euen *Sphacus* is very deformed and vnſeemely, but in compariſon of Sage, which is more dry and deformed, *Sphacus* is fweeter and leſſe deformed. So that conſidering all theſe Incberations the louer of all Authors muſt make to be *Sphacus*, I find none that can be more fully ſatisfied thereunto, then the *Latin name* the leſſer Sage: notwithſtanding that *Turnerus* hath omitted the ſame, and that *Tragus* vnnaturally for that it is not deſcribed as the greater Sage, for both *Matthiolus* in his laſt Edition in page 1000 without further deliberation, no doubt, and *Dodonæus* in the Author of *Lugdunenſis* hath expreſly ſet it downe ſo, and *Fuchſius* may be excuſed for not remembring it in the table, and *Dodonæus* answered that by *Tragus* alſo, judgement euen *Sphacus* according to the Greeke name before ſhewed, which is *Salvia* in Latine, is exceedingly deformed, or unſeemely, as well as the great Sage, though in compariſon of the one with the other, the great Sage is the more dry and rugged. Sage is called by the Arabians *Achiſeni* and *Ribeas*, by the Italians *Salvia* and *Salvia* by the Spaniard, as well as *Salvia* by the French *Sauge* by the Germanes *Salbey* of the Dutch *Salie*, and by us in English, Sage.

The Vertues.

A decoction of the leaves and branches of Sage made and drunke, ſaith *Dioſcorides*, prouoketh urine, bringeth downe the feminine courſes, helpeth to expell the dead child, and is a remedy againſt the ſtinke of the Fundament or Forkin, and cureth the bites of venemous beaſts: it prayeth the bleeding of wounds, and cleanſeth foule ulcers or ſores: the decoction of the leaves and branches made with wine, doth take away the itching of the eyes, if they be bathed therewith. *Galen* ſaith, it is a mundifying keeping quality, and a little binding, and *Actius* ſaith the ſame alſo, but he further ſaith, that ſome report that the ſame thereof being eaten when it is raine, doth ſtay the immoderate fluxe of womens courſes, and all other fluxes of theirs: *Agrippa* ſaith that it enabling women whoſe wombes be too moiſt and ſlippery, not able to conceive by reaſon of that default, ſhall take a quantity of the juyce of Sage with a little ſalt, for ſeuen dayes before they compone with their Husbands, it will helpe them to conceive, and alſo for thoſe that after they have conceiued, are liable to often miſcarey vpon any ſmall occaſion, for it cauſeth the childe to be the better retained, and to become the more lively: *Theophraſtus* ſaith that in *Cyprus* and *Ægypt*, after a great ſlaughter, women were forced to drinke the juyce of Sage, to cauſe them to be the more fruitfull. *Orpheus* ſaith, that three ſpoonfuls of the iuyce of Sage taken faſting with a little honey, doth preſently ſtay the ſpitting or cutting vp of blood: For them that are in a conſumption, theſe Pils are much commended. Take of Aſpharad and Ginger of each two drammes, of the ſeed of Sage a little ſodden or the freſh eight drammes, of long pepper twelve drammes, all theſe being brought into fine powder, let there be ſo much juice of Sage put thereto, as may make it into a maſſe fitting for pils, taking a quantity of them every morning faſting, and to likewiſe at night, drinking a little ſack or wine after them. *Matthiolus* ſaith, that it is very profitable for all manner of paines of the ioynts, whether they be inwardly or outwardly, and therefore helpeth luck as have the falling ſickneſſe, the lithargie or drowſie euill, ſuch as are neſt and heaſie of ſpeech, and thoſe that have the palſie, and is of much uſe in all defluxions or diſtillations of rhin theume from the head, and for the diſeaſes of the cheſt or breſt. The leaves of Sage and Nettles brothed together, and laid upon the inpoſthume that riſeth behind the eares, doth aſwage and helpe it much: alſo the juyce of Sage taken in warme waters, helpeth an hoarſneſſe and the cough: the leaves ſodden in wine and laid upon any place affected with the Palſie, helpeth much, if the decoction be drunke alſo. Sage taken with Wormewood is vſed for the bloody fluxe: *Pliny* ſaith it prouoketh womens courſes, and ſtayeth them comming downe too full: helpeth the ſtinging and byting of Serpents, and killeth the wormes that breed in the eares, and alſo in ſores. Sage is of excellent good vſe to helpe the memory, by warming and quickning the ſenſes, and the conſerue made of the flowers is vſed to the ſame purpoſe, as alſo for all the former recited diſeaſes: they are perſwaded in *Italy* that if they eate Sage faſting with a little ſalt, they ſhall be ſafe that day, from the danger of the biting of any venemous beaſt; they vſe there alſo never to plant Sage but with Rue among it, for feare of Toades and other Serpents breeding vnder it, and infecting it with their venemous poyſon, &c. the danger wherof is recorded in *Boccace*, of two Friends or Lovers, that by eating the leaves of that Sage vnder which a Toade was found to abide, were both killed thereby, and therefore the Poet prayeth them both together to have wholeſome drinke, ſaying; *Salvia cum ruta faciunt vina pocula ſana.* Sage hath beene of good uſe in the time of the plague at all times, and the ſmall Sage more eſpecially (which therefore I thinke our people called Sage of Virtue) the juyce thereof drunke with vinegar. The uſe of Sage in the Moneth of May, with butter, Parſley, and ſome ſalt, is very frequent in our Country to continue health to the body: as alſo Sage ale made with it, Rolemary, and other good hearbes for the ſame purpoſe, and for teeming women, or ſuch as are ſubject to miſcary, as it is before declared. Gargles likewiſe are made with Sage, Rolemary, Honyſuckles, and Plantaine boyled in water or wine, with ſome Honey and Allome put thereto, to waſh cankers, ſore mouthes, and throats, or the ſecret parts of man or woman as need requireth. And with other hot and comfortable hearbes to be boyled, to ſerve for bathings of the body or legges, in the Summer time eſpecially to warme the cold ioynts or ſinewes of young or old, troubled with the Palſie or crampe, and to comfort and ſtrengthen the parts. It is much commended againſt the ſtitch or paines in the ſide comming of winde, if the grieved place be fomented warme with the decoction thereof in wine, and the hearbs after the boyling be laid warme alſo thereto.

Cha.

CHAP. XX.

Horminum. Clary.

THere are diuers sorts of Clary, some manured onely, called Garden Clary, others growing wilde whereof I shall here shew you many, collected from sundry parts.

1. *Horminum sativum vulgare Sclarea.* Garden Clary.

Our ordinary Garden Clary hath foure square stalkes, with broad, rough, wrinkled, whitish, or hoary greene leaves, somewhat evenly cut in on the edges, and of a strong sweet scent, growing I meane neare the ground, and some by couples upon the stalkes. The flowers grow at certaine distances, with two small leaves at the joynts under them, somewhat like unto the flowers of sage, but smaller, and of a very whitish or blewish blue colour: the seed is greyish, and somewhat flat, or not so round as the wilde, the roots are blackish, and spread not farre, and perish after the seed is ripe, it is most usuall to sow it, for the seed seldome misseth of leauing a liuing.

2. *Horminum sativum foliorum Dioscoridis.* The true garden Clary of *Dioscorides.*

The small Clary riseth up but with one square hairy stalke, a foote halfe a span high (as here as I could yet obserue) diuided into seuerall square branches, whereon are set at every joynt two leaues one against another, which are somewhat broad and round, a little rugged like unto Horehound, but more greene than white, and of a reasonable good and small scent; at the toppes of the stalkes stand diuers leaues, one row under another, of a very fine deepe purple violet colour, yet the lowest are paler than the uppermost, and seeme farre of to be flowers, but neerer obserued are discerned to bee but the toppe leaues, the flowers comming forth under them at spaces about the stalkes, of a whitish purple colour, smaller than any of the sorts of Clary, standing in brownish purple huskes, which after the flowers are past, while the seed ripeneth, turne themselues downeward, whereby the seed is lost, if it be not gathered in fit time: the roote is small and perisheth every yeare, seeming to bee new sowne in the Spring, for it seldome commeth of the seed that it shed, the frosts and Winter most likely killing it.

3. *Horminum Syriacum.* Assirian Clary.

Assirian Clary is somewhat like unto Garden Clary, having a square stalke, but two foote high, very little hairy, diuided towards the toppes into smaller branches, whereon doe grow at the joynts two rough leaues, those below being larger than those above, and somewhat smoother, as long and large as a mans hand, unevenly waued about the edges: the flowers are like unto Garden Clary, for the gaping forme, but smaller, and of a white colour, after which come small flat greyish seed, hauing red ribbes and black lines on them, when it is in flower, it smelleth pretty and sweet, but else not.

4. *Horminum Germanicum humile.* Low Germane Clary.

This small low Clary of Germany hath square soft somewhat hoary stalkes, a cubit high, whereon doe grow large leaues, very like unto our Garden Clary, two growing at a joynt on the contrary part thereof, one unto another, which leaues are much the hairy to view, not rough on the edges, and deeply cornered like wilde, both leafe hoary, and of little fauour or scent: the flowers grow at spaces about the stalkes to the toppes, bowing their spiky heads, which are of a purple colour, not much bigger than Lauender flowers, after which come small blackish seed; the roote is thicke, and of a sweet taste, blacke on the outside, with diuers fibres set thereto, which perisheth euery yeare, and likewise many leaues.

5. *Horminum syluestre vulgare.* Our ordinary wilde Clary, or *Oculus Christi.*

The wilde Clary (that groweth in many places of this Land) hath many square stalkes, two or three foote high, whereon are set broad darke greene leaues, dented about the edges, somewhat rugged and hard in handling, the flowers growing towards the toppes of the stalke, like unto the gaping or hooded flowers of the garden Clary, but smaller, and of a blewish blue colour, after which come round brownish seed: the roote is long, tough and blacke, with diuers strings annexed unto it, whereby it taketh fast hold of the ground: the herb a strong smell thereof, but nothing so sweet as our garden Clary. There is another kinde hereof, the toppes of whose stalkes are purplish, with flowers of a purple colour, and somewhat larger leaues: and another likewise like unto, differing onely in that the toppes of the stalkes are greyish, and not purple, the flowers of a pale blue colour, and the leaues a little torne in on the edges.

6. *Horminum syluestre album flore albo.* Hoary wild Clary with a white flower.

This white Clary differeth little from the former, but onely that this hath more hoary leaues than it, a little deeper indented into the edges, and the flowers are wholly white.

7. *Horm.*

3. *Horminum sativum sativum Dioscoridis.*
The true garden Clary of Dioscorides.

4. *Horminum Germanicum luteum.*
Lute Germane Clary.

7. *Horminum sylvestre Italicum.* Italian wild Clary.

7. *Horminum sylvestre Italicum.* Italian wild Clary.

This Clary groweth with such like square high stalkes as the former, whereon grow in the like manner two leaves at a joynt, which are greene, but more rugged or fuller of wrinckles, & somewhat longer, ending in a longer point: the flowers likewise stand at the coppes of the stalkes and branches, in spaces or distances like the other, and hooded or gaping as they are, but smaller, and of a red colour: the seed is small and blacke, standing in the brownish huskes, that conteined the flowers, in the like manner as all the rest doe: the roote is living, and perisheth not after seed bearing.

8. *Horminum sylvestre Lavendulæ flore.* Wild Clary with Spike flowers.

This wild Clary groweth like unto the ordinary wilde Clary, with square hairy stalkes as high as it, set with harder narrower and smoother leaves, deeplier endented about the edges, and rounder pointed, the flowers are much like than they; and neither in bignesse or colour, much differing from the flowers of Spike or Lavender, growing in spaces as the rest doe: the seed and roots differ not, nor the smell hereof much, from the other wild kindes.

9. *Horminum sylvestre salvifolium.* Sage leafed wild Clary.

The Sage leafed Clary hath low square stalkes, not much above a foot and a halfe high, whereon grow two hard rugged leaves at a joynt, very like unto Sage leaves, but not hoary at all, of a darke greene colour, dented about the edges: the flowers grow at spaces round about the stalkes, of a faire purple violet colour in some, and more pale in others, or almost of an ash-colour in others: the seed is black, and so is the root without, but yellow within, and abideth without perishing, as most of these wilde kindes

2. *Horminum sylvestre latifolium flore.* Wilde Clary with broad flowers.

3. *Horminum sylvestre angustifolium.* Sage leaved wilde Clary.

kindes doe, the smell hereof is more pleasing and lesse heady than most of the others.

There is another of this kinde that differeth chiefly from it, in that it groweth much higher, and hath thicker stalkes, larger and thicker leaves also, spotted with divers white strakes, and spots therein, else in forme and colour both of leaves and flowers, there is no difference. *Sundry sorts.*

10. *Horminum sylvestre Creticum.* Low Candy Clary.

The low Clary of Candy hath divers leaves lying upon the ground, having every one a long foote-stalke somewhat small toward it, and growing broader to the middle, ending in a small point, and three or foure inches long, rough or rugged, or snipe about the edges: the stalkes are somewhat couered on which doe grow such like leaves, set by couples as in the rest, and towards the toppes white flowers, very like for forme and colour unto the flowers of Garden Nepte, yet without any sweet scent to commend it.

11. *Horminum Anguillarum lacinatum.* Torne and nettle leafed Clary.

This Clary is small and low also, growing not aboue a foote high with his stalkes, which are square and hairy, seldome diuided into branches; the leaues that are set thereon by couples, as in the other sorts, are somewhat small and hairy about one inch in breadth, and three in length, carue in deepely on the edges, especially the lowest; but those that grow up higher are but onely waued, or grosely indented like the leaues of *Syriaca Asclepias*, or Milk waste, the flowers are small and white, standing in rundles about the toppes of the stalkes, ending in a long spike, which bendeth downewards with the length: after which come black seed.

12. *Horminum luteum sine Calus Iouis.* Yellow wilde Clary, or *Iupiters* distaffe.

This kinde of yellow wilde Clary hath divers large hoary, or whitish greene leaves, dented about the edges, standing upon long foote-stalkes, rising from the roote, which are broader at the bottome, smoother also, and somewhat lesse carnose in handling, as the square stalkes also are, and somewhat hairy, that arise from among them to the height of eleuen foote, whereon are set by couples such like leaues as grow below, but somewhat lesser: at the toppes of the stalkes the flowers come forth, set at spaces, which are gaping, and like unto Clary, but of a faint yellow colour, after which come browne black seed; the roote is composed of many long strings, whereby it taketh strong hold in the ground, and abideth many yeares: both leaues and flowers smell somewhat strong.

13. *Verbena Æthiopica, foliis ad radicem pinnatis, & ad summitatem subrotundis.* Plaine and jagged Æthiopian Clary.

The two last remembred sorts of Æthiopian hearbs have, the one being set forth in my former Worke under the name of Æthiopian Vervein, could hardly vpon those textures resolution and deliberation, to what genus or kinde they ought to be referred, rather to set them to this tribe of the Claries, and especially to our common garden Clary, than to the *Verbenaca*, as all Authors before me have done; for although they may be Verbenas in regard of their seed vessels, yet the whole forme and frame of leaves, flowers and seed are more like unto the garden Clary, as also the time of springing and perishing, as the Clary doth after seed-bearing, which few of the other wilde Claries doe: Whereas Mallowes they cannot properly be, in regard of their hooded or gaping flowers, which the Mallowes properly so called have, as I have shewed more largely in the Chapter of Sage going before, and

m

in this. The description hereof is in this manner. Each of them have divers very large leaves spread upon the ground, every one nigh a foote long, and almost halfe a foote broad, ending in a point, in the one smooth, and in the other very much worne in on the edges on all sides, and dented thereabouts, both also of a whitish hoary greene colour, with much white hoarinesse or woolinesse upon them, in the middle whereof riseth up a hoary square stalke, divided toward the toppe into sundry small branches, whereon are set divers smaller leaves, and at the toppes divers large white hooded flowers, the one like the other, set at distances about the branches: after which come the seed, two always joyned together in one seed vessell, which are brownish, the one like the other also. The plant dyes both the after-seed time, which is usually the second yeare after the springing.

The Place.

The first is planted onely in Gardens, and so is the second in these Westerne parts of *Europe*, both on this side and beyond the *Alpes*, by the judgement of the best Authors. The third was first brought by *Vlisbonensis* into these parts out of *Syria*. The fourth is wilde in many places of *Germany*. The fifth is wilde in most owne Country, almost every where by the way sides, and so is the other of this kind with the purple stalkes, but the other with greene stalkes groweth in *Hungary*, and divers other places in *Germany*. The sixth *Clusius* first found in the Widowes neare *Segnium* in *Hungary*. The seventh was sent out of *Italy*, and as it is likely is originally of that Country. The eighth grew with *Clusius* of the seed he received out of *Spaine*, but yet as he saith he found it like wise neare the riding place at *Greenewich*. The ninth groweth in *Hungary* almost every where in their Vineyards, and by the way sides. The tenth grew of the seed was sent out of *Candy*. The eleventh both at *Montpelier* and in *Candy*. The twelfth through-

Original from UNIVERSITY OF MICHIGAN

throughout all *Hungary* in great plenty, and in *Austria*, & in many other places. The last as *Dioscorides* saith, on Mount *Ida* in *Phrygia*, and in *Aegilops*, but of late dayes gathered from some of the Hills of *Greece* and *Illyria*, that are neere the Sea, but is chiefly kept in Gardens.

The Time.

They all flower in the Summer Moneths of June and July, yet some a little later than others, and their seed is ripe in August, or thereabouts.

The Names.

These are called in Greeke *Sclareia & elelisphacos quasi sclarea quod sit herba sclarea maxime ad venerem florulae*, as *Dioscorides* saith; for *sclareia* ligustrum *herba quaedam sterilis quae dicitur in venerem prodit*: because it provoketh to venery. And *Gesner* that translated *Dioscorides* into Latine, translateth the word into *Gemmula*, from the fountaine he useth most likely in hearing reasons, in Latine also *Hermenium*. We call it in English Clary, of the Latine *Sclarea*, or *S. Clarea*, which as *Angelius* saith, is so called of the Ethiopians, and is always taken for our ordinary Garden Clary, or all Cheese eye. The first ordinary Clary is *Clusius* his first kinde of wilde Clary with *Matthiolus*, *Camerarius*, *Gesner* and others called *Sclarea* and *Sclarea hortensis*, with *Lobel Sclarea*, with *Tragus Gallicanum sativum*, and with *Lugdunensis* and *Gerard Gallicanum*, *Horminum*, and *Ormenum* with *Cordus* and others: but *Ruellius* and *Fuchsius* take it to be the Garden *Horminum* of *Dioscorides*, which *Matthiolus* contrarieth, and *Dodonaeus* taketh it rather *Horminum sylvestre* of *Dioscorides*, and *Bauhinus* upon *Pliny*, *Scordium alterum Plinij*: by *Fuchsius Sideritis Heraclea*, of *Dodonaeus* and *Dalechampius Orvala*, and is called likewise by some others *Centrum Galli*, and *Horminum*. It is taken of some to be the *Scorpios* whereof *Pliny* maketh mention among the *Scorpioides* and some his *Vesicaria alia*, others take it to be *Phrebion* of *Galen* or *Bacchus* of *Dioscorides* & some *Heliotropium* of *Pliny*: *Pliny* as I shewed you before in the Chapter of Horehound, mistaketh every where the Greeke word *πράσιον* which is Horehound, as if it were *πράσιον parvum* Leekes, for here he saith that Clary hath the leaves of Leekes, reciting the words of *Dioscorides*, when as he should have said like unto Horehound. The second kinde here set downe, is called by *Matthiolus Horminum domesticum*, and by *Lacuna*, *Ancnidara*, *Dodonaeus*, *Lobel*, *Calalpinus*, *Castor Durantes*, *Lugdunensis*, *Camerarius*, *Tabernamontanus*, and *Bauhinus*, *Horminum* or *Horminum sativum*, or *Horminum vulgare*, (although *Gerard* against the authority of so many worthy and learned Writers saith, they are deceived without alleging his reasons how, and calleth it wilde Clary with purple leaves) in English the true Garden Clary of *Dioscorides* and others. The third is called *Horminum Syriacum*, both by *Camerarius* and *Bauhinus*, and was brought out of *Syria* by the name of *Biforme* or *Biformed* and called also *Anale* by some, in English Assirian Clary. The fourth is called by *Clusius* in his Pannonick observations, *Horminum sylvestre Lusitanicum Pannonicae primum*, and in his third *Horminum sylvestre*, in his History of plants: in English Germany Clary. The fifth is our ordinary wild Clary called *Oculus Christi*, and *Horminum sylvestre vulgare*: of *Fuchsius*, *Cordus*, *Gesner*, *Lonicerus*, *Turner*, *Lobel*, *Camerarius*, *Lugdunensis*, *Clusius*, and others. *Gerard* his figure of *Calus Iovis* is the true figure of this wilde Clary. *Brunfelsius* calleth it *Salvia agrestis*: and *Besler* that set forth the Garden of *Eystet*, *Salvia agrestis flore purpureo*. *Tragus* and *Gesner Salvia sylvestris & mas*. It is likely also to bee *Dodonaeus* his fourth *Orvala sylvestris*. *Calalpinus* saith, it is the common *Gallicanum* in *Italy*. *Tabernamontanus* calleth it *Sclarea sylvestris*. And some would make it to be *Pliny* his *Alethrolophus*, and others to be a kinde of *Verbenaca vetula*, upright Vervaine: and of *Bauhinus Horminum praecisis foliis serratis*. The sixth is called by *Clusius Horminum sylvestre 4 tertium flore*, and is the other sort of his fourth wild kinde in his History of plants. *Gerard* his figure of *Horminum sylvestre*, is the true figure of this plant. *Tabernamontanus* calleth it *Sclarea sylvestris flore albo*, and the great Booke of *Eystetensis Salvia agrestis flore albo*, in English hoary wild Clary with a white flower. The seventh is the fourth sort of the fourth kinde of wild Clary by *Clusius*, of *Bauhinus Horminum minus foliis profundius serratis*: in English Italian Clary with a red flower. The eight is *Clusius* his first sort of the fourth kind of wild Clary: which hee had from *Spaine* by the name of *Bucharis*, and groweth at *Greenwich* also. *Tabernamontanus* calleth it *Sclarea Hispanica*, and *Gerard Gallicum alterum*, of *Bauhinus Horminum sylvestre lavendulae flore*: and *Clusius* saith it is the *Sideritis pentapetala* of *Lugdunensis*, in English wild Clary with spike flowers. The ninth is the *Horminum sylvestre* of *Matthiolus*, *Calalpinus*, *Castor Durantes* and *Lugdunensis*, *Tragus*, calleth it *Salvia sylvestris tertia Lobelij*: *Lobel* it is called *Verbascum virgae pastoris folio purpureo flore*: and so also of *Lugdunensis*, it is *Dodonaeus* his *Orvala altera*, and *Clusius* his fift kinde of wilde Clary, whereof there are two sorts, the one greater than the other, as is set downe in the descriptions. *Bauhinus* calleth them *Horminum sylvestre latifolium maius & minus*. The tenth is *Lobel* his sixth kinde of wilde Clary which he called *Horminum minus ignotum Cretense*, and in English Candy Clary. The eleventh is called by *Bauhinus Horminum praecisis foliis & serratis & Salviae folio Scordepeucis* as *Columna* it was as hee said, sent him likewise by the name of *Horminum Creticum album*. The twelfth is called by *Lobel*, *Clusius*, *Camerarius*, *Lugdunensis*, *Eystetensis* and *Gerard Cretae forte*. *Dodonaeus* calleth it *Orvala tertia*, *Calalpinus Apulum*, *Dalechampius* and *Lugdunensis Calceolifolia*, and is *Clusius* his second wild Clary. Some call it *Camphorata*, some *Sphaelata*, and others thinke it to be *Stoebe*, *Plinij*. *Tabernamontanus* calleth it *Horminum luteum glutinosum*. Some others also call it *Horminum luteum* and *Horminum Cretae luteum*. The thirteenth is of two sorts, the one called *Aethiopis*, and the other *Aethiopis altera*, and by *Bauhinus* who onely hath written thereof, *Aethiopis Lavendulae folio*, which I have called in Latine *Sclarea Aethiopis lavendulae*, as I doe the other *Aethiopis seu Sclarea Aethiopica vera Lugdunensis*, for the reasons before alleaged: in English Plaine and jagged Ethiopian Clary: The Italians call Garden Clary *Schiarea*, *Schiaregia*, *Schiarea*, and *Herba buona*: *Garmond*, and the rest in Latine *herba S. Iohannis*, and the white Clary *Hominum*: the French call the garden kinde *Orvale*, or *toute bonne*, and the wilde sort *Orvale Sauvage*: the Germanes call the one *Scarlach*, and the other *Wilder Scarlach*: the Dutch *Scarley*, and wild *Scarley*: in English Clary and wild Clary, and *Oculus Christi*.

The Vertues.

Our garden Clary (as I find before) that *Dodonaeus* thinketh to be the right wilde Clary of *Dioscorides*, because it is of greater force and vertue above any of the other sorts, which are called wild Clary, for *Dioscorides* saith that the wild kind is more effectuall than the tame or garden kinde) is of most use in all Christian Countries, I thinke for my inward cause, for the true kinde of *Dioscorides*, and the rest of the wild kindes here set downe are lesse used, as I thinke, and to lesse effect. But the seed thereof chiefly, as well as of our garden Clary, is used to be put into the eyes

Original from UNIVERSITY OF MICHIGAN

eye, to cleare them from any moates, or other such like things are gotten within the lidder to offend them, as also to cleanse them from white or red spots in them. The Mucilage of the seed of either sort made with water and applyed to tumors or swellings, dispersieth and taketh them away, and also draweth forth splinters, thorne, or other things gotten into the flesh, the leaves tried with vineger either by it selfe, or with a little honey, doth helpe hot inflammations, as also Biles, Felons, and the hot inflammations that are gathered by their paines, if it be applyed before they be grow too great. The powder of the dryed leaves put into the nose provoketh neesing, and thereby purgeth the head and braines of much rheume and corruption. It provoketh to venery, either the seed or the leaves taken in wine. It is in much use with men or women that have weake backes, to helpe to strengthen the reine, either tried by it selfe, or with other hearbes that conduce to the same effect, and in ruptures often, or the fresh leaves fried in butter, being first dipped in a batter of flower, egges, and a little milke, served as a dish to the Table, is not unpleasant to eate, but specially profitable for those, for whom, as I said, it is convenient. *Lobel* and *Pena* saith, that some Brewers of Ale and Beere in these Northerne regions (I thinke they meane the Netherlands, for so *Dodonæus* meaneth) doe put it into their drinke to make it the more heady, fit to please drunkards, who thereby according to their severall dispositions, become either dead drunke, or foolish drunke, or madde drunke. It helpeth downe womens desired sicknesse, and expelleth the secondine, or after birth. It is used in *Italy* to be given to women that are barren through a cold and moist disposition, to heate and dry up that moisture, and to helpe them to be fruitfull, and stayeth the whites, it helpeth also a cold stomacke oppressed, with cold flegme, purgeth the head of rheume and much corruption, the overmuch use hereof offendeth the head, and is hurtfull for the braine and memory. Yellow Clary, or *Turpides* distaffe is hot and drying, and the juyce is of especiall good use to cleanse and heale foule ulcers. The Ethiopian Clary is commended for the roughnesse of the throat, and to helpe to expectorate the rotten and purulentous matter in the Pleurisie, or in other coughes, either the decoction of the roote drunke, or made into an Electuary with honey. *Dioscorides* saith also, it is good for those that are troubled with the Sciatica.

Chap. XXI.

Verbascum. Mullein.

Many of the *Verbasca* Mulleins that are properly so called, doe grow wilde in divers and severall places in our owne Country, and therefore are not usually brought into gardens, yet because foure of them are more rare, and seldome met withall, I thinke it not amisse to place you all of them here, with those also that have beene sent us from beyond Sea.

1. *Verbascum album vulgare, sive Tapsus barbatus communis.*
Common Mullein.

1. *Verbascum album vulgare sive Tapsus barbatus communis.*
Common Mullein.

The common white Mullein hath many faire large woolly white leaves lying next the ground, somewhat longer than broad, pointed at the ende, and as it were dented about the edges: the stalke riseth up to be foure or five foote high, covered over with such woolly leaves as the lowest, but lesser, so that no stalke can be seene for the multitude of leaves thereon up to the flowers, which come forth on all sides of the stalke, without any branches for the most part, and are many set together in a long spike, in some of a gold yellow colour, in others more pale, consisting of five round pointed leaves, which afterwards give small round heads, wherein small brownish seed is contained: the roote is long, white and wooddy, perishing ever after it hath borne seed.

2. *Verbascum Danicum humile.* Dwarfe Mullein of Denmarke.

This small Mullein groweth like the ordinary Mullein with yellow flowers, having such like woolly leaves growing thick together at the bottome, but much smaller: the stalke riseth not up above a foote high at the most, set with some leaves thereon from the bottome: the flowers are very large for the proportion of the plant, and yellow like the ordinary, differing in no other thing from it.

3. *Verbascum non folijs longioribus.* White Mullein with long leaves.

This Mullein hath many thicke white woolly leaves lying upon the ground, like unto the common white Mullein, but these are somewhat narrower, and thereby seeming longer; from among which riseth up a round hard woolly stalke, about five foote high, set with the like leaves, as grow below, but smaller unto the middle thereof, where it beginneth to give forth seede, and in some plants and places to divide it selfe into branches, whereon are set many flowers, growing round about the stalkes, as bodies thicke together, consisting every one of five round pointed leaves of a whitish colour, and in some plants and places more yellow, with a few yellow threads in the middle: in whose places afterwards come round hard seed vessels, very like unto

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

unto the seed vessell of Foxe-gloves, or Finger-flowers, but not so long, wherein is contained very small and brownish seed: the roote is somewhat long, thicke and hard, but not woodly, with divers long fibres set thereunto.

4. *Verbascum femina flore albo vel pallido.* Sweet white Mullein.

The sweet white Mullein hath white hoary and woolly leaves like the other, but longer, narrower, and more indented about the edges, and not so many growing below on the ground; the stalke is woolly, and riseth higher than the former, having greater flowers growing at the toppes, much sweeter also than it, and of a white colour, wherein sometimes some reddish lines are to bee seene therein: in other things this differeth not from the former.

3. *Verbascum nigrum vulgare.*
Ordinary black Mullein.

3. *Verbascum nigrum vulgare.* Ordinary black Mullein.

Our ordinary black Mullein hath leaves nothing woolly or hairy, but of a darke greene colour somewhat large, longer pointed, and dented unevenly about the edges, the stalke riseth almost as high as the common white Mullein, and usually parted at the toppes into some branches, bearing long spiky heads of gold yellow flowers, and in some tending to purple like the other, with some threads in the middle, which are reddish in some, and purplish in others: the seed is like the other: the roote perisheth after seed time as the other doth: the whole plant hath a stronger or more grievous smell in it than the white kinde.

6. *Verbascum nigrum odoratum.* Sweete black Mullein.

This black Mullein hath foure or five leaves lying upon the ground somewhat long and broad, ending in a long point, somewhat hard, and as it were crumpled, of a darke greene colour, without any manifest dents or notchings about the edges: from among which riseth up a round hard greene stalke three foote high, oftentimes without any branches, but more often divided into two or three branches, whereon grow many yellow flowers smaller and thicker set together, that is, two or three at a place, than in any other, and smelling pretty sweet, which fall away without giving of seed in the most that I have observed, or very seldome bearing small seed in round small heads: the roote is somewhat great and long, with divers fibres annexed unto it, and perisheth not, but abideth many yeares.

7. *Verbascum laciniatum.* Iagged Mullein.

This jagged Mullein hath large and long leaves unevenly cut in on the edges, seeming to bee waved, somewhat like the leaves of Horned Poppy, of a darke greene colour, and a little hairy withall: the stalke is small and greene, but high, and branched divers-ly, bearing smaller yellow flowers, and more sparsedly set than in the other blacke sorts, the seed and roote are not unlike the others. *Lobel in Adversariis* should seeme to set out this plant as *Bauhine* and others doe intimate, and as himselfe doth demonstrate it to be *Verbascum altera Matthioli*: but his description both of the order, forme, and colour of the flowers in his, is much differing from this: for he saith the flowers are set under the stalkes: 2. Sage or wild Clary are, and of the same forme and colour, and therefore giveth it the title of *Verbascum sylvestre folio Salvia*, as it is to be amended: and in his observations, *Verbascum sylvestre folio Salviæ laciniato.*

8. *Verbascum Salviæfolium creticum Cifadæ.* Sage-leafed Mullein.

This strange Mullein ariseth from a woodly roote, divers white hoary leaves like unto sage leaves, but whiter, thicker, and naturally pearled, every one having a long foote stalke, from among which rise up divers hoary white round stalkes, set here and there with such like whitish leaves, but a little smaller and narrower: at the toppes of the stalkes stand divers flowers, one above another, consisting of five round pointed leaves, of a yellow colour, with a few reddish threads therein.

9. *Verbascum folio Salviæ tenuifolia Syriacum.* Small Sage-leafed Mullein of Syria.

Although I never saw this plant, yet because *Lobel* who first set it forth, entituleth it *Phlomis*, and placeth it among the *Verbascum*, Mulleins, I can see no lesse than shew you it also with them: with this my note of *Verbascum*, rather than *Phlomis*, from the colour of the flowers differing from all the other. Take therefore this short description of them, untill a more exact may be given. It hath long, narrow and pearled leaves like unto the leaves of Tuscane Sage, all hoary as the former Mullein are, which have also such white eares on them: the flowers are yellow, many standing together at their toppes: somewhat like to those of the wild Campion, or Flower of *Buckler*, called by divers Monkes.

The Place.

The first groweth by the side of the sea and banks in many places in this Land: the second in the fields betweene *Cressenhang* and *Sudbury*, neare *Gretton* in *Worcester*, there observed by *Lobel*. The third and fourth doe grow but in some places of our owne Country, for that one shall hardly finde a plant in a great way. The fift in many places likewise, both in *Kent*, *Sussex*, *Essex*, and elsewhere. The first is sometimes also to be found with white

7. *Verbascum latifolium, Fuggeri Mollein.*

8. *Verbascum Salviæfolium exoticum Cretense.* Sage leafed Mullein.

9. *Verbascum folio Tabaci maximo Spicatum.*

yet scarsely to be met with, and indeed unlesse one well exercised in the knowledge of plants, doe light upon it, and know it, it will scarse be regarded of a great many others. The seventh *Lobel* saith he found neare the ruines of an old Church, by the Bathes at Bathe in *England*. The eight is a stranger to us, we have onely the knowledge that it groweth at *Padua*, or thereabouts, in a garden of a Signor *Clarissimo* of *Venice*, called *Cornaro*. And the last is a greater stranger than it.

The Time.

All these Mulleins doe flower about July, except the eighth and the last of whose time we are as yet ignorant, but hope shortly to be so well informed that we may informe others.

The Names.

Verbascum is called in Greek [illegible] from [illegible] *flamma*, for that it served as a wicke to put into lampes to burne, and of the Latines *Candela regia* and *Candelaria*, because the ancient used the stalkes dipped in suet to burne, whether as Candells or otherwise, and so likewise the English name Hignaper, for Highraper, the h being left out, used in the same manner as Taper or Torch. It hath also some other names in Latine, as *Phlomos*, *Phlapsos*, and *Taptus barbata*, and *Lanaria*, in English also named Torches, some Hullockes longwort, some Hares beard, and some *Iupiters* staffe: The first is called *Verbascum mas*, and *Verbascum masculum* of most Writers. The second hath no other name than is in the title. The third is called by some *Verbascum vulgare*, and by some *Faminum coma aurea*, *Lobel* called it in his observations *Verbascum fœmina*, and in the Icones, *Verbascum*, and *Verbascum Lychnitis Matthioli*: of *Fuchsius* it is called *Verbascum candidum minus*: of *Dodonæus* in French, of *Tabac* and *Tabac de hart*, it is called *Verbascum album fœmina*, and of *Pannonius* in Latine *Verbascum asphodelus*, in English, white Mullein with long leaves. The fourth is called by *Lobel Taplus barbatus montanus, alterius meridionalium* (and not *Septentrionalium* as *Bauhinus* hath

it)

it) *flore albo*, in English Sweet white Mullein. The fift is called *Verbascum nigrum* of all others. The fixt is not fet forth by any other Author that I can finde than by *Bauhinus*, who onely remembreth it, as a kind of his faift yellow *Blattaria*, or peradventure that *Blattaria* of *Plin*y with many branches: for the common blacke wilde Mullein is not this, but another plant, and therefore the name in the title is sufficient for it. The seventh is called by *Matthiolus Verbascum alterum*, and *Lobel* fo faith alfo, and may be his *Brancafolium*, or *Salvifolium laciniatum* as I faid in the defcription. *Lugdunenfis* calleth it *Verbascum laciniatum Matthioli*, and *Cuncta prima Verbascum folio papaveris cornuti*. The eighth *Lobel* calleth *Verbascum fylveftre, falvifolium rotundum*, and *Bauhinus Verbascum fubrotundo falvia folio*, and faith he had it out of *Cordus* his garden, by the name of *Verbascum Cliffoldes*: in English I have called it Sage, leafed Mullein, becaufe I judge it may be a Mullein, in regard the flowers are *Cliffes* faihion which is not vnlike to the reft of the right Mulleins. The laft is called by *Lobel Pifanus Tychonis glaucus Syriacus, Lugdunenfis & Bauhinus, Verbascum folio Salvia rotundifolia*. It is called by the Italians *Verbasco*, and *Taffo barbaffo*: by the Spaniards *Verbasco*: by the French *Bouillon*: by the Germanes *Wollkraut*: by the Dutch *Wolle craught*: and vs in Englifh Mullein, &c. as is aboveiaid.

The Vertues.

Mullein is commended by *Dioscorides* againft lackes and fluxes of the belly, if a fmall quantity of the roote be given in wine: the decoction thereof drunke is profitable for thofe that are burften, and for thofe that have crampes and convulfions; and likewife for thofe are troubled with an old cough: the decoction thereof gargled, eafeth the paines of the toothache. If the feed and flowers hereof, together with the flowers of Camomill, and the powder of dryed Venice Turpentine, be caft upon a few quick coales in a chafing-difh, or fuch like other thing fet into a clofe-ftoole, and the party fitting bare over the fumes, that is troubled with the piles or falling downe of the fundament, or any the paines of that place, doth give much eafe and helpe: as alfo for thofe that have a great defire to goe often to the ftoole and can doe nothing, efpecially for fuch as have the bloody Flixe. An oyle made by the often infufion of the flowers, is of very good effect for the piles alfo. The decoction of the roote in red wine, or in water, if there be an ague, wherein red hot fteele hath beene often quenched, doth ftay the bloody flixe. The fame alfo openeth the obftructions of the bladder and reines when one cannot make water. A decoction of the leaves hereof, and of Sage, Marjerome, and Camomill flowers and the places bathed therewith, that have their veines and finewes ftarke with cold, or with crampes, doth bring them much eafe and comfort. It is faid that there is not a better remedy found out for the hot gowre then to drinke three ounces of the diftilled water of the flowers every morning and evening for fome dayes together. *Arnoldus* faith, that if two drams of the juyce of the leaves of Mullein before it beare ftalke, be taken in a draught of Muscadine at every time, for three or foure times one after another, an houre before the fit of the quartane ague commeth upon my, it fhall furely helpe them. The juyce of the leaves and flowers being laid upon rough warts, as alfo the powder of the dryed roote rubbed on, doth eafily take them away, as *Matthiolus* faith, although it will doe no good to thofe that are fmooth: and that the powder of the dryed flowers is an efpeciall remedy for thofe are troubled with belly ackes, or the paines and torments of the collick. The decoction of the root hereof, and fo likewife the leaves is of great effect to diffolve the tumors or fwellings, as alfo the inflammations of the throat. The feed and leaves boyled in wine, and after laid to any place that is prickt with a thorn, hath a fplinter, or fuch like thing got into the flefh, draweth the fame forth fpeedily, eafeth the paines, and healeth them alfo. The leaves being bruifed wrapped in double papers, and covered with hot afhes and coulters, to bake a while, and then taken forth and laid warme upon any botch or boyle that hapneth in the groine or fhare, by filthineffe or otherwife, doth diffolve and heale them. The feed hereof bruifed, boyled in wine, and laid upon any member out of joynt after it is fet in againe, taketh away all fwellings and paines thereof. The leaves and toppes of the leffer white Mullein boyled in water, and laid upon the places pained with the gowt, doth wonderfully eafe them. The diftilled water of the flowers hereof dropped into the eyes, taketh away the watering of them, as alfo taketh away that redneffe of the face is called in Latine *Gutta Rofea*, and in Englifh, the Role, if it bee waihed therewith often, having a little Camphire diffolved in it. The waters is likewife ufed againft running or creeping fores, or any other deformity of the skin. The flowers bruifed and made up into an ointment with the yolke of an egge, a few crummes of bread, and the juyce of leekes laid upon the painefull piles when they fwell, doth eafe the paines exceedingly, and helpe to bring them into their right place. Country men doe often give their Cattell that are troubled with coughes, the broth of the hearbe to drinke with good fucceffe, as alfo to thofe that by furfeatly, or through loofeneffe and weakeneffe, voyd out their guts behind them. The leaves alfo a little bruifed, and laid or bound to a Horfe foote that is grievoufly prickt with fhoeing, doth wonderfully heale it in a fhort fpace. *Diofcorides* faith it was a report in his time, that if dryed figges were lapped in the leaves of female Mullein, which is that with large and white flowers, they will not putrifie at all. The golden flowers of the blacke Mullein boyled in lye, dyeth the haires of the head yellow, and maketh them faire and fmooth. The leaves boyled in wine and a little honey put to it, is fit to waih and cleanfe foule ulcers, and boyled in vineger, doth helpe greene wounds. Taken alfo with Rue it is a remedy againft the ftinging of Scarpions.

CHAP. XXII.

Blattaria. Moth Mullein.

[illegible] certainely a kind of black Mullein, and therefore to follow next, whereof there are fundry forts as fhall be fhewed.

1. *Blattaria lutea major.* Sweet yellow Moth Mullein.

The leaves of this Moth Mullein doth fpring with many greene leaves lying on the ground, fomewhat long and broad, and fome of a rolling bore, almoft like vnto *Sage*, but pointed at the ends: the ftalkes are two or three foote high, with fome fmaller leaves on them, growing forth from the middle upwards into many long branches, ftored with many fmall pale yellow flowers, of a fmall fweete fcent, yet ftronger than in the others, and feldome giveth feed, but dyeth in the roote, which dieth or rotteth of the other doe.

Original from UNIVERSITY OF MICHIGAN

1. Blattaria flore magno luteo. The greater yellow Moth Mullein.

This Spanish kinde hath longer and greener leaves than the former rounder also at the ends than the next that follow: the ſtalke is ſtronger and higher than it alſo, whereon beſides the leaves grow toward the toppe many gold yellow flowers, conſiſting of five leaves a piece, as all the reſt doe, not ſo thicke ſet as the former, but a good deale larger, with foure purplish threads in the middle, ſtanding round about like unto a five, after which come in their places, round heads, two or three, or more ſometimes together, but moſt uſually one, wherein lye ſmall duſky ſeed: the roote is not great, or full of fibres, but periſheth every yeare, after it hath given ſeed, except that it abide ſometime in a milde winter.

3. Blattaria lutea altera flore vulgaris. The ordinary yellow Moth Mullein.

This yellow Moth Mullein (that is moſt frequent in our gardens) hath ſuch like long leaves as the laſt, but narrower and roundly dented about the edges: the ſtalke is uſually ſingle, and without branches, whereon ſtand ſuch like gold yellow flowers, but leſſer, with the like purple threads in the middle: the ſeed veſſels are ſmaller, and the ſeed ſmall, both ſo like the laſt, that they cannot be diſtinguiſhed: the roote likewiſe periſheth every yeare after ſeed time.

4. Blattaria flore luteo purpureo variato. Cloth of Gold Moth Mullein.

The greateſt note of difference betweene this and the laſt deſcribed, conſiſteth not in the flowers, which is a yellowiſh purple, or the ground yellow, ſwo ſhadowed with a bright crimſon colour, which is of moſt delight: the threads in the middle are not ſo purpled red as in the former, but neare unto the colour of the flower: ſecondly, it ſeldome beareth ſeed: thirdly, it dothe longer abide in the roote, although in a hard Winter it will periſh like the two laſt: thus out of doubt hath beene raiſed from the ſeed of the laſt. *Later* ſetteth forth a ſort hereof with greene flowers which I never ſaw.

5. Blattaria flore albo. White Moth Mullein.

The leaves of this Moth Mullein are of a little feather-green colour, and ſharper dented about the edges, in other things it differeth not from the ordinary yellow, but that the flowers are pure white, and both the like purple threads like fives creeping up as it were at the middle of the flowers.

6. Blattaria flore purpureo. Purple Moth Mullein.

The leaves of this purple Moth Mullein are broader, ſhorter, and of a grayer greene colour than the former, and without any denting for the moſt part, yet gnawed at the ends: the ſtalke riſeth not ſo high as the former, but ſometimes branched, bearing ſuch like flowers of a faire deepe blue or purple colour, tending to reddiſh, the threads in the middle of the flower being yellow: the ſeed veſſels hereof are ſmaller than in the former: the roote is long, thick, and blackiſh on the outſide, abiding ſundry yeares, and riſeth plentifully from the ſhedding of it owne ſeed.

The blue Moth Mullein differeth in nothing from the laſt, but in the colour of the flower, which is of a paler bluiſh violet colour.

7. Blattaria Cretica incana rotunde laciniato folio. Hoary Candy moth Mullein with round torne leaves.

This Candy Mullein hath round hoary ſtalkes, riſing upto the height of a foote and a halfe, whereon are ſet divers leaves without order, which are long, and as it were torne into ſmaller leaves, for every leafe hath ſmall pieces of leaves, ſet on each ſide of the middle ribbe thereof, ſeparated from the end leafe, which is ſomewhat broad, round, and a little dented about the edges, the whole leafe is very hoary, covered as it were with a woolly downe (eſpecially in the hot Country where it groweth, but here it is hoary, white, and not ſo woolly) from the middle of the ſtalke upwards it breaketh forth ſometimes into branches, whereon doe grow yellow flowers, very like unto the flowers of the yellow *Blattaria*, but

6. *Blattaria flore purpureo.*
Purple Moth Mullein.

7. *Blattaria Cretica incana rotundo folio.*
Hoary Candy moth Mullein with round pointed leaves.

but smaller: after which came small round heads, containing small browne seed, both heads and seed being smaller than those of the other Blattaries: the root perisheth with us at the first approach of winter, and seldome giveth ripe seed, because it flowreth so late, whereby we are to seeke of new seed every yeare.

8. *Blattaria Cretica incana longiore laciniato folio.* Hoary Candy Mullein with long leaves.

This other Candy Mullein is in manner of growing, hoarinesse of leaves, yellow colour of the flowers, and in other things like unto the former, the onely difference, in this from the other is, in that the cod leafe hereof upon every stalke is more long than the former, (which is as broad as long, making it seeme almost round) and the heads of seed are somewhat longer also.

9. *Blattaria altera folio rotundo flore luteo.* Round leafed Moth Mullein.

The first leaves of this Mullein are somewhat long and pointed at the end, but those that are set upon the stalkes, are all round pointed, and not so long every one, compassing the stalke at the bottome of the leafe, and are of a darke greene colour on the upperside, and grayish or hoary underneath: at the setting on of every leafe unto the stalke, come forth likewise two other smaller leaves, and from the middle of them shoot forth two or three flowers upon small long foot-stalkes, which are yellow, with purple threads in the middle of them, like unto the other Blattarias: the heads and seed are small like unto the other, and the roots perisheth after seed time, as most of them also doe, and often groweth by the shedding of it owne seed.

10. *Verbasci non spicifera spinosa, sive Blattaria Cretica asperior.* Thorny Moth Mullein of Candy.

I was in some doubt with my selfe whether this plant should belong to the *Verbasca*, as some would have it, or to the Blattaries, but finding it more agreeing with these than with them, although it bee woodily or shrubbie, I have here placed it in his proper place, as I thinke. It riseth up with many small hoary, hard and woodily branches, spreading round about the roote not above a foote and a halfe high, dividing it selfe into many slender branches, which are tender and greene while they are young, but quickly after turne hard and hoary, every sprigge of the branches ending in a sharpe thorne: the leaves are many set together at spaces of the stalkes and branches, somewhat like unto the leaves of the Sea-stocke-gillofower; but much smaller and shorter, a little torne about the edges, but towards the tops smaller and smaller, and not cut in at all, and of an hoary colour: towards the tops of the branches also come forth many flowers, differedly set thereon (and not as the *Blattaries* or *Verbascas* doe, in a long spike) that consist of five round pointed yellow-ish leaves, with some purple threads in the middle of them, like unto the *Blattarias*: after which come such like round hard heads, containing small browne seed like unto them also: in Candy and other hotter Countries, when it is growne old, it beareth a great bushy and thorny head, as it is here expressed: the whole is hard, long and woodily, spreading much under ground, and abideth many yeares in the naturall place of their owne Countries where it groweth, but must have some covering or defence within against the extremities of our Winters, else it will hardly endure.

10. *Blattaria tertia flavida.*
Thorny Moth Mullein of Candy.

10. *Summus arti Blattaria frutescens cum suis adolescentia plantæ.*
The tops of the thorny moth Mullein when it is grown old.

The Place.

The first, third, and fift sorts have beene found in severall places of our Land, as well in *Kent* on *Blackheath*, and neare *Detford*, as in other places: the other 3. of the first five sorts are onely nursed up with us in gardens, their naturall place being not knowne, but the other sorts that follow, except the ninth, doe grow in *Candy*, and from thence have beene sent by *Honorius Belluis* an Italian Physitian, in his time abiding in *Candy*, to divers persons in *Italy*, as to *Iohannes Pona* of *Verona*, and others there, and to *Clusius*, and *Plantean* in the Low-countries, and to *Bauhine* and others: The ninth *Bauhinus* saith he onely found in his Apothecaries garden in *Basil*.

The Time.

They all flower in Summer, and give their seed presently after.

The Names.

The name *Blattaria* in Latine hath beene imposed hereon from *Blatta in se contrahentibus*, as *Pliny* saith (for it hath no Greeke name.) The first sixe or seven sorts have their names in their titles, as most Authors call them, but the seventh being the first *Candy* kind, *Honorius Belluis* first wrote of, and called it *Autumnis*, or *Arcturus*, and saith he is bold to so doe, not knowing better whereunto to referre it, (although it doth not throughly agree to the *Autumnis*, or *Arcturus* of *Dioscorides*) which he sent to *Clusius*. Finding it better to agree with *Blattaria*, than any other plant, have put it under that tribe, and have given it an English name, according to the rest of the *Blattarias*, Hoary Candy Moth Mullein with round pointed leaves. *Bauhinus* in his *Pinax* calleth it *Verbascum lanatum Cretici arvensis*, and the Italian *Pona*, *Verbascum fruticosum auriculatum*. *Columna* saith it was sent unto him with the name of *Morum Creticum*, but he calleth it *Verbascum Brassicæ folio*, and referreth it to that *Verbascum* of *Dioscorides*, that hath the leafe of a Cole wort. The eighth *Pona* in his Italian *Rodon* calleth *Arcturi secunda species*. The ninth *Bauhinus* calleth *Verbascum folijs subrotundis flore Blattariæ* and I in English Round leated Moth Mullein. The last is called in *Candy Cedastiende*, *quasi bellæ thronis*, as *Honorius Belluis* saith, that sent it to *Clusius* (for *Bauhinus* called it *Cledonia*) who thereupon finding the leaves to be like unto Sea Stocke gilliflower, called it *Leucoium marinum Creticum*, but withall saith it is in flower differing from theirs, because all the kindes of Stocke gilliflowers have but foure leaves in every flower, and this hath five. Some others therefore would give it a more proper name as they thinke, and call it *Verbascum frutescens sinosum Creticum incanum*, from the sinuousness of the leaves and stalkes, but I thinke it may more fitly be ranged with the *Blattarias*, as I said before, for the reasons there expressed, in English Thorny Moth Mullein of *Candy*.

The Vertues.

I can finde no Author hath spoken of any other properties belonging to any of these *Blattarias*, then those *Pona* doth attribute to the ordinary sort, that is, to gather Mothes unto it, wheresoever it is layed.

CHAP.

Chap. XXIII.
Stœchas. Cassidony.

THere are two kindes of *Stœchas*, one with a purple flower, the other with a yellow, of each whereof there are diverse sorts; *Hirtuchrysum* also is added unto them, by *Bauhinus* and others, that entitle many sorts of *Chrysocome* with that name, but I doe not so thinke it fit.

* *Stœchas Vulgaris.*
The ordinary Cassidony or French Lavender.

1. *Stœchas vulgaris.* The ordinary Cassidony or French Lavender.

The common Stœchados as we call it in some places, or French Lavender that groweth with us, is a more tender plant than lavender, and more like an herb, than a bush or shrub not above a foot and a halfe high, having many narrow long whitish greene leaves like unto Lavender, but softer and smaller set at severall distances about the stalkes, which spread into sundry branches, at the tops whereof stand long and round, and sometimes foure-square heads, of a darke greenish purple colour, compact of many scales, from which come forth the flowers of a bluish purple colour, after which follow seed vessels, which are somewhat whitish when they are ripe, containing blackish browne seed within them: the roote is somewhat woody, and will hardly abide our cold Winters, except in some places, or before it have flowred: the whole plant is somewhat sweet, but nothing so much as Lavender.

2. *Stœchas vulgaris flore albo.* White flowred Cassidony.

This Cassidony differeth not from our ordinary garden Cassidony in any other thing so much as in the flowers, for although the leaves grow thick together upon the branches, being a little greener, and not altogether so white, and the heads short likewise, yet the flowers starting from among the scales, are larger than in the other, and of a pure white colour, which is very rare to meete with.

3. *Stœchas longioribus ligulis.* Cassidony with long leafed heads.

This Cassidony likewise differeth very little from the ordinary kinde: the chiefest differences noted betweene them are these; the toppes of the branches are bare, without leaves upon them, for an hand breadth in length or more, unto the heads: and the heads of these are not fully so large as in the other, but longer, and have divers hard, stiffe, and longer skinny purplish leaves rising above the heads of them, than at any time seene in the other, which in some places have a shew of some short pieces like unto thinne skinny leaves, of a purple or blue colour, the flowers, seed, and rootes are alike, and so is the smell.

4. *Stœchas serrata folio.* Cassidony with dented leaves.

This dented Cassidony hath much like square brittle slender hoary branches, whereon are divers long narrow leaves set many growing together, which are dented or notched about the edges, and as it were curled or crumpled, greene on the upper side, and hoary underneath, of a hot taste, some what bitter: the toppes of the branches end in some what long square stalkes, naked and without leaves unto the spiky heads, which are truly slenderer and longer than in the other; the flowers are like unto the other, but of a more purple colour, at the toppes of the heads stand such like skinny leaves, of a bluish purple colour as the former hath, the seed and rootes doe not differ.

5. *Stœchas citrina Dalechampi.* Yellow Cassidony with greene heads.

I doe place this Cassidony betweene both these sorts, because it doth in some things partake with both, the description whereof is in this manner. It hath many greene stalkes, and woodily like the rest, whereon grow the leaves as grasse, many set together, whereof the rootes are most are longer than the other, all of a pleasant greene colour, as the toppes of the branches stand such like leafy heads as the former, but longer, from which come forth yellow flowers round about the heads, at the toppes whereof stand two long greene leaves.

6. *Stœchas Rosmarini facie Cretica.* Candy Rosmary like Cassidony.

I have received seed out of Candy by the name of *Stœchas* like this for plant, so like in face or forme unto the ordinary Stœchas, or Cassidony, that any at the first sight would surely say it were the same: rising up with a stalke, not much higher than Cassidony, divided from the very ground into divers branches, and they againe and againe into many lesser, standing somewhat upwards a little, better at every joynt, sometimes with two, and sometimes with three or foure small and narrow long leaves, of a grayish greene colour, smelling somewhat sweet: at the joynts with the leaves towards the toppes of the branches grow forth small flowers, very like unto Rosemary, both for colour, forme, and bignesse, after which succeed small round heads, or seed vessels, no bigger than Pepper-cornes, wherein are contained small blacke seed: the roote is slender and woodily, divided into severall sprayes: the whole plant is of an obscure gray colour, and smelleth somewhat like Stœchas, but more weakely, casting a little bitter, with small heat, but more astringency.

7. *Chrysos-*

5. Stœchas longioribus ligulis. Cassidony with long leaved heads.

6. Stœchas Rosmarini folio Cretica. Candy Rosemary like Cassidony.

4. Stœchas serrato folio. Cassidony with dented leaves.

7. Stœchas Citrina sive Cretica altera. Golden or yellow Cassidony.

Original from UNIVERSITY OF MICHIGAN

3. Chrysocome foetidissima aurea. Stinking golden Cudweed. Golden Cudweed, or golden Cassidony.

This golden Cassidony hath sundry hoary branched stalkes, with long and narrow whitish leaves, dispersedly set therupon into the toppes, where the flowers appeare in umbels, each branch bearing a large tuft of leafy yellow flowers, like a loose or parted umbell, keeping their colour long before they wither, and being gathered in a fit dry time when they are in their perfection, will abide, and be kept a long time after: the seed is red, smaller than Marjerome, and sharper: the roote is small and black: the whole plant is of a strong sweet scent, not unpleasant.

4. Chrysocome flore Stoechadis Citrina Cretica. Candy golden Cassidony, or Goldilocks.

This Candiot groweth very like the former, but with smaller long leaves, all hoary, the flowers are in larger umbels, greater also, and of a more shining pale gold colour, which will abide, being gathered in the beauty as the other. There is another sort called *Elichrysum Orientale* by *Bauhine*, differing little from this tall sort, but in the leafy heads of flowers, which are greater and longer than they, and in the whole plant which is taller and more hoary. *Elichrysum Orientale.*

5. Chrysocome Creticum altera. Spanish golden Cassidony.

5. The golden Cretan or Spanish Cassidony.

5. Chrysocome Creticum altera sive Hispanica. Spanish golden Cassidony.

This other Candior or Spaniard, which you will, groweth sometimes but with one stalke, or else with more, halfe a yard high, covered with an hoary downe, having sundry long and narrow leaves on them, sometimes differedly set, and sometimes three together, green on the upper side and hoary underneath: at the toppes grow small umbels, bearing one or two leafy long heads of yellow flowers, somewhat like to those of Immortelle, consisting of many threds or thrums.

6. Stoechas citrina odora laxa. Sweet yellow Cassidony.

The yellow sweet Cassidony is a small low plant, not rising above a foote and a halfe high at the most, with divers slender branches somewhat hoary, whereon are set small long and narrow leaves, of a darke or more sullen hoary colour, then those of the former golden Cassidony: at the toppes of the long divided stalkes, stand single heads of yellow scales, nothing of so lively a yellow colour as they are, not full round, but a little longer than round, with a few threads or thrums at the tops, which being forth small brownie seed, wrapped in some downe: the roote is black, but smaller and slenderer than it: this hath a little heady scent than the other, yet not unpleasant.

7. Stoechas Citrina vulgaris. Vnsavory yellow Cassidony.

This small Cassidony hath divers low hoary stalkes, not above a foote high, whereon doe grow small long hoary leaves, broader and larger than the last: at the toppes of the stalkes stand most commonly two heads, yet sometimes but one, which are greater and longer than the last, and the scales likewise longer, and somewhat of a brownish greene with the hoarinesse, from whence rise many pale yellow threads or thrums, which when they are past, the seed ripening, is inclosed in downe, and blowne away with the wind: the roote is lesse than the last, and blackish, but not lesse woodily: this whole plant and every part is utterly without any scent to bee perceived in it.

8. Stoechas Citrina sylvestris. Wilde yellow Cassidony.

The wilde Cassidony (for thereunto I referre it) hath a round hairy stalke, lined with soft pure white wooll, divided at the toppes into seven small short branches, the leaves that stand on them are somewhat longer and larger than the last, green on the upper side, and grayish, hoary, and woolly underneath, and a little endented about the edges: the ends of the branches are naked without leaves, for foure inches long, bearing at the toppes of every of them one leafy head, with divers yellow threads or thrums in the middle, like unto the last, but somewhat larger.

9. Stoechas Citrina Cretica flore amplo. Candy unsavory yellow Cassidony with large flowers.

This brave silver-like plant groweth very high and tall, having a straight round stalke that is white or hoary and of a fingers thicknesse, spreading sundry branches, so thick set with small long and hoary leaves, many together at places, that they hinder and hide the branches almost wholly, and are more like unto Cassidony than Lavender-cotton leaves, whereunto *Lobelius* doth liken them, but not dented about the edges: the upper part of the stalkes divide themselves into small spriggs, bearing each of them on a long slender stalke a large yellow flower, like unto a single Marigold standing in a greene huske, wherein after the flower is withered and past, groweth small long seed like unto rowe: the seed: the roote is long, white, and tender: this plant hath neither scent or taste much to be perceived in it, having a little bitternesse, whereby the Natives finde it effectuall to kill the wormes, to provoke urine, to open obstructions, and to helpe the jaundise, and the powder of the dryed herbe, or the juyce thereof, to cleanse and heale some ulcers and sores.

10. Stoechas purpurea vulgaris. Sweet purple Cassidony.

I doe acknowledge that I doe not please my selfe, but others in the placing of this plant in this place, and by this name, for although it hath a foote or stem in some things like unto the yellow unsavory Cassidony, yet in other things it is farre differing from it, that I could by my judgement more truely place it with the *Tuscan* Knapweeds, than with these, as the deepe, most discerning will easily so iudge that will duely consider it, which is thus. It riseth to the height almost of a cubite, growing or standing erect the branches, whereby it spreadeth in compasse more than in height, from a long tunicated blackish root, shooting forth woodily and hoary branches, whereon doe grow many long and narrow leaves, of a darke greene colour on the upperside, and a little hairy withall, but of an hoary white on the under-

13. *Stachas Citrina Creticæ flore duplo.*
Candy ordinary yellow Cassidony with large flowers.

underside, and very woolly, and a little dented about the edges: at the toppes of the branches come forth sometimes but one, but more often two long heads together, composed of many scales, at the toppes whereof stand the flowers, which are nothing but long threads or thrums, of an excellent purple colour, as sweet in scent, as pleasant to the sight: after the flowers are past, in those scaly heads grow the seed wrapped in downe, which is somewhat like unto the small Fine Thistle seed.

The Place.

The first Cassidony or Starhas which is used by Apothecaries and others in Physick, groweth in *Arabia*, as well as in *France* or *Spaine*, or upon Mount *Gargano* in *Italy*, which is called in the Italian tongue *Monte Santo Angelo*. The second was found in *Murcia*, a place in *Castile* or *Spaine*. The third is found in many places both in *France* and *Spaine* promiscuously among the other common sorts. The 4. *Clusius* saith is very rare to meet with, for that he onely found naturall on the toppe of the Calpe. The fifth *Dalechampius* only saith set forth, without naming the place where it grew. The sixth *Lobel* saith groweth in the *Province of France*, in *Spaine* also, and nigh the *Rhone* in *Germany*, but lesse sweet: the seventh and eighth in *Candy* and *Spaine* likewise: the ninth and tenth *Lobel* setteth forth to grow about *Montpelier* in *France*, and *Clusius* saith hee found them in *Spaine* and *Portugall*. The eleventh grew on the Hills neare *Terracina* in *Italy*: the 12. was found among the low Scarlet Okes and Strauberry trees in the Mountaine *Corus* neare *Montpelier*: the 13 in *Candy*: and the last in *France*.

The Time.

Although divers of these have beene observed to bee in flower in March and Aprill, according to the climate where they grow naturall, yet in our Gardens of these more Northerly countries, the former three sorts flower not untill May or June, and the rest flower not untill August for the most part, if they doe abide, for they are all of them very tender, and must bee kept with great care and looking to.

14. *Stæchas purpurea elatior.*
Sweete purple Cassidony.

The Names.

It is called *Conas* in Greeke, and *Stæchas* in Latine, and most commonly *Stechades* by the Apothecaries, and *Stœchas Arabica*, because the best was brought out of *Arabia*. *Dioscorides* saith it tooke the name *Stœchas* from the Ilands called *Stechades* where it groweth, which are over against *Marsellis*, yet *Marsellis* is two dayes journey from the Sea, and those Ilands doe lye neare unto the Country of *Olbia*. *Cæsalpinus* saith it groweth in every Country, and as well in *Candy*, as the Ilands *Stechades*, in English it is called Stœchadove, Cassidony, and French Lavender, but the *Stœchas Citrina* is so called upon the correspondency and likenesse of the properties and temperature, as well as of the forme of leaves and heads: it is also called *Cotonaria*, *Chrysocome*, and *Tuscana*. Old *Gerard* was very confused in the figures of the two chapters of *Elichrysum* and *Stœchas Citrina*, or *Chrysocome*. For his *Cotonaria* is *Matthiolus* his *Elichrysum vulgare*, and his *Stœchas Citrina Matthioli* his *Elichrysum Italicum*, which is *Clusius* his *Stœchas Arabica flore luteo*: his *Crysocome*, or *Amaranthus luteus*, is *Stœchas Citrina vulgaris* his *Amaranthus Gatesi*, is *Stœchas Citrina altera quorundam* of *Lobel*: the deleription of most are according to *Lobel*: in English also they have divers names as golden Tufts, Goldilocks, Golden Flower, gentle Golden flower of life, and yellow Cassidony, by which I rather cottole these plants, then by the others. The first is called *Stœchas purpurea*, and *Arabica*, or *Stœchas* by *Matthiolus*, the second *Bauhinus* onely mentioneth, *Clusius* calleth the third *Stœchas longioribus foliis*, and *Lobel Stœchas nudis canliculis fuscum*, *Lugdunensis Stœchas capitulis foliatis*, and *Bauhinus Stœchas caulis-*

culis

Original from UNIVERSITY OF MICHIGAN

tula vna folatus, in English Calfidony with long hafted heads. The fourth is called by *Clufius Stachys crispo folio*, by *Dodonæus* and *Lobelius Stachys folio serrato*, of *Gerard* and his Corrector *Stachys vndulata*, but the figure is that of *Leucoides tenuifolio folio*, as *Clufius* giveth it, for there are not two *Stachides* with diuided leaues. *Lugdunensis* fetteth it downe for *Succisa* of *Auicen*, according to *Mr Coles* iudgement, in English Calfidony with dented leaues. The fift beſides the name in the title, is called by *Lobelius Stachys viridis capitulis oblongis*. The ſixth is called by *Alpinus lib. de plantis exoticis Rafnatinum Stachydis facie*, but becauſe it doth come neareſt to *Stachas* than to Rolemary in my opinion, I have referred it thereunto. The ſeuenth is called *Stachys Cirrina* by moſt Authors, by *Lobel Chryſocome*, and *Coma aurea ſive Amaracoides lutea* by *Cluſius* and others, and taken by thoſe of *Montpelier* to be the right *Chryſocome* of *Dioſcorides*, excepting one ſmall word wherein there might be a fault alſo. *Gesnerus*, and *Lobelius* entitle it *Elichryſon*, whereas *Dioſcorides* ſaith *Helichryſum*, differeth from his *Chryſocome*, in having ſcatheriewood like leaues (and therefore I referre *Helichryſum* rather to the Milfoiles, as you ſhall finde there among them. The eighth is called *Elichryſum* by *Honorius Belon*, and the other part thereof, *Elichryſon Orientale* by *Lobelius*, and by *Cordus* in Epitome, *Stachas Cirrina comis ſroondiribus*. The ninth may be as well the *Chryſocome peregrina ſecunda* of *Clufius*, as his *quinta Cretica*, for he ſaith they are very like. The tenth is the *Stachas Cirrina altera*, and *Alexandrina* of *Lobel*, by *Clufius Chryſocome peregrina prima*, by *Lugdunenſis Agerati alia quorundam*, and by *Lobelius Cinis ſuper ſylueſtre aconiti folium expanſis corymbulis*. The eleventh *Lobel* calleth *Stachas Cirrina altera rodora*, and is *Cluſius* his *Chryſocome peregrina tertia*, which *Lugdunenſis* fetteth downe, for *Gnaphalium marinum Hallehanum*, and *Lobelius* calleth *Stachys ſempiterni folio flore oblongo*. The twelfth *Lobelius* calleth *Elichryſi ſylueſtris flore oblongo ſimile*, in English it would yellow Calfidony. The thirteenth *Alpinus lib. de exoticis plantis*, calleth *Scordium Creticum*, but I, as it is in the text, for the reaſon expreſſed in the deſcription. The laſt was ſent by *Pillorius* from *Montpelier*, by the name of *Stachas peregrina odorata*, who ſaid it was to be referred to the *Stachas Cirrina altera rodora*, becauſe it was ſo like it, but yet was a differing ſort from it: the cauſes that make me diſſent from that opinion, whereof I ſaid ſomething before in the deſcription, I will here ſet downe: by the deſcription you finde it hath a ſcaly head, and purple thoumnies rising in the midſt of it, which is the flower (and ſuch have the flowers of all the *Iacææ*) and the ſeed likewiſe incloſed in the heads among the downe, are like unto the ſeeds of the ſmall low Pine Thiſtle, which are like the ſeeds of other Thiſtles, that is flat, hard, and ſhining, and ſuch are moſt of the ſeeds of the *Iacææ Cyanæ*, and ſome others: but none of the *Stachides purpureæ*, or *Cirrinæ*, have ſuch like ſeeds, and theſe two things cauſe me to think it rather to be referred to the *Iacææ* whereunto it is like both in flower and ſeed. There is a controverſie betweene *Mathiolus* the Author of the great Herball named *Lugdunenſis*, and *Pena* and *Lobel* which ſhould be the true *Chryſocome* of *Dioſcorides*. *Lobel* and *Pena* in their *Icones*, ſtriving to make *Stachas Cirrina altera*, called *Coma aurea*, and of ſome *Tinearia* and *Amaracoides lutea*, and taken of *Dodonæus* to be *Elichryſon* of *Theophraſtus*, and *Ageratum* of *Dioſcorides*, to ſee the true *Chryſocome* of *Dioſcorides* and *Mathiolus*, in folio 720, contradicting and confuting them. *Lobel* and *Pena* in the deſcription of *Stachas Cirrina*, ſay that the golden yellow toppe or head of cuſted flowers thereof hath cauſed the name of *Chryſocome*, which our age could not hitherto know, in wanting the knowledge of the true Hiſſope, unto whoſe tufted toppes it was by *Dioſcorides* compared: but now that the true Hiſſope is declared and ſet forth (which they make to be the Winter or Pot-Marjerome of our Country, as I have ſhewed you in the firſt Chapter of this Booke) with whoſe tufted toppes or umbell of flowers, they compared the flowers of the yellow Calfidony, they are perſwaded that the *Stachas Cirrina* is the true *Chryſocome* of *Dioſcorides*, but yet afterwards they ſay that one word or two in *Dioſcorides* deſcription of *Chryſocome* doth hinder it, and that is that the roottes of *Chryſocome* (ſaith *Dioſcorides*) are ſmall like unto the roottes of Black *Hellebor*, and the talle thereof reſembling *Cyperus*, of a ſweet, but auſtere taſte, for which they think there may be ſome fault in the text of *Dioſcorides*. Thus you ſee the ſcope and drift of their reaſons to be, that becauſe few did know what herb was the true *Chryſocome* of *Dioſcorides*, who cõpared the tufted heads of flowers thereof unto Hiſſope, & that chiefly it was manifeſt, that our Hiſſope not having any tufted head or umbell of flowers, but a ſpiked head was not the true Hiſſope of *Dioſcorides*, and therefore they having ſhewed what was the true Hiſſope, would alſo declare this yellow Calfidony, whoſe tufted head of flowers is like unto that of their Hiſſope, to be the true *Chryſocome* of *Dioſcorides*. Vnto all which allegations *Aegloanes* thus anſwereth. That firſt he would examine whether our ordinary Hiſſope be the true Hiſſope of *Dioſcorides*, and what part thereof is compared or referred to the *Chryſocome*, and then whether this *Stachas Cirrina* be the true or no. There are faith he, two ſorts of Hiſſope well knowne to us, the one tame, or of the garden, with a ſpike of blue flowers, which is the more bitter: and the other wilde with a red flower, which is leſſe bitter. Now they that deny either of theſe to be the true Hiſſope of *Dioſcorides*, are led by this reaſon; that the leaves of each of them are long and narrow, not like unto any of the kindes of *Origanum*, which are round, and by *Dioſcorides* compared to the leaves of Marjerome, Penniroyall, and Dittany. This faith he, hath troubled many that did not know a third kinde (which is the round leafed Hiſſope declared in the firſt Chapter of Hiſſope) ſet forth by him, and like the other two ſorts, but that the leaves are round like unto *Origanum* or Marjerome. If this kinde of Hiſſope had been knowne to them, they would not have called for an herb out of *England*, to ſupply the place of the right Hiſſope, ſeeing it hath a place of it ſo neere, even among the ſorts of wild *Origanum* or Marjerome, whereunto it is like, but ſomewhat altered by manuring, from that which is common. But this their Hiſſope or Pot-Marjerome hath no corymbi in her tops, they are rather a heape of flowers gathered together, as the wild *Origanum* or Marjerome hath, for no man did ever attribute any ſuch heads or tufts as are called *corymbi*, unto any of them. This knot being untied, it followeth (ſaith he) that we try whether the *Stachas Cirrina* be *Chryſocome*. In this their plant there is no likenes of leaves, neither of the ſorts of Hiſſope to ſee leaves, to wit, either of the long or of the round hafted ſort, called both the roots of leaves and ſtalkes of flowers of the *Stachas Cirrina* looſely ſet together, is not a cloſe tuft of heads, ſuch as *Dioſcorides* (which is a cloſe umbell or tuft of heads or ſeeds, ſuch as the Iris hath) is uſually ſaid to bee, but very ranſly a few yellow golden round ſtanding bullets, or beads at the toppes: the roote alſo thereof hath no ſtalke and ſmall fibres as *Hellebors* ought hath, nor is like to *Cyperus*, nor hath an auſtere ſweet taſte, all which *Dioſcorides* hath: He therefore (I meane the foreſaid *Mathiolus*) ſaith that hee hath often times revolving theſe doubts, iuggled by thoſe Herbarills that have knowledge in plants, that herbe which the Greeks call *Scorpius*, and ſome in Latine *Eruca*, *Tenbor*, *Tragum*, and *Bracchiatum*, in English *Turnep*, and which *Dioſcorides*

ellus too credulous of fables, though it was produced from the seed of Flaxe put into the roote of an Onion to be very agreeable to the deſcription of *Chryſocome*, in the toppes ſet with many corymbi or tufted heads: in the leaves like unto the ordinary long leafed Hiſope: and in the roote branching as *Helleborus niger*, of the colour of *Cyperus*, of a taſte not unpleaſant, which is ſomewhat anſtere with the ſweetneſſe, by which quality it is profitable to the diſeaſes of the liver and lungs. Thus (ſaith he) ſeemeth probable to me, and therefore I could not but ſilent therein, ſetting forth the nature of *Chryſocome*, leaving it to the judgement of thoſe that are more learned. I have, I confeſſe beene a little too proliſe or tedious in this narration, but I was rather willing to ſet forth the whole minde of the man, then to abridge any of his reaſons, that comparing both his negatives and affirmatives, yee may agree or diſſent from them: For my owne part ſeeing *Cloſius* and others, doe account the *Stoechas Citrina* to be *Chryſocome* of *Dioſcorides*, and miſ-like of this opinion of *Turnus*; I can doe no leſſe, and thinke there is farre leſſe reaſon in any to ſuppoſe *Turnus* to be *Chryſocome*, than *Stoechas Citrina*. for *Dioſcorides* in the deſcription thereof, mentioneth no likeneſſe of leaves, but of the toppes of tufted heads to be like unto Hiſope, and the ſmall roottes unto thoſe of *Helleborus niger*, equalling *Cyperus*. The Arabians call *Stoechas Aſtichados*, and *Aſtiechados*: the Italians *Aſtica* and *Stechado*: the Spaniards *Cantueſſo*: the French *Stichader*: the Germanes *Stichas kraut*: the Dutch *Stoecas kruit*: and we in Engliſh Stoechadove Caſſidony, and French Lavender. The *Stoechas citrina* is called by the Italians *Abrotanella gialla*, by the Germanes *Meeren blumen*, and *Rhein blumen*.

The Vertues.

The decoction of our garden Caſſidony is as effectuall as Hiſope for the diſeaſes of the breaſt, that is, for coughs and colds. It is put into Antidotes, that is ſuch medicines, as are remedies againſt infection and poiſon. It is of a mixt temperature, as *Galen* ſaith, to wit, of a ſmall earthly cold eſſence, from whence it hath the quality of binding: and of another more earthly extenuated, from whence it is bitter, by the mixture of both which, it openeth obſtructions, and freeth the body from them, it extenuateth, cleanſeth, and ſtrengthneth all the inward parts and bowels, as alſo the whole frame of the body. *Meſues* ſaith it cleanſeth, purgeth, and reſolveth all obſtructions of the liver, ſpleene, and of the other inward parts; it hindereth putrefaction, and correcteth their intemperature: by that ſmall aſtringent quality that is in it, it ſtrengthneth the braine and ſinewes, the heart, and all the other inward parts: it purgeth black choller and flegme, as well from the head and braine, as the ſinewes, and other the inſtruments of the ſtomach, and comforteth them alſo. It is very effectuall in all cold griefes, uſed in drinkes, baths, or fomentings. An oyle made therewith and fomented, giveth as it were life to the braines and ſinewes, by warming and comforting them. Taken with vineger of Squilles, it helpeth the falling ſickneſſe, and ſwimming of the head, and is helpfull for all other paines of the head and ſtomack, with *Lapis Cyprius*, or *Sal Indicum*, it helpeth thoſe that are melancholick, whom feares and terrours doe accompany. Taken with the juyce of Bugloſſe and of Pipins, it helpeth the paſſions of the heart, and melancholy; it eaſeth the paines of the ſinewes, arteries, muſcles, and joynts: take in what manner you will: the fumes thereof taken into the noſtrils, openeth them when they are cloſed: Taken in a Syrupe or any other forme, it helpeth the quartane ague, and all other day agues, eſpecially in thoſe that are flegmatick. It is eſpecially hurtfull to thoſe that are hot, dry, and cholerick, becauſe it troubleth the ſtomack, and proveketh both thirſt and fainting: but becauſe it worketh ſlowly, ſome *Saffron* is added unto it to quicken it, or elſe ſometimes the *Myrobalani Indi*, or *Chebuli*, to make it the more forcible, and ſometime Squilles are added, eſpecially in the griefes of the head. It is made the ſtronger, if it be ſteeped or boyled in wine: it is the leſſe hurtfull if it be boyled with wine, the juyce of Pipins, and a few Raiſons of the Sunne. Caſſidony and a little Spiked Lavender ſteeped in old oyle, is of much good uſe, and of great effect for all the cold cauſes aforeſaid. The heads of Caſſidony are of more force than the leaves: *Pliny* ſaith it provoketh women monethly courſes and urine: it is of ſpeciall good uſe for the cold griefes of the mother, and for women with child. The other yellow *Stoechas* or Caſſidony, is much about the ſame temperature and vertues, ſerving very well for moſt of the affects before ſpecified, as you ſhall heare: It is ſomewhat bitter and binding, and therefore it warmeth, dryeth, openeth and cleanſeth, where cauſe requireth. The toppes or flowers ſteeped or boyled in wine, openeth all obſtructions of the liver and gall, and therefore helpeth the jaundice and dropſie; and is very profitably taken of thoſe that have the falling ſickneſſe, and for all other the diſeaſes of the braine, proceeding of a cold cauſe, as catarrhs, rheumes, and diſtillations, and alſo all cold griefes of the head, that are continuall; and the Palſie alſo, whether you take the decoction of the hearbe, or the powder thereof in Oxymel or *Rhodomell*; it like wiſe killeth the wormes of the belly. It being boyled in lye is very profitable for all thoſe diſeaſes of the head, to waſh it therewith, and beſides cleanſeth the head of ſcurffe, dandraffe, and ſuch other things as offend it, and killeth lice therein. The decoction of the hearbe openeth and cleanſeth the reynes, and urinary parts, cauſing abundance of urine, eſpecially in them whoſe urine was ſtopped before. The flowers are very profitably uſed in all thoſe bathings, that are applyed to the obſtructions, and cold griefes of the mother. *Fuchſius* ſaith he hath by good experience found it effectuall in the diſeaſes of the liver, which proceed from the bad contuſion therein, by reaſon of clammy humours, and thick vapours, that paſſe thorow the ſinnicles thereof: it is not without danger given to thoſe whoſe lungs are enflamed: but is eſpecially good for all rotten fowre, and ſalt flegme oppreſſing them. *Crato* ſaith that they of *Spaine* uſed the decoction of the Spaniſh ſort againſt the wind collick with good ſucceſſe.

Chap. XXIIII.

Lavendula. Lavender.

There are two ſorts of Lavender or Spike, that is a leſſer and a greater, of each whereof there are ſome diverſities, as ſhall be ſhewed.

1. *Lavendula major ſive vulgaris.* Garden Lavender.

Our ordinary Lavender riſeth up with a hard woodily ſtemme above the ground, parted into many ſmall branches, whereon are ſet whitiſh long and narrow leaves by couples, one againſt another, from among which ariſe up naked ſquare ſtalkes, with two leaves at a joynt, and at the toppes divers ſmall huskes ſtanding round about them, formed in long round heads or ſpikes with purple gaping flowers ſpringing out of each of them: the roote is woodily

woodily, and ſpreadeth in the ground: the whole plant is of a ſtrong ſweet ſcent, but the heads of flowers much more and more piercing the ſenſes, which are much uſed to be put into linnen and apparell. There is alſo a kinde hereof that beareth white flowers, and ſomewhat broader leaves, but it is very rare, and kept but with a few with us, being more tender, and not ſo able to endure our cold Winters.

2. *Lavendula minor ſive Spica.* Small Lavender or Spike.

The Spike or ſmall Lavender is very like unto the former, but groweth not ſo high, neither is the head or ſpike ſo long, but ſhorter and ſmaller, and the flowers of a deeper purpliſh blue colour: the leaves alſo are a little harder, whiter, and ſhorter than the former: the ſcent alſo is ſomewhat ſharper and ſtronger. This is nothing ſo frequent with us as the firſt, and is nurſed up but with few, that take delight in rare hearbes and plants, and kept in a warmer place.

3. *Lavendula minor flore albo.* Small white Lavender or Spike with a white flower.

This ſmall Lavender is in all things like unto the other ſmall Lavender, but that the whole plant is ſmaller, and the flowers are white, which maketh it to differ from the other.

4. *Lavendula folio multifido.* Jagged Lavender.

This ſmall Lavender riſeth up with ſquare rough and hoary branches, to the height of a foote and a halfe, bearing thereon many hoary whitiſh leaves, very much jagged or carne on the edges, into many parts unto the middle ribbe, and each part cut or jagged, of a ſharpe taſte, and a pleaſant ſcent, yet much weaker than in the other ſmall Lavender: from among which riſe foure-ſquare hoary ſtalkes, without any leaves on them unto the toppes, where they beare ſmall ſpikes of purple flowers, like unto the ſmall Lavender or Spike, but that the flowers ſeeme to ſtand ſquare, or in foure parts or corners: the roote is hard and woody like unto the other.

The Place.

The three firſt ſorts are found naturally in many places of *Spaine* and *Narbone* in *France*, where the other groweth, although both ſorts with white flowers, are much more rare, and ſeldome, and nurſed up as I ſaid with us in their Gardens that are curious. The laſt was found by *Cluſius* both about *Malaga* in *Spaine* and *Minerbe* in the Realme of *Granado*: it groweth alſo ſometimes in the gardens of thoſe that are curious of all rare hearbs and plants.

The Time.

Theſe all flower about the end of June, and beginning of July, and although *Cluſius* ſaith hee found the laſt about *Malaga* in flower in February, and in March about *Murcia*, yet it doth not flower in theſe colder Countries untill June at the ſoonеſt, or July.

The Names.

Lavender is called in Latine *Lavendula*, and *Lavandula*, and of ſome *Lavanda, quaſi lavatoria cauſa*, becauſe it was much uſed in waſhings. The ordinary great Lavender is called by *Matthiolus*, *Nardus Italica*, and *Aſpalathus*. *Tragus* calleth it *Spica Nardi Germanica*, but moſt other Authors *Lavendula major*; as they doe the ſmaller, *minor & famina*. *Dalechampius* upon *Pliny* would make it to bee *Caſſia alba*, as hee would alſo have *Rosmarinus* to be *Cunila mas*, and of ſome to be the *Iphion* of *Theophraſtus*. It is thought of many, to be the *Cinerem* that *Pliny* ſaith *Figones* called *Caſſa*, which were frequently planted in the gardens of *Italy* for their Bees to feed on, and was alſo uſed in garlands, as were *Rosa* in the *Coronaria* and *Eucolia*: maketh mention, before the time of *Pliny*, in theſe verſes.

Tum Caſſia, atque alia ſpirant ſua munera ſylvæ
Pinguia nec molli ſtillant unguenta cinnamo,
Ure ſub humentes quæ cortices, exſuperant ſudores, and
Non ullum pretio vincunt, non Africa tellus
Thuricremis odoribus, non Panchaia arbos
Floribus, irriguumque bibus balſama virentem.

1. *Lavendula major five vulgaris.* Garden Lavender.

Their alſo.

4. *Lavendula folio multifido.* Jagged Lavender.

Argoil.

Angelius in that point in that Lauender should be the *Cotonea alpina* of *Theophrastus*, and that Rolmary should be his *Cotonea maritima*, which I could more confidently affirme from the description of the parts, which are the properest like them; were that both sorts of *Cotonea* have double striated seedes, of a hard substance, which renders Lauender nor Rolmary fit for any vse, but the one sort of *Cotonea* hath a good scent, and the other a worse scent, although *Dioscorides* would pervert the word, to make the like to have a good scent, as well as the white, which also (contrary to those words of the text) doth not flower after the autumne quarter, which is a note of the like; and Rolmary, although it doe so, yet it flowreth but in the Spring: and lastly, that the roote of *Cotonea* doth not decay euery yeare, whereas neither Lauender nor Rolmary doe so. The learned Lauender vnder by *Dodon.* is to be the like, and others since his time, doe so entitle it likewise, yet, as I said before, the figure of the *Lauendula* in *Dioscor.* both old and new, is the true figure of this *Lauendula latifolia*, as *Bauhinus* calleth it, and therefore I marvaile that *Matthiolus* did not see, or would not take such an error, that I am sure could not escape him.

The Vertues.

Lauender is of a hot and dry quality, and is very good for all the griefes and paines of the head and braine, that proceed from a cold cause; as the Apoplexie, falling sicknesse, the drowsie or thicke sleeping, cramps, conuulsions and palsies; as also those that are giddie headed. It strengthneth the stomack, and helpeth the liuer and spleene from obstructions, prouoketh women sore in labour, and expelleth the dead child, and the secundine or after birth. The flowers of Lauender, (as some write) are good to make women that are troubled with the disease of cold fluxe of the matrice to be fruitfull thereunto. A decoction made with the flowers of Lauender, Rosemarie, Fennell, and Mayweed flowers, drunke (as Dodon. saith) very profitably vsed, doth helpe the sullen declining, and the giddinesse or turning of the head in sicknesse, if it be vsed in a bath with the decoction of the flowers, and the paines of the teeth. Two or three drops of the distilled water of the flowers taken, doth helpe those that have lost their speech or voyce, drawne at the nostrils. It resisteth all the corruptings and pollution of the aire, and the sweetnesse and fairenesse of the flowers, not onely drunke, but also applied to the temples, or bathe betweene the fingers, doth allay the sorrow, care, heauinesse of the body in frequent visitations and humours, it is not fit to vse it, because of the heate of the body, whose vse doth greatly resemble. The oyle of Lauender is much commended to all the diseases of the ioynts, sinewes, ligaments, cramps, conuulsions, dulnesse or dullnesse of the members, as also to the fingers full of cramps, the dullnesse or dullnesse of the ioynts, &c. for women to be bathed therewith, as also to helpe to weaken their trouble. The oyle chimically drawne from Lauender, which is vsually called oyle of spike, is of a sweet and pleasing vertue, that it is to be vsed with great respect, and but some few drops vsed with other things, either for inward or outward griefes.

Chap. XXX.

Rosmarinus. Rolmary.

THere was formerly but one sort of Rolmary knowne, but we have now more diversity, than hath been extant before, which shall be declared in this Chapter.

1. *Libanotis communis sive Rosmarinus vulgaris.* Ordinary Rolemary.

Our ordinary garden Rolemary is so well knowne I thinke, to all manner of persons being continually in their hands, that I shall scarse need to describe it, yet not to passe it over so slightly. It is well obserued in our owne Land in diuers places (as Noble mens gardens, &c.) where it hath stood long, as well as in the warmer parts of all places, that it groweth in time to a great height, with a great and woody stemme of a dole brime substance, and whereas (in to make instruments of, &c.) being cut into long thin boords for the purpose) it reacheth forth into diuery armes, and from them againe into many other smaller branches, at the ioynts whereof are set certaine diuisions, many long and very narrow leaves, greene aboue and grey vnderneath, and with them all all along the stalkes towards the toppes, diuers small gaping flowers, of a pale bleake bluish colour, standing in whitish husks: the seed is small and reddish, but seldome doth any that is sowne in our Country endure the hard Winter without extraordinary care, and therefore is vsually encreased by slipping: the whole plant doth smell exceeding sweet.

2. *Rosmarinus latifolius aureus*, Gilded Rolmary.

This Rolmary differeth not from the former in any thing but in the leaues, which are edged or striped, or painted with a faire gold yellow colour, which is continued all the yeare through out, yet fresher in Summer than in Winter.

3. *Rosmarinus latifolius.* Broad-leafed Rolemary.

This also groweth like the former, but wee have not seene it growne so great in our Country, nor with such woody branches, and is more tender to beare: the leaves are larger, and of a more deepe shining greene colour on the vpperside, and little or nothing whitish underneath, more thinly also and sparedly set on the stalkes: the flowers likewise differ not from the precedent.

4. *Rosmarinum flore duplici.* Double flowred Rosemary.

The double flowred Rosemary thus farre differeth from the former, that it hath longer ſtalkes while it is young then the laſt, ſo not fo eaſie to breake: larger alſo and larger leaves than the firſt, and the flowers double like as the Larkes heele or ſpurre: and all this information is but by information, not ſight.

5. *Rosmarinum ſilveſtre Matthioli.*
Matthiolus his wild Bohemian Roſmary.

5. *Lotus Rosmarinifol.*
Wilde ſweete Siberia Roſemary.

5. *Rosmarinum ſilveſtre Bohemicum Matthioli ſive Lotus Siberiacus Clus.* Wild ſweet Sileſia Roſmary.

This wilde ſweet Roſemary of *Sileſia* riſeth with woody ath coloured branches, two foote high or more, which ſhoote forth other branches of a purpliſh colour covered with a browniſh yellow hoarineſſe, on which are ſet many darke or ſadde greene leaves, like unto thoſe of Roſemary: but covered with the like hoarineſſe as the ſtalkes are, eſpecially on the naturall place, but not ſo much, being tranſpirated and folding their lides to cloſe together, that they ſeeme nothing but ribbes or ſtalkes, of no excellent pleaſant and ſweet ſcent: at the ends of the branches grow certaine browniſh ſcaly leaves, out of which ſpreadeth a tuft of many flowers, conſiſting of five white leaves a peece, with ten white chives or threads in the middle, and in ſome plants with ſixe leaves and 12. threads or chives, after which follow long and five ſquare heads, ſpotted with ſilver like white ſpots while they are greene, but grow browniſh when they are ripe, and turne downe their toppes, opening their husks, as the ſtalkes, left the ſeed which is as ſmall as duſt, ſhould ſuddenly fall out: the roote is woody with ſmall ſpraye.

6. *Rosmarinum ſilveſtre inodorum.* Vnſavory wild Roſmary.

Becauſe this plant doth ſo nearely reſemble Roſmary, I have thought it meete to ioyne it with the reſt, although it is not ſweet like them: it groweth above a foote high, having divers reddiſh branches which divide themſelves into another order of a whitiſh colour, ſet confuſedly with long and narrow leaves, greene on the upper ſide, and hoary underneath, like thoſe of the dwarfe willow, of no pleaſant ſcent at all, but of an aſtringent taſte: at the ends of the branches ſtand divers heads, compoſed of many ſhort leaves, out of which thruſt forth ſundry flowers, ſtanding on long foote ſtalkes made of five leaves a peece, of a fine delayed reddiſh, or fleſh colour, after which riſe ſhort five ſquare heads with blunt points, containing ſmall pale coloured ſeed.

7. *Rosmarinum ſilveſtre minus noſtras.* Our wild Roſmary.

Our wilde Beedy Country Roſmary groweth not ſo high, with ſmaller leaves, nothing ſo great and long as Roſmary leaves, but thicker and ſhorter, of a darke greene ſhining colour above, and ſomewhat yelliſh greene underneath, ſet very ſparſedly and very tender and plaine blackiſh greene twiggie, at the toppes whereof grow the flowers, and out of thoſe heads as in the former, as farre as I could perceive by thoſe plants, that were ſent me and others out of *Lancaſhire*, of a reddiſh colour: the whole plant hath as little ſcent as the laſt, which is none at all that I could perceive.

1. *Rosmarinus latifolius vulgaris.*
Vulgare male floribus.

2. *Rosmarinum foliis thymi angustis.*
Our wilde Rosmary.

The Place and Time.

The ordinary Rosemary groweth in *Spaine* abundantly neare the Sea side, the scent whereof is many times felt by those in the Spanish fleet that passe by many leagues off from the Land, in *Languedoc* also in *France*, and divers other hote countries, but will not abide (unlesse kept in howses) the Winter in divers places of *Germany*, *Denmarke*, and thereabout. Verie many in number; the first in *Silesia*, *Bohemia*, and the parts there about; the last in the same places with the 4th, but also in divers places of *Lancashire*, and *Yorkshire*, bordering there. The first flowreth in April and May with us, and sometimes in August againe, the others not untill August.

The Names.

It is called not vnfitly *Libanotis*, or *coronaria*. *Stephanomelissa* is added thereunto, to distinguish it from the other *Melissophylla*, that are umbelleferous plants; in Latine *Rosmarinus* & *Rosmarinus mas*, *Rosmarinus*, *Cedar* or *Cypresse tree*, called in *Libanotis Coronaria* according to the Greeke: *Matthiolus* on *Dios.* taketh it to be the *Conyza* of *Theophrastus*, and *Anguillara* to bee the *Cedia* of *Hyginus* acceptable to Bees, and therefore (saith he) are their hives, as also those the *Conyza nigra* of *Theophrastus*, and I consider to be his *Album*, but *Matthiolus* hath confused matters (as is shewed in the Chapter before) for as *Bauhinus* noteth it, would make it to bee the Hebrewes *Hadsopi*, a thing Hillop differed from the Hillops of all other Nations, but without true judgement. *Cordus* in his *Scholia* calleth the first *Rosmarinus minor sive vulgaris*, as he doth the third *Rosmarinus sylvestris*, and *Camerarius* *Rosmarinus sylvestris*. *Fuchsius* the first is called *Rosmarinum vulgare* & *Rosmarinus*, by *Matthiolus* *Rosmarinus hortensis*, by *Dodonæus* in his Dutch Herball, *Ledum Solisburum* by *Clusius*; *Ledum folijs rosmarini oblongum* by *Lobel*, and *Chamæpeuce* by *Cordus* on *Dioscorides*, and in his History else because the narrow long leaves being folded together, do represent the Pine or Pitch tree leaves. The first is called by *Clusius* as it is in the old title, but is not remembred by any before. The Arabians call it *Elkagabar*, the Italians *Rosmarino*, the Spaniards *Romero*, the French *Romarin*, the Germanes *Rosscosarin*, the Dutch *Rosmarijn*, and we in English Rosmary.

The Vertues.

Rosmary is an herbe of as great use with us in these dayes, as any other whatsoever, not only for Physicall, but civill purposes; the civill uses as all know, are at Weddings, Funerals, &c. to bestow upon friends: the Physicall remedies both for inward and outward diseases are many and worthy, for by the warming and comforting heate thereof is helped all cold diseases, both of the head, stomack, liver, and belly: the decoction thereof in wine helpeth the cold distillations of the braine into the eyes, &c. and all other cold diseases of the head and braines, as the giddinesse or swimming thereof, drowsinesse, or dulnesse of the minde and senses like a stupidnesse, the dumbe palsie, or losse of speech, the lethargie and falling sickenesse, to be both drunke, and the temples bathed therewith: it helpeth the paines in the gummes & teeth by the same falling into them, or by putrefaction causing an evill breath from them, or a stinking breath: it helpeth also a weake memory by heating and drying up the cold moistures of the braines, and quickning the senses: it is likewise very comfortable to the Stomack in all the cold griefes thereof, and to stay the provocation to casting, easing the stomack the better to containe and to digest the meate, either the decoction or powder taken in wine: it is a remedy for the windinesse in the stomacke or bowels, and expelleth it powre-

Original from UNIVERSITY OF MICHIGAN

powerfully to attenuate tough and tenacious phlegm, and winde it out of the Lungs: it openeth the obstructions of the Liver, by warming the coldness, evacuateth the grossness and afterwards binding and strengthening the weakness thereof: it helpeth the Jaundice, and to procure a cleare light, if all the whole herb or flowers be taken of the flowers falling with bread and fair water, Primrose and water Lily, that the decoction be made thereof with water, and then they have the yellow Jaundice, doe cease, their bodies presently after the taking thereof, it will cleanse the eyes, the flowers and the conserve made of them, is singular good to comfort the heart and to expell the contagion of the pestilence, to burne the hearbe to Ashes and Cinders in the time of the infection, to correct the aire in many places: the flowers and the leaves are very profitable for women that are troubled with the whites, if they be daily eaten: the dried leaves dried (until) and taken in a pipe like as Tobacco is taken, helpeth those that have any cough or Phthisick, consumption, or wasting and drying the inward parts, whether it came by diseases of the head and breast, spoken of before, as also to those that have diseases of the cause requireth for the inward parts, yet must it be taken with discretion, least it doe more harme than good, for it is very quick and piercing, and therefore but a little must be taken at once. There is another profitable use made by tobacconists in this manner: take what quantity you will of the flowers, and put them into a strong glasse close stopped, and digest them in hot Horse dung for 14. dayes, which then being taken forth and unstopped, put a pipe into the mouth, and close the mouth close into another strong glasse, which being set in the Sunne, all will distill down into the lower glasse, and be preserved as precious for divers uses, both inward and outward, and as a soveraigne Balme to heale the diseases before spoken of, to cleare a dimme sight, and to take away spots, markes and scarres in the skin. The distillary of *Violets* is by often experience found to bee good for the drunken, or the *Violet* leaves, for the patient to use often in the decoction thereof, and to bathe the affected parts.

Chap. XXVI.

Leucoium Alpinum hoc Rosa Alpina. The sweet Mountaine Rose.

1. *Leucoium Alpinum hoc Rosa Alpina.*
The sweet Mountaine Rose.

Because both *Clusius* and others, referre this plant for the sweetnesse thereof, to the family of the *Cytisi Leguminosi*, as he and the rest in the foregoing Chapter, and called it *Anthyllis*, neither of which I dare doe, not thinking them (although sweet) to belong thereunto, else I had not placed them here, but with the other form of *Lotus*, I thinke it meet to speake hereof among the flower heads, whose description is thus: with sundry slender and thicke, a foot long or thereabouts, lying for the most part on the ground, covered with an whitish coloured barke, at the ends whereof are set without order many hard leaves, like unto those of the Italian dwarfe Bay of a shining greene colour on the upperside, and paler underneath, sometimes pointed, and sometimes round at the ends, and soft withall hairy about the edges as the young tops are likewise, of an whitish green colour, at the ends of the branches breake forth a tuft of halfe blowne flowers like Bells hanging downe their heads, and divided at the mouthes into five parts, of a deepe red colour on the outside, set naked with many silver-like spots, as the flakes of them are also, but of a paler red colour on the inside with divers threads in the middle, and of a pretty sweet scent, after which come five parted heads, containing within them very small brownish seed like dust, which being rubbed while they are greene, doe stay bleeding where that they offend the fingers: but *Lobel* saith his branches red berries like Asparagus, which *Clusius* saith his doth not, the roote is long, hard, and woody, the branches doe often take roote as they lye on the ground, and abide greene all the Winter. There is another of this kinde as *Clusius* saith he observed, that had fewer, but greater leaves, harder and longer pointed, not hairy on the edges, and of a more sad darke reddy colour underneath, and the flowers more elle covering, a pinke to six inches & the leaves sometimes are found serrate (small cuttednesses or knots, like Vetch, or sometimes plaine) as well Nine, rugged or not even on the edges, (either) of a reddish or sometimes paler colour and of a sweet scent, whereof I have one in pale, which supplieth the place of gilla.

Their Place and Time.

Both these flowers are found on the slopes and on the declining of hilly Fields in *Germany* and *Austria* among the stones, as *Clusius* saith, and on the Hills neare *Trent* and *Verona*, as *Lobel* saith. They flower in June and July, their seed is ripe in the end of August.

The Names.

These plants being lately found and made known to us, have received sundry names, as every one in his opinion

on thoughe ſtreſt, *Kluſius Aldero andus* calleth it *Nerium Alpinum*, *Geſner* and *Camerarius* in horto, *Baſilicum Alpinum*, and ſo doth *Lobel* alſo, who alſo calleth it *Chamærhododendros Alpina minor*, as hee doth the other ſort hereof *Chamælea folio, ſive hirſuti folia minus odora*: *Cluſius Ledum Alpinum*: *Lobelius Rhododendros Alpina quibuſdam*. *Geſner* himſelfe calleth it in his Booke *de lunaria*, *Nerium Alpinum*, *in horto Germanis*, and in *Deſcriptione montis fraſſi*, *Roſa Alpina* from the vulgar, who call it *Alproſen* and *Bergroſen*, he maketh it alſo in the Chapter of *Chamærium*, to be his third ſort. *Lugdunenſes* would referre it to the *Eoonimus* of *Theophraſt*, but *Cluſius* ſheweth the error of that opinion: but it is very likely that *Lobel* his, differeth from this of *Cluſius*, as I ſhall ſhew you in the Chapter of Bayes.

The Vertues.

Cluſius ſaith he could not underſtand, of any other uſe that this plant might be put unto, then that the Diers there, uſed the ſmall galles that grow ouer, to dye a black colour like unto other galles.

Chap. XXVII.

Coſtus hortenſis major, Coſtmary. And *Coſtus hortenſis minor ſeu Ageratum*, Maudeline.

I Muſt joyne both theſe ſweet herbes together, both for the likeneſſe of their flower, and neereneſſe of their names: of the former there is but one ſort, but of the other there are divers, whereof I doe intend to ſhew you the knowledge in this place.

1. *Coſtus hortenſis major*. Coſtmary or Alecoaſt.

Coſtmary or Alecoaſt hath many broad and long pale green leaves, dented or nipped about the edges, every one upon a long foot-ſtalke, among which riſe up many round greene ſtalkes, with ſuch like leaves thereon, but leſſer up to the toppe, where it ſpreadeth into three or foure branches, every one bearing an umbell or tuft of gold yellow flowers, ſomewhat like unto Tanſie flowers, but leſſer, which afterwards are the heads containing ſmall flat long ſeed: the roote is ſome, what hard and ſtringie, which being divided with the heads of leaves, may bee replanted in the ſpring for increaſe.

2. *Ageratum vulgare ſive Coſtus hortenſis minor*, Common Maudeline.

Common Maudeline hath ſomewhat long and narrow leaves ſnipt about the edges, the ſtalkes are two foote high, bearing at the toppes many yellow flowers ſet round together, and all of an equall height, in umbels or tufts like unto Tanſie, after which followeth ſmall whitiſh ſeed, almoſt as great as Wormſeed: the whole hearbe is ſweet and bitter, being as well gained by ſlipping as ſowing.

3. *Ageratum flore albo*, White Maudeline.

This Maudeline hath woodly ſtalkes, and many ſmall leaves thereon like the other, but ſomewhat ſmaller and leſſe dented or notched in on the edges, at the toppes of the ſtalkes grow many flowers, as it were in a tuft together, like unto the common Maudeline, but wholly white, except a little ſhew of yellow in the middle: the ſcent of the whole plant is not ſo ſtrong as the other, the roote is ſmall and ſtringie like the other alſo.

4. *Ageratum minus*, Small Maudeline.

This other ſmall Maudeline hath divers hoary ſtalkes, not riſing much above a foote high, beſet as thick with leaves as the former or fuller, upon all ſides of the ſtalkes, which are ſmaller, longer, narrower, and whiter than the other, and not dented at all about the edges, ſomewhat like unto the leaves of yellow or golden Caſtidony, here before deſcribed: at the toppes of the ſtalkes ſtand many yellow flowers, thicke thruſt together, in an umbell or tuft, very well reſembling the firſt or common garden Maudeline, of a reaſonable good and quicke ſcent, which turne into downe, and is carryed away with the winde, the roote is ſmall and white with many fibres annexed unto it.

5. *Ageratum purpureum*. Purple ſweete Maudeline.

This rare and dainty plant hath many ſmall leaves lying upon the ground, round about the toppe of the roote, ſomewhat like unto the leaves of the firſt Maudeline, here ſet forth, nicked on the edges towards the points of them, and not backwards, ſomewhat bitter in taſte, yet not ſo much as the common, from among the leaves ariſe many ſmall ſtalkes, beſet with ſuch like leaves as grow below, but ſomewhat ſmaller unto the very toppes, where many flowers ſtand one above another, every one upon a ſhort foot-ſtalke, conſiſting of five ſmall greene leaves, of an excellent violet-like purple colour, comming forth of ſmall greene huſkes, of ſo excellent a dainty ſweet ſcent, that it paſſeth the Violet in ſcent, and to be compared with Muske: after the flowers are paſt, there ariſe ſmall long ſeed veſſels, bearing ſmall ſeed therein: the roote is yellow, ſmall and ſhort, buſhing forth many ſmall fibres, whereby it taketh faſt hold of the ground.

6. *Age-*

4. *Ageratum vulgare sive Costus hortorum.*
Common Maudelion.

4. *Ageratum altum.*
Stout Maudelion.

5. *Ageratum purpureum.*
Purple sweet Maudelion.

6. *Ageratum Fœniculum.*
Fennell leaved Amaranthus.

6. *Fœniculum Foeniculaceum.* Fennell leafed Madeline.

This herbe is to be joyned with the Mandelines, for that the flowers decay not being gathered, and kept for a long time. It hath many Fennell like leaves lying upon the ground, round about the roote, which shooteth forth divers ranked or cornered stalkes, a foote and a halfe high, whereon doe grow at certaine distances, on each side two above another such like leaves compassing the stalke at the foote of them as Fennell doth: at the toppes of the stalkes stand large umbels of flowers, some of the stalkes rising lower then others, yet all making a round compassed tuft of yellow flowers very like unto the flowers of Corundell for the forme, but of a more excellent gold yellow colour, which being gathered before they grow to full maturity, will abide a long time in their perfect beauty, whereby it hath gained the name, and to be joyned with them: the roote is somewhat long, blacke and woodily, rugged also, and thicke wrinched with divers fibres growing to it.

The place.

The first three sorts have beene found naturall in divers rough untilled places of *Tuscane* in *Italy*, and *Narbone* in *France*, but in gardens onely with us. The fourth groweth on dry grounds, and often out of old mud and stone walles. The fift groweth upon the rockes in cliffs, where it hath but a small crust of earth upon it, the roote growing fourth into the chinkes, and moistned onely by the vapours of some waters, falling neare it, or the dew and moisture from the rocke. The last groweth in dry and hungry grounds, and among the Pine trees in woods.

The time.

They flower all flowers in June and July in moist places where they are planted and prosper.

The Names.

Coalmary or Alecoal in English, is called in Latine by some *Caltha hortensis major*, and by others *Buphthalmum*, *Anthos Orvale*, *Anthos Romana*, *Chrysanthemum Corymbifera major*, *Millefolium Sacrocon*, *Orvale* by other writers, *Herba Mariæ*, by *Dodonæus*, and *Leucoium* by others as the Italians doe, the Romanes *Fœnum monile*, the French *Coq & Poulet*, as the Dutch doe *Patronie*. The *Agrimonie* called ἐυπατόριον in Greeke, *Eupatorium*, or *Eupatorium non lactucæ*, because it (about the flowers gathered in a fit time) were not old or decay by age: *Matthiolus*, *Cæsalpinus*, *Lobelius*, *Columna*, *Tragus*, *Lugdunensis*, *Camerarius*, and *Tabernæmontanus* doe call it *Agrimonia*, *Dodonæus Bubonium*, *Cæsalpinus Caucalis tertia*, and *Caucalis hortensis minor* by *Lobelius*, *Mentha sylvestris minor* by *Cordus*, by *Cæsalpinus Conyza*, *Herba Isidis* by *Anguillara*, *Cotula odorata hortensis*, *Germanis* and *Lugdunensibus Melissa* by *Tragus*, *Cotula hortensis*, *Matricalis* and *Leucoium*, in briefe most of the best later Writers, judge it to be the true *Agrimonia* of *Dioscorides*, although some would disprove it: and likewise the true *Eupatorium* of *Avicen*, although *Rasis* denyeth both the one and the other. But the *Eupatorium* of *Actius* and *Serapio* (with him) differ not, and what *Actius* and *Serapio* are both of them but one plant, even the *Centory Septentrionall*, but *Matthiolus* hath answered both these objections in my judgement sufficiently, in these words to *Serapio*, *Marinus*, as nothing can be better. And to conclude with them, they are no Practisioners in Physicke, that shall deny the *Eupatorium* of *Dioscorides*, to be the *Agrimonie* of *Dodonæus*. The second *Agrimonie* with white flowers, is the second *Agrimonia* with *Matthiolus* and *Lugdunensis*, and called *Agrimonia floribus candidis* by *Lobel*, *Tabernæmontanus* and *Camerarius*: the third is the third *Agrimonia* with *Matthiolus* and *Lugdunensis*, and called *Agrimonia minor* by *Lobel*, *Camerarius*, and *Tabernæmontanus*, and *Eupatorium folijs serratis*: the fourth is the *Eupatorium peregrinum* of *Lugdunensis*, which is a very long Germane called *Artemisella Germanica*, yet is not the *Cotula Pharaonis* of *Cordus*, *Bauhinus* calleth it *Artemisia peregrina Alpini*: the last is called by *Lugdunensis Agrimonia Pyrenæa*, but *Bauhinus* referreth it to the *Artemisia montana Anthemidis* or *Matricariæ folio* of *Lobel*, to the *Artemisia montana* of the same *Lugdunensis* and *Tabernæmontanus*, and to the *Chrysanthemum Alpinum flore dilutè luteo* (but in my opinion it is not that *Chrysanthemum* of *Clusius*, for we have had it growing in our gardens from the seed, but as by the name of *Chrysanthemum montanum flore luteo*) and therefore her fourelife calleth it *Chrysanthemum Alpinum flore citrino magno*.

The Vertues.

The ordinary Coalmary as well as Mandeline (as some of the other are) are of the same quality, peculiar to their shamefastnesse, & mollifieth the hardnes of the mother. *Galen* saith it is hot in the first degree, & dry in the second, that it digesteth, and also a little cooleth, it helpeth inflamations, it gently purgeth choler and the gorge, that it expelleth: that which is grosse it cutteth and diviedeth, that which is tough and glutinous it resolveth: that which is toxic, and hindereth putrefaction or corruption, it dissolveth without astriction, openeth stoppings, and healeth both evill affects, and is a wonderfull helpe to all sorts of day agues. It is stringent to the stomack, and strengthneth the liver, and all the other inward parts, and taken in victuall it worketh the more effectually. Taken fasting in the morning, it is very profitable for the paines in the head, that are continuall, and to dry up, and consume all thin distillations or rheumes from the head into the stomack, and helpeth much to digest raw humours that are gathered therein. It is very profitably applyed to those that are fallen into a continuall evill disposition of the whole body, called *Cachexia*, taken especially in the beginning of the disease. In briefe it is an especiall friend and helpe to evill, weake, and cold livers. The seed is familiarly given to children for the wormes, and so is the infusion of the flowers of white Wine, and given to them to the quantity of two ounces at a time. It maketh an excellent salve to cleanse and scale old sores, being boyled with Oyle olive and Adders tongue with it, and after it is strained, to put a little Wax, Rosen, and Turpentine, to bring it into a convenient body.

Chap. XXVIII.

Tanacetum. Tanfie.

There are two sorts of Garden Tanfies, whereof the one is called ordinary or common Tanfie, and the other curled or double Tanfie: but there are some others also to be spoken of here in this Chapter.

1. *Tanacetum vulgare & crispum.* Ordinary and curled Tanfie.

Our garden Tanfie hath many hard greene leaves, or rather wings of leaves, for (although they be

two

1. *Tanacetum vulgare.* Ordinary wilde Tanfie.

rowe forte, yet the deſcription may ſerve them both) they are many ſmall ones ſet one againſt another all along a middle ribbe or ſtalke, and ſtande about the edges, in one ſort the leaves ſtand thicke and the lacs, and ſomewhat crumpled, which hath cauſed it to be called double or wilde Tanfie; in the other ſort thinner and more orderly ſet: it ſheweth up with many hard ſtalkes, whereon grow at the toppes of the branches gold yellow flowers like buttons, which being gathered in their prime, will hold their freſh colour a long ſeaſon: the ſeed is ſmall, and as it were chaffie: the roote creepeth under ground, and ſhooteth up againe in divers places: the whole heardbe both leaves and flowers are of a ſtrong bitter, ſmell and taſte, but yet pleaſant and well taſte endured.

2. *Tanacetum vſuale.* Party coloured Tanfie.

The party coloured Tanfie is in roote, leafe and flower, altogether like the other common garden Tanfie, the onely difference betweene them conſiſteth in this, that upon the firſt ſhooting up of the heads of leaves, they are almoſt all white, and after they are grown to great, there will ſtill many leaves, remaining white, among the greene, which maketh it the more delightfull, ſeeming like unto a party coloured Feather, in regard of the fine cut leaves of white and greene.

3. *Tanacetum bipennatum.* Woolly Tanfie.

Woolly Tanfie from a thick blackiſh ſpreading roote, ſendeth forth divers winged leaves, ſomewhat like unto the former Tanfie and more unto the leaves of Yarrow, (whereof ſome would make a ſalade) of a very fweet ſcent, and withall very woolly, ſet cloſe together about the roote, among which ſpring up divers woolly ſtalkes, having a few ſuch like leaves upon them, and at the toppes many tufts of yellow flowers.

4. *Tanacetum minus, floreſcens.* Small white Tanfie.

Small white Tanfie hath divers winged leaves lying upon the ground, round about the toppes of the roote, very much cut or divided into parts, ſomewhat reſembling both Tanfie and Yarrow, of a pale greene colour, being both leſſe bitter in taſte, and leſſe hot, or ſtrong in ſmell than Tanfie; from among which leaves riſe divers low ſtalkes, beſet with ſmaller leaves up to the toppes, where the flowers ſtand in tufts, the borders being of a white colour, and the middle thrum yellow; the roote is long and woody, ſhooting divers wayes.

5. *Tanacetum Alpinum.* Mountaine Tanfie.

The Mountaine Tanfie hath many winged leaves lying upon the ground, compaſſing the toppes of the roote, very like unto the ordinary Tanfie, in the diviſion of the leaves, and of a deepe greene colour, ſomewhat in taſte, but more pleaſant in ſome than it: from whence riſe up the ſtalkes, little above a foote high, here and there beſet with the like leaves, but ſmaller; the flowers at the toppes are like unto Camomill flowers, with a border of pale of white leaves, and a yellow thrumme in the middle: the roote is ſmall and fibrous, ſomewhat thicke at the head, and ſmaller downewards, with divers ſmall fibres thereat.

6. *Tanacetum vnedorum.* Vnſavory Tanfie.

Vnſavory Tanfie hath his large winged leaves, very neere reſembling Tanfie, lying upon the ground, and among them ſound hard greene ſtalkes, with very few and ſhorter leaves thereon, at the toppes whereof ſtand divers flowers upon ſhort foote-ſtalkes, very like unto the flowers of the great white Daiſy, and as large, conſiſting of fourteene or fifteene leaves, as a pale or border, about a yellow thrumme in the middle: the roote ſpreadeth under the upper part of the earth, and goeth not farre downe: the whole is altogether without any ſtrong ſmell or taſte at all, yet the leaves are of a hot and ſharpe taſte, quickly piercing the tongue.

There is another of this kinde of vnſavory Tanfie, whoſe leaves are more looſely ſpread, although as much divided, and the flowers being white, are as ſmall as Feverfew.

The Place.

The ordinary Tanfie groweth in Lane places beyond ſea by the hedges and ditches ſides, and in the borders of fields, the wilde Tanfie is peculiar to our owne Land, and ſo is the ſecond, and likely to have degeneration from the ordinary: the ſeventh accompteth it naturall to moſt parts of his Country, where the ſhips doe often lodge, and ſometimes keepe their ſtalle. The third is found in the high *Pyrenæi* in *France*, and in other places. The fourth groweth as well in *Germany* as *France*, in ſundry places. The fifth groweth on the high and mowy Hilles of the Alpes, among the Switzers. The ſixt groweth about *Montpelier*, and about *Valentia*, and in the Country of *Dauphine* in *France*.

The Time.

They flower all in the middle Moneths of June and July.

The Names.

The Greeke called *Athanaſia*, is ſuppoſed to be taken, as *Pauline* thinketh, from *Tanacetum*, or *Athanaſia*, his *Athanaſia tenuifolia*, and *Athanaſia* with a greater number of leaves, or *non vulgaris*, he gave the yellow flowers growing in Gardens, ſet out of a long time after, like as divers of the other heards that are remembred. *Tabermon-*

tanus

1. *Tanacetum lanuginosum.* Woolly Tanſie.

4. *Tanacetum album flore albo.* Small white Tanſie.

5. *Tanacetum Alpinum.* Mountaine Tanſie.

6. *Tanacetum vulgare.* Vulgary Tanſie.

ſcene calleth the ordinary Tanſie, *Artemiſia Dioſcoridis*, and the double Tanſie *Artemiſia ſativa flore*. The ſecond hath no other name then is in the title, except that ſome doe call it white Tanſie, becauſe many of the leaves will bee white. The third is called *Tanacetum Lanuginoſum* of *Lugdunenſis*; *Lobelius* in his *Icones* would referre it to the *Stoechades Millefolia flavo flore* of *Cluſius*, and *Millefolium luteum* of *Lobel*, but I thinke he is therein miſtaken, for the leaves of *Stoechas* being much ſmaller, and having no ſcent declare it to. It may be alſo the *Helichryſum Italicum* of *Matthiolus*, but not any *Achillea*, whoſe deſcriptions yee ſhall have in another part hereafter. The fourth is called by *Dodonæus Tanacetum minus flore albo*, of *Lobel Tanacetum minus candido floribus*: (but it is not likely to be the *Achillea* of *Matthiolus*, *Caſpar Bauhinus* and others, who follow the deſcription of *Dioſcorides* and *Matthiolus*, the flowers of whoſe *Achillea* are of a whitiſh purple, with ſome yellow ſpots in them) for that it hath both the forme and the ſmell of Tanſie, but ſomewhat weaker. The fifth by *Lugdunenſes* is called *Tanacetum vernum Alpinum*, and ſuch that the people in the Mountaines where it groweth, call it *Herba Aſtronis*, and ſome *Anthemis Alpina Cæſalpino* in hee, calleth it *Tanacetum caruæ herbulæ*, in Engliſh Mountaine Tanſie. The two laſt are called *Tanacetum ſideritis* of moſt, yet ſome doe adde *Bellidis, majoris flore*, and ſome *Bellis Tanaceti folio*: ſome have thought it to bee *Sideritis Italorum*, but *Pena* contradicteth it. *Cluſius* ſhoweth the differences of the greater and the leſſer. Wee call it in Engliſh according to the Latine, Vnlavory Tanſie, and place it here among the reſt of the ſweet Tanſies, for the names ſake, rayſed from the likeneſſe of the leaves, although it hath no ſcent. The Italians call it *Tanaceto*, and *Daneda*: the French *Tanaiſie*, and *Athanaſie*: the Germanes *Reinfaren*, becauſe the leaves reſemble Feene, and the Dutch thereafter *Reinvaer*, wee in Engliſh Tanſie.

The

Original from UNIVERSITY OF MICHIGAN

The decoction of the common Tansie, and some of the tell runneage in shell thereof, or the juyce drunke in wine, is a singuler remedy to all the greefes of the wame, to provoke it being stopped, to help those that have the strangury, and have weake reines and kidneies, and that cannot make their water but by drops. It is also very profitable to dissolve and expell winde, whether in the stomach, belly, or bowels, and to procure women monethly courses, and easeth the windinesse in the mother. It is commonly and usually vsed in this manner, as also applyed to the lower part of the belly, it is likewise found to be profitable to such women as are given to saffronesse in childbearing, to cause them goe out their full time, without danger or losse, it eateth also against the stone in the reines and gravell in the bladder, & gently prouoketh vrine. It is much vsed both in Lent and in the beginning of the Spring, while the hearbe is young and tender, to make cakes thereof with egges fried, which are called Tansies, and are very profitable for such stomackes, that are troubled with bad humours, leaving them more hote to digest them, and by clearing the stomack of them, to carry them away downeward. The iuyce much commended and very profitable given to children for the wormes, and the juyce mixeable in a clisterpipe being boyled in oyle, it is very profitable against the wormes that are in the fundament by crampes, or are in some through cold: It is said also, that the roote preserued in Sugar, is a remedy for them that have the gowt, if they take the roote fasting for a certaine time together.

Chap. XXIX.

Matricaria. Featherfew.

Matricaria, Feuerfew, for so Featherfew is to be entreated of here, as shall hereafter follow.

1. *Matricaria vulgaris simplex.* Common Featherfew.

Common Featherfew hath many large fresh greene leaues, very much nicke or cut on the edges: the stalkes are hard and round, set with many such like leaues, but somewhat smaller, and at the toppes stand many single flowers, vpon leuer all small foot-stalkes, consisting of many small white leaues, standing round about a yellow thrumme in the middle: the roote is somewhat hard and short, with many strong fibres at it: the sent of the whole plant is very strong and stinking, and the taste very bitter.

2. *Matricaria flore pleno.* Double Featherfew.

This differeth very little from the former but in the flowers, which are very thicke and double, with white leaues, so that onely a little yellow spot is to be seene in the middle.

1. *Matricaria vulgaris simplex.* 2. *Florepleno.*
Common Featherfew. Double Featherfew.

3. *Matricaria minor foribus nudis.* Naked Featherfew.

This kinde differeth not from the former, but that it hath lesse flowers, & scarcely any of the pale or border of white leaues about them, and therefore being naked, and without those leaues, I have named it naked Featherfew, as an especiall difference from the former.

4. *Matricaria odorata.* Sweet Featherfew.

This other Featherfew differeth not from the rest, either in stalke, leafe, or flower, being in all things so like, that there cannot be discerned any difference betweene them, vntill you smell thereunto, and then it is found to be of a more pleasant sauer smell, which is stedfast in the kind, and is not to be chaunged by art, or degenerated by any casualty, but the worke of nature onely.

5. *Matricaria tenuifolia.* Vnlavory Featherfew.

The Vnlavory Featherfew is a small low plant, rather spreading than rising high from many branches, whereon are many leaues set, here and there without order, every one being smaller, shorter and thicker than the leaues of the common Featherfew, but cut in deeper sides, somewhat like vnto Rue, of no smell at all: the flowers are white with a yellow thrumme in the middle like the rest, which have a certaine heate still resting, but very weake: the roote is lothy like the former.

6. *Matricaria flos Pyrethri tenuifolius.* Fine-leafed Featherfew.

The Pyrethrum hath fine leaues below, rising from the roote, of a little reddish colour, from whence rise vp diuers stalkes, but not so high as the common Featherfew, and leaues withall, that it might be taken for a seuerall kinde: at the toppes of the stalkes stand yellow flowers, consisting of many small leaues, set in the middle of a yellow pricke or thrumme, which fall away, and leaue behind them small yellowish seede, wherein it differeth from the Matricaria, which hath white seede: the whole plant is of a strong sauer, and the taste very bitter, which quickly dieth, and perisheth in the winter.

7. *Matricaria*

1 Matricaria sive Parthenium Alpinum Clusij. Mountaine Featherfew.
2 Matricaria marina minimum. Small Sea Featherfew.

1. *Matricaria sive Parthenium Alpinum Clusij.* Mountaine Featherfew of Clusius.

Mountaine Featherfew hath many slender weake greene branches trayling on the ground, and taking roote as they creepe thereon, very like unto Camomill, and not rising above a foote high, about which are set many leaves, almost as fine as Camomill, but cut in after the manner of Mayweed or Featherfew, and very neere of the same smell as Featherfew, being of a hot taste, but not unpleasant: at the toppes of the stalkes stand many flowers together, very like unto the former, but that the middle thrumme is smaller and paler, and the circling leaves not altogether so white, but as large, and somewhat rounder or closer set, of the same scent with the herbe: the roote is composed of many small fibres growing downe from a small head.

2. *Parthenium marinum minimum.* Small Sea Featherfew.

I have thought fit to place this Sea plant, with the rest of the same sort, as I meane to doe with as many as will abide the culture and manuring, to prosper in this garden, intending to shew you the rest in their convenient places. The roote is small spreading abroad many long fibres, from whence rise up slender weake branches lying upon the ground, diversly set without order, with many small whitish greene leaves cut in or dented on the edges, very like in forme, unto the leaves of the great white Dittie, but much lesser and more full and fleshy, or thicker, of a strong fearne scent, somewhat like unto Featherfew, or rather unto stinking Mathes or Mayweed: at the toppe of every branch stand one or two flowers somewhat like unto those of Featherfew or Mayweed, but smaller, and the bordering leaves also smaller, having a whitish greene head or huske of leaves under them.

The Place.

The first is found wilde in some places of this Land, as well as in others, yet for the most part it is nourished in gardens as well as the second, which as *Clusius* thinketh, is peculiar to us: the third grew in *Egypt*, and was there found by a Gentleman called Master *William Cor*. The fourth grew in an Iland called *Ilva* in the Tuscan Sea, as *Camerarius* saith, but it hath beene found wild in our owne Country, as it hath beene affirmed unto mee, as well as the other naked kinde. The fift groweth in *Egypt*, as *Prosper Alpinus* saith, and is onely naturall to that Country. The sixth was found in *Spaine*, by *Alpinus* a learned Physitian of *Barcinone*, and sent to *Melchior Wieland* who compiled the great Herball called *Lugdunense*. The seventh *Clusius* found upon the Mountaines of *Styria*, which is a part of the Alpes. The last *Pena* saith grew plentifully neere the Fishermens Cottages, at the foote of *Mons Pelerinus* in *Narbone* in *France*.

The Time.

They all flower in June and July, but the Sea plant is the latest.

The Names.

It is called in Greeke [illegible]. *Parthenium quasi virginale quid malierum morbis utentibus, & inde nata Matricaria.* It is called also *Febrifuga*, from whence I thinke our English name Featherfew, or Feaverfew is derived, it being good to expell feavers or agues. It is held by most of the later Writers to be the true *Parthenium* of *Dioscorides*, yet *Lacuna* and *Pena* (even as *Brasavolus* and *Fuchsius* before them, whom *Matthiolus* doth confute) by many reasons observed, doe prove that both the face or forme of the leaves, compared by *Dioscorides* to Coriander but lesser, as also the properties given to *Parthenium*, can by no meanes be found in this *Matricaria*: but may all most truely and plainely be found in *Cotula fœtida*, or stinking Mayweed: the discourse is too long here to recite, I therefore referre you to the place where you may read it at large, in the description of *Parthenium* in their *Adversaria*, as also in *Parthenonis* in the Chapter of *Matricaria*. *Parthenium*, as *Gesner* saith was called in his time, *Anthemis*, *Heliotis*, *Leucoïum* and *Amaracus*; and *Tragus* affirmeth, that *Heliotis* was called *Perdicium* and *Parthenium*, and in another place he saith that it was called *Leucanthemum* and *Tanacetum*, and that *Celsus* called it *Perdicium* and *Meridium*, so that hereby it may be seene, that *Parthenium* was a word applyed to many herbes. *Fuchsius* would make *Matricaria* to be the second kinde of *Dioscorides* his *Archemche*, called *Leptophyllos*, that is *tenuifolia*, and *Parthenium* to be *Cotula fœtida*, which as I said before, *Matthiolus* disproveth: the second is a name lent by divers Authors as it is in the title, and by *Tabernamontanus Archemoselinophyllo flore plano*: the third is a figure not heard of by any Author before, as I take it. The fourth *Camerarius* calleth *Matricaria altera ex Ilva*, or *Tanacetum Archemisiæfolium flore simplici luteo*, and *Bauhinus Matricaria odorata*; and we *Matricaria* of so good a scent. The fifth *Prosper Alpinus* saith is called in *Egypt Achamee*, and he thereupon called it *Parthenium Indicum*: in English Outwory Featherfew. The sixth was judged by *Alpinus* (ancient reasons or causes (as I said before) to be another *Parthenium*, *viz.* *Cotula fœtida*, and it may be that of *Hippocrates*, which many judge to be *Cotula fœtida*, *Bauhinus* calleth it *Matricaria foliis Abrotoni*. The seventh *Clusius* calleth *Parthenium Alpinum*, *Matricaria Alpina* [illegible], The last *Lobel* and *Pena* call *Cotula sive Parthenium marinum minimum*, and *Lugdunense Parthenium marinum minimum*, and the like.

Wee call the *Chamæmelum nobile* of *Matthiolus*, set out in the same place of *Lugdunensis*, for they are both one, as may be gathered both by the figure and description, although the flowers in *Lobel* figure be more coloured; in English small sky Feather-few. The Italians call it *Manzanella*, and *Amarella*: the French *Herbe aux Vers*: the Germans *Wolrauten*, and *Wolrauen*, the Dutch *Wolrauen*, and wee in English as I said before, Feather-fews or else Feverfews.

The Vertues.

It is chiefly used for the diseases of the mother, whether it be the stranguling or rising of the mother, or the hardnesse or inflammations of the same, applyed outwardly thereunto, or a decoction of the flowers in wine, while a little Nutmegge or mace put thereto, and drunke often in a day, is an approved remedy to bring downe women cooled speeding, and to warme those parts annoyed by obstructions or cold, as also helpeth to expell the dead birth, and the afterbirth. For a woman to receive the fumes of the decoction of the herbe, made in water or wine, is good, as also for the same purposes, and to the same ends to apply the boyled herbs warme to the grieved parts. The decoction thereof made with some syrupe or honey put thereto, is used by many with good successe as well to helpe the cough, and shortnesse of the breath, as also to cleanse the reines and bladder, and helpe to expell the stone in them. The powder of the herbe, as *Dioscorides* saith, taken in wine, with some Cummel, purgeth like to *Hellebore*, but softer and lighter, and is available for those that are short winded, and are troubled with melancholy and heavinesse or sadnesse of the spirits. It is very effectuall for all paines in the head, coming of a cold cause, as *Dioscorides* saith, the leaves being bruised and applied to the crowne of the head; it is also profitable for those that have the Vertigo, that is, giddinesse and swimming in the head. It is also drunke warme (I meane the decoction) before the accesse or coming of an ague, as also the herbe bruised with fine graines of Pepper (and some put thereto garlic, that is, *Dioscorides* reason wherefore) and applyed to the wrists of the hands, to take away the fits of agues. Some do mingle the ashes of the herbe and flowers to take away wrinkles, and other spots and deformities in the face. And some with good successe doe helpe the winde and colicke in the lower part of the belly, (and I suppose it good also for the winde in the stomack) by boyling the herbe and seeds in a pot, with Leeke seede or parsley seed, and a little wine and oyle in a frying-pan, and applyed warme outwardly to the place, and renewed as there need. It is an especiall remedy against *Agues*, if it be taken for three dayes together an hour before the fit, as *Dioscorides* saith, much used in *Drinke*, fryed with eggs, as we doe Tanies, we receive great delight and refreshment, which else would make it unpleasing, being taken away by the mannered dressing.

Chap. XXX.

Chamæmelum, Camomill.

WE have thought fitting to place you in this Chapter some common and well knowne to most, others not so rare, and lesse of use by a few and unto them I thinke is not amisse to joyne the Mayweeds, because they are so neer the like finding, as leife or not sweet.

1. *Chamæmelum vulgare*. Ordinary Camomill.
2. *Chamæmelum flore pleno*. Double Camomill.

1. *Chamæmelum vulgare*. Ordinary Camomill.

Our ordinary Camomill is well known to all to have many small creeping branches, set with very fine leaves, bushing and spreading thick over the ground, taking root still as it spreades: the toppes of the branches have white flowres with yellow thrummes in the middle, very like unto Feather-few, but larger, and not so hard; but more soft and gentle in handling, which grow small whitened, not observed by many, and being set in the ground, will bring forth plants every where abroad: the whole herbe is of a very fine sweet scent.

2. *Chamæmelum sylvestre*. Naked Camomill.

We have another sort of our small Camomill in our gardens, of the self same kinde, like unto the former, but with whiter, finer, and shorter leaves set on the stalkes, that rise somewhat higher, and beare naked small flowers, that is consisting onely of the yellow thrummy heads, without any pale or border of white leaves, smelling almost as sweet as the former.

3. *Chamæmelum flore pleno*. Double flowred Camomill.

This double Camomill groweth very like the single, but is lesse, and more upright, having smaller greene leaves, the flowers being composed of many rowes of white leaves, standing upon short foot stalkes: which yelloweth (as in the single) with the like yellow seed, which is of a pleasant sweet smell, and spreadeth on the ground in the like manner, and perisheth in the like sort in Winter: the double flowers rarely bring forth any seed, which being scattered abroad, will not prove double Camomill, except it be sowed in the Spring.

4. *Chamæmelum parvum*. Small Camomill of

This small Camomill groweth not above a foot high, having very small leaves, not longer than the flowers themselves, cut very small, but deeper, and more finely cut or torne than the former, smelling as sweet as the

5. Chamæmelum Hispanicum. Great Spanish Camomill.

6. Chamæmelum Hispanicum. Sweet Spanish Camomill.

5. *Chamæmelum Hispanicum amplo flore.* Great Spanish Camomill.

This great Camomill groweth in the same manner as the ordinary Camomill doth, with greene striped stalkes, of a cubite high, spreading forth into many parts, whereon doe grow such like leaves, and as finely cut in or divided, the ende whereof are thicker, and divided into two parts, and not very thicke set on the branches, at the tops whereof stand the flowers, each being foure times larger than the flower of the ordinary sorte, consisting of about twenty waved or cockled leaves of a very pale yellow colour almost white, for a pale or border, about a pale yellow thrum in the middle: after the flower is past the seed ripeneth in the same heads, which is small and yellowish like the ordinary sort: the roote consisteth but of a few fibres, which dye every yeare, the plant being but annuall, and must be new sowne in the Spring; it is of a good scent, somewhat resembling the garden Camomill.

6. *Chamæmelum Hispanicum vernum odoratum.* Sweet yellow Spanish Camomill.

This yellow Camomill is like unto the garden Camomill in all things, saving the flowers which are wholly yellow, both the bordering leaves, which are of a shining yellow colour, about fourteene in number, and the middle thrum: so the whole flower is at least twice as bigge as the flower of the ordinary sort, and almost as sweet, but lesse strong by the halfe than the former.

7. *Chamæmelum Hispanicum incanum parvum.* Small hoary Spanish Camomill.

This small Camomill groweth not to be above an hand breadth high, having some few hoary whitish greene finely cut leaves, lying upon the ground, being as small and fine as those of Southernwood, or fine Wormewood, from among which riseth up a bare or naked stalke, without any leaves thereon, and one somewhat large flower, standing at the toppe, having many white leaves, standing about a pale yellow middle thrum; the whole plant and every part thereof, is as well without scent as without taste.

8. *Chamæmelum Alpinum inodorum.* Unsavory Mountaine Camomill.

Unsavory Mountaine Camomill hath many hoary stalkes rising from the roote, without leaves for a certaine distance, and then having many set together, small toward the bottome, seeming to bee but as stalkes to the leaves which are somewhat narrow, and deeply cut in on both sides, as it were into deepe notches, being more thicke and full of juyce, then other sorts are by much, among which rise up divers other weake stalkes, without any other leaves on them, and one large somewhat large flower at the toppe of each, like unto a Camomill flower, but larger, the border of leaves being white, and the thrum yellow in the middle: the branches spread farre, and take roote in divers places: the roote is composed of a few whitish strings, the plant hath little or no smell to commend it, and is of little bitternesse in taste.

9. *Cotula fœtida, & vulgaris.* Maye weed with a strong and no scent.

Maye weed is so like unto Camomill, that I must needs joyne them together: but that which stinketh groweth more upright than either that which smelleth not, or the common Camomill, and neither of them creepe or runne on the ground, with the branches taking roote as Camomill doth: the leaves thereon are longer and greater than

Original from UNIVERSITY OF MICHIGAN

8. Chamæmelum Alpinum hadrum.
Ivie-leaved Mountaine Camomill.

9. Cotula fœtida vulgaris.
Maywed with a strong and ill scent.

Camomill, yet very like, but of a paler greene colour, the one sort smelling strong and unpleasant, the other having no scent at all: the flowers of them both are very like unto Camomill, but larger both the white border and the middle yellow thrum, whereby and by the scent thereof they are onely to be discerned from Camomill for many doe gather the flowers of that which smelleth not, instead of Camomill flowers, either of ignorance or wilfulnes, and so sell them presumptuously to the Apothecaries, that know not this note of distinction.

Of this kinde there hath beene found eight formes, and in divers places of this Land, a sort with double flowers almost as large as double Camomill flowers. *Flore pleno*

The Place.

Small Camomill growth familiarly wilde in many places (on greenes as they are called) of this Land, and with the Maywed oftentimes that stinketh not, which groweth (as aforesaid) among corne, as the stinking sort doth: the naked and double sort grow onely in gardens: the fourth was found by *Cyclamine Bock* in *Africa* by *Tamus*: the fifth, sixth, and seventh in divers places in *Spaine*: the eighth in sundry places of the *Alpes*: the last plentifully in our owne Land.

The Time.

They all flower in the Summer, yet some earlier than others.

The Names.

Camomill is called in Greeke [illegible] of *Dioscorides*, and [illegible] of *Theophrastus*, and this for a distinction [illegible] of the whitenesse of the flowers: and [illegible] of the scent of an Apple or Quince. It is called by Pliny in Latine *Leucanthemum* and *Anthemis*, but most generally *Chamæmelum*, and of some *Chamæmilla*, as it is also in the Apothecaries Shops. Some call the garden Camomill, both single and double *Chamæmelum hortense* [illegible], thinking them to be sweeter kindes than the wilde, when as that which groweth wilde usually [illegible] gardens, and with manuring become of as good a scent, or any other before in the garden. The rest have their names in their titles, both in Latine and English, as much as is convenient, and therefore we have called them (as Maywed as is before said in the last Chapter) more rightly taken to be *Cotulæ*, more [illegible] Camomill: some call [illegible] called *Cotula fœtida*, as it is thought from the *Diminutive Cotula*, the diminutive being [illegible] ceremony called *Cotula* by the Greeke [illegible] *Camæmelon* of *Theophrastus*, that is, Apple of the earth, or Camomill: the Germanes *Rottenkolen*, the Arabians call *Camomill Bidonaj* & *Ballonaj*: the Italians call it *Camamilla*, the Spaniards *Camamilla*, the French *Camomille*, the Germanes *Chamillen*, and the Maywed [illegible] *Cotula*, and we in English Camomill.

The Vertues.

A decoction made of Camomill, and drunke, taketh away all pains and stitches in the sides. The flowers onely of Camomill brayed, and made up into balles with honey, driveth away all fits of agues, if the party grieved bee annointed with the same oyntment in the temples, upon the crowne of the head, to the soles of the feete, and that hee lie downe in their beds warme, and sweat vehemently upon them, and that they sweat well: this is verified in Egypt, and Italy, to be a sure remedy as certaine, for he saith that the Sophi of the Persians consecrated this herbe to the Sunne, and a remedy for all fits of agues; but therein saith *Gilla* they were deceived, for it bea-

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

leth onely those that are already digested; but it is very profitable for all other sorts of agues that come either from flegme or melancholy, or from an inflammation of the bowels: for these (saith he) Camomill is a soveraigne remedy to be applied, when as they shall be concocted: and therefore there is nothing can be more acceptable and profitable to the *Hypochondria*; that is, the sides, and that part where the liver and spleene lye, then it. The bathing of a decoction of Camomill taketh away wearinesse, and easeth paines to what part of the body soever it be applyed, besides, it comforteth the sinewes that are overthrayned, mollifieth all swellings, and those that are not overhard, and rarifyeth those that are bound together. It moderately comforteth all parts that have need of warmth, and digesteth and dissolveth whatsoever hath need thereof by a wonderfull speedy property. It easeth all the paines of the collick and stone, as also all paines and torments of the belly, and provoketh urine gently. The flowers boyled in pottage drinke, provoketh sweat, and helpeth to expell colds, aches, and paines wheresoever; the same is an excellent helpe to bring downe women's courses; A Syrupe made of the joyce of double Camomill, saith *Bauhinus* but of garden Camomill say *Pena* and *Lobel*, with the flowers and white wine, is a remedy against the jaundise and dropsie, that commeth by the evill disposition of the spleene. The flowers boyled in lye is very good to wash the head, and to comfort both it and the braine. The oyle made of the flowers of Camomill is much used, against all hard swellings, and paines, or aches, thrinking of the sinewes, or crampes, or paines in the joynts, or any other part of the body; and helpeth to dissolve wind, and paines in the belly, used in glisters for that purpose: annointed also, it helpeth sciatica, and paines in the sides. Mayweed is often used with good successe for the same purposes that Camomill is, both to dissolve tumours and winde, and to ease paines and aches in the joynts, &c. especially the stinking sort, which is stronger in operation than the other.

Chap. XXXI.

Ambrosia. Oke of Cappadocia.

Although there be extant with some Writers, two sorts of *Ambrosia*, as *Matthiolus* in his last Edition, and three sorts with *Lobel* in his observations, and so likewise with *Gerard*; yet finding both the sorts in *Matthiolus*, and the latter sort in *Lobel* and *Gerard*, to be other hearbes, as I shall shew you in the sixth place among the *Absinthians*, and not *Ambrosia*: I have here onely shewed you one, as *Dodonæus* before me hath done also, which is the first both with *Lobel* and *Gerard*, as the truth, and is unto to be knowne.

1. *Ambrosia hircosa*, Oake of Cappadocia.

1. *Ambrosia hircosa.* Oake of Cappadocia.

The Oake of Cappadocia from a long slender roote, budding forth with many fibres, sendeth forth one hoary white limped, or straked stalke, ribbed to be two foote high at the least in any good ground, divided or spread into many branches, from the very bottome, whereon are set without any certaine order, somewhat large leaves, upon pretty long foot-stalkes, very much cut in on the edges, somewhat resembling the division of Mugwort leaves, especially the ends of them, but much smaller than they, being all whitish or hoary upon the greene, and of a very pleasing scent, not so hot or rammish as Borrys or Oake of *Jerusalem*: at the toppes of all the branches both great and small, stand the flowers, which are small round yellow mealie buttons, never opening abroad, nor bringing any seed, but fall away as idle chaffe: but under these flowers from among the leaves, come forth small short stalkes, bearing two or three, or foure small rough and pointed heads, without any flowers before them, wherein is contained small round blackish seed, almost like the kernels or stones of Raisins or Grapes.

The Place.

This is said to grow naturally in *Cappadocia*, but *Belonius* setteth it downe to have found it in many places of *Asia minor*, and is onely to be found in gardens thorowout all *Europe*.

The Time.

It flowreth not within untill August, and hardly giveth us any perfect seed, for the least cold night comming before it can seed, taketh it away, making it presently to perish, so that for the most part wee are to seeke for seed, from *Italy*, or other places.

The Names.

It is called in Greeke ἀμβροσία φυτὸν ἀπὸ τῆς τροφῆς τῶν θεῶν, *Ambrosia phyton apo tes trophes ton theon*, the meate of the Gods: for in Gentilisme accounted of it, for the excellent fragrancy it yeilded, and that meate all men did not make it their food, or because, as they supposed, it did make men that did eate thereof, to bee of so long life, that they might be held to be immortall. *Anguillara*, *Gesner in hort.* and *Camerarius* suppose it to bee *Conyza Hyppocratis*. *Lugdunensis* calleth it *Artemisia mas tenuifolia*, but giveth two figures thereof, one with an upright stalke without any branches, and the other branched. *Tragus* likewise calleth it a kinde of *Artemisia*, and some doe take it to bee the second *Artemisia* of *Fuchs*, but *Dodonæus*, *Camerarius*, *Lobel*, and *Tabermontanus*, doe all call it *Ambrosia*,

Ambrosia, as Serapio & Aegyptius; Rembertus calleth it *Ambrosia maritima*: in English Oake of *Cappadocia*.

The Vertues.

The properties referred by this ancient Writers to this hearbe are scarce answerable to so glorious a title; for *Dioscorides* saith onely, it hath a property to repell, slay and bind those humours, that fall into any part of the body, being annointed or outwardly applyed, and so saith *Galen* also, and more is not said by any Author thereof: onely *Pliny* in writing the words of *Dioscorides*, in stead of repelling, hath set downe dispelling, as mistaking the Greeke word, and mis-interpreting it.

Chap. XXXII.

Botrys, Oke of Ierusalem.

WE have generally knowne but one sort of *Botrys*, which is a small low hearbe, but of late dayes there hath come to our knowledge, another sort more tall, and like unto a small shrubbe, because it is more woody.

1. *Botrys vulgaris*. Common Oke of Ierusalem.

The ordinary Oke of *Ierusalem* is a small bushy hearbe, full of branches, a foote and a halfe high, with some few, and not many leaves thereon, which at the first springing are reddish on the underside, and after grow to be of a yellowish greene colour, especially when they grow old, and in the time of the flowring and seeding; which are much cut in on the edges, like unto Grundsell but larger: the toppes of the branches, and so downe to the halfe of their height, is fully stored with small pale yellow flowers like unto the blossomes of Vines, which turne into small brownish seed: the roote is long and hard when it hath given seed, perishing yearely: the whole plant is of a resinous sweet scent, and while it is greene is somewhat clammy in handling.

2. *Botrys Americana*. Indian Oke of Ierusalem.

This *Botrys* or Oke of *Ierusalem* riseth up higher, and the branches are more wooddy and durable; the leaves are somewhat like unto wild Arrache, but larger, and much cut in on the edges, like unto the former: the whole plant, both flowers and seed, is most like unto the former; and doth most likely abide the Winter of his naturall warme Countries, which are nothing so violent as ours, but will not doe so with us, without much care to preserve it; but doth spring of the seed sowne, as well as split, &c. or before the gathering: the scent whereof is somewhat strong, but not unpleasant, very neare unto the other.

The Place.

The first groweth in *Italy* and *Narbone* in *France*, in divers places, as well by the water sides, as in the dry sandy grounds. The second is naturall of *Africke* & *Persia*, from whence it hath bin brought.

The Time.

They both flower and seed in August and September, and doe often raise themselves, of their owne sowing, especially the former.

The Names.

It is called in Greeke βότρυς and *Botrys* in Latine, *a similitudine & formatione in botrys formatae racemis subiunctis*, because the flowers, and so the seed also groweth like unto a bunch of Grapes. All Authors call it *Botrys*, yet *Ephesius* calleth it *Artemisia Turcica*, and *Cameracius* saith that the Indians call it *Parmenion*. *Curtius* upon *Dioscorides* calleth it *Ambrosia altera species*, and moreover saith, that in some Apothecaries shops in *Germany*, the seed there of was taken for *Ambrosia*: *Dioscorides* saith, that in his time, the Capp-docians called it *Ambrosia*, and some others *Artemisia*. *Rembertus* calleth it *Botrys Ambrosioides vulgaris*. And the other he calleth *Botrys Ambrosioides Mexicana*, and saith the seed was sent by the name of *Botrys*: wee doe generally call it *Botrys frutescens Americana*, as a distinction from the other: in English shrubby Oke of *Ierusalem*.

The Vertues.

Dioscorides applyeth it not to any other thing, then that it helpeth those that cannot take their breath, unlesse they hold their peace (because, being taken in wine: but others have found out more especiall properties therein; for in that it both heateth and dryeth, attenuateth, cutteth, clenseth, purgeth, openeth, and expectorateth tough flegme. It is very profitable for all the diseases of the chest or breast, troubled with flegme, whether it be thin or tough, or rotten: the compound mixture so fair forth, as also for those that are short winded, or have the cough of the lungs, either the hearbe with fetle alone being boyled, and the decoction taken with Syrupe of Violets, or with Liquoris added unto it, or the decoction not taken for divers dayes together. The greene hearbe is of especiall good use to the cure of the itch, sores bruised on a tyle, and moistned with Muscadine, and laid hot to the belly. As also, if you take of the leaves of this plant, Feather-few, and Camomill flowers, and fry them together with some oyle of

Original from UNIVERSITY OF MICHIGAN

Filius into a cake, and apply it warme to the belly, is an approved remedy for women in childbed, that feele any pains of the mother, after their delivery. The fumes of the decoction thereof also taken underneath, by sitting over it, helpeth to bring downe the courses, and to expell the dead child. It is much used to be laid into Wardrobes or Presses, not onely to kill or drive away the mothes, but for the sweet scent to perfume the garments.

CHAP. XXXIII.

Artemisia. Mugwort.

THere are three or foure sorts of Mugwort to be here declared, besides a stranger lately come from Virginia, which Plinie and others doe reckon but two sorts, one with broader, and another with smaller leaves.

1. *Artemisia vulgaris.* Common Mugwort.

The common Mugwort hath divers leaves lying upon the ground, very much divided or cut in deepely about the brimme, somewhat like unto wormewood, but much larger, of a sad or darke greene colour on the upperside, and very hoary white underneath: the stalkes (doe grow in some to be very high, and then the flowers are deeper coloured) rise to the foure or five foote high, whereon grow such like leaves as those below, but somewhat smaller, branching forth very much towards the toppe, whereon are set very small pale yellowish flowers like buttons, which fall away, and after them come small seed, inclosed in small round heads: the roote is long and hard, with many small fibres growing from it, whereby it taketh strong hold in the ground, but both stalke and leafe doe die quite down every yeare, and the roote sheareth anew in the Spring: the whole plant is of a reasonable good scent, and is easily propagated by the slips, then by the seed.

2. *Artemisia minor.* Small Mugwort.

This small Mugwort is somewhat like unto the former, having such like leaves, divided or cut in on both sides, greene above and whitish underneath, but much smaller than they: the stalke likewise (for oftentimes it hath but one) riseth not so high, nor is so great, but bearing the like flowers, yet paler: the seede whereof is also alike.

3. *Artemisia montana mas.* The Mountaine Mugwort.

The Mountaine Mugwort is also not much unlike the former, having divers square brownish branches, not above a foote and a halfe high, whereon doe grow such like leaves almost, but longer, narrower, and much more crumpled, or finely jagged on the edges: the flowers are pale and small like the former: the roote is long and blacke, spreading in the ground.

4. *Artemisia Tenuifolia.* Fennell Mugwort.

This kinde of Mugwort riseth up of it selfe but with one stalke, diviaing it selfe from the bottome thereof into many branches, whereon are set somewhat sparingly, somewhat longer and larger leaves than the small Mugwort, but more finely cut in on the edges, unto the middle ribbe, and ending in a longer point: the toppes of the branches are more plentifully stored with flowers than the other sorts, which are also small seed, bearing abundantly.

5. *Artemisia Virginiana.* Virginian Mugwort.

This Virginian being so lately come to our knowledge, that we can have no perfect description thereof unto you to set up, somewhat higher and larger spread, with much divided leaves like the first but greater, the flowers hath not beene yet thereof observed.

The Place.

The former groweth plentifully in many places of this Land, as well in others, by the way sides, as also by small water courses, and in divers other places. The second likewise is found in some of those places, but more sildome seene. The other three are strangers, and nurtled up with us onely in gardens.

The Time.

They all flower and seed in the end of summer.

The Names.

It is called in Greeke ἀρτεμισία, and *Artemisia* in Latine also, and recorded by *Plinie*, that it tooke the name of *Artemisia*, from *Artemisia* the wife of *Mausolus*, King of *Caria*; when as formerly it was called *Parthenis*, and *Parthenia* Maidenwort, and as *Apollinaris* saith, was also called *Parthenium*: but others thinke it tooke the name from *Artemis* who is called *Diana*, because it is chiefly applyed to Womens diseases. The first is generally called of all Writers *Artemisia & vulgaris*, because it is the most common in all Countries. Some call it also *Mater herbarum*,

rum. The second is called by *Matthiolus* and others *Artemisia minor*, and so doe we. The third is called by *Lugdunensis Artemisia leptophyllos incana*, and in English Fine Mountaine Mugwort. The last is called by *Bauhinus Artemisia Polyspermos*, and the other by *Lugdunensis Artemisia Monoclonos quorundam alijs Ambrosia*, in English Fruitfull Mugwort.

The Vertues.

Dioscorides saith, it heateth and evenuateth. It is with good successe put among other herbes, that are boyled for women to sit over the hot decoction, to draw downe their courses, to helpe the delivery of the birth, and to expell the secundine or afterbirth, as also for the obstructions and inflammations of the mother: it breaketh the stone, and causeth urine to make water where it is stopped: the juyce thereof made up with Myrrhe, and put under as a pessary, worketh the same effect, and so doth the roote also, being made up with Axungia into an oyntment, it doth take away Wens and hard knots, and kernels that grow about the necke and throat: as also to ease the paines about the necke, but especially and with more effect, if some hold Daisies be put with it. The herbe is safe being fresh, or the juyce thereof taken, is a speedy remedy, upon the over much taking of *Opium*: three drammes of the powder of the dryed leaves taken in wine, is a speedy, and the best certaine helpe for the Sciatica. A decoction there of made with Camomill and Agrimony, and the place bathed therewith while it is warme, taketh away the paines of the sinewes, and the crampe. It is said of *Pliny*, that if a Traveller binde some of the herbe about him, he shall feele no great moile at all in his journey; as also that no evill medicine or evill beast shall hurt him that hath the herbe about him. Many such like superstitions and irreligious relations are set downe, both by the ancient and later Writers concerning this and other plants, which to relate, were both unseemely for me, and unprofitable for you. I will therefore omit them, the idle conceit of some of our later dayes concerning this plant, and that is even of *Gerarde*, who professeth to be an eye witnesse of this foppery, that upon Saint *Johns* eve, there are coales to be found at mid-day, under the rootes of Mugwort, which after or before that time, are very small or none at all, and are used as an Amulet or charme about the necke of those that have the falling sickenesse, to cure them thereof. But Oh the weake and fraile nature of man! which I cannot but lament, that is more prone to believe and relye upon such impostures, than upon the ordinances of God in his creatures, and trust in his providence.

CHAP. XXXIIII.

Abrotanum. Sothernwood.

Sothernwood (which is the *Abrotanum mas*, as the late and best experienced Authors doe hold; the *Abrotanum femina* is the Lavender Cotton, which shall be set downe in the next Chapter,) there are many sorts as they shall be declared in their order: of which number I have taken some from those herbes going before, as also from Wormewood that shall follow, because I suppose they rather belong to this Tribe, than to any of the other, from whence I have taken them.

1. *Abrotanum mas vulgare*, Common Sothernwood.

1. *Abrotanum mas vulgare*, Common Sothernwood.

Our ordinary Sothernwood (which is the most common in gardens with us and generally called Sothernwood; for the other sorts are called by other names, for the most part, and not acknowledge to be of this kinde) riseth up with many weake and woodddy branches bending downewards, if they be not held up, specially while they are small, for the elder stems are more strong and great, rysing in time to bee higher than any man, from which doe grow out many small and long branches, whereon are set many small fine and short leaves, as fine as Fennell, but not so long, of a grayish or russet greene colour, somewhat strong, but not unpleasant in smell, and of a strong and somewhat bitter taste: from the middle almost to the toppes of the upper sprigges, stand small round yellow flowers hanging like little buttons, which never open much, but passe away, and after them come the seed, which is smaller than that of Wormewood: the roote groweth not very deepe, but is wooddy, with divers strings annexed unto it: this loseth all the leaves on the stalkes and branches every yeare, and shoot forth anew in the Spring.

3. *Abrotanum maximum*, Great Sothernwood.

This great Sothernwood is altogether like the former, growing as high, or rather higher, and with leaves like thereunto, but somewhat longer and greener, of a strong rellnous scent, not so pleasant, but drawing somewhat neare unto the smell of Camfire or Frankincense, the flowers and seed differ not from the other, nor the roote, which is wooddy and runneth under ground in the same manner.

3. *Abrotanum arborescens*. Tree Sothernwood.

This rare kinde of Sothernwood groweth upright, with one stem or stalke to the height of a man, if the lower small sprigges bee pruned from it in the growing, and shooteth forth many branches on all sides, on which doe grow many leaves, very much cut in and divided, but are nothing so fine

and

3. *Artemisia abrotanum.*
The Sothernwood.

4. *Abrotanum vulgare.*
Vnlavory Sothernwood.

and small as the former, but yet a little quicker, and nearer resembling Wormewood, as it is also in the taste, and more aromaticall than Sothernwood: the flowers stand at the toppes of the branches, being more plentifull and larger than the former, but yellow like them, after which come the seed, which likewise is somewhat larger: the roote is woodily, spreading many strings and fibres: the plant is more tender than the others, and will require some care to preserve it in the Winter more than they.

4. *Abrotanum vulgare.* Vnlavory Sothernwood.

Vnlavory Sothernwood springeth up with many slender, but wooddy whitish stalkes for the most part, leaning or lying upon the ground, yet sometimes standing somewhat upright, upon which at severall places, come forth many small whitish leaves, not so small or finely cut or divided as the common Sothernwood, but greater, of little or no smell at all, but of a hot taste, drawing the same into the mouth, which they spit forth: from among which spring forth small greenish purple branches, set with the like leaves, but smaller, and many small pendulous green tufts with purple heads, along the sprigges to the toppes, which when they open, shew out small pale purplish flowers; the roote is somewhat wooddy, and branceth forth divers wayes, with many small strings or fibres.

5. *Abrotanum fœmella vulgatius.* Small Sweet Sothernwood.

This small Sothernwood shooteth forth many small wooddy branches, rising seldome above halfe a yard high, but very thickly spreading into other smaller sprigs, set full of small leaves, somewhat longer, greater, and greener than the last: the toppes of the stalkes are flored with many small round heads, which shew forth small yellow greenish flowers: the roote spreadeth like the other: the whole plant as well leaves as flowers, and the sprigges yeeld a very good scent and pleasant savour, more than the other, somewhat inclining to Wormewood.

6. *Abrotanum campestre.* Field Sothernwood.

This Field Sothernwood hath many small fine leaves, rising from the roote, very like unto the leaves of common Sothernwood, but of a darke greene colour, and likewise many wooddy stalkes, about a foote high or more (yet sometimes higher) divided diversly, having such like leaves growing thereon, as are below: the slender sprigges are flored with clusters of small round greene heads or buttons, which contain small yellowish flowers like Sothernwood, and divers of small seed following them: the roote is long, thick, sticke, and wooddy, with divers strings annexed thereunto: the smell is not much unlike unto Mugwort, then Sothernwood.

7. *Abrotanum vulgatius incanum.* Hoary Field Sothernwood.

This other Field Sothernwood is in all things like the last described wild Sothernwood, but that the leaves are of a whitish or hoary green, and of a more aromaticall scent and taste, and that the roote is of a darke reddish colour on the outside, with divers small fibres growing from it.

The Place.

The first is usually found growing in our Gardens, but for the originall is not set downe. The second groweth in *Germany*, and brought into their gardens. The third came first into *Italy*, from whence it hath been sent to divers other places, as we have it, as I suppose, from the Low-countries, &c. The fourth *Clusius* saith he found in *Austria*, *Hungaria*,

1. *Abrotanum hortense vulgare.* Small Sweet Sothernwood.

2. *Abrotanum vulgare.* Tall Sothernwood.

7. *Abrotanum femina Dod. Gerard.* Yellow Flowred Tall Sothernwood.

Hungaria, and other parts thereabouts. The fifth is onely found in the gardens of Herbarists that are curious. The sixth groweth in *Hungaria Syria Cappadocia Constantinopolitana*, as *Tabernæmontanus Clusius* testifie. And the last about *Louain* in *Austria*, from whence, *Bauhine* in his *Prodromus* saith, it was brought to him.

The Time.

Most of them doe flower in July and August, yet some later, so that we seldome see them bear seed, especially the greatest.

The Names.

It is called in Greeke *Ἀβροτανον ἀρρεν τὸ λεπτοφυλλον ἀκρον, ἐφ᾽ ᾧ σπερμα πολὺ καὶ δάκρυα πολλὰ ἀπορρεῖ· θηλυ δὲ τὸ παχυφυλλον, ἐφ᾽ ᾧ σπερμα ὀλίγον καὶ δάκρυα ὀλίγα*; in Latine after the Greeke *Abrotanum*, but more usually *Abrotanum*. *Pliny* calleth this *Cupressus*, and the *Spina montanum*. The first is called generally by all Authors *Abrotanum mas*, and by *Cordus nigrum*, except *Dodonæus* in French, and *Guillara* who call it *feminc*, in English common Sothernwood. The second is called by *Cæsalpinus Ambrosiana vulgaris, cauliculis rectis ramosis densis incanis*, and by *Bauhine Abrotanum mas vulgatissimum maximum*; in English great Sothernwood. The third is called by *Matthiolus Abrotanum hortense Camerarii*, and *Abrotanum arborescens* of *Lobel*, *Lugdunensis*, *Tabernæmontanus*, and *Gesner*, but *Dodonæus* calleth it *Abrotanum fœmina arborescens*, and *Bauhine* in his *Pinax*, *Abrotanum tenuifolium arborescens*, in English Tree Sothernwood. The fourth is called by *Dodonæus Abrotanum indorum & nigrum*; by *Lobel*, *Lugdunensis*, and *Gesner Abrotanum incanum*; but *Clusius* calleth it *tenuifolia*, and *Anthemis tenuifolia*; all these Authors doe give one and the same figure to this plant: *Dodonæus* for *Abrotanum*, *Lobel* and others for *Abrotanum*, and *Clusius* for *Anthemis*. *Bauhine* calleth it *Abrotanum latifolium medium*; in English Vnlavory Sothernwood; for we have a Wormewood that is unlavory, differing from this, as shall be shewed you among the Wormewoods. The fift is called by *Dodonæus*

Dodonæus and *Lobel* *Abrotanum femina flore & semine luteo* by *Tragus* *Abrotanum viride*, and by *Bauhine* *Abrotanum mas vulgatissimum viride*: in English small green Southernwood. The fifth is called by *Matthiolus* in his later Edition *Abrotanum album*; whom *Lonicer*, *Lonicerus*, *Cæsalpinus*, *Lugdunensis* and *Camerarius* doe follow; and *Lobel* *Abrotanum mas*, *Gesner* calleth it *Ambrosia Leptophylla*, and *Clusius* *Artemisia tertia tenuifolia*, it is *Tragus* *Abrotanum femininum album* 1. and *Tabernæmontanus* *Abrotanum*, and *Bauhine* *Abrotanum vulgatius*, or English Field Southernwood. The fifth is called by *Bauhine* *Abrotanum campestre minimum Cordi dictum*: in English Hoary field Southernwood. The Arabians call it *Calliun Romi*, or *Scalpon*: the Italians and Spaniards *Abrotano*: the French *Aurone femelle & male*: the Germanes *Stabwurtz*: the Dutch *Abrotanum*: and wee Southernwood.

The Vertues.

Dioscorides saith, that the seed burned, beaten to warme water and drunke, helpeth those that are burstен, or are troubled with crampes, or convulsions of sinewes, with the Sciatica, and with the difficulty in making water, and to bring downe womenes courses: it is commonly taken in wine, and is also in confection against all deadly poison, and driveth away Serpents, and other noysome creatures, especially against Scorpions and poisonfull Spiders; as also by the smell of the hearbe being burnt, or laid in places where they come: the oyle thereof being annointed on places convenient, especially the backe bone, before the fit of agues taketh them, doth wonderfully ease: it is profitably laid to the eyes to take away the inflammations of them, if it be put with some part of a roasted Quince, and boyled with a few crummes of bread; boyled with barly meale, it cleareth away pimples, pathes, or wheales, that rise in the face, or other parts of the body. The seed as well as the dryed hearbe, is often given to kill the wormes in children: the hearbe bruised and laid to, helpeth to draw forth splinters, and thornes out of the flesh: The ashes thereof dryeth up and healeth old ulcers, that are without inflammation, although by the sharpnesse thereof it biteth sore, and putteth them to sore paines, as also the tetters that happen in the privie parts, of men or women. The ashes likewise mingled with old Sallet-oyle (for we have neither the oyle of the seed of the Mallick tree, which is much commended, nor the oyle of Cherua, or the great Spurge, called *Palma Christi*, nor some other that are used in other Countries) helpeth those that have their haire fallen, or their heads bald, to cause the haires to grow againe, either upon the head or beard: Some lay the juyce thereof with oyle doth the same. *Dioscorides* saith that the oyle made of Southernwood, and put among other ayntments, that are used against the French disease, is very effectuall, and likewise killeth vermine in the head. The distilled water of the hearbe is said to helpe them much, that are troubled with the stone, as also for the diseases of the spleene and mother. It is generally held by all both old and new Writers, that it is more offensive to the stomacke than Wormewood, because it hath not that allaying in it. The Germanes commend it for a singular wound hearbe, as their name of *Stabwurtz* given unto it doth testifie.

CHAP. XXXV.

Abrotanum fœmina. Lavender Cotton.

There are divers sorts of Lavender Cotton, to be here remembred.

1. *Abrotanum fœmina vulgare.* Ordinary Lavender Cotton.

1. *Abrotanum fœmina vulgare.* Ordinary Lavender Cotton.

The ordinary Lavender Cotton hath hardry wooddy brittle hoary branches, whereon are set many long foure-square hoary or whitish leaves, dented about the edges: at the tops of the branches stand naked stalkes, bearing every one a large yellow head or flower, like unto Tansie or Maudeline, but greater, of a gold yellow colour, abiding so a long time upon the stalkes, and being kept dry likewise: after which commeth small darke coloured seed: the roote is wooddy, and spreadeth hardry hard fibres: it is of a strong sweet scent, but not unpleasant.

2. *Abrotanum fœmina magnum.* Great Lavender Cotton.

This Lavender Cotton is very like the ordinary Garden kinde, but not halfing so thicke with stalkes, growing to have a great bush and thicke stemme or stalke, not far with so many branches thereout, but somewhat bigger than the other, whereon grow foure-square dented leaves, like thereunto, but somewhat larger, thicker and greener: the flowers stand in the same manner every one upon his long stalke, being as yellow and large as those, which give the like seed: the roote spreadeth in the ground with hard wooddy branches, like the other, and endureth the extremities of winter as well as the other: the smell of the whole plant, and every part thereof is strong, resembling a great many, as the other doth, to be good against the stinging, as well as the other.

3. *Abrotanum fœmina humilis minor flore,* French Lavender Cotton.

The French Lavender Cotton groweth not to bee so high as the ordinary Garden kinde, but hath many wooddy short little branches, seldome halfe a yard high, diversly spread into many other small ones, whereon are leaves like the o-

ther,

3. *Abrotanum femina Narbonensis longis folijs.* French Lavender cotton.

they lost somewhat smaller, and more thinly or sparsedly set on the branches, of a greenish white colour, neither so green as the last, nor fully so white as the ordinary, of a strong scent, some what like the ordinary kind; the flowers stand upon the toppes of the smaller sprigges, every one by it selfe, upon a bare or naked stalke, without leaves for a good space, which are of a paler yellow colour than they, and much larger, which give seed somewhat of a darker colour than it: the roote is as great and wooddy, and spreadeth much in the ground.

4. *Abrotanum femina Ericæ folijs.* Fine Lavender Cotton.

This Lavender Cotton groweth not so great or high as the French kind, but hath many short wooddy branches, whereon doe sparsedly grow smaller, shorter, and finer whitish greene leaves, very like to the leaves of common Heath: the flowers are yellow standing in the like manner as the others doe: this hath a fine small scent to commend it, some what resinous, not very faintish or weake.

5. *Abrotanum femina folijs Rorismarini magnis.* Rolmary leafed Lavender Cotton.

This kinde of Lavender cotton, shooteth forth from his wooddy roote, many slender hoary stalkes, little above a foote long, whereabout grow many very narrow small and flat leaves, like unto the leaves of Rolmary, which while they are young are more hoary white, and have but a small shew of denting about the edges: but when they are grown old, they are more greene, and the denting about the edges is more apparant, of a sweet scent, and bitter taste: from these stalkes come forth divers short sprigges, with very few leaves on them, on the toppes whereof stand several yellow flowers, like unto Lavender cotton, but made lesse, which die downe to the stalkes every yeare, after it hath borne seed, as the other kindes doe.

6. *Abrotanum femina folijs Rorismarini minus.* Small Rolmary leafed Lavender cotton.

There is no difference betweene this and the last, in the leaves and flowers, but in the smalnesse thereof, being more slender, low and small in every part, which is not by reason of the place (as being more dry and barren) where it groweth: for growing in the same place, with the former, is smaller, and the seed being sowen retaineth still the same forme it had, in the naturall place.

7. *Abrotanum femina viridis minor.* Small greene Lavender cotton.

This small kinde of Lavender cotton is very like unto the last small kinde, but that it groweth somewhat greene and higher, having greene and not hoary stalkes at all, as the leaves also are, and a little longer, being as bitter in taste as it, but not of so sweet a scent: the flowers stand in the same manner upon slender stalkes, and of the same fashion, but of a paler yellow colour: the roote is wooddy like it, and full of small fibres.

8. *Abrotanum femina repens.* Creeping Lavender cotton.

This creeping Lavender cotton also, is a small low heathe, whose branches stand not upright, but lie downe, as it were, creeping upon the ground, and are as white and hoary, or rather more than the ordinary, and so are the small dented leaves also, but they are some what thicker and fuller: the flowers likewise are yellow like the rest, but somewhat smaller, and the smell is not much unlike unto it also.

9. *Abrotanum peregrinum Lobelij Cupressi folijs.* Strange Lavender cotton.

This strange plant I have here inserted among the rest of the Lavender cottons, presuming it to be his right place, although *Lobel* giveth it the name of Southernwood, with the face of Cypresse: but hee maketh no mention of any flowers, whether they are answerable thereunto, which might assure us of the truth, and put the rest out of all doubt: but as he setteth it downe, so doe I give it you here, the description thereof, until I see the rare thereof, to shew its contrary or confirme the same. From a small roote riseth up many black hard slender stalkes, about a foote, and a foote and a halfe high, bearing many long, narrow, and flat leaves, interlaced or brouded like unto the leaves of the Cypresse or Savine tree, and dented about the edges: the flowers as I said, he doth not expresse, nor can I give you any further knowledge hereof as yet.

The Place.

The last groweth in *Germany*. The second in divers places in *Narbone* in *France*. The third is not knowne unto us, whence it is naturall. The fourth, fifth, and sixth, *Cluſius* found about *Salamanca* in *Spaine*. The seventh is unknowne whence it is: and the last it is likely by the title whereby it was sent, came out of *Egypt*. Many of these grow in the gardens of those that are curious Conservers of rare plants.

The Time.

They doe all, or most of them flower in July and August.

The Names.

There is some controversie among Writers concerning the true *Abrotanum femina* of *Dioscorides*, some holding that which others refuse and confute; but by *Matthiolus*, and the most judicious of the later Writers, this is said to bee the true *Abrotanum femina* of *Dioscorides*, although *Fuchsius* and *Dodonæus* doe deny it, unto whose

Original from UNIVERSITY OF MICHIGAN

Clusius doth agree, saying that it cannot be that of *Dioscorides*, which hath as hee saith, divided leaves like unto Sea Wormewood, and yet setteth downe both it and the rest of that kinde, under the name of *Abrotanum famina*, which I thinke he would not doe, if he thought they had not some neare resemblance; but *Matthiolus* doth shew against *Fuchsius*, that the plant which he setteth forth for *Abrotanum famina*, is farre unlike it (being the *Absinthium Ponticum* of *Dioscorides* and others, whereof I shall speake in the next Chapter) and that although *Fuchsius* doth set forth the true *Abrotanum Femina* of *Dioscorides*, yet it is under the name of *Chamæcyparissus*, not knowing it to be the right. *Dodonæus* also (whom *Gerard* followeth in translating his words, and his Corrector herein (who is currant) counselleth that this Lavender cotton cannot bee *Dioscorides Abrotanum famina*, but would make his greatest and best smallest Sothernwoods to be it: which as all may well observe, differ very little either in leaves or flowers, from the ordinary *sort*; and therefore I the more marvaile that hee should refuse that, for the flowers take onely, seeing his *vim* and *facultates* are so like in flowers: but *Dioscorides* in describing his *Abrotanum famina* saith, *florum racemi sunt, semenibus in fumos fulgore aureis*, which doth most lively expresse the flowers hereof, and cannot be referred to either of his Sothernwoods, and therefore he setteth forth this plant, and the divers kindes thereof, under the name of *Santolina*, which he would referre to *Cluſius* his *Stœchas Citrina*, but how truely let others judge. The fifth is the *Abrotanum famina vulgare* by *Matthiolus* and divers others, and *Santolina* by *Anguillara*, as they call it in some places of *Italy*, and *Crespolina* by *Catalanus*, as they call it in other places of *Italy*. Some of the later Writers would make it to be the *Chamæcyparissus humilis herba* of *Pliny*, which may well be doubted of, seeing he is so briefe therein, giving only the bare name, and a few properties: the second is called by *Camerarius Abrotanum famina foliis magis crispatis*, whereunto *Cluſius* seemeth to agree, making it his second *Abrotanum Famina*. *Fabius Columna* maketh it to be an other sort of *Polium*, but not so hoary as our ordinary Lavender cotton, in English great Lavender cotton. The third is called by *Cordus Santonicum majus*, by *Tabernæmontanus Absinthium marinum primum*, by *Pena* and *Lobel* it is taken to bee the true *Seriphium* of *Dioscorides*, yet say it hath the face of *Abrotanum famina*. *Dodonæus* calleth it his first *Santolina*: as is *Cluſius* his third *Abrotanum famina*, which he calleth *Narbonensis*. *Columna* has *Polio altera species minor*, and *Bauhinus* his *Abrotanum famina flore majore*: in English French Lavender cotton. The fourth is *Dodonæus* his third *Santolina* and *Bauhinus* his *Abrotanum famina foliis crispis*, and called by some *Lupanaria* to *Lavendanum*. *Bauhinus* judgeth it to be *Chamæcyparissus Valentina*, as it is set downe in *Lugdunensis*, but by the comparison of the description thereof, I finde that that *Chamæcyparissus* doth better agree with the second Spanish *Abrotanum famina* of *Cluſius* called *Salmanticensis secunda*, in his Spanish observations. The fifth is *Cluſius* his fourth kinde of Lavender cotton, and the first of his Spanish kindes, and called by *Bauhinus Abrotanum famina foliis Rosmarini majoris*: the sixth is the second Spanish *Abrotanum famina* of *Cluſius*, which *Bauhinus* calleth *Abrotanum famina Pyrenaicum foliis minus*: the seventh is the third *Abrotanum famina Salmanticensis* of *Cluſius*, called by *Bauhinus Abrotanum famina viridis*. The eighth is *Dodonæus* his fifth *Santolina*, which *Bauhinus* calleth *Abrotanum famina repens tenuifolium*, in English Creeping Lavender cotton. The last *Pena* and *Lobel* in their *Adversaria* say, they received both the plant and seed from *Belonius*, under the name of *Sabinæ Ægyptia*, and referring it thereunto, call it *Abrotanum peregrinum Cupressi folijs*, which *Bauhinus* thinketh to bee *Dodonæus* his fourth *Santolina*: but there is some doubt thereof, as I said before in the description, for *Dodonæus* giveth flowers to his fourth *Santolina*, with the leaves of Cipresse; but *Bauhinus* maketh two sorts of this plant of *Lobel*, the one he calleth *Abrotanum famina foliis Cupressi*, and the other *Abrotanum Sabinæ folio*, and quoteth *Lobel* for both, when as *Lobel* doth acknowledge but one plant, although it be set downe in two severall places of the *Adversaria*, but not in his observations as *Bauhinus* saith: *Gerard* his figure of *Chamæcyparissus*, which he calleth Lavender cotton, is utterly false, being the figure of *Abrotani terrestris clavatæ*, and his whole Chapter a meere transcript of *Dodonæus* in most things thereof. The Italians call it in some places *Santolina* and *Crespolina* in others, as is before said; the Spaniards *Yerva lombriguera*: the French *Petit Cypres*, and *Cypres de jardin*, and *Grande roche*: the Germanes *Garten Cypres*: the Dutch *Cipres*, and we in English Lavender cotton.

The Vertues.

Dioscorides, and so all other Writers doe generally say, that the vertues hereof and of the former Sothernewood are alike, working the same effects, and applyed to all the diseases it is appropriate unto: but particularly it is observed by *Matthiolus*, that halfe a dramme of the pouder of the dryed leaves of Lavender Cotton, taken in a draught of the distilled water of Featerview, every morning fasting, for ten dayes together at the least, and afterwards every other day, is a very profitable medicine for women troubled with the whites to stay them. *Pliny* saith that his *Chamæcyparissus* (which as I said before, is taken by some to be this Lavender cotton) is good against the poison of all venemous Serpents and Scorpions being taken in wine. The seed is generally in all our Country given to kill the wormes, either in children or elder persons, and accounted to be of as great force as Wormeseed: the leaves also are good when seed cannot be had, but are not of so great vertue. *Cluſius* saith, that in *Spaine* they use the decoction of the Spanish kindes, to take away the itch and scabbes, in whomsoever have them, but he adviseth, there should be caution used in giving it.

CHAP. XXXVI.

Absinthium. Wormewood.

THE Greeke, *Pena*, *Lobel* and *Gerard* make mention but of three sorts of Wormewood, the one a sea wormewood, which we have as he saith, the best growing in *Pontus* and *Cappadocia*. The other Sea Wormewood of *Narbonne*, and the third *Romanum* of the Country beyond the Alpes in *France*, yet there both have been found out many kindes or sorts of them, for some likenesse of leaves or vertues, as hereafter shall be declared hereafter.

Absinthium vulgare. Common Wormewood.

Common Wormewood is said to have many large whitish greene leaves, somewhat more hoary underneath, much divided or cut into many parts, from among which rise up divers hard and woodly hoary stalkes,

Original from UNIVERSITY OF MICHIGAN

1. *Absinthium vulgare.* Common Wormewood.

two or three foote high, beset with the like leaves as grow below, but smaller, divided at the toppes into smaller branches, whereon grow many small buttons with pale yellow flowers in them, wherein afterward is contained small seede: the roote is hard and woodie, with many strings thereon; the stalkes hereof dye downe every yeare; but the roote bringeth forth a tuft of greene leaves all the winter shooting forth new againe, which are of a strong scent but not unpleasant, and of a very bitter taste. There is a Tree Wormewood like hereunto, but growing greater and higher in the warme Countries.

2. *Absinthium Ponticum Verum.* True Roman Wormewood.

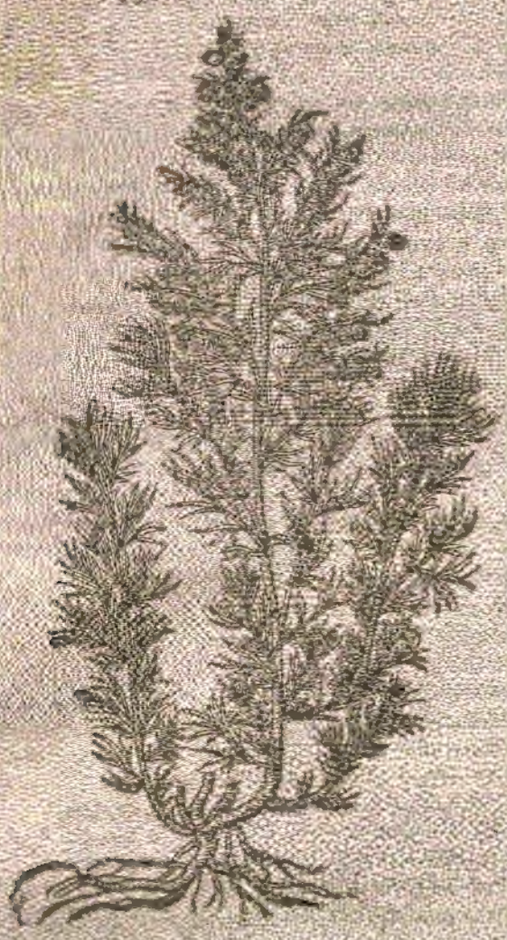
This Wormewood hath more slender and shorter stalkes, by a foote at the least than the former, and reasonable large leaves, yet smaller, and more finely cut in and divided than it, but as white and hoare both leaves and stalkes: the flowers also are of a pale yellow colour, standing upon the small branches in the same manner; so that, but that it is smaller in each part, it is altogether like it: the roote likewise is smaller, lesse woody and fuller of fibres: the smell thereof is somewhat aromaticall sweete, and the bitternesse is not so loathsome to take. Vnto this answereth the *Absinthium Ponticum Crericum* of Bauhinus, but that it is in the owne Country more sweet in scent, and little or nothing bitter to taste, but somewhat altereth in another sorte.

3. *Absinthium Ponticum sive Romanum tenuifolium.* Common Romane Wormewood.

This is a small low herbe (if I may call it a Wormewood) with much more slender & short stalkes than the last, whereon grow very small and fine short hoary white leaves, smaller and finer than those of the fine Sothernwood, which grow as leverall joynts, many comming forth together, at the tops of the stalkes grow small yellowish flowers, neither so many nor so great as the last: the roote from a thorie head shooteth forth many long fibres, whereby it is nourished in the ground, sending forth divers sprouts round about it, whereby it is much encreased: the smell hereof is more and more weake than the other, & the taste likewise not so bitter.

4. *Absinthium Scoticum Bellidis.* Five leaved Wormewood of Scotland.

This small Wormewood, hath many small hard and thin hoary stalkes, whereon are set, without order, small and somewhat long hoary leaves, very like unto the leaves of Sea Wormewood: which stalkes are divided now and then in the toppes, into many other small and slender branches rising from the joynts, where the leaves doe grow with many small heads, which shew forth many small whitish flowers.



5. *Absinthium lentiscum.* Vnsavory Wormewood.

The Vnsavory Wormewood is in leafe to like the first common Wormewood, both for the whitenesse, largenesse and division thereof, that it cannot be knowne from it, till, unlesse you make your note the iudge of the scent, which in this is so small, that it is generally held to be without any: it ariseth in the heate of Summer, a small weake stalke, such as is found in some of the Scots Wormewoods: the flowers and all things else are alike: but this is somewhat more tender to be preserved in the Winter than the former.

6. *Absinthium album sive Pedemontanum.* White tufted Wormewood.

This white Wormewood hath the roote compacted of many small blacke fibres, which shooteth forth many heads of long somewhat thick and broad hoary white leaves, cut about the edges, in some places more than in others, somewhat like unto the leaves of the great head Dasie. But smaller from some of these heads or shoots doth arise slender hoary stalkes, about a foote and a halfe high, set here and there with such like leaves as grow below, but smaller, at the top whereof stand many scaly silver white and greene heads in a tuft together, out of which breake forth silver white small flowers.

Original from UNIVERSITY OF MICHIGAN

flowers, made of many leaves standing in a double row, in the middle tipt with a little yellow (the whole tuft of flowers doth somewhat resemble the flowers of Yarrow: but much more pleasant to behold) which stand a great while in flower, and afterwards turne into small chaffy seed: thus boldeth some heads on the leaves all the Winter, but are very small untill the Spring begin to come on, which then shoote forth, and become as large as is expressed before, having little or no smell at all, but exceeding bitter.

2. *Absinthium umbelliferum tenuifolium.* White tufted Wormewood with fine leaves.

This other white Wormewood, hath much smaller and finer cut leaves than the former, but as hoary white as the other: the stalkes are shorter and thing to high: the umbell or tuft of flowers is somewhat smaller also, but as white, so that it differeth in nothing from the former, but in the smallnesse of the plant, and in the small and fine divisions of the leaves, neither hath it any more smell or lesse bitter taste. *Ruellius* maketh two sorts more of this kind, when as *Dodonæus* in his *Pemptades*, that all the differences arise onely from the soyle and climate, which he hath observed both by sight of the divers plants, and examining of them.

3. *Absinthium album Vallesiacum.* The Valdaine white tufted or Wormewood.

This white Wormewood hath many soft woolly and very white leaves, small, long and narrow, made very like unto our fine Wormewood, but much *Lanuginous* or hairy, taketh it is of the very same virtues, are also of a sweeter scent, and not so long as all the rest: the flowers are yellow, that grow towards the toppes of the stalkes, which are many as give small seed like the other kinds of Wormewood.

4. *Absinthium montanum.* Hairy Mountaine Wormewood.

From a reddish fibrous roote ariseth divers small standing

stalkes about a Spanne high, set very sparsedly, with very fine cut hoary leaves, like both for forme and colour to our ordinary Romane Wormewood: from the middle whereof upwards to the toppes, at the severall joynts with the leaves shoote forth slender stalkes, bearing at the ends of them scaly heads, out of which come pale coloured flowers, and after them small blacke seed, smelling like Tansie, the whole plant smelleth and tasteth like Wormewood.

Bauhinus setteth forth another sort, which he calleth *Absinthium Abrotani cauliculis brevibus*, which should be here inserted, but that I thinke it rather a *species* of the *Absinthium ponticum*, because hee saith it beareth heads like the *Seriphium*, or *Santonicum*, and therefore I forbeare to recite it.

The Place.

The first groweth as plentifully in *England*, in many places wild, as in other Countries. The second is found upon divers high Mountaines, and not elsewhere wild, but is nursed up in many gardens both in *Italy* and *Germany*, and so with some lovers of rare plants with us. The third *Clusius* saith groweth plentifully in many places of *Hungary* and *Austria*, and in other places also as other Writers doe set downe, it is much esteemed in our Country, and therefore found in many Country gardens of our Land. The fourth *Clusius* saith, he onely found in *Austria*, where women gather it and bring it to *Vienna*, for the use of the Apothecaries, or any else, promiscuously with the other Pontike or Romane Wormewood. The fifth is not knowne whence his originall was, but is onely kept in gardens as a rarity, and scarcely among others. The first *Clusius* saith he first found, onely on the high cliffes of *Austria* and *Styria*, and afterwards on the Mountaines. The seventh groweth on Mount *Baldus*, and on *Seravo* one of the Bellune Mountaines. The eighth groweth on the hills, among the Valesians, as the last doth also.

The Time.

They doe all for the most part flower in August, yet some earlier, or later than others.

The Names.

Wormewood is called in Greeke [illegible] *amarissimum, vel importabile, vel inhabile, quia illud non tangunt quidam sed deglutiunt celeriter bibentes. Dioscorides* calleth it also [illegible] *a profunde amarore.* The first is generally called *Absinthium vulgare*, and of some *Santolinum*, yet *Ruellius* calleth it *Ponticum*, and *Bauhinus* saith it is the *Ponticum Plinii & Romanum officinarum*, meaning his owne Country: for I am sure it is not so called by any of our Apothecaries in their shops. The second is scarce knowne to any in our Land, *Gesner in hortis* calleth it *Absinthium commune minus sive Alpinum*, *Camerarius* upon *Matthiolus Absinthium montanum*, and so doth *Tabernamontanus* who calleth it also *Romanum*, *Lobel* calleth it *Absinthium Ponticum Alpinum*, and *Gerard Absinthium tenuifolium Ponticum Galeni*. The third is more frequent as I said before, and usually called *Absinthium Ponticum*, or *Romanum*, of most Writers, judging it to bee the true *Absinthium* of *Pontus*, that *Dioscorides* and *Galen* doe commend; yet *Gesner* and *Lacuna* call it *Abrotanum femina*, and so doth *Fuchsius*, for which as I said in the Chapter before, *Matthiolus* taxeth him of an error. *Tragus* calls it *Abrotanum mares*, and *Cordus* upon *Dioscorides Abrotanum album*. *Ruellius* and *Cesalpinus* take it to be *Absinthium Santonicum*: and *Lobel* and *Pena* in their *Adversaria* set it downe for the *Absinthium Gallicum Sardonium* of *Dioscorides*, in English every where almost, Romane Wormewood, or Cypresse. The fourth is called by *Clusius Absinthium tenuifolium Austriacum*, and by *Lobel* and *Lugdunensis Absinthium Ponticum Tridentinum herbariorum*, by *Dodonæus Absinthium Seriphium*, but his figure is the same, with *Clusius* his *Austriacum*, *Lobel* his *Tridentinum*, and *Gerard* his *tenuifolium sive Romanum*, in the fifth fine leafed Wormewood of *Austria*. The fifth *Gesner in hort.* and *Lobel* in his observations call *Absinthium insipidum*, and *Bauhinus Absinthium Ponticum Absinthio vulgari simile*, in English Vulgare Wormewood. The sixth *Clusius* calleth *Absinthium Alpinum umbelliferum*, *Camerarius Absinthium Ponticum flore albo*, and *Lobel* and others *Absinthium album*, in English white tufted Wormewood. The 7. is another kind hereof growing in other places, as *Bauhinus* hath well observed, and so setteth it downe in his *Prodromus*, for *Pona* setteth forth 3. *species* in his Italian Booke, differing in nothing but the smalnes of leaves and flowers, *Lobel* calleth it *Absinthium alterum Italicum*. The 8. is called by *Gesner in hortis*, *Absinthium Seriphii semine*, & in his Appendix *Absinthium album Valesiæ*, for he saith in the said Country of *Valesia* it is called *herba alba*, *Camerarius* saith it is called by some *Absinthium Santonicum*, & thinketh it may better be called *Santonicum femina Valesiorum*, than *Seriphium*, & *Gesner* doth, *Bauhinus* calleth it *Absinthium Seriphium montanum angustifolium*. The last *Bauhinus* calleth *Absinthium Alpinum minimum*, and saith it is the *Alpinum* 2. of *Pona*, in his Italian *Baldus*, because *Pona* there saith it is very like that of *Gesner* & *Camerarius*, which is the last before this, but I cannot so thinke, for that of *Pona* is a *species* of the umbelliferous kinds. There is a controversy among many learned men and Writers, as you may here well perceive, by their names they give to the severall Wormewoods are extant; which should be the true *Absinthium Ponticum* that *Dioscorides* prefereth, and *Galen* so much commendeth and preferreth before all others, both for the good smell, and aromaticall taste, others being excessive bitter and loathsome, and that it hath lesser leaves and flowers, but especially for the attraction it hath more than others, which is so effectuall for the liver and stomacke. *Lobel* and *Pena* in their *Adversaria* have scanned the matter, and answered all objections as I thinke at large. The summe whereof to let slippe I will here set downe for all to understand. First, for the kindes. *Dioscorides* and *Galen* make but one kinde of *Absinthium*, and not many and but onely say, that the best in property groweth in *Pontus*, as they doe in divers other hearbes, there in what place the most vigorous of that kinde doth grow, which property it obtaineth, more by the goodnesse of the place, injoying the commodity of a free and cleare ayre, and other things correspondent, then by the nature of the hearbe it selfe. Then for the scent, that it is more aromaticall than others, yet hereby they intimate that others are sweet, although not so much, which is well knowne likewise to be the benefit of the place where it groweth, for some hearbes are more or lesse sweet, or more or lesse stinking, which transplanted doe alter; as *Agrimony* and divers others are sweet in some place, and nothing at all in others. Then the leaves have troubled many learned men, for they thinke it a fault in the transcribers, to set downe lesser for greater or longer, as it often happeneth in *Theophrastus*. But more often in *Dioscorides* as in the Chapters of *Helenium Abrotanum* and others, & may be also in *Galen*, not by his owne fault but by the transcribers: but *Galen* himselfe in his Chapter of *Abrotanum* taketh away all these doubts, where he saith thus, there are three Species, or differences put under the name of one kinde of Wormewood, that which is called *Ponticum*, the second *Santonicum*, and the third *Seriphium*: *Seriphium* and *Santonicum* are enemies to the stomacke, and trouble it: Wormewood onely among them named *Ponticum*, that is growing in *Pontus*, is pleasing to the stomacke. From which place we may well gather that the strife is appeased, concerning this matter that

our

our common Wormewood is that Wormewood of *Dioscorides*, the best whereof as he saith, is that which groweth in *Pontus*, without naming either *species* or *genus*: so that it is for certaine that our common or Romane kinde, is not another from the *Ponticum*, and by reason of the place is more vigorous and effectuall, but not differing in property. *Galen* acknowledgeth that in this there is bitternesse, and an altriction gratefull to the stomacke, necessary for cholericke vomettings, and to cleanse it from obstructions, by which it giveth strength and comfort thereunto: which things we see by infinite and daily experiments, even of the common people, as well as of Physitians, to be effected by our common Wormewood, used either inwardly or outwardly: none findeth fault with the smell for it is of an aromaticall scent, and is very fit and apt to refreth the spirits of any: *Galen* in appointing that of *Pontus* to be used, doth it rather to exclude the *Seriphium* and *Scythicum*, then that which he simply calleth *Absinthium*: Thus much I thought good to relate out of *Pena* and *Lobel*, referring the rest to the learned, to be further satisfied, if they please to read the whole tractate: but by this is said you see, that the vertues of our common Wormewood are so excellent, that we need not seeke for another kinde to performe those, that are commended in Wormewood: and therefore I the more marvaile at our Apothecaries, that take the Sea Wormewood, in stead of the Romane or Ponticke, and use it rather than the common, onely because there is lesse bitternesse therein, than in the common, and therefore more pleasing to the taste, when as the properties are no way answerable. Neither can I commend the use of that fine leafed Wormewood, which is commonly called Romane Wormewood, to bee used in stead of the Ponticke, not having either that bitternesse or that altriction, which are both so comfortable to the liver and stomacke. Our common Wormewood hath beene observed to grow in *Pontus*, and the Countries there abouts, by *Bellonius* in his travels, as he setteth it downe in his 76. Chapter of his first Booke of observations, and elsewhere, and brought to *Constantinople* for their use there. And it is generally held, that the Arabian Physitians did first name it Romane, which *Dioscorides* named Ponticke, and from them, all others since have held it in so great account, imagining it to be a sort differing from the common. The Arabians call it *Afsinthium*, the Italians *Affenzo*, the Spaniards *Ajenjos*, the French *Aloine* and *Absoste*, or *Absinthe*: the Germanes *Wermuet*, the Dutch *Affsem*, and we Wormewood.

The Vertues.

Dioscorides saith that Wormewood is of an heating and binding property, that it purgeth choller, that cleaveth to the stomacke or belly: that it provoketh urine, that it helpeth surfeits, and that taken with *Sesili* and *Spica Celtica*, it easeth the paines of the stomacke, and the hard swellings of the belly: the decoction or the infusion thereof taken, doth take away the loathing to meate, and helpeth those that have the yellow jaundise: (for which purpose *Camerarius* in his *horto medico*, giveth a good receite. Take saith hee of the flowers of Wormewood, Rosemary, and blacke thorne, of each alike quantity; of Saffron halfe that quantity: all which being boyled in Rensh-wine, let it be given after the body is prepared by purging, &c. A small draught thereof taken for some few dayes together, bringeth downe women monethly courses: being taken with vinegar, it helpeth those that by Mushrooms, are almost strangled: being taken in wine it is a remedy against the potion of *Iris* (which as I said before, is the roote of the blacke *Chameleon*, and with *Pliny* translated *viscum*, Mistletoe or Birdlime) of Hemlocke, the biting of that small beast or Mouse which we call a Shrew, and of the biting of that Sea fish called *Dracunculus*, which is called a Quaviver: it helpeth the Quinsie being annointed with it, and Nuts mixed together: and taketh away whitles and pothes used with water: it taketh away the black and blue markes in the skinne, that come after bruising or beating, if it be mingled with honey and annointed; as also it helpeth the dimnesse of the eyesight being used in the like manner: it helpeth sore and running eares, as also easeth the paines of them, if the hot vapours of the decoction, bee taken in thereat by a funnell or otherwise; it easeth the toothach: a decoction made thereof with vine or boyled wine, and annointed, easeth the paines of the eyes; it helpeth the paines of the heart and liver, being beaten and mixed with the *Ceratum Cyprinum*, and applyed to the place affected; as also applyed to the stomacke with Rosewater, it giveth much comfort to those that have lien long sicke: it helpeth those that are troubled with the swelling and hardnesse of the spleene, or those that have a hot sharpe water, running betweene the flesh and the skin, if it be used with figges, vineger, and the meale of Darnell: The wine that is made thereof, called Wormewood wine, is availeable for all these purposes, restoring many to health that have beene troubled with those diseases, so that they have no agues that take thereof. Being put into Chests, or Presses, or Wardrobes, it preserveth them from wormes and mothes, &c. and driveth away Gnats or Wasps, and such like, from any part of the body, if the skin be annointed with the oyle thereof: the joyce is of like effect, but is not used so much in drinkes, for it troubleth the stomacke, and causeth headach: being put into the Inke wherewith Bookes are written, (or printed) it keepeth them from being eaten with Mice. *Galen* in his sixth Booke of simples maketh mention of Wormewood in this manner. Wormewood hath a binding, a bitter, and sharpe quality, it likewise heateth, cleanseth, strengtheth, and dryeth. It therefore purgeth downewards the cholericke humours of the belly, and avoideth them also by urine, especially those that are in the veines: but helpeth no flegme that is contained therein, or in the chests or lungs: for the astringent quality therein, is stronger than the bitter: but by reason of the sharpnesse it partaketh more of heate than of cold, so that the temperature thereof, is hot in the first degree, and dry in the third, yet the juyce is farre better than the hearbe it selfe: and speaking of Sea Wormewood called *Seriphium*, he saith it is like unto Wormewood both in kind and in taste: which qualities *Dioscorides* giveth to *Santonicum*. The of *Seriphium* he saith it is more agreeing to Sothernwood, than to Wormewood: whereby it is strange to observe, that the place in *Dioscorides*, or in *Galen*, is perverted by some Writers faults, for they cannot be so farre differing in judgement one from another: It is often used, and by most, either inwardly given, or outwardly applyed for the wormes, in children or elder persons: *Pliny* saith, it healeth old sores or ulcers in the head, and cureth the itch also: the decoction thereof with Cummin seeds taken warme, easeth the paines of the belly and cholicke: the seed thereof helpeth the bloody flixe, and all other flaxes: it is said, that if a few leaves of Wormewood be eaten, it defendeth one from surfeiting and drunkennesse. The vineger wherein Wormewood is steeped, helpeth all gnawing of a stinking breath, that commeth either from the gums or teeth, or from corruption in the stomacke. It is this wine which commended in tertian and other lingring agues, by opening obstructions and purging the urine, and by strengthning the liver and stomacke: The conserve thereof much used, preserveth them from the dropsie that are fallen into it, or are in danger to fall thereinto, so as there be a fit course held before, by purging the offensive humours, and such other helpes as the learned Physitian may appoint. The

Original from UNIVERSITY OF MICHIGAN

distilled water is somewhat effectuall, but is much weaker to all the purposes aforesaid: yet the temples being washed therewith, it helpeth the paines of the head that come of a cold cause, and dropped into the eyes helpeth to cleare the eyesight. The other Wormewoods, although they have some properties, yet by how much they want of the bitternesse and attriction, by so much weaker they are for the diseases aforesaid.

CHAP. XXXVII.

Absinthium Seriphium fœmarinum, & Italicum. Sea Wormewood, and strange Wormewood.

BEcause I would not overburden one Chapter with too many sorts of Wormewoods, I thought it convenient to entreat of the Seahindes, and other strange sorts, in a Chapter by themselves, which are as followeth.

1. *Absinthium Seriphium fœmarinum Anglicum.* English Sea Wormewood.

The English Sea Wormewood riseth up with many hoary round woody stalkes, three or foure foote high at the least, having thereon divers hoary white long and narrow leaves, broader and longer than any Southernwood leaves of the common Romane Wormewood, but nothing so large as the true Romane Wormewood, of a kind of saltnesse, but not bitter taste, and of a kinde of unpleasing savour: the flowers are small and yellow standing at the joynes with the leaves, towards the toppes of the branches, as the former common Wormewood doth, and give the like small seed: the roote groweth somewhat deepe and woody.

2. *Absinthium Seriphium Narbonense.* French Sea Wormewood.

The French Sea Wormewood groweth not so high as the former, nor so white and hoary, the leaves are small long, and finely cut like them, but thicker, and of an evill coloured greene colour, and strong unpleasant savour, and evill taste: the flowers are yellow, growing as the former doe, and the seed that follow in the small round heads alike.

3. *Absinthium Seriphium Germanicum.* Germane Sea Wormewood.

This Germane Sea wormewood is also very like the last, but with fine hoary white leaves, somewhat finer & smaller, and groweth not so high: in other things there is little or no difference.

4. *Absinthium marinum Lauendulæ folio.* Lavender leafed Sea Wormewood.

4. *Absinthium marinum Lauendulæ folio.* Lavender leafed Sea Wormewood.

This Wormewood shooteth forth many slender weake woodly and tough stalkes, bending a little downewards, whereon doe grow divers hoary white long leaves, somewhat broader than Lavender leaves, having sometimes some cuts or divisions at the bottomes of them, which is but seldome seene, and in a very few of the lowest neare the ground: those that are set on the stalkes are smaller, and sometimes are not divided at the ends, of a reasonable weake scent, betweene Lavender and Southernwood: but unpleasant taste: the flowers grow after the same manner that the common Wormewood doth, and of a yellow colour, and the seed is not unlike thereunto also.

5. *Absinthium Santonicum Ægyptiacum.* Egyptian Wormewood.

I must here remember also this plant (that is set forth by *Matthiolus* the first, and from him *Dodonæus, Lugdunensis, Tabernamontanus, Gerarde* and *Banhinus*, doe all number it among the Wormewoods, as I *Lobel* and *Lyte* likewise doe: yet much doubt whether it be a Wormewood or no, for that they say they saw it growing with *Lettuce* about a foote height, and the dryed plant with *Velvet buds Downe*, to all shew like unto Maidenhaire, with white leaves set on both sides, the middle stalke) rather to incite others to obtaine it, that it may better be knowne, than that I have any knowledge thereof my selfe, whose description *Hasselquist* who had it from *Cayro*, setteth forth in the manner: it is (saith he) a small low bushe, growing in *Egypt*, with small leaves, almost like unto *Lavender cotton*, and many slender short branches set full of leaves: the seed is small and bitter in taste but not extreme: some saith he would make it an *Abrotanum mas*, as they might better, as he saith, call it a *Femina*. Some also thought that the Wormeseed that commeth from the Levant to us, should be gathered from this plant, but as he saith, he is doubtfull thereof himself: yet withall saith, that it hath all the vertues that the Italian Wormewood hath.

6. *Absinthium Santonicum Alexandrinum foli Tamaricis & Lini Semine.* Wormeseed Wormewood, or Levant Wormewood.

This Wormewood likewise is a plant set full of branches, and with very few, and those very fine small leaves on them, as the bottome like unto the finer sorts, of an ash colour, but dotted so plentifully with seed upwards, that it seemeth to be there without leaves, and wholly to consist of seed, which as *Rauwolfius* saith, are somewhat bitter in the naturall places, and of a reasonable good and quicke scent with us, especially if they be fresh and

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

old, but much stronger, as it should seeme by his relation that tasted it, where it grew and moved one to call very forcibly.

The Place.

The first groweth neare our Sea Coasts in many places of this Land, as also of the Low-countries; the second neere the Sea at *Montpelier*, and by *Venice* also; the third in *Misnia* in *Germany*; the fourth about the Coasts of the Venetian Gulph, and in the Iland of *Candy* likewise; the fifth is said to grow in *Egypt*, but *Pona* and *Lobel* doubt thereof: the last groweth in *Syria* and *Arabia*, from whence being brought into divers Christian Countries, it hath there sometimes growne, and there from the figure taken and set forth, *Rauwolfius* as it is set downe in the Appendix to *Lugdunensis* saith, hee saw it growing about *Bethlehem* in the Land of *Jury*.

The Time.

These all flower and seed when the former sorts doe, saving the two last, which running out of warme Countries are later than the rest within us.

The Names.

The names of [illegible] are confounded by many Authors: for the first is called *Absinthium Ponticum*, or *maritimum* by the best Authors, who call it either *Santonicum*, or *Cyprium*, yet *Columna* in *Phytobasano* calleth it *Abrotanum Foemininum*: the second is called by *Dodonæus* and *Lugdunensis* *Absinthium Narbonense*, but *Lobel* his *Absinthium Ponticum*, as in my judgment is the same, although *Dodonæus* makes them different, calling the one *Absinthium Santonicum*, *Cyprium*, as before, the other *Absinthium Santonicum Gallicum*, the third *Cyprium* saith *Lobel* saw in the garden of *Aurelianus Scribonius*, hee had it from *Misnia*, and thereupon he called it *Absinthium Cyprium Misnense*, and *Pauhinus Absinthium Scythicum Germanicum*, and saith it is

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

the *Absinthium Scriphium* of *Gesner in hortis*: the fourth is called by *Lobel, Tabernæmontanus*, and *Gerard, Artemisia marina*, by *Clusius Artemisia folio Lavendulæ*, by *Dodonæus Absinthium angustifolium*, but *Camerarius* wondring why he should so doe, calleth it *Absinthium latifolium marinum*, and by others *Absinthium Scriphium & marinum*, *Camerarius* thinketh it is *Matthiolus* his *Absinthium marinum*, but surely his figure doth much differ from it: the fifth is called by *Matthiolus* and *Lugdunensis*, *Absinthium Scriphium Ægyptium*, by *Dodonæus* and others *Absinthium Ægyptium*, by *Lobel*, *Absinthium alterum sive peregrinum Ægyptium*, and by *Alpinus Absinthium Santonicum Ægyptiacum*: the last is called by *Ingrassia Abrotanum mas*, not knowing that Wormeseed was gathered from it, by *Matthiolus Semantina*, (as the Italians call it, and the French *Barbotin*) and so doe *Dodonæus*, and *Tabernæmontanus*, and *Semen Santonicum* by him, *Lobel Lugdunensis*, and others, *Stoebe Arabum* by *Rauwolfius* and *Lugdunensis* in *Appendix*, *Santonicum* by *Lonicerus*, *Semen Zedoariæ* by *Lobel* and *Absinthium Scriphium Alexandrinum* and *Zinziberum* by *Cordus* upon *Dioscorides*, and in his History of plants also, by *Bauhinus Absinthium Santonicum Alexandrinum & Indicum*, for they are both but one plant, although he setteth them downe for two: by divers others *Semen Lumbricorum & ad Lumbricos*, whose seed is generally called Wormeseed, and therefore I have called the plant rather Wormeseed Wormewood, than Holy Wormewood, not thinking any more holinesse in this than in others.

The Vertues.

The Sea Wormewoods are of nothing that goodnesse in quality as the common and aromaticall bitter sort are, they are as *Dioscorides* and *Galen* say, adverse and hurtfull to the stomack: yet because it hath not that bitternesse therein as the common sort, it is more accepted and used by many, that rather desire to please their palate, than to be cured of their diseases by bitter medicines, our Physitians and Apothecaries feeding this humour for their owne profit, and to please their patients. The Wormeseed is chiefly, and as I may almost say, onely spent for the worms in children, and to smaller effect if elder persons take it.

Chap. XXXVIII.

Chamædrys. Germander.

I Might have joyned both *Chamædrys* and *Teucrium* in one Chapter, because divers Authors both ancient and moderne have not distinguished them, some naming that *Chamædrys* which others call *Teucrium*, and contrarily some call that *Teucrium* that others call *Chamædrys*: yet I thinke it fit to sever them into two Chapters, and speake of them both true and false, as they are now generally received.

1. *Chamædrys vulgaris.*
The common Germander.

Maximus

1. *Chamædrys vulgaris.* The common Germander.

Common Germander shooteth forth sundry stalkes with small and somewhat round leaves, endented about the edges, the flowers stand at the toppes of a deeper purple colour than the next, the roote is composed of divers sprigges, which shoote forth a great way round about, quickly overspreading a ground.

2. *Chamædrys major.* Great Germander.

The great Germander riseth up with bigger and harder square stalkes, halfe a yard high, spreading into divers branches from the very bottome, whereon are set two leaves at a joynt, somewhat larger than in the ordinary, and more dented about the edges, greene above, and somewhat grayish underneath: the flowers doe stand in a longer spiky head, and are larger, but of a paler purple, and gaping like the other: the roote is more bushing with threads, and creepeth lesse than the other. *Prosper Alpinus* saith in his Booke of Egyptian plants, that in *Candy* hee saw a Germander almost two cubits high, with leaves twice or thrice as bigge as any that grew in *Italy*.

3. *Chamædrys Apula vulgatior.* Germander of Naples.

The Germander of *Naples* never riseth up with more than one whitish square stalke, about a foote high, at each joynt whereof grow two long and narrow hairy thicke leaves, dented about the edges, round at the ends, and of a whitish greene colour: the flowers grow at the toppe in a long spike with smaller and rounder leaves set with them, and are hooded as the former are, with whitish beards, and a long yellowish point in the middle, but standing in prickly husks: the seed is small, long, and round headed, yet greater than the proportion of the plant would seeme to give.

4. *Chamædrys laciniata folio.* Jagged Germander, or with fine cut leaves.

This fine Germander riseth up usually but with one weake slender square stalke, divided into other smaller branches of a long not above a foote high, whereon doe grow divers leaves, two always set together at a joynt, on each side of the stalke, which are very much cut in on both sides, making no shew of the forme of any Germander leafe, unlesse one

one head is very well : from the middle to the tops of the ſtalkes, at the joynts with the leaves, come forth purpliſh flowers like the former, after which follow ſmall blackiſh ſeed ; the roote is ſmall and fibrous, and dyeth every yeare after it hath given ſeed, but will come oftentimes of it owne ſowing and ſhedding.

5. Chamædrys ſpinoſa Cretica. Thorney Germander of Candy.

This Thorney Germander is a ſmall low plant, having many ſquare hairy and hoary ſtalkes, not above a cubite high, full of joynts, whereat grow forth divers ſomewhat round and long leaves, dented about the edges, in the lower much more than in the upper, which ſeeme to be without any denting at all : at each joynt with the leaves ſtand forth moſt uſually two thornes, and ſometimes more, which are in ſome ſmall and ſhort, in others bigger and larger : and ſometimes ſhooting forth from thoſe joynts ſmall branches, which end alſo in a thorne : from the middle of the ſtalkes upwards, come forth the flowers at the joynts among the leaves, ſtanding in ſmall hairy and hoary huskes, very like for ſome unto the flowers of Germander, but of a yellowiſh, red or brownish colour : after the flowers are paſt the ſeed groweth in thoſe huskes, which is blacke and round.

6. Chamædrys ſpuria montana Cliſi flore. Mountaine Germander.

The Mountaine Germander riſeth up with many weake and ſlender browniſh woodily ſtalkes, about a foote high ; whereon are ſet without any order as in the former, many ſmall leaves dented about the edges, very like the leaves of the common Germander, but ſomewhat ſmaller, greene on the upper ſide, and gray or hoary underneath : at the end of every ſtalke of leaves, there ſhooteth forth a long ſlender and hairy foote-ſtalke, without any leafe thereon : on the toppe whereof ſtandeth one large white flower, conſiſting for the moſt part of five leaves, yet ſometimes it will have eight or ten, according as nature liſteth, and the fertilty of the ſoyle is ready to produce, with many ſmall threads in the middle : after the flowers are ſhed, there come up in their places large cods or huſkes, of long hairy ſeed like unto thoſe of mountaine *Arach*, but greater : the roote is hard and wooddy, ſhooting long ſtrings and fibres under ground, and divers ſtrings likewiſe above the ground, which like roote as they lye, the ſtalkes that bore ſeed dying downe to the ground every yeare : and the roote renewing them again in the Spring : it hath little ſcent to be perceived therein, but of an aſtringent or drying taſte.

7. Chamædrys Alpina ſaxatilis. Rocke Germander.

From a hard knobbed roote ſhooting forth many blackiſh fibres, ſpring up divers round ſtalkes, about a foote high, not branching forth at all, whereon grow two ſhacke leaves together, in order up to the toppes, the lower being larger than thoſe above, ſomewhat dented about the edges, but not ſo much as thoſe of Germander, of a ſtaining greene colour on the upper ſide, and yet covered as it were with a little hoarineſſe or downe, but very grayiſh, almoſt white underneath : the toppes of the ſtalkes end in a long ſpiky head of flowers, with leaves among them, every one conſiſting of foure or five, and ſometimes of ſixe or ſeven ſmall pointed leaves, of a pale blue colour, with ſome threads in the middle : after which come ſmall round blackiſh ſeed in ſmall huskes : this loſeth not his greene leaves or ſtalkes in Winter, but being of ſmall or no ſcent at all, but of an auſtere and harſh taſte.

8. Chamædrys Pannonica Cornuti. The greater baſtard Germander.

The baſtard Germander (for ſo I eſteeme all of them, rather than true Germanders, which have not hooded and gaping flowers, as the true Germanders hath, but conſiſting of foure or five, or more leaves as theſe doe, however theſe leaves lee like to make them be ſtyled baſtards) hath many ſquare and ſomewhat hairy hollow ſtalkes from the roote, beſet with two large leaves at a joynt, ſomewhat like unto Germander leaves, but larger, and ſeldom dented at the edges : towards the toppes branching forth into ſpiky heads of blue flowers, conſiſting of foure leaves apeece, whereof the uppermoſt is the largeſt, with ſome

4. Chamædrys ſpuria Cretica. Thorny Germander of Candy.

Stripes

florets or yellow thereof, and even small threads and a long pointell in the middle: after which arise small flat, two forked husks, containing small seed: the roote creepeth a little under ground, sending forth here and there some stalkes; but else stalkes also as they lye on the ground, will take roote and shoote forth slipes: the taste of the leaves are bitter.

Original from UNIVERSITY OF MICHIGAN

Clusius giveth two other forts of this kinde, one a hill plant creeping and throwing forth branches sharply square, whose leaves are smaller, and the flowers paler; the other lower, having narrower and larger leaves, else like but not differing in any thing else.

β. *Chamædrys spuria minor latifolia.* The smaller bastard Germander.

This smaller bastard kinde hath many weake purplish, or brownish branches, lying rather on the ground, than standing upright, and not above a foote high, whereon are set two leaves at a joynt as in the rest, very like unto Germander leaves, and dented about the edges also, but somewhat lesser: the toppes of the stalkes are likewise bestowed with spiky heads of flowers, consisting of foure leaves, whereof the uppermost also is the longest, of a more excellent deepe blue than in the other, yet sometimes it is found with flowers of a paler blue, or almost of an ash-colour, and in some pure white: the seed following the flowers is small and reddish, growing in a small huske: the roote is bushy and creeping under ground as well as above, like the other, and abideth like it, shooting forth new stalkes every yeare: the taste hereof is a little bitter like the other, but more stringent.

γ. *Chamædrys spuria minima.* The least bastard Germander.

This least bastard Germander (for the manner of the growing, and height of the plant is very like unto the small Centaury of the Spring, set forth in the Chapter of Centaury of Velvets in my other Booke) hath two or three small short stalkes rising from the roote, not above two or three inches high, whereon doe grow two small dented leaves together, as in the former, but much smaller, rounder, and thicker, and standing so close one joynt unto another, that they can hardly be discerned to grow severally, but all together: from the toppes whereof doe forth make short foote-stalkes, every one sustaining betweene two small leaves, one large flower in comparison of the plant, made of foure leaves like the other, of a pale blue or ash colour: after which come flat and larger huskes than in the other, containing such like small seed: the roote is of many fibres shooting forth here and there some other plants.

21. *Chamædrys spuria sylvestris.* Common Wild Germander.

The common wilde Germander that groweth every where in the Meadowes, sendeth forth divers square upright stalkes, yet sometimes a little bending, having two leaves set at each joynt, one against another, the lower ones somewhat large, and almost round, yet pointed at the ends, and dented about the edges, but smaller up higher, the tops of the stalkes are spiked with divers blue flowers set about them, made of 4 small round leaves a peece, with a little white eye in the middle, small pointed, and foure chives also, after which come small flat pouches, containing small seed: the roote is small and thready.

22. *Chamædrys spuria sylvestris hirsutissima.* Rougher leafed wild Germander.

This small Germander hath divers round reddish stalkes, some what rough, hard and hairy, an hand breadth high bending downwards, whose lower leaves are somewhat long and broad, round at the ends, and not dented at all about the edges; but those that grow up higher upon the stalkes are shorter and narrower pointed also at the ends, and toothed about the edges: the flowers grow spike fashion, being either of a pale blue colour or bluish, made of foure leaves like the other, and in like sort seen: the seed and seede vessels like the roote is blackish, hard and stringy.

23. *Chamædrys Austriaca latifolia.* Lagged white Germander of *Austria*.

The lower of this lagged Germander that grow upon the round rough stalkes, are hard and somewhat hairy, divided into many small long peeces, the flowers are nine standing in a long spike, as many other of the former doe, and round bearded heads after them with very small seed in them.

24. *Chamædrys Hispanica folio crassiore divisa.* Wilde Spanish Germander with fine cut leaves.

The round stalke hereof is more slender than the last and hairy, set with many joynts, and shorter and narrower leaves thereat, full of small leaves at the toppe, where it breaketh forth into two small foote-stalkes, whereon stand six small flowers, with each a small long pointell in the middle.

The Place.

The greater Germander is found in many Countries, as well as in the upper *Germany*, as *Clusius* saith, and the lesse in the lower, as *Lobel* saith, they are onely found in gardens with us. The third groweth in the fields of *Naples*. The fourth groweth in *Savoy*, as *Johannes Tradus* saith, and is onely preserved with those that are curious conservers of rare simples. The fifth we have often had among other seeds out of *Italy* and *Spaine* from *Barrelo*, and did grow in Cardinall *Bembus* his garden, as *Ruellius* saith. The sixth *Clusius* saith he found on the highest toppes of the Alpes in *Austria* and *Styria*, and *Camerarius* saith it is found plentifully on the Hills South to *Styria* and *Stutzerland*, and in Dunsplowne in *Essex*, as *Gerard* saith. The seventh *Pona* setteth downe in the description of *Mons Baldus* that he found there. The eighth and the two lesser kindes thereof, *Clusius* saith he found in *Hungary*, *Austria*, *Bohemia*, and other places thereabouts. The much *Clusius* also saith hee found in the lower *Austria*, about *Vienna* and *Newstad*. The tenth *Clusius* also saith he found in the toppe of the lowest Mountaine in *Austria* called *Leopoldus*. The eleventh is found, in every Meadow that growes the Land almost, as also by ditches and hedge sides: The twelfth in the Meadowes by *Puffe*. The thirteenth in *Austria*, and the last in *Spaine*.

The Time.

These also flower in June or July at the furthest, except the Thorney Germander, and the Spanish and Candy kindes, which flower late.

The Names.

Germander is called in Greeke [illegible], quasi *Chamædrys, quasi Humilis aut parva quercus, a foliorum similitudine*, and *Teucrium* of *Teucer* King of *Troy*, as *Dioscorides* saith, in Latine *Chamædrys* of *Pliny*, etc. and *Quercula minor*, and of some *Tormentum*. The first and second are generally called of most *Germanders*, and of some so; and of some as I said *Dioscorides* and *Pliny* call them, according to the kinde, and of some *Serratula minor*, and of some others *Scordium*, and *Scordium*, from the taste. The third is called by *Columna Trixago Apula minor*, as *Lobel* saith, and by *Ruellius Botrys*. The fourth is called by *Matthiolus Chamædrys altera* and in *Italy Camedrio*, and *Camedreo*, who accounteth it an error in them that would make it *Chamæpitys*, as *Dodonæus* doth. *Fuchsius* and others *Chamædrys spuria*. *Tragus* calleth it *Germander* that is *scrofula*, and *Matthiolus* to be *Chamædrys altera Dioscoridis*, whom *Dodonæus* and *Clusius* follow. The fifth is called *Chamædrys* and *Botrys* and *Botrys Chamædryoides*, and by that name hath continually been sent to us. *Bauhinus* calleth it *Botrys Chamædryoides*,

Original from UNIVERSITY OF MICHIGAN

dragides. The fifth *Bauhinus* hath onely set forth and given it the name in the title. The sixth is called by *Clusius Chamædrys montana*, and by those *Lugdunenses* and *Tabernæmontanus*, who saith it is also called *Argentina Montpelliensis*, *Chamædrys Alpina* by *Camerarius*, who saith some called it *Hirsuta*, and thereupon *Gesner* called it *Cirsium de herba Cerefolij quibusdam*. *Lobel* called it *Chamædrys montana frutescens durior*. *Lugdunensis* saith, some call it *Leucas* of *Dioscorides*. *Bauhinus* calleth it *Chamædrys Alpina Cisti flore*. The seventh is called by *Pena* in the description of *Clusius Rafidas Veronica parvi & semper virens*: *Bauhinus* saith it is *Clusius* his sixth *Teucrium pumilum* in his History of plants, and calleth it himselfe *Chamædrys Alpina saxatilis*. The eighth is called by *Clusius Teucrium nonum Pannonicum*, in his Pannonick observations, and maketh it the fourth *Teucrium* in his History. *Bauhinus* calleth it *Chamædrys spuria major flore striato*. The ninth is *Clusius* his fifth *Teucrium* in his History of plants, or *Teucrium Pannonicum minus*, which *Bauhinus* calleth *Chamædrys spuria minor latifolia*. The tenth *Clusius* calleth *Teucrium maximum*, and *Bauhinus Chamædrys Alpina maxima hirsuta*. The eleventh is called *Chamædrys vulgaris* of some by *Fuchsius*, *Turner*, *Lonicerus*, and *Lugdunenses*, *Hyndehemedys* by *Thalius*, *Teucrium præcox* by *Lobel*, and by *Clusius*, and commonly with us *Chamædrys*, *Germander*: the twelfe is called by *Bauhinus Chamædrys spuria minor angustifolia*, who taketh it to be the third sort of the fourth kinde of *Clusius* his *Teucrium*. The thirteenth and the last are remembred onely by *Bauhinus*. There is some doubt ouerthe among our latter writers, what herbe should be the true *Chamædrys* and *Teucrium* of *Dioscorides*, *Galen* and other ancient writers: for *Dodonæus* by comparing both the Texts, saith that our common *Chamædrys* doth more properly belong to the descriptions of *Dioscorides* and *Rhazis Teucrium*, and accordingly *Teucrium* unto *Chamædrys*, for *Dioscorides* setteth them downe in this manner, [illegible] that is, Germander is a small shrubbe of a span height, and of the other he saith, *Teucrium herba est virgata, foliis virgatis plurcs ferchi*. *Teucrium* is an herb bearing many stalkes, and hereby he saith it is evident, our common Germander is not a shrub, which doth raise it selfe up as *Teucrium* doth; and besides that, *Plinie* in describing *Teucrium* saith, it spreadeth branches like rushes, which doth more fitly agree to our common Germander: thereby transferring the *Chamædrys* to be the taller shrub, and *Teucrium* the lesser and lower: yet he saith, seeing *Dioscorides* himselfe saith, that in his time they were transferred, for the likenesse of their leaves one unto another, it is not absurd to call them as they are usually entituled: but as I shall shew you in the next Chapter, the *Teucrium* of *Dioscorides* is better to be explained than *Dodonæus* doth. It seemeth also that *Dodonæus* having become in an errour in his former workes concerning *Hieracium mas & fœmina*, giving the figures of the *Chamædrys sylvestris* thereunto, reclaimed himselfe in his later History of *Pemptades*, and left them both out, as not allowing of his former opinion. The Arabians call it *Domedrie Chamæritis* and *Kamadrion*: the Italians *Camedrio* and *Querciuola*, and some *Calamandrina*: the Spaniards *Chamædrios*: the French *Germandrée*: the Germanes *Gamanderle* and *Bathengele*: the Dutch *Gamander*, and we in English Germander.

The Vertues.

Germander is hot and dry in the third degree, and is more sharpe and bitter than *Teucrium*, and as *Dioscorides* saith, is a remedy for coughes taken with honey, for those whose spleene is become hard, for those that can hardly make their water, and helpeth those that are falling into a dropsie, in the beginning of the disease, especially if a decoction be made thereof, when it is greene and drunke. It doth likewise bring downe the termes, helpe to expell the dead child, and taken with vineger doth waste or consume the spleene: it is most effectuall against the poison of all Serpents, both drunke in wine and laid to the place: used with honey it cleanseth old and foule ulcers, and taketh away the dimnesse and mistinesse of the eyes, being made into an oyle and annointed. It is likewise good for the paines in the soles, and for crampes. The decoction thereof taken for some dayes together, driveth away, and cureth both quartane and tertian agues. The Tuscane, as *Blasius Lolas* saith, doe highly esteeme thereof, and by their experience have found it, as effectuall against the plague or pestilence, as *Scordium* or water Germander. It is also as he saith good against all the diseases of the braine, as the continuall paines of the head, the falling sicknesse, melancholicke fullenesse, the drowsie evill, those that are forth through the dulnesse of the spirits, and for crampe, convulsions, and palsies: a dramme of the seed taken in powder, doth purge choller by urine, and is thereby good for the yellow jaundise: the juyce of the leaves dropped into the eares, killeth the wormes in them: It is also given to kill the wormes in the belly: which a few toppes of them when they are in flower laid to steepe a day and a night in a draught of white wine, and drunke in the morning will doe also. *Theophrastus* in setting downe the properties of Germander saith, that the one part of the roote pierceth upwards, and the other part downwards; wherein there is more wonder than for *Thapsia* and *Iselia*, that is blistering Fennell and tuberous or knobbed Stonegroden so: *Andreas Vesalius*, pag. 49. speaking of the China roote saith, that if a decoction hereof bee made in wine, and taken for 20. dayes continually foure houres before meate, it is a certaine remedy for the gowt. *Dioscorides* giveth the receipt of a Syrupe very effectuall for the spleene in this manner. Take saith he, Germander (*Chamepitys* or Ground Pine, Ceterach or Mile waste, and Madder, of each one handfull: the barke of the roote of Capers, the rootes of Smallage, Elecampane, Orris, or Flagge Flower-de-luce and Liquorice, of each halfe an ounce. Of the leaves and barke of Tamariske, and of Cyperus, of each three drammes, of the seed of Anise, Fennell and Smallage, of each one dramme, of Isatis flowes one ounce. Let all these be boyled according to art, in a sufficient quantity of Posset, (that is of vineger and water equall parts.) Vnto each pound of this decoction being strained, put five ounces of Sugar, and three ounces of Cinamon water, which being made into a cleare Syrupe, take foure ounces every morning fasting. The decoction thereof is good to stay the whites in women, if they sit therein while it is warme, and likewise easeth the passions of the mother: being boyled in vineger and applyed to the stomacke with a little leaven, stayeth vomitings, that rise not from chollericke or hot causes: the leaves hereof and the seed of *Aegilla* quilted in a Cap, stayeth the catarrhe or distillation of raw cold and thinne rheumes: being boyled in lye with some Lupines or flat beanes and the head washed therewith taketh away the dandraffe or scurfe thereof. The mountaine Germander is used by those of the Alpes, where it groweth; to stay all manner of fluxes, whether of the belly, or of the blood, the feminine courses, and the bloody flixe, as also to stay vomiting.

Teucrium

Chap. XXXIX.

Teucrium. Tree Germander.

THere groweth that I shew you in this Chapter the rest of the Germanders called *Teucria* Tree Germanders to distinguish them from the former sorts, whether they be true or false.

1. *Teucrium arbuscula latifolium*
The more common Tree Germander.

1. *Teucrium arbuscula latifolium.* The more common Tree Germander.

Tree Germander groweth like a little shrubbe, and hard woodily, but brittle stalkes, a foot or two and sometimes a yard high, if it be well preserved and defended from the injuries of the Winters, branching forth on all sides from the very bottome, bearing alwayes leaves by couples, smaller, smoother and thicker than those of Germander, of a darke dyeing greene colour on the upperside, and grayish underneath, and dented also about the edges like them; the gaping flowers stand about the toppes of the branches spike fashion, one above another, of a pale whitish colour tain'd *Cæsius*, or a purplish tawny *Bay*, of both which I have had plants, somewhat longer than those of Germander, and without any hood above, having a few threads standing forth; the seed is small, blackish and round, contained in small round, but pointed husks; the roote is somewhat woodily, with many blu lush fibres; the whole plant is of a fine weake scent, but somewhat stronger if it be a little bruised, holding the stalkes and greene leaves continually, if it be not espoiled to the sharpnesse of the Winter season.

2. *Teucrium Creticum.* Tree Germander of Candy.

This shrubby Germander of *Candy* riseth up with such like woodily brittle stalkes as the former, but somewhat smaller and whiter, whereon doe grow such like leaves, and in the same manner, but somewhat lesser, lesse greene, and shining above, and more hoary underneath, two alwayes set at a joynt, but on the contrary side; with the leaves towards the toppes come forth five or six flowers standing in a husk, like unto the former, but a little lesse, and of a purple colour, after which come small round seed like the other; the whole plant is somewhat sweeter than the former.

3. *Teucrium Hispanicum.* Tree Germander of *Spaine.*

This Spanish shrubby Germander groweth in some places of *Spaine*, to the height of a man, but usually much lower with one woodily grayish comme or stalke, dividing it selfe into some branches, but lower than the former, two alwayes set at a joynt; the leaves stand likewise two together, somewhat greater, and waved a little at the edges, of a sad greene colour above, but not shining, and more hoary underneath, the flowers stand at the joynts with the leaves towards the toppes of the stalkes, of a white colour, without any hood above, and with sundry threads in the middle, the lower leaves hanging downewards; the smell thereof is lesse sweet and more bitter than the former, but abideth in the stalkes and leaves thereof, greene like the reed, but will require a little more care for the Winters provision in our Country.

4. *Teucrium Montanum.* Vnsavory Tree Germander of the Alpes.

This small low growing shrub hath divers hairy and woodily stalkes, not above an hand breadth high bending downewards, and dividing it selfe into many smaller branches, whereon are set very small hoary leaves, somewhat rugged or wrinkled and dented a little about the edges, like unto the uppermost small leaves of wood sage, the flowers are set loose for the preservation of the plant, being like unto Germander and hooded, of a purplish blue colour, standing in the bosomes of the leaves at the toppes of the stalkes, the seed is skinny and white, the whole plant hath little or no scent.

The Place.

The first groweth in the rocky places of sundry hills in *Italy*, and other Countries; the second came from *Candy* to *Clusius*, the third *Cordus* saith he found neare the sea coasts in *Spaine*, not farre from *Hercules* pillars, as also in the Island of *Cadiz*; the last in *Austria* neere *Vienna*, was found on the greater hill of Some *Tartars* in Switzerland.

The Names.

This Tree Germander doth differ to know but little from the former.

The Nature.

The first and second is wholly, and the last in part *Temperate* like *Plants*, and may also call it *Temperate*. In the 4. Chapter the description of *Dioscorides* is ordinarie something *Teucrium* and *Chamædrys*, but he doth not in my opinion declare the whole truth, which from the text of *Dioscorides* may bee gathered; for *Chamædrys* he saith *folia habet effigie quodammodo querna*, it hath leaves like the Oake, both for shape and division,

which

Original from UNIVERSITY OF MICHIGAN

5. *Teucrium Bastard.*
Tree Germander or Spine

which argueth them to bee greater than of *Teucrium*, whereof hee saith, *Trissagon est similitudine tenuifolia, non multum a Cicere altero*: so that *Teucrium* hath lesser leaves than *Chamædrys*, yet like the lesser sorts thereof, and not much differing from those of the peasse, and with such leaves is the *Teucrium* furnished. *Pliny* in his 25. Booke and 5. Chapter, hath finely erred in the description of *Teucrium*, where he saith it is called *Hemionitis*, or *Hemionion* (as *Matthiolus* hath it) having neither flower nor seed, which some would call *Asplenion* or *Splenion*, as he hath it, and then telleth tables how the vertue thereof was knowne to be good against the spleene, in that the Swine that eate thereof were found to have no milt. And againe, that the intrailes of Beasts being cast upon the hearbe, the milt or spleene of them only lying nearest was consumed, *fellent*, of the dead flesh, and then addeth by way of true description (although somewhat varying from that of *Dioscorides*) of *Teucrium*, so that he confoundeth both *Hemionitis* and *Teucrium* together in one description. *Matthiolus* saith that some did take *Teucrium* or *Scordium* minus, or *Balamitesa*, called by others *Telephium*. The first is simply called *Teucrium* by *Matthiolus*, *Lobel*, and many other Authors, and by *Clusius Teucrium caule fruticoso*, but by *Dodonæus Chamædrys altera seu Alterum genus*, so by *Gesner* called *Teucrium Creticum*, saying it was sent by the name of *Chamædrys vulgaris*, and *Bauhinus Teucrium Creticum minimum*: the third *Clusius* calleth *Teucrium frutescens Hispanicum*, and so doe *Lugdunenses*, *Tabernæmontanus*, and others, that have taken it from him. *Bauhinus* calleth it *Teucrium pseudo-chamæpitys folio sinuato*, and maketh a *quere*, whether *Clusius* had made before, *an Teucrium Creticum Dioscoridis*: the last *Bauhinus* calleth *Pinus*, and *Tragus* calleth *Teucrium Alpinum, inodorum magno flore*, and yet is the same with the *Teucrium folio Scordonia*, as any may well see that will compare them together, for *Tragus* even he that had his from *Candy*, by the name of *Scordium verum*, sheweth that it hath the leaves of *Scordonia*, but lesse.

The Vertues.

Galen maketh *Teucrium* to be hot in the second degree, and dry in the third, and of thinne parts, and cutting also, whereby it is helpfull for the spleene: it is saith *Dioscorides* used either greene or dry, and is good to consume the spleene, being inwardly or outwardly applyed: it is also used against the biting of venemous creatures.

CHAP. XL.

Scordium. Water Germander.

Scordium being a kinde of Germander must be next entreated of, yet for that it smelleth of Garlick, it could be separated from them, and with it the other of his kinde, and some also for the affinity in name or kinde are not unfit to be joyned together in this Chapter.

1. *Scordium legitimum.* Water Germander.

Water Germander riseth of a small roote full of white strings spreading in the ground, and creeping or running about also, shooteth forth divers weake square hairy branches, which take roote in divers places, as they lye and spread, whereby it encreaseth much, whereon doe grow many leaves, two alwayes at a joynt, which are somewhat larger and longer than garden Germander leaves, of a sad or darke greene colour, whereon yet there is a kinde of hairinesse and hoarinesse, somewhat soft in handling, full of veines, and dented about the edges, of a scent somewhat strong, resembling Garlicke: the flowers are small, red, and gaping, standing at the joynts, with the leaves towards the toppes of the branches: we have not observed what seed it beareth.

2. *Scordonia sive Scordium alterum quibusdam, & Salvia agrestis.* Wood Sage.

Wood Sage riseth up with square hoary stalkes, two foote high at the least, having two leaves set at every joynt thereon, which are somewhat like unto Sage leaves, but smaller, softer, whiter and rounder, a little dented about the edges, and smelling somewhat strongly: at the tops of the stalkes and branches stand the flowers in a slender long spike, turning themselves all one way when they blow, and are of a pale or whitish colour smaller than Sage, but hooded, and gaping like unto them: the seed is blackish and round, foure usually set in a husk together: the roote is long and stringy, with divers fibres thereat, and endureth many yeares.

3. *Scordium Plinii primum.* The first Garlicke Germander of *Pliny*.

Because *Dodonæus*, *Lobel*, *Pena*, and *Dalechampius*, have set forth divers hearbes for the true *Scordium* of *Pliny*, some *Scordonia* or *Salvia agrestis*, some *Stachys*, and others *Gallitrichum*, none of them having the smell of *Scordium*, or the vertues that *Pliny* giveth to his *Scordium*: therefore *Plinius Bellus* a Phylitian in Candy, a diligent searcher, and of great knowledge and judgement in hearbes, sent to his friends in divers places, the true *Scordium* of *Pliny*, with the leafe of Wild Mints, or water Mints; whose description is as followeth: it hath from a long creeping and fibrous roote, abiding long, and not perishing every yeare, many square hairy white branches, lying round about it on the ground: whereon are set two leaves at a joynt, broader and rounder than the former *Scordium*, and all hoary white, being somewhat like unto the leaves of Horehound, or water Mints: at the toppes of the branches

1. Scordium legitimum. Water Germander.

2. Scordium sive Scordium alterum galegidem & latifolium. Wood sage.

3. Scordium Plinij primum. The first Garlicke Germander of Pliny.

come forth the flowers standing as it were in a long spiky head, with leaves among them, which are of a very pale purplish colour, almost white like unto Horehound, after which commeth small round blacke seed: the whole plant smelleth of Garlick, as much as Scordium, and thereby to be knowne as well as by the leaves, to differ from those before vnder these other Authors haue set forth.

4. Scordium alterum Plinij Fuchs. Another Garlicke Germander of *Pliny*.

The other Scordium riseth vp with fix stalkes more vpright, and more branched than the former, bearing the like leaves,

4. Sanicula officinarum Tabernæ. Anglice, Sanicle or Containe of Bury.

5. Sellaria. Sawle alone at Ickely the hedge.

leaves, but somewhat larger, and roundly dented about the edges, two at every joynt, and two branches with them like wife, having tuked toppes of reddish flowers.

5. *Sellaria.* Sawle alone, or Ickle by the hedge.

The lowne leaves of Sawle alone are rounder than thistle that grow towards the toppes of the stalkes, and are set finely one at a joynt, being somewhat round and broad, and pointed at the ends, dented also about the edges, and somewhat resembling Nettle leaves for the forme, but of a fresher greene colour, and not rough or pricking: the flowers are very small and white growing at the toppes of the stalkes one above another, like unto Rocket, which being past, there follow small and long round pods, wherein are contained small round seed somewhat blackish: the roote is thinne and threadly, perishing every yeare after it hath given seed, and raiseth it selfe againe from its owne sowing: the whole of any part thereof being bruised, smelleth of Garlicke, but more pleasantly, and tasteth somewhat hot and sharpe, like almost unto Rocket.

Alter. This is sometimes found with larger and rounder leaves, in nothing else differing.

6. *Scordium Scrophularia Clusiana.* The Germander like hearbe of Scyples.

This Germander like hearbe hath a square tender hollow stalke, somewhat hairy, and of a whitish greene colour as the leaves are like wilde, two alwayes set at a joynt, the lowest being smaller than the other that grow upward in the middle of the stalke, being somewhat like unto Mint leaves, but rounder at the points, and roundly dented about the edges like Germander, one more sparingly: from the joynts with the leaves on all sides, from the very bottome almost of the stalke, spring forth branches set with the like, but smaller, longer, and more pointed leaves towards the toppes where growe forth gold yellow gaping or hooded flowers, every one upon a slender footstalke, betweene the leaves like the head of an Elephant, with the bowed snowt, and two crooked seeds on each side thereof, and purplish spots like eyes under the upper lippe of a very sweet scent, and flowering by degrees one after another, after which come grayish seed contained in heads with very thinne skins that they may be discerned through them: the roote is long and white, with some transuerse graines like wheate cornes growing at them.

The Place.

The first groweth in many wet grounds, and by water sides in many places of *England*. *Dioscorides* saith, as well on the Hills, as by water sides: but it will abide well if it be transplanted into a garden, and *Cæsalpinus* saith that it is found to be stronger and sharper that groweth on high grounds. The second groweth in woods and by wood sides, as also in diverse fields and by-lanes in many places with us: the third as is said groweth in *Candy*, plentifully. *Hermolaus Barbarus* saith, the people gather it promiscuously with the former sort, and he ate it or tell it to others: the fourth doth grow also in *Candy*, and sent to *Simon Contarini* from whom *Lobel* saith he had the knowledge thereof. The fift groweth under walls, and by hedge sides, and path ways in fields in many places: the last on the hill *Cyllene* in *Naples*, as *Columna* saith.

The

The Time.

They doe flower in Iune, Iuly, and August, some what before which time, the most usuall manner is to gather the water Germander, and dry it to keepe.

The Names.

Water Germander is called in Greeke Σκόρδιον and in Latine *Scordium*, from σκόροδον which is *Allium* Garlicke, because of the smell: the likenesse of the Greeke name did much deceive the former ages before us, for as *Matthiolus* writeth, it began to be knowne but a while before his time, and that all men both Physitians and Apothecaries used the wild Garlick called *Ophioscorodon* in stead of the true *Scordion* in their medicines, the occasion whereof (besides their owne ignorance and negligence in not distinguishing of the words) was *Arabus*, as it is most likely or his Translator that appointed *Scordium* in one composition of Treakle, and wild or crow Garlicke in another: and the Physitians of the former ages, thinking that *Arabus* had interpreted hindelie, expounding one place by another, continued the error by tradition without further search, until learning & all other sciences began to be more sought into, and refined as it were from the grosse puddle of ignorance and barbarisme, which brought the knowledge of this to light, as it did of many other things; so that now our curiosity doth not rest in *nomen & cognitionem*, but transcendeth *ad imaginem & animam rei inquirendam*. It is called also *Trissago palustris*, Water or Marsh Germander, both for the likenesse thereof unto Germander called *Trissago*, and for [illegible] ing thereof in marshes, &c. Some also call it *Polygonon* from the strong scent to unpleasure to the senses [illegible] that *Crateuas* did alledge one of the sorts hereof unto Mithridates, and called it Mithridation; and [illegible] ence as well as from Garlicke, was called poore mens Treakle, and by our Country people Eng[illegible] e full is called *Scordion*, or *Teucrium palustre* of all Writers, and although *Tabernemontanus* and [illegible] h hunt, doth make two sorts thereof, as *major* and *minor*, a greater and a lesser; yet I never could [illegible] ference then in the place which produced them, being one more or lesse fruitfull or barren [illegible] ound is called by *Lobel* and *Camerarius Scordium alterum*, and *Scordium majus Plinij* by *Ge[illegible] Salicis emarcam*, and *Anthyllis quibusdam Trageri*, *Lonicerus*, and *Tabernemontanus*, call[illegible] alica Bubij*, and *Bojeti Salicis*, and *Lugdunensibus Salicis agrestis*, as *Dalechamps* also doth, w[illegible] e *Splendens Theophrasti*, as I have formerly shewed. *Cordus*, *Thalius*, and *Gesner* call [illegible] though his figure thereunto is not right. *Cæsalpinus* calleth it *Mollugini alterum*, *Bi[illegible] m Salicis folijs*. The third is called *Scordium legitimum Plinij*, both of *Bellus* a[illegible] ne *Bubius*, and it is very probable that *Camerarius* doth meane this sort, which [illegible] *Lonicerum*: for as I said before, *Bellus* saith, the people of *Candy* make no differe[illegible] ing put them together. It is probable also, that *Anguillara* called this *Scordium al[illegible]* ich [illegible] and about the banke of the River *Piscara*, with leaves as large as Baulme: and that such is found in [illegible] *Grecce* and other places, nothing differing either in stemme or quality from the first. The fourth is called by [illegible] in his Italian *Baldus Scordium secundum Plinij*. The last is called by most Authors *Alliaria*, yet *Gesner* [illegible] *boreis* calleth it *Alliastrum*, and *Erucius Cordus Rimmarium*, but *Angullara Rimmaria*. *Dalechampius* upon *Plinie* taketh it to be his *Scordium elephas*, and so doth *Lobel* also, some also take it to be *Tulipidium Crateuæ*, and *Tragus* calleth it *Tulipidium cornutum*. The last *Columna* calleth it *Elephas Camporum Lavendulæ*, and *Pauliburs Scordio affinis*, *Elephas*. The Italians call *Scordium Calamandrinæ palustre*, the Spaniards *Camedreos de arroyos*, the French *Scordion* and *Chamarac*, the Germanes *Wasser Reitengel*, and *Lachen Knoblauch*, the Dutch *Water Gamander*, and we in English Water or Marsh Germander. The Italians call Sawce alone, or Iacke by the hedge *Alliaria*, the French *Alliaire*, and *Herbe a ail*, the Germanes *Knoblauchs kraut*, and *Saltz kraut*, the Dutch *Look zonder look*.

The vertues.

Dioscorides and *Galen* doe both agree that water Germander is of an heating and drying, or binding quality, bitter also, and a little sowre and sharpe, whereby it is effectuall to provoke urine, and womens monethly courses: the decoction thereof in wine being either greene or dry, is good against the bytings of all venemous beasts or Serpents, and all other deadly poisons; and also against the gnawing paines of the Stomake, and paines of the side that come either of cold or obstructions, and for the bloody flixe also: made into an Electuary with Castle, Rollin, and Honey, it is availeable against an old cough, and to helpe to expectorate rotten flegme out of the chest and lungs: as also to helpe those that are bursten, and troubled with crampes. *Galen* in [illegible] *Antidot.* (which *Matthiolus* and others also ioyne vnto) recordeth that it was found written by sundry faithfull and discreet men, that in the warre of the Bondmen, where the bodies of the slaine had lien upon *Scordium* any long time, before they were buried, they were found to be lesse putrified than others, that had not fallen thereupon, especially those parts that were next the herbe: which observation bred a perswasion of the vertue thereof to bee effectuall, as well against the poison of venemous creatures, as the venome of poisonfull herbes or medicines. It is a speciall ingredient both in Mithridate and Treakle, as a counterpoison against all poisons, and infectious either of the plague or pestilentiall or other Epidemicall diseases, as the small pockes, measels, faint spots, or purples: and the Electuary made thereof, named *Diascordium*, is effectuall for all the said purposes: and besides is often given, and with good successe before the fits of agues, to divert or hinder the accesse, and thereby to drive them away. It is often taken also as a Cordiall to comfort and strengthen the heart. It is a most certaine and knowne common remedy to kill the wormes, either in the stomacke or belly, to take a little of the juyce thereof, or the powder in drinke fasting. The decoction of the dryed herbe is also most soveraigne to Tormentill lined, and given to those that are troubled with the bloody flixe, is a safe and sure remedy for them. The juyce of the herbe alone taken, or a Syrupe made thereof is profitable for many diseases aforesaid, as also for the [illegible] The dryed herbe being used with a little honey cleanseth foule ulcers, and bringeth them to cicatrization, as also defileth fresh wounds: the dryed herbe made into a cerate or pultis, and applyed to corrections in the head, as Wens and such like, helpeth both to constraine the matter from further breeding of them, as also to dissolve and differre them being growne. It being used also with vinegar or water, and applyed to the place, easeth the paine thereof. The greene herbe bruised and laid or bound to any wound, healeth it, for it never festreth. Wood sage is hot and dry in the second degree, the decoction thereof is good to bee given to those whose urine is keyed, for it provoketh it and womens courses also. It is thought to be good against the French poxe, because the decoction thereof drunke doth provoke sweat, digesteth humours, and dissolveth

4. *Gerdo gallicum Tabernæmontani.* Another Garlike Germander of Dod.

5. *Scordium.* Sawce Alone, or Hockly the lesse.

leaves, but somewhat larger, and roundly dent[ed] [e]very joynt, and two branches with them likewise, having [pur]ple tops [and] red[dish] [flo]wers.

5. *Scordium.* [Sawce] Alone.

The lower leaves of Sawce Alone are round[ish] [and] those that grow towards the toppes of the stalkes, and are [o]fcentimes set at a joynt, being somewhat round [and] pointed at the ends, dented also about the edges, and somewhat resembling Nettle leaves for the forme, but of a fresher greene colour, and not rough or pricking, the flowers are very small and white growing at the tops of the stalkes one above another, like unto Hockly, which being past, there follow small and long round pods, wherein are contained small round seed somewhat blackish, the roote is stringy and threaddy, perishing every yeare after it hath given seed, and raiseth it selfe again from any owne fowing: the plant or any part thereof being bruised, smelleth of Garlicke, but more pleasantly, and tasteth somewhat hot and sharpe, like almost unto Rocket.

Major. This is sometimes found with larger and rounder leaves, in nothing else differing.

6. *Scordium Syriacum Tabernæmontani.* The Germander-like Scordium of Naples.

The Germander-like Scordium hath a square reader hollow stalke, somewhat hairy, and of a whitish greene colour as the leaves are like unto, two diverse set at a joynt, the lowest being smaller than the other, that grow upward to the middle of the stalke, being somewhat like unto Mint leaves, but rounder at the points, and roundly dented about the edges like Veruin more, but more sparingly: from the joynts with the leaves on all sides, from the very bottome almost of the stalke, spring forth branches set with the like, but smaller, longer, and more pointed leaves towards the toppes whereof come forth gold yellow gaping or hooded flowers, every one upon a slender foot stalke, wherevnto the leaves like the head of an Elephant, with the bowed lippe, and two crooked teeth on each side thereof, and purplish spots like eyes under the upper head, of a very sweet scent, and flowring by degrees one after another, after which come greenish seed contained in heads, with very thinne skins that they may be discerned through them: the roote is long and white, with many trembled graines like wheate corne growing there.

The Place.

The first groweth in many wet grounds, and by water sides in many places of *England*: *Dodonæus* saith, it groweth on the Hills, as by water sides, but it will abide well if it be transplanted into a garden, and *Lonicerus* saith that it is found to be stronger and sharper that groweth on hilly grounds. The second groweth in woods and by wood sides, as also in divers fields and by lanes in many places with us: the third as is said groweth in Candy, about *Heraclea*. *Venetus Bellus* saith, the people gather it plentifully with the leaves for, and so use it, or else it withereth: the fourth doth grow about *Venice*, and sent to *Vienna Austriæ*, from whom *Pona* saith he had the knowledge of it. The fift groweth under walls and by hedge sides, and path-wayes in fields in many places: the sixt is set in the garden of *Patavium* in *Naples*, as *Columna* saith.

The Time.

They doe flower in June, July, and August, somewhat before which time the moſt uſuall manner is to gather the water Germander, and dry it to keepe.

The Names.

Water Germander is called in Greeke Σκόροδον and in Latine *Scordium*, from σκόροδον which is *Allium* Garlicke, becauſe of the ſmell: the likeneſſe of the Greeke name, did much deceive the former ages before us, for as *Matthiolus* writeth, it began to be knowne but a while before his time, and that all men both Phyſitians and Apothecaries uſed the wilde Garlick called *Opheſcordon* in ſtead of the true *Scordium* in their medicines, the occaſion whereof (beſides their owne ignorance and negligence in not diſtinguiſhing of the words) was *Paulus*, as it is moſt likely or his Tranſlator that appointed *Scordion* to one compoſition of Treakle, and wilde or crow Garlicke to another: and the Phyſitians of the former ages, thinking that *Avicen* had interpreted himſelfe, expounding one place by another, continued the error by tradition without further ſearch, until learning & all other ſciences began to be more ſought into, and refined as it were from the groſſe puddle of ignorance and barbariſme, which brought the knowledge of this to light, as it did of many other things; ſo that now our curioſity doth not reſt in *medios ſed in melliora*, but tranſcendeth *ad intima Germinum ſecreta inquirit*. It is called alſo *Trixago paluſtris*, Water or Marſh Germander, both for the likeneſſe thereof unto Germander called *Trixago*, and for the growing thereof in marſhes, &c. Some alſo call it *Teucrium* from the ſtrong ſcent ſo unpleaſant to the ſences. *Plinie* ſaith that *Crateva* did alſoe one of the ſorts hereof unto Mithridates, and called it Mithridation; and it may be from hence as well as from Garlicke, was called poore mens Treakle, and by our Country people Engliſh Treakle. The laſt is called *Scordaſtrum*, or *Trixago paluſtris* of all Writers, and although *Tabernæmontanus* and *Gerard* that ſo loweth him, doth make two ſorts thereof, as *major* and *minor*, a greater and a leſſer, yet I never could obſerve any other difference then in the place which produced them, being one more or leſſe fruitfull or barren than the other. The ſecond is called by *Lobel* and *Camerarius Scordium alterum*, and *Scordium minus Plinij* by *Geſner*, who calleth it alſo *Salvia montana*, and *Scordiaſtrum Lobelij*; *Tragus*, *Lonicerus*, and *Tabernæmontanus*, call it *Salvia ſylveſtris*, and *Salvia Boſci*, and *Boſci Salvia*, and *Longobardica Salvia agreſtis*, as *Dodonæus* alſo doth, who taketh it likewiſe to bee *Sphacelus Theophraſti*, as I have formerly ſhewed. *Cordus*, *Thalius*, and *Gerard* call it *Scordium*, and *Scordiaſtrum* although his figure thereunto is not right. *Cæſalpinus* calleth it *Melliſſum alterum*, *Ericus*, and *Raubinus Scordium alterum Salvia ſylveſtris*. The third is called *Scordaſtis legitimum Plinij*, both of *Reiſius* and *Pona* in his deſcription of *Aquæ Badenſes*, and it is very probable that *Camerarius* doth meane this ſort, which he calleth *Scordium Creticum longifolium*, for as I ſaid before, *Reiſius* ſaith, the people of *Candy* make no difference betweene them, but in gathering put them together. It is probable alſo, that *Anguillara* called this *Scordium alterum*, which hee ſaith was found about the banke of the River *Piſcara*, with leaves as large as Baulme: and that ſuch is found in *Candy* alſo, in *Greece* and other places, nothing differing either in ſcent or quality from the firſt. The fourth is called by *Pona* in his Italian *Bubula Scordaſtis ſecundum Plinij*. The laſt is called by moſt Authors *Alliaria*, yet *Geſner in horto* calleth it *Alliaſtrum*, and *Ericius Cordus Rivamarina*, but *Anguillara Limonaria*, *Dalechampius* upon *Pliny* taketh it to be *Sphacelus Theophraſti*, and ſo doth *Lobel* alſo, ſome alſo take it to be *Thlaſpidium Cretenſe*, and *Tragus* calleth it *Thlaſpidium erraticum*. The laſt *Columna* calleth it *Elephas Camperlarcenſium*, and *Raubinus Scordio affine*, *Fleiſch*. The Italians call *Scordoun Caſtagnadoro paluſtre*, the Spaniards *Camedreos de arroyos*, the French *Scordion* and *Chamaræs*, the Germanes *Waſſer Knobelgel*, and *Lachen Knoblauch*, the Dutch *Water Gamandree*, and we in Engliſh Water or Marſh Germander. The Italians call Sawce alone, or Iacke by the Hedge *Alliaria*, the French *Alliaire*, and *Herbe aux aulx*, the Germanes *Knoblauch kraut*, and *Saltzkraut*, the Dutch *Look ſonder look*.

The Vertues.

Dioſcorides and *Galen* doe both agree that water Germander is of an heating and drying, or binding quality, bitter alſo, and a little ſowre and ſharpe, whereby it is effectuall to provoke urine, and womens monethly courſes: the decoction thereof in wine being either greene or dry, is good againſt the byrings of all venemous beaſts or Serpents, and all other deadly poiſons; and alſo againſt the gnawing paines of the Stomake, and paines of the ſide that come either of cold or obſtructions, and for the bloody flixe alſo: made into an Electuary with Creſſe, Roſſin, and Honey, it is available againſt an old cough, and to helpe to expectorate rotten flegme out of the cheſt and lungs: alſo to helpe thoſe that are burſten, and troubled with cramps. *Galen* in *lib. 1. de ſimpl.* (which *Matthiolus* and others alſo ſeeme to doe) reciteth that it was found written by ſundry faithfull and diſcreet men, that in the warre of the bondmen, where the bodies of the ſlaine had lien upon *Scordium* any long time, before they were buried, they were found to be leſſe putrified than others, that had not fallen thereupon, eſpecially thoſe parts that were next the hearbe; which obſervation bred a perſwation of the vertue thereof to bee effectuall, as well againſt the poiſon of venemous creatures, as the venome of poiſonfull hearbes or medicines. It is a ſpeciall ingredient both in Mithridate and Treakle, as a counterpoiſon againſt all poiſons, and infections either of the plague or peſtilentiall or other Epidemicall diſeaſes, as the boyle pockes, meaſels, ſaint ſpots, or purples: and the Electuary made thereof, named *Diaſcordium*, is effectuall for all the ſaid purpoſes: and beſides is often given, and with good ſucceſſe before the fits of agues, to divert or hinder the acceſſe, and thereby to drive them away. It is often taken alſo as a Cordiall to comfort and ſtrengthen the heart. It is a moſt certaine and knowne common remedy to kill the wormes, either in the ſtomacke or belly, to take a little of the juyce thereof, or the powder in drinke faſting. The decoction of the dryed hearbe with two or three roots of Tormentil ſliced, and given to thoſe that are troubled with the bloody flixe, is a ſafe and ſure remedy for them. The juyce of the hearbe alone taken, or a Syrupe made thereof is profitable for many of the former ſore greefes. The dryed hearbe being uſed with a little honey cleanſeth foule ulcers, and bringeth them to a ſpeedy cure, as *Dioſcorides* ſaith, wounds: the dryed hearbe made into a cerate or pulſes, and applyed to ſore fleſhes in the face, as *Wens* and ſuch like, helpeth both to conſtraine the matter from further breeding of them, as alſo to diſcuſſe and diſperſe them being growne. It being uſed alſo with vineger or water, and applyed to the temples, eaſeth the paines thereof. The greene hearbe bruiſed and laid or bound to any wound, healeth it, be it never ſo great. Wood ſage is hot and dry in the ſecond degree, the decoction thereof is good to bee given to thoſe whoſe urine is ſtayed, for it provoketh it and womens courſes alſo. It is thought to be good againſt the French pox, becauſe the decoction thereof drunke doth provoke ſweat, digeſteth humours, and diſſolveth

Original from UNIVERSITY OF MICHIGAN

swellings and nodes in the belly: the seed or fruit of the heard, rather greene than dry made into wine, and taken, is accounted a safe and sure remedy for those who by falls, knocks, or beatings, doubt some veine to be inwardly broken, to disperse and avoid the congealed blood, and to consolidate the veine, and is also good for such as are inwardly or outwardly hurten, the drunke also inwardly, and the hearbe applyed outwardly: the same also, and in the same manner used is found to be a sure remedy for the palsey: the juyce of the hearbe or the powder thereof dryed is good for moyst ulcers and sores in the legges, or other parts to dry them, and thereby to cause them to heale the more speedily: it is no lesse effectuall also in greene wounds, as we have found upon sundry occasions. Iuice of the hedge-nettle eaten of many country people as sauce to their salt fish, and helpeth well to digest the crudities, and cold and corrupt humours are engendred by the eating thereof: it warmeth also the stomacke, and easeth the griefes: the juyce thereof boyled with honey, is held to be as good as Diacalamentum, Ireos, Piperis, Hellebor, Mustard for the nose, to help to vent and expectorate the flegme that is tough and hard to rise: the seed braused and boyled in wine is a great remedy for the wind collicke, or for the stone, being drunke warme: the same also given to women troubled with the mother, both to drinke, and the seed put into a bath, and applyed while it is warme, is of singular good use: the leaves also or seed boyled, is good to be used in glisters, to ease the paines of the stone: the greene leaves are held to be good to heale the ulcers in the legges: the roote taketh sharpe somewhat like unto Radishes, and therefore may be used to the same manner, and to the same purpose that it is.

Chap. XLI.

Bacchar. Bacchar.

Although learned Writers have set forth divers hearbes, for the true *Bacchar* or *Dioscorides*, and other learned men have refuted them: yet these hearbes come nearest thereunto, the one the learned of *Rome* have accounted the truest, and with them many others doe agree: the other *Ruellius* setteth forth, which are therefore here proposed unto you.

1. *Bacchar ie Mousseline.* French Bacchar.

This hearbe hath divers somewhat long and large leaves lying upon the ground full of veines, which make it rise as if it were crumpled, soft and gentle in handling, and of an overworne greene colour, seeming to be woolly: from among which in the summer time, riseth up a strong stiffe stalke, three or foure foote high, set with divers such like leaves, but smaller up to the toppe where it is divided into many branches, at the ends whereof come forth divers flowers, three before for the most part, at the end of every severall branch, and every one out of a small foote-stalke: which flowers consist wholly of small threads or chaffe, standing close and round, and never fall open like other flowers, that consist of leaves, but a dead or purplish yellow colour, out of greenish leafy heads, which threads turne into a whitish downe: at the bottome whereof is the seed, small and chaffy, which together with the downe is carried away with the winde, and riseth up in sundry places in a garden, where it is once planted, and beareth seed: the roote consists of many strings and fibres, shooting somewhat thick, not running deepe into the ground, but so taking hold of the upper face of the earth, that it may easily be pulled up with ones hand: the smell whereof is somewhat like unto *Acorus*, but lesse in garden, than growing wild, even as *Acorus* doth in gardens, and divers other sweet hearbes that are of thin parts and subtile.

2. *Bacchar is Dioscoridis Ruellio.* Syrian Bacchar.

The Syrian Bacchar, shooteth forth from an hoary stalke, about a foote high, into many smaller sprigges, bearing somewhat long and narrow leaves thereon, as white, hoary, and woolly as Mullein leaves, without any foote-stalke at the bottome, but compassing the stalke about: theise being larger below, yet lesse than Mullein, and those above smaller, and smaller to the toppe: whereon stand the flowers very thicke set together, somewhat like unto golden Tufts, or Mountaine Cassan-weed, called also Cudweed, of a pale purplish colour: the roote was not fully observed, but seemed by some parts thereof, to be much like unto Hellebor, and sweet also.

The Place.

The first groweth plentifully neare *Montpelier*, and many other places also. The other in *Syria*.

The Time.

The first flowreth with us about the end of July, or beginning of August. The other time is not expressed.

The

The Names.

It is called in Greeke νάρδος βαρβαρικὴ, as some would have it νάρδος Πυκνὴ, as thought it should be named νάρδος Πυκνὴ, from the excellent smell it hath: Plinie saith that some in his time called it *Nasitortium*, but both these they were in an error that did so call it, for *Nasitortium* is truely and properly called of the Greekes νάρδος ἡμέρος *Nardus rustica*, and therefore I cannot but following the ordinarie reprehended so long agoe, give it the English name of *Germans* Spikenard, which comes it nigh in colour, smell, nor taste, neither for forme nor vertues: and for it, nor *Asarum* neither the name of *Nasturtium Barbarie*, also is false and although in former times divers did thinke, that *Asarum* and *Baccharis* or *Dioscorides* were all one herbe, and consequently under the name of *Asarum baccare*; some taking *Asarum* to be *Baccharis*, and so contrarily some taking *Baccharis* to be *Asarum*, but *Dioscorides* his *Asarum* is not *Dioscorides* his *Asarum*, but his *Baccharis*, as any may plainely see, that shall read his description, yet now time and diligence have expell those errours. The soil of where it is called *Rosa terra Montpelliensium*, whereunto it doth more nely agree, then any other herbe that others have set forth, as *Dodon* and *Lobel*, *Clusius*, and others doe agree although *Dodonæus* calleth it *Conyza major altera*, and saith it hath little or no likenesse unto *Dioscorides* his *Baccharis*. Whether his *Conyza major*, is laid by the Author of *Lugdunensis*, to be this *Baccharis Montpelliensium*, and *Lobel* and *Pena* say that the plant which *Matthiolus* set forth for *Baccharis*, should agree unto that of *Dodonæus*, but is a kind of sweet Mullein, or a kinde of Moth Mullein: yet *Ruellius* in his *Penia*, calling this *Conyza minor altera*, the living thereby that many did call it so, referring it as well to *Matthiolus* his *Conyza minor*, as to his *Baccharis*, which *Lugdunensis* saith, are so contrary one unto the other, as that they cannot be annointed both one alike, as to the Chapter of *Baccharis* he setteth. They of *Tripolis* in Syria, as *Clusius* saith, called it *Helenium*, and divers both women and Monkes, used both the roote and the hearbe, for teale and itches, which is one of the properties whereunto the true *Helenium* serveth. The other *Rauwolfius* onely finding in *Syria*, seemeth to referre unto *Dioscorides* his *Baccharis*, which *Clusius* thinketh rather to bee a kinde of that Mountaine Cotton weed, which *Fuchsius* calleth *Filago minor*, and therefore *Bauhinus* calleth it *Gnaphalio montano affinis Ægyptius*.

The Vertues.

Dioscorides saith, that the rootes of *Baccharis* boyled in water and drunke, helpeth those that are troubled with convulsions and crampes, as also those that have ruptures and are bursten, such as have bruises by falls or otherwise, and those that can hardly draw their breath, or are shore winded, as also for old coughs, and the difficulty in making water; it also procureth the feminine courses, and is very wholsome against the bytings of venemous creatures being taken in wine: the greene roote being bound or hanged to, expelleth the birth, and is good for women in travell to sit over the warme fumes of the decoction thereof. For the sweet smell thereof it is put into Wardrobes to perfume, and the smell thereof procureth sleepe: But the greene leaves by reason of their astriction are good to ease the paines of the head, the inflammations of the eyes, and the watering of them in the beginning, the hot swellings of womens breasts after childing, and those hot inflammations called Saint *Anthonies* fire, being applyed to the places affected. *Pliny* saith further, that it helpeth to breake the stone, and to take away paines and prickings in the sides. *Fuchsius* and others saith moreover that the decoction of the roote openeth obstructions, and that the leaves are helpefull by their astringent quality to stay fluxes: *Virgil* in his seventh Eclogue saith, that it was used in his time as a garland to secure one from witchery and charmes, in these verses.

Cinxerat, & magicis sedulus herbis erat.

CHAP. XLII.

Nardus. Spikenard.

It ought of right and meete any meaning to shew you the Indian Spikenard in this place, in that it is a plant peculiar to certaine parts of the world, and was never brought to grow in these Christian Countries, yet seeing I have not found nor seene any kind, very like unto it, which I shall set forth unto you, and have seene all, save for the rarity either of scarcitie of property, or both, have beene called *Nardi*.

Nardus Indica Gangitis, sive Indica. Indian French Spikenard.

Nardus Celtica, sive Celtica Spicanardi which *Pena* saith doth grow in divers places of *Syria* and *Egypt*, which relation is hardly; for that never could understand by any of our Merchants that trade into those parts, that it was

1. *Nardus Gangitis spuria Narbonensis.*
Baſtard French Spikenard.

was a commodity ſo neare at hand, but brought further of; as I ſhall hereafter further declare) this baſtard kinde hath beene obſerved to grow anſwerable in a manner to all the parts thereof. For it hath a few ſmall hard fibres, which thruſt themſelves into the ground: from which ſpring forth divers hairy round ſoftly heads or beards, of the bigneſſe of ones finger, and of an hand breadth high, of a pale browne colour, which are not pointed at the toppes but flat or blunt, through each of theſe heads, even from the loweſt part next the roote, ſhoote forth divers long rough greene rattes, ſcarce a foote high, many of theſe growing cloſe one unto another, for that they make the forme or ſhew as it were, but of one plant; and after this manner hath hee ſet forth the figure thereof: but hee further addeth afterwards, (which *Lugdunenſis* pretermitteth, although he ſetteth downe all the former part) that it is altogether without ſmell, except thoſe hairy ſpiked heads or beards, which being bigger than the Indian kinde, doth ſmell ſomewhat like unto that Moſſe that groweth upon Oakes, or that other that groweth upon the ground, and that theſe heads being halfe way within the ground, doe ſend forth each of them in the middle of thoſe rigid ruſhes, a tall ſlender and ſmooth ſtalke, riſing about a cubite higher than the ruſhes: from the middle whereof up to the toppes of them on each ſide come forth many ſmall greene cods pointed at the ends ſtanding in cuppes like unto thoſe of Cranes bill. The whole forme hereof doth ſo neare reſemble the true Spikenard, as it hath beene obſerved by *Pena* and others, who as he ſaid among a number of bundles, found ſome that had the parts both of fibres heads, ruſhes, and leaves diſtinctly, to be ſeene as this is here deſcribed; that it is not to be doubted that it is a *ſpecies* thereof.

2. *Nardus ſive Spica Celtica.* Mountaine French Spikenard.

This Mountaine Spikenard creepeth upon the ground under the looſe leaves and moſſe, &c. with ſmall long and hard ſlender rootes (for ſo I call them rather than ſtalkes, as ſome others doe, becauſe in theſe rootes conſiſteth the whole vertue and efficacy of the plant, and are by the beſt Apothecaries uſed onely in Mithridatum &c. and no part elſe) covered with many ſhort ſmall dry leaves like ſcales: ſending forth in divers places as it creepeth and ſpreadeth, here and there ſmall blackiſh fibres into the ground, whereby it is nourriſhed: at the head whereof ſtand ſundry ſmall buttons or heads, from whence ſpring many ſmall narrow, and ſomewhat thicke greene leaves, not divided or dented at all, ſmalleſt at the bottome, and broad toward the end, which change yellow in the end of Summer, or beginning of Autumne: among theſe leaves riſe up ſometimes more, and ſometime but one ſlender ſtalke without any leaves thereon, at the toppe whereof ſtand many ſmall whitiſh flowers, like unto the ſmaller ſorts of Valerian, every one on a ſlender foote ſtalke; which afterwards bring ſmall ſeed like unto them alſo: the whole plant is ſweet and aromaticall, more than the Indian Spikenard, hotter alſo, and ſharper in taſte, than either of the other.

3. *Nardus Celtica altera.* Mountaine French Spikenard with tafted flowers.

This other French Spikenard differeth in nothing from the laſt but in the ſtalke with flowers, which is branched at the toppe, bearing three or foure flowers in a tuft together, on the end of every ſmall branch.

Bauhinus in his *Prodromus* ſetteth forth another ſort hereof like thereto in moſt things, but that it is wholly without ſcent.

4. *Saliunca Neapolitana ſive Nardus ex Apulia.* Italian Spikenard.

This ſmall plant hath a thicker and yellow roote than the laſt recited, ſomewhat rugged, but not ſcaly like it, and ſomewhat reſembling the garden Valerian, but leſſe, having fibres at the bottome, and in divers other places at ſeverall ſpaces, where it ſhooteth forth alſo upwards divers heads or ſmall knots, and from them many ſmall long leaves, ſomewhat larger than the other, narrower likewiſe below, broader upwards and pointed at the ends; what flowers, ſtalkes, or ſeed it beareth is not expreſſed: it hath the ſweet ſcent of garden Valerian, and likewiſe the ſharpe taſte thereof: and this is all is declared of it; but that they of *Naples* uſe it in their medicines, in ſtead of the *Malabathrum* of *Dioſcorides*, for the excellent ſweetneſſe of the leaves.

5. *Herculea viſcorum Clarii.* Vnſavory Spikenard.

This ſmall plant (being found dry amongſt many bundles of *Spica Celtica*, or French Spikenard, by *Clutius* in *Antwerp*) is ſet forth to have a blackiſh hairy roote, like unto it, but without any ſmell at all, and ſmaller, ſhorter, and whiter leaves, rather grayiſh, and of an aſh-colour: it was found without any ſtalke, and in *Dioſcorides* and *Pliny* ſay it was found in their time: but theirs (as they ſay) had a ſtrong ſcent, but not ſweet, and growing with it was uttered among the true; and by the ſmell as well as colour and taſte was to be knowne from it, for it tooke the name *viſcum* of *Hercules*, of the ſmell thereof like unto that of a goat.

6. *Nardus montana tuberoſa.* Knobbed mountaine Spikenard.

This kinde of Valerian or Spikenard, call it which you will, hath his firſt leaves lying on the ground, without any diviſion in them at all, being ſmooth and of a darke greene colour, which ſo abide all the Winter: but thoſe that ſpring up upwards, when it runneth up to flower, are cut in on the edges, very like unto the jagged leaves of the great garden Valerian, and ſo the elder they grow, the more cut and jagged they are: the ſtalke and flowers are very like the ſtalke with flowers of the garden Valerian, but of a darke or deep red colour, and more ſtore of them thruſt together: the ſeed alſo is not unlike it: the roote is tuberous or knobbed, both above and below, and round about

Valeriana Montana longiore radice
Long Tuberous Mountaine Spikenard.

about it, with some fibres shooting from them, whereby it is encreased, and smelleth very like the roote of the garden Valerian, or Setwall, or not altogether so strong, being greene, as when it is dry.

7. *Nardus Montana longiore radice.* Long tuberous Mountaine Spikenard.

This other Mountaine Spikenard or Valerian is very like the last, but hath a longer round white roote, shooting forth many long knobs, and small fibres underneath, which may be separated, and grow for increase: it hath many small long and somewhat darke greene leaves like it, but smaller: the stalkes are not above halfe a yard high, in any that I have observed, bearing some finer cut and divided leaves thereon than any below, two alwayes standing together at a joynt; at the toppes stand reddish flowers, thicke thrust together in an umboll like the other, which passing away, leave small seed behind them naked upon the stalkes: the whole plant is of a same weake scent, but the roote is much stronger, and much more when it is dry, than when it is fresh and greene.

The Place.

The true *Nardus* is said by *Garcias* to grow only in *India*, whatsoever is there have said thereof. The first here was found upon that pleasant high hill in *Narbone*, called of the French, *L'heri de Dieu*, and *Dez Escadyer*, both for the pleasantnesse of it, and for the excellent herbes that grow thereon. *Pena* saith, in the mossy moist places thereof, facing the South and Mediterranean Sea, which is not farre from a small village called *Cayre*. The second is found upon the Alpes in *Germany* in divers places, as also of *Leyden* in great plenty, and sundry other places. The third is found on the same hills, and on others also. The fourth was found upon the Hills in *Apulia*, which are in the Kingdome of *Naples*. The fift was seene as is afore said dry, but never seene growing greene: but that we may well conjecture, that it grows where the French Spikenard was gathered, as *Dioscorides* also and *Pliny* imagined. The sixth was found by *Pena* in the Gulfe, on the hills neare *Aldebarone*, and on the hills of *Peyronia*: *Clusius* saith hee had it from *Peyronius Imperatus* of *Naples*, and gathered from the hill *Vesuvius*. The last is likely, being a kinde of the other to bee found in the same places with the other.

The Time.

They all flower and florish in the Summer moneths of June, July, and August, some earlier or later than others.

The Names.

Nardus is called in Greeke Νάρδος, *a Nardo urbe Cyriaca forte* (saith *Lobel*, *Euphrates conterminæ Cappadociæ quæ Nardus spica*, and for the Indian kinde is generally called *Spica Nardi*, and of some *Nardus Indica*, for a distinction betweene it and *Celtica*. The first of these *Pena* calleth *Nardus Tragi in specie Narbæa*, both for the likenesse that it hath into the true *Nardus Gangitis* of *Dioscorides*, and that the next Towne of any note unto that Hill whereon it groweth, being about seven miles off, is called *Gange*; and by that name of *Nardus Narbonensis*, and *Nardus spuria Narbonensis*, it is called by all other Writers. The second is called *Nardus Celtica* of *Dioscorides*, and of all other Writers since, and *Cæsalpinus* following *Pliny* *Indicum Gallicum*. It is in shops called *Spica Celtica*, and by the most and best, is judged to be the *Salmaca* that *Virgil* in his Bucolicks maketh mention of in these Verses.

Fortunatus & ille deos qui novit agrestes,
Panaque Pelorumque senem, Nymphasque sorores,
Talia tentabat, sanabat talia Mopsus; in English, thus:

As the Mountaine Spiknard unto the purple Rose tree,
So (if I judge) *Amyntas* yeelds to thee.

And is thought by them also, that the name *Spica* is corruptly put for *Salmaca* in *Dioscorides*: for the Valesians call it in their tongue to this day *Selliga*, as favoring of *Salmaca*, as *Pena* saith also: yet *Matthiolus* misseth full with *Fuchsius* and *Lonicerus* for taking them to be both one; and the Germanes also, who were reckoned a part of the *Celtes*, call it *Selliande*: Some would have it called *Nardus lignistica*, because it groweth so plentifully amongst Alpes of *Liguria*, and yet *Matthiolus* saith, that the Physitians of *Genua* which is a City in *Liguria*, did not know it before his time, and that he had published his Commentaries upon *Dioscorides* in the Italian tongue, which caused many both Physitians and Apothecaries, to be more inquisitive into the knowledge of herbes, than they were before. Some also following the Arabians doctrine and words call it *Nardus*, or *Spica Romana*, because they call it in their tongue *Commul Rummi*. The third is called by *Cæsalpinus* in his Booke upon *Matthiolus* *Spica Celtica foliis latioribus*, or *Cubitis Nardus Alpina seu Celtica*, but *Bauhinus* maketh this of *Clusius* to be the former, when as *Cæsalpinus* saith it is not the same with *Matthiolus* and others, which is the better, and *Bauhinus* himselfe called it *Nardus Celtica altera*. The other is remembred by *Lobel* upon *Dioscorides*, and *Bauhinus* in his *Prodromus* and *Pinax*, and called by him *Nardus Celtica foliis latioribus*. The fourth is called by *Lugdunenses Salmaca Neapolitana*, by *Tabernæmontanus* *Plantago Apulia*, and by *Bauhinus* *Nardus vera Apulia*. The fifth as is before said, was thought by *Clusius* to be the *Hyacinthus* of *Dioscorides*, although it smel not strong as he saith his doth: *Aequilinus* taketh it to be the *Nardus Sampharitis* of *Dioscorides*, although *Matthiolus* findeth fault with him for that opinion; *Gerard* calleth it Valerian in English, whereunto it hath no correspondence: for not having smell or taste, it cannot have the properties of *Nardus*, which hath both. The first is generally called *Nardus montana*, and also Succedent by all Writers, to be *Dioscorides* his *Nardus montana*, notwithstanding hee saith it hath neither stalke nor flowre, nor seed, for *Matthiolus* freeth him from that fault, first both because in the former part of his owne description

Original from UNIVERSITY OF MICHIGAN

ron be such, it hath the stalke and leafe of *Eryngium*, and therefore could not be so forgetfull, as within two or three lines to contrary his owne Writing) in laying the errour in the writers of his copy, in the same manner as he set downe at *Dioscorides*, and is declared in the 1 chapter thereof going before: that is, *ἀγριον* for *ἀμπελος ἀγρια*, *prolixa* for *scabra*, as hereafter, for it produceth not the roote onely and no part else being to be used: as also that the leaves hereof doe not agree with the leaves of *Eryngium*, wherein it is most likely an errour is committed also, in mistaking and mistaking one word for another, for all other things agree sufficiently thereunto. *Dioscorides* and *Galen* say that it was called *Syriacus*, because it was brought out of *Cilicia* in leatherne bagges, which were called *Syra*, and *Syria*, as it is in *Dioscorides* copy, but called *Pyrites*, as it is in *Galen*, because it was used as a perfume in their sacrifices. *Brasauolus*, *Lonicerus*, and others make two sorts thereof, one that hath but one two or three round small rootes like unto *Gyrasa*, which thereupon he calleth *Nardus montana radice oblonga*, and the other hee calleth *Nardus montana radice rotunda*, and *Cordus* an *Nardus montana longa radice*, which as it may be the place onely, where they naturally grow, that causeth the difference of forme in the rootes, as it happeneth in *Aconites*, *Napellus*, and many other things, reckoning here to returne: for being transplanted and manured, they grow much greater, and somewhat alter that forme in roote as they be in the naturall places, yet I have given you the figures of both to see the difference.

The Vertues.

Dioscorides saith that the true Indian Spiknard is of an heating and drying facultie, and that it provoketh urine. It is profitable to slay the looseneſſe of the belly, and all fluxes both of men and women, and thin watry humours, being taken in drinke or applyed to the places affected: being drunke with cold water, it is profitable to those that have a loathing of meate, or having swellings or gnawings at their stomacke, as also for them that are liver-growne, that have the yellow iaundice, or the stone in the reines or kidneys. The decoction used as a bath for women to sit in, or over it, taketh away the inflammations of the mother: it helpeth watering eyes by repelling and staying the humour and thickning it also. *Galen* saith the same things and adjoyneth withall, that it dryeth up the fluxes of humours both in the head and breast. It is an especiall ingredient into Antidotes, against poison and venome, as Mithridates, &c. There had need be caution taken in the using of it, for it often provoketh vomitings, being either put with Rubarbe, as sometimes it is appointed, or in other cordiall medicines: and therefore our London Physicians in their *Pharmacopœa*, have appointed it to bee left out of many cordiall medicines. It is also worth great caution to be forbidden to women with child, because it procureth them much disquiet, and easy force their course beyond either their time or convenience. The oyle made thereof according to art, doth both warme those places that are cold, maketh the humours more subtill that were thicke or congealed before, digesteth those that are grude and raw, and also moderately dryeth and tenderth those that were too loose or fluxible: and hereby worketh powerfully in all the cold griefes and windinesse of the head and braine, of the stomacke, liver, spleene, reynes and bladder, and of the mother: being snuffed up into the nostrils, it purgeth the braines of much fleume gathered therein, and causeth both a good colour and a good savour to the whole body: Being steeped in wine for certaine dayes, and afterward distilled in *Balneo Mariæ*: the water hereof is of singular effect, for all cold indispositions of the members, used either inwardly or outwardly: for it comforteth the braine, helpeth to stay thin distillations, and the cold paines of the head, as also all shaking and palsitick griefes: it helpeth also in all sudden passions of the heart, as faintings, and swoonings; and for the colliche, two or three spoonefuls thereof taken upon the occasion: The first of these which is the bastard kinde, being almost without smell or taste, doth declare it to bee of small vertue and efficacy: but the mountaine French Spiknard, is reckoned to be effectuall, for all the purposes that the true Spiknard serveth for, but is weaker in operation; and moreover by reason it is somewhat more heating and lesse drying than it, it is more pleasing to the stomacke, and provoketh urine more effectually: the decoction thereof with Wormewood being drunke, helpeth those that are troubled with the swellings and windinesse of the stomacke, and being taken in wine is good for them that are stung or bitten by any venemous creature. It helpeth also to dissolve all moder and hard swellings, and is profitable for the spleene, reines, and bladder. It is also an ingredient of no small effect in *Mithridatum*, and others; and is used outwardly in oyles and ointments, to warme and comfort cold griefes whersoever they be. The Mountaine Spiknard is weaker than the Celticke or French Spiknard, by the judgement of *Dioscorides*, *Galen*, and others.

Chap. XLIII.

Valeriana. Valerian.

There are many sorts of Valerian to be remembered in this Chapter, some naturall, others strangers to our Country; and yet have beene free denizons in our gardens a long time, others but of late.

1. *Phu maius sive Valeriana maior.* The great Valerian.

The great Valerian hath a thicke short grayish roote, lying for the most part above ground, shooting forth on all sides divers knobs like small peeces of rootes, which have all of them many long and great strings or fibres under them in the ground, wherein it draweth nourishment: from the heads of these rootes spring up many greene leaves, which are long, broad and long, without any division at all in them at denting on the edges but those that grow upon the more divided on each side, some to the middle ribbe, being winged, as made of many leaves together on a stalke, and those upon the stalke in like manner are more divided, but smaller toward the top than those below: the stalke riseth to be a yard high, or more, sometimes branched at the toppe, with many small whitish flowers, sometimes declining over at the edges with a pale purplish colour; of a small sweet which falling away, there succeede small brownish seed: that is easily carried away with the wind: the roote smelleth more strong than either stalke, leaves or flowers, and is likewise of more use in medicine.

There is a Mountaine kinde hereof, as *Lonicerus* saith, found in *Saxony*, which is more sweete than this, even of the smell of a Pomecitron, but it is more soft or gentle than it. *Alterâ gloriosior.*

2. *Valerian*

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

2. Valeriana tuberosa. Knobbed Valerian of Candy.

2. *Valeriana tuberosa rotundifolia.* Knobbed Valerian of Candy.

This Valerian of Candy hath the first leaves that spring up and lie upon the ground round about the roote grosse thick, and round, like unto the leaves of *Ribwort*, and sometimes greater: the next that come after these are somewhat longer, and somewhat divided or cut in on the edges, and those that follow more and more divided, & that those that grow upon the stalke, are very like unto the first but lesser. Valeriana the stalke is hollow, a cubit high or better, somewhat reddish, having here and there two smaller leaves set as a point against the other, which is divided into some fewer branches, stored many where flowers in an umbell, thick together somewhat larger than those of the former, which turne afterwards into small and flat seed with a little downe at the head of them, like the pappus also: the upper most roote from whence the leaves and stalke doe spring, is small round knobs and tubers one, from whence shoot forth round about it, divers other smaller roots, fastned thereunto by long strings, like as the rootes of *Filipendula* are, the taste whereof is very like unto the former great Valerian.

3. *Valeriana Alpina major flore latifolio.* Broad leafed wild Valerian of the Alpes.

This wild Valerian hath many large and somewhat round pale greene leaves, and in some they will be yellowish, rising from the roote, lying upon the ground round about, every one having a long foote-stalke thereunto, some whereof are very like unto Ivie leaves, but lesser and gentler, and others longer like unto the leaves of *Centaury Bell*, but lesser also, and not so hard: in some a little dented, in others more dented about the edges, but not divided at all: the stalke is round, and about a foote and a halfe high, in some greene, in others somewhat reddish, having few leaves thereon, which are smaller, longer, and deeper cut in on the edges, than any below, and at the toppe is branched, whereon stand divers small purplish flowers, like unto the other Valerians: after which come small seed like unto the rest: the roote is long, round, and whitish, set with divers knots or joints, and long fibres under them, of a reasonable good smell, like unto wild Valerians, and of a biting taste.

4. *Valeriana Alpina minor.* Small wild Valerian of the Alpes.

This small Valerian hath foure or five small long, and somewhat narrow leaves, with one or two dents only at the edges, lying on the ground neere the roote, and are somewhat like unto the leaves of the great wild White Daisie, especially those that grow highest, and are the smallest, but with fewer dents or notches about the edges: the stalke which doth not rise above a foote high, having very few leaves thereon, which are smaller, longer, and narrower than those below, as well as few dents or notches on the sides as the other: the toppe of the stalke is divided into a few small branches, on every of which grow a few white flowers, like unto the Valerians but smaller: the roote is small, and creepeth a little under ground, sending forth fibres, but no bulbe fewer than the former.

5. *Valeriana Annua flore Asteris Cluſij.* Summer Valerian.

This annuall Valerian, hath divers long leaves lying on the ground, all of them deeply cut in or gashed at the edges, somewhat like the leaves of the Starre Thistle, among which rise up round hollow stalkes, two or three foote

4. Valeriana alpina minor.
Small wild Valerian of the Alps.

5. Valeriana rosea five Ruffica Cluij.
Roseat Valerian.

Foote high, with foure leaues growing thereon, two alwayes set togeather at a ioynte as in the other Valerians, but smaller and more diuided than the lower; branching forth towards the top, on the which stand many flowers set togeather in tufts, being small and hollow, diuided at the brimmes into fiue parts, making a flowre or flowres, consisting of fiue leaues a peece, somewhat like unto the flowres of the Indian Valerian next following, and are of a pale red or flesh colour, which afterwards being small seed, like unto the ordinary Valerian of Dodonæus: the roote is small, woody, and woodie, but perisheth every yeare; this kinde is much weaker then other Valerians.

6. Valeriana Indica flore Purpureo. Indian Valerian.

The Indian Valerian groweth quickly into a stalke, from the first leaues that spring vp, which are but few next the ground, somewhat long and broad, not vnlike vnto the first leaues of the Mountaine Spikenard, of a pale greene colour, the stalkes weake and hollow, not standing vpright, but leaning or bowing downewards, set with ioynts, at the which stand two long leaues, like vnto those below, but a little more cut or diuided at the edges, and at the ioynts like vnto shoote forth two branches, somet imes more and sometimes but one branch on the one side, which are diuided, and at the toppes of them doe beare many flowers, set (like vnto Valerian) on nakell or scale, each whereof is small, long, and hollow, diuided into fiue diuisions: two of the vppermost whereof are longer and shorter then the rest, and their two points turned backe like lippes, and the fift is the greatest standing in the middle, the whole flowre consisting of fiue leaues, of a pale purple colour being open, and in others milke white; each of these standeth in a small greene huske, wherein also the seed is contained, and groweth vpon a bunch, which openeth it selfe, and scattereth the seed on the ground, when it is ripe, and is not carefully sowed and gathered, which is

6. Valeriana Indica foe. Arabica. Indian Valerian.

spongy, rounder, bigger, and blacker than any of the former Valerians, without any downe at the end of them: the roote is small and stringy, perishing every yeare with the first frosts, the whole plant is utterly without any smell, in all that I have seene, and almost without taste likewise.

7. *Valeriana rubra angustifolia.* Narrow leafed red Valerian.

This small red Valerian is very like unto the greater red Valerian set forth in this & my former Booke, but differeth chiefly in the smalnesse, being lower, and the leaves long, and very narrow, very like unto the leaves of Line or Flaxe, but not so long, harder or rougher in handling then they, and ending in a point: the flowers are of a pale red, like unto them for forme being long, but smaller than they, and having a little scent to commend them.

8. *Valeriana Petræa.* Rocky Valerian.

This small Valerian hath divers leaves lying upon the ground, some of them little or nothing divided, others as much cut in, and gashed on the edges, as any of the other Valerians, but they are nothing so great: the stalke is branched at the toppe, carrying tufts of purplish flowers, but smaller: the seed that followeth is smaller, without any downe at the head, but in stead thereof it hath little skins, as it were at the ends, divided in five parts, making them seeme like a starre, much like unto the toppes of the seed of Scabious: the roote is small and fibrous, having a small scent of Valerian, as the leaves and flowers have also.

9. *Valeriana minor annua.* Small Valerian of a yeare.

This small Valerian hath the first and lower leaves long, somewhat round and dented, but the other that follow, and grow upon the stalke, are divided like unto wilde Valerian: the flowers are small and purplish, which are followed by a small seed that is blowne away with the winde, the roote is small and threaddy, perishing every yeare.

10. *Valeriana minima.* Small Valerian.

This little Valerian is very like unto the small wilde Valerian, but much smaller, having the leaves much divided like thereunto: the stalkes are not above halfe a foote high, bearing tufts of small purplish flowers: the rootes are long and small, with small white threads or strings, like unto the small wild Valerian.

There are some other hearbes set forth by *Lobel* and others for Valerians, which in my judgement have so little resemblance thereunto, that I have not thought good to range them in their Tribe, but rather them to others to which they have more affinity: one is called *Polygonum Sanguinarium*: the other *Pseudonarcissus albus*, which *Dodonæus* calleth *Leucoium album*, and generally is called of most, *Lilium convallium Theophrasti*, or Cornu Valeri, which I have mentioned among the kindes of Lettice in this and my other Bookes.

11. *Valeriana rubra Dodonæi.* Red Valerian.

This Valerian hath divers hard, but brittle whitish greene stalkes rising from the roote, full of ioynts or knees, like ioynts, whereat stand two leaves on each side one, and now and then foure small leaves from between them, which are somewhat long and narrow, broadest in the middle, and small at both ends, without either deepe or shallow dent on the edges, of a pale greene colour: the stalkes are three or foure foote high, branched at the toppes, with tufts at the ends whereof stand many flowers together, somewhat like unto the flowers of the ordinary Valerian, but with longer neckes, of a fine red colour, but without any scent of Valerian: after the flowers have stood blowne a good while, they suddenly fall away, and the seed which is small and naked, with a little tuft of downe at the toppe thereof, whereby it is easily carried away with the wind, ripeneth quickly after: the roote is great, thicke, and white, continuing long, and shooting out new branches every yeare.

12. *Valeriana Græca.* Greeke Valerian.

The Greeke Valerian hath many winged leaves lying on the ground, somewhat like unto the wilde Valerian that groweth by the ditch sides, but more tender and small, among which rise two or three round hollow brittle stalkes, two or three foote high, whereon are set at the ioynts such like leaves as grow below, but smaller, the toppes of the stalkes are divided into many small branches full of flowers, each consisting of five small round pointed leaves of a faire bleake blue colour in some plants, and in others white, with some white threads tipt with yellow pendents in the middle: after the flowers are past, there come up in their places small hard heads, containing small blackish seed: the roote is compoſed of a number of small long blackish threads, without any scent of a Valerian.

13. *Valeriana sylvestris.* Wild Valerian.

This wild Valerian hath sundry winged leaves springing from the roote, whereof the end lease is the largest, of a sad greene colour, without any dents on the edges, the stalke hath two such like leaves at a ioynt as grow below, but smaller, and at the toppe branched, with sundry small whitish purple flowers, but deeper than the Garden Valerian, the roote is a bulb of blackish threads and strings, which send forth strings of encrease, besides that the bulbe *Major.* at branches doe shoot forth fibres also. Of this kinde there is accounted a greater and a lesser.

The Place.

The firſt is ſaid by *Diſcorides* to grow in *Pontus*, it is found in the very grounds of Mountaines, and in other moiſt places, it is generally kept in our gardens. The ſecond grew in *Candy*, and was ſent by *Honorius Belon* from thence unto *Caſpar*. The third groweth on the Mountaines of *Auſtria* and *Stiria*, and ſo doth the fourth alſo, as *Clusius* ſaith he had it from *Pannonia*, but recordeth not from whence he had it. The fifth is ſaid to come from *Mexico* a Province in the Weſt Indies, it came into theſe parts firſt from *Italy*, and as *Bauhinus* ſaith, this which beareth purple flowers, groweth (as before is given to underſtand) in the Country of *Canton*, or of the Canaries in a place there called *Scanlet*, and from thence was called of ſome *Valeriana Scanlis*, and that with the white flower in the Country of the Salinoes. The ſeventh was gathered on *Mons Baldus*. The eighth *Fabius Columna* found on the Mountaines in the kingdome of *Naples*. The ninth growth in garden onely with thoſe that are curious, the nine-full place being not knowne. The tenth *Lobel* ſaith groweth about *Montpelier* in *France*. The eleventh and twelfth in our gardens chiefly, for we know not the naturall places of them. The laſt two ſorts grow in many Marſhes and wet Meadowes by Rivers and water ſides in our owne Country.

The Time.

They doe all flower in the Summer moneths of June and July, & the Indian kinds if they be ſet early, will flower ſooner, and continue flowring untill the froſts pull it downe, and ſo doth the Summer or ſtinkall alſo.

The Names.

It is called in Greeke ἀ Φὶν, and ἀ Φὶν ὀρεινὴ, *Nardus montana*, or *Celtica*, becauſe it is in ſmell and taſte like unto *Nardus* in Latine *Valeriana*, *a mollitie gubernaculi valet ſcortinarijs*. Some alſo call it *Phu vulgare*, becauſe it is an eſpeciall ingredient into Treakle, and *herba Benedicta*, of *Paracelſus* it is called *Tredica*. The firſt is generally called, both in ſhops and of all other, *Phu majus*, and *Valeriana major officinarum*: in Engliſh the great garden Valerian, and of ſome Capons taile, and ſet-wall; but Setwall properly is *Zedoaria*, an Out-Indish roote of the Apothecaries ſhops, which is not yet known to grow in any of theſe Chriſtian Countries. The ſecond is called by *Bauhinus Nardus Cretica*, becauſe the roote is have the ſmell of *Nardus*, (but the whole herb of the leaves, as hee ſaith himſelfe, is much properly like *Valerian*) as all the ſweet Valerians are more or leſſe. The third is called by *Cæſalpinus Verbena montana, ſeu prima Lobelij*, and is the *Valeriana Alpina prima*, and alſo the *Valeriana Alpina ſtirpium folio* of *Bauhinus*, deſcribed in his *Prodromus*; both which as hee himſelfe ſaith, are comprehended under the *Phu Clusij*, and is alſo the ſame that *Pona* ſent from *Montpelier*, unto *Lobel* in his life time, under the name of *Valeriana montana*, which I doe here publiſh, and it is probable to be the *Valeriana vera* of *Lugdunenſis*, although *Bauhinus* ſeemeth to make it another peculiar ſort. The fourth is called by *Cæſalpinus Valeriana ſylveſtris, ſeu prima ſecundi facultis*, which *Bauhinus* calleth *Valeriana Alpina Nardi Celticæ folio*. The fifth is called by *Cæſalpinus Valeriana montana ſeu Pona*, and *Bauhinus* calleth it *Valeriana folio Calamintæ*. Theſe two are generally now called *Valeriana montana*, which I doe here publiſh, and it is probable to be the *Valeriana vera* of *Lugdunenſis*, although *Bauhinus* ſeemeth to make it another peculiar ſort. The fourth is called by *Cæſalpinus Valeriana ſylveſtris, ſeu prima ſecundi facultis*, which *Bauhinus* calleth *Valeriana Alpina Nardi Celticæ folio*. The fifth is called by *Cæſalpinus Valeriana montana ſeu Pona*, and *Bauhinus* calleth it *Valeriana folio Calamintæ*. Theſe two are generally now called *Valeriana montana*, which I doe here publiſh, and it is probable to be the *Valeriana vera* of *Lugdunenſis*, although *Bauhinus* ſeemeth to make it another peculiar ſort. The ſixth is called by *Cæſalpinus Valeriana ſylveſtris, ſeu prima ſecundi facultis*, which *Bauhinus* calleth *Valeriana Alpina Nardi Celticæ folio*. The ſeventh

cold after sweating, or over-heating their bodies, they be troubled with the cholicke or winde, or are otherwise distempered: or to use the greene hearbe bruised and laid to any cut or wound, or to draw out any thorne or splinter, and heale it after.

CHAP. XLIIII.

Conyza. Fleabane.

MANY *Authors* setteth forth three sorts of *Conyza* or Fleabane, a greater and a lesser, and a third which is between both. *Theophrastus* and *Pliny* that followeth him, make but two sorts, a male and a female: others have added a fourth, the least of all: but there are divers other hearbes referred unto them by *Dioscorides* and others, as they have found them in their travels: some of these sorts are found wild in our Country in some places, but because they are not very frequent to meet with, I thinke it not amisse to ranke them with the rest of their Tribe in this place.

1. *Conyza maior vera Dioscoridis.* The truest great Fleabane.

The Figure.

1. *Conyza maior vera Dioscoridis.* The truest great Fleabane.

This great *Conyza* which is accounted the truest and nearest unto that of *Dioscorides*, hath divers hard rough, or hairy round woody stalkes, two or three foote high; whereon are placed without order, many long and somewhat narrow pale greene leaves, dented a little about the edges, very clammy as the stalkes also, but much more in the hoter Countries, than in ours, and are somewhat like unto the leaves of the Italian Starre-wort, but larger, and more pointed at the ends: towards the toppes of the stalkes come forth at every joynt with the leaves a yellow flower, somewhat large, like unto the flower of Hawkeweed or Groundsell, which when it is full ripe, turneth into downe, and flyeth away with the seed: the smell hereof is somewhat strong, but somewhat sweet withall, and not loathsome: and is so glutinous and clammy, that what small thing soever as Flyes, &c. lighteth upon it, is held thereon.

2. *Conyza major montana Germanica.* Great Mountaine Fleabane of *Germany*.

This kinde of *Conyza* hath divers round greene stalkes, about two foote high, nothing so clammy as the former, having many long pointed leaves set thereon without order, of a sad or darke greene colour, each whereof is foure or five inches long, and an inch and a halfe broad: the flowers are yellow, somewhat larger than the other, every one standing at the toppes of the branches upon a long stalke, in the same manner that the former doe, that is with a pale or border of leaves, and many small thrums in the middle, falling into downe, and is carryed away with the winde, even as they doe. There is another of this sort with longer leaves, and lesser flowers.

3. *Conyza Betonicæ mellitæ facie.* Hoary sweet Fleabane Muller.

This Fleabane Muller riseth up with divers long and somewhat broad leaves, neere unto the forme of Fox-glove leaves, but that these are hoary or gray on the upperside, and of a brownish greene on the underside, herein somewhat like unto the leaves of *Rha Hortense folio*, or Ballard Rubarbe with Elecampane leaves: the stalkes are hairy likewise, rising to be two or three foote high, set with the like leaves as grow below, but smaller and smaller up to the toppes, where many flowers stand together, like unto the former Fleabane, and much greater than Groundsell, which turne into downe and flie away with the winde: the roote is composed of many blackish strings and fibres, whereby it taketh fast hold of the ground, the whole plant is somewhat clammy, yet much lesse than the first, and much sweeter than it.

Lobel giveth us the figure of another sort, whose chiefe difference consisteth in that the leaves are lagged or cut in on the edges.

4. *Conyza Helenitis pilosa.* Hairy Hexbane Muller.

This kinde of Fleabane is like in formes of leaves and flowers, and other things to like the last rehearsed Fleabane Muller, that there is no other difference to be found (but in that the leaves and stalkes are besides the hoarinesse, more hairy and rough) which doth cause it to be held as a differing sort.

5. *Conyza montana pilosa.* Hairy Mountaine Fleabane.

This kinde of Fleabane is also a differing kinde from the last, in that the leaves as well as the stalkes which are round, firme, a foote high or more, are hairy and woolly, being smaller than the former, and not much bigger than the leaves of Hyssope, that are glutinous and clammy (which may be by reason of the hoe climate wherein it groweth) as the first, of a strong virulent scent, like to the smell of a Goat: at the toppes of each of these stalkes, which are many, stand many small pale yellow flowers, somewhat like unto the flower of a Sow-thistle, which turneth into downe,

2. Cacalia saxatilis Germanica.
Cacalie Mountaine Plantaine of Germanie.

3. Cacalia Hieracii folio.

4. Cacalia saxatilis, folio ampliori.

downe and is carried away with the winde, as the reſt: the roote is blackiſh without, but white within, ſtarke, tough and woodily, of an hatefull taſte, ſlimie or ſuttle, as the whole plant alſo is ſomewhat bitter, with a little acrimony alſo to be tolled therein.

6. *Cacalia odorata ſerotina.* Sweet purple Fleabane.

From a thort whitiſh roote with many fibres thereat, ſpringeth up many ſmall thort leaves, ſomewhat like unto the leaves of the garden Baſile, but ſomewhat more broad, among which riſeth up a ſtalke two foote high ſometimes, ſeconded at the bottome, ſet here and there up to the toppe with longer and narrower leaves, where it is divided into ſmall and ſhort branches, whereon ſtand many flowers, one above other, in ſmall ſcaly greene heads or huskes, compoſed of many ſmall and narrow bluiſh purple leaves, ſomewhat white at the ends or tippes, with a ſmall yellow thrumme in the middle, and in the middle thereof, there riſe up ſlender white threads, whereby each flower conſiſting of three colours, white, purple, and yellow, maketh it ſeeme the more delectable to the Spectators: after theſe flowers are paſt, there ſucceed in thoſe huskes or heads the ſeede, which long ſeed lying in the downe, caſt leaving three about at the head, which together therewith is blowne farre and wide, if it be not gathered and kept: the whole plante of a ſharpe taſte, but the roote much more, almoſt like unto pepper, and of a ſtrong but not unpleaſant ſmell.

7. *Cacalia cordata Alpina minor.* Lesſer Alpe Heart-leafe Fleabane.

The roote of this Fleabane is ſmall, woodily and reddiſh, from whence ſtretch a few darke hairy ſtalkes, about a foote long, divided at the halfe way into three ſmall branches, each whereof hath other ſmall ſtalkes, and one flower at the head of them, which is of a purpliſh blue colour, like unto the laſt

fall, and likewise turning into a downy matter easie to be carryed away with the winde: the leaves on the ſtalkes are thinly ſet thereon, being hairy thicke, long and narrow, about three or foure inches in length, and about an inch in breadth.

8. *Conyza cærulea Alpina minor.* Small blue Mountaine Fleabane.

This ſmall plant is a ſpanne or hand breadth high, and ſometimes lower, having a ſmall round tender ſtalke, ſomewhat hairy, whereon groweth onely one bluiſh flower, like unto the greater kinde of Mountaine Fleabane, but three times ſmaller, with many threads in the middle flying away with the wind, when it is ripe as the others: it hath many ſmall leaves at the bottome of the ſtalke, and the toppe of the roote, which are of a pale greene colour, and about three inches long, but ſhorter as they grow higher upon the ſtalke, every one having a three footed ſtalke at the bottome thereof: the roote is blue kiſh and fibrous.

9. *Conyza minor vulgaris.* The moſt ſmall Fleabane.

The little Fleabane is ſeldome found with more than one ſtalke riſing from the roote, which is a foote and a halfe, or ſometimes two foote high, and ſometime lower than a foote, ſomewhat hairy and clammy alſo, but greener than the great kinde, as the leaves are alſo, which are long, narrow, and fat or clammy, ſomewhat like unto the leaves of *Lunaria* or Toade flaxe, ſet thereon up to the top, where it ſometimes brancheth forth, or from the middle thereof upwards, with the ſmall leaves come ſmall pale yellow flowers, like unto the great kinde, which turne into downe, and are blowne away with the winde, as the others are: the roote is ſmall and ſlender, with a few fibres thereat, like the whole plant, which ſmelleth ſweeter than moſt of the former, and dyeth every yeere, and either ruſteth, it ſelfe of its owne ſowing, or muſt bee new ſowne every yeere.

9. *Conyza minor vulgaris.*
The moſt ſmall Fleabane.

10. *Conyza minor Syriaca.* Small Syrian Fleabane.

The ſmall Syrian Fleabane hath many ſmall low branches about a foot or more high, whereof few ſtand upright, the moſt of them leaning or lying downe upon the ground, and taking roote againe, in ſeverall places as they lye, the leaves that are ſet thereon are ſmall and long, ſomewhat like unto the leaves of the Olive tree, being fat or clammy, and hairy alſo, of a ſtrong ſcent, yet ſomewhat ſweete withall: the toppes of the ſtalkes are garniſhed with ſmall yellow flowers like unto the laſt, which when they are ripe flye away with the winde as they doe.

There are other ſorts of Fleabanes which becauſe they grow in moiſt, watery, or wet places, ſhall be remembred hereafter among the mathy or warry plants.

The Place.

The firſt groweth naturally onely in the warmer Countries of *Spaine*, *Italy*, *Narbone* of *France*, and the like, and will hardly endure the cold of theſe Countries, and therefore muſt be carefully kept in the Winter, if any would have it. The ſecond is familiar to *Germany*, and therefore will better abide, having beene found by *Iacobus Thalius* and others in *Boeotia* ſide in *Saxony*, and wee in many places of our owne land, as toward *Hampſtead*, &c. The third and fourth *Lobel* ſaith were found upon the hills in *Artois*. The fifth was found by *Clusius* on high hills in *Spaine*. The ſixth is found in divers places in the Kingdome of *Naples*, in moiſt fields that are in the Mountaines, as *Colonna* ſaith, as alſo in the ſandy places neare the River of *Rhoſne* by *Lobel* in *France*, and the *Alpes* in *Austria*, as *Clusius* ſaith. The ſeventh was found on Saint *Bernards* Mount in *Switzerland*, and the eight on the Hill of Saint *Gothard*, as *Ruellius* ſaith in his *Pandectes*. The ninth groweth not farre from *Medoüilla* in *Spaine*, as *Clusius* ſaith, as alſo in the woods of *Gevennes* neare *Montpelier*, as both he and *Lobel* ſay. The laſt *Prosper Alpinus* found growing about *Tripoly* in *Syria*.

The Time.

They doe all flower in the Moneths of June, July, and Auguſt, ſome earlier or later than others: the firſt and the ninth for the moſt part flower laſt.

The Names.

It is called in Greeke, [illegible], and in Latine alſo: *Asteris ſive Aſtra ſpecies tertia, vel aſter caluus Dioſcoridis*, becauſe as is ſaid in the Deſcription, the glutinous cleaminene both of leaves and ſtalkes, holdeth faſt whatſoever falleth upon them, yet *Dodonæus* ſaith it is ſo called, becauſe *Aegilops vel Calcitrapa vulnera aegrotis inferens mouet. Eyes ſmeddraeth* in *Pedanius*, and we in Engliſh, Fleabane accordingly, becauſe being burnt or laid on Cinders, it ſmelleth like Graine, Flete, or Wergenuine *Dioſcorides* ſaith, and not Hogwort, for that is another hearbe as ſhall bee ſhewed in his place. The firſt of the truelleſt great *Conyza* of *Dioſcorides* in the judgement of *Cordus*, *Dodonæus*, *Lobel*, *Pena*, *Clusius*, *Gesnerus*, and others. The ſecond *Iacobæa Thalij*, as I ſaid, but called *Conyza major montana*, in his hiſtorie, in the which he called *Bubon alterum*, both of them being very like one unto another, whereof *Cordus* in his *Scholies* upon *Dioſcorides* ſeemes to make mention, and *Ruellius* thereupon alſo in *Conyza montana latifolia vulgaris*. The 3. of both *Cordus*, as I ſaid, *Dodonæus* are in their titles, for *Lobel* in the Dutch Herball, becauſe the ſcent of the in is not ſo ſtrong like the others *Cordus*, nor flower like them. The fifth is called by *Lugdunenſis Conyza montana latifolia*, and *Ruellius Conyza montana cærulea altera vulgaris*. The ſixt is called by diverſe *Conyza cærulea*, as *Dodonæus* ſaith, and of *Cordus* *Bubon montanum*, becauſe her ſaith it is like unto the *Smallage Parſley*. *Gesner* in his booke *De Collectione Stirpium*, and *Clusius* alſo, it *Conyza cærulea altera*, *Tabernamontanus Conyza cærulea*, it is called alſo *Dracunculus* of the eighth *Conyza montana*. *Ruellius* calleth it *Conyza cærulea minor*, and ſaith it is the ſame that *Dodonæus* in his French booke calleth *Erigeron petitum*, and in his Latine Booke *Erigeron quartum*, but *Dodonæus* in thoſe places in the text ſpeaketh of no blue or purple colour in that *Erigeron*, but onely ſaith it hath a pale yellow flower, ſo quickly fading, that it continueth not a day, but even almoſt the ſame houre that it is blowne, it doth

fade!

tude, which I am sure this *Bauhinus* doth not, and is not wholly yellow, as that of *Dodonæus* is. The seventh and eight *Bauhinus* calleth *Conyza media Alpina major & minor*. The 9 is called *Conyza minor vera*, both by *Fuchs, Clusius, Lobel*, & others, because it differeth from the more common sort. The last *Pona rolius* referreth to the *Conyza minor* of *Dioscorides*, which *Clusius* rather thinketh is a *species* of his greater kinds, yet *Bauhinus* calleth it *Conyza media altera*, and so doth both *Ruellius* and *Clusius* to call it *Conyza major Dioscoridis*. The Italians call it *Conyza*: the Spaniards *Altamegos*: the French *Conyze*: the Germanes *Flandling* and *Durrwurtz*: the Dutch *Donderwort*.

The Vertues.

The leaves of Fleabane as *Dioscorides* saith, are fitly applyed to the bytings or hurts of all venemous creatures, & also for paines and small swellings, and for wounds: the leaves and flowers boyled in wine and drunke, is good to bring downe women courses, and to helpe to expell the dead child: taken also in the same manner, it is good to procure urine, or when one maketh it by drops: it helpeth also those that have the yellow jaundise, and the griping paines of the belly: it is also good for the falling sickenesse, taken in vineger: the decoction is good to helpe many griefes of the mother, if women be bathed therewith, or sit therein: if the juyce be put into the Matrix it causeth abortion or unseasonable time: the *oyle* made of the hearbe, and annointed, is very effectuall to take away all shaking fits of agues, and those tremblings that come of cold. The small kinde helpeth the paines in the head. *Gesner* saith that both the greater and the lesser are hot and dry in the third degree, and therefore powerfully warmeth any place whereunto they are applyed, whether used of themselves, or boyled in oyle and annointed; the leaves bruised and bound to any greene wound or cut, being first well washed or cleansed, healeth in a short space: applyed also to the soles of the feete, it stayeth any fluxe or flux, and bound to the forehead a great helpe to cure one of the frensie: it openeth the obstructions of the liver, if the decoction thereof made in wine be drunke: if either Goats or sheepe eate hereof it will kill them by any extremity of thirst. The lesser is effectuall to all the purposes aforesaid, but is more powerfull to helpe any fluxe, or the bloody fluxe. The sixth is said before, helpeth the toothach.

CHAP. XLV.

After, Starrewort.

THe diversitie in many things that the Starrewort have with the Fleabanes, enforced me to place them next thereunto, whereof we have such a number, as well of those that were formerly knowne to the Ancients, as those which our later times have made knowne to us, and from *Virginia, New-England*, &c. have come not the least flore unto us. And although *Dioscorides* hath set forth but one kind, which he called *After Attticus* of the place no doubt, where it grew most plentifully, or was of greater force, which was the Country of *Attica*, yet later Writers having found out divers other hearbes, somewhat like unto it, have referred them thereunto; all which I meane in this Chapter to declare unto you.

1. *After Atticus luteus vulgaris*. The true Attic After, or yellow Starrewort.

1. *After Atticus luteus vulgaris*. The true Attic After, or yellow Starrewort.

This Starrewort riseth up with two or three rough hairy stalkes, a foote and a halfe high, with long rough hairy brownish darke greene leaves on them, divided into two or three branches: at the top of every one whereof standeth a flat scaly head, compassed underneath with five or six long browne rough greene leaves, standing like a Starre, the flower is also standing in the middle thereof, is made as a border of narrow long pale yellow leaves set with brownish yellow thrums, the root dyeth every yeare after seed time.

2. *After arvensis Columnæ*. The soft Starrewort of *Naples*.

The soft Starrewort is very like unto the former yellow Starwort, but that the leaves hereof are somewhat broader, larger, and not so rough or hairy: the stalkes in like manner branched toward the toppe, which is more slender there than below, but groweth thicker where the flower standeth, and bendeth downe: and upon the toppe of every branch standeth one flower, somewhat like the other, consisting of many yellow leaves, with brownish threads or thrums in the middle, and compassed about with many more greene leaves, which are soft and gentle in handling, and not prickly or rough as the other: the seed is hitter in taste, long and narrow, somewhat flat withall, yellowish, clammy, crested, and worse in smell: the root is composed of divers bigge yellowish strings, of an aromaticall taste.

3. *After supinus*. Low creeping Starwort.

This low Starwort riseth up with many slender weake crested, and somewhat hairy stalkes, leaning downe-wards, and not standing upright, whereon are set many

3. *Aster luteus. Low creeping Starewort.*

long and slender leaves, a little round at the toppe, very like unto the former, but smaller and greener nere to the toppe; every stalke beareth one flower, which is yellow and large, like unto the flower of a corne blacke, and is covered in a very hard huske, made of small greene leaves, which when the flower is fall, becommeth so hard and woodie, that one can scarce open or breake it, to take out the seed which lyeth close sticking thereunto. The root is long and slender, having a few fibres thereat, and abideth divers yeares, it is to be a little defended from the extremity of Winter.

4. *Aster luteus maximus, Asteris.* A great yellow Starewort of Austria.

This starwort hath many long and narrow leaves, of a pale greene colour at the ground, somewhat like unto the leaves of that kinde of *Hieracium* that is called Dwell-bat, whose leaves are not jagged at all, but are sometimes covered with a little downe. The stalke is about foure foote high, brownish and round, whereon are set (yet sparsedly) long narrow pointed leaves, a little dented about the edges, at the toppe whereof it is divided into a few small and short branches, every one bearing a large yellow flower, composed of many small scales, standing in five leaves apiece, set together in a round head, compassed about with many long, somewhat broad and fat leaves, of a most excellent yellow colour, with a weake scent or none at all; after the flower is fall, the seed is contained in the head, covered as it were with three square, lying disparted in a downy substance; the roote is somewhat thicke and blackish, growing close at the ground, sending forth many strings or threeds, whereby it may be encreased.

5. *Aster montanus, folijs Salicis.* Starewort with Willow leaves.

This Starewort from a long creeping roote, wonderfully spreading under ground, and encreasing, shooteth up divers erected stalkes greene coloured, very smooth, garnished with leaves thereon, being longer, larger, and greener than the tall, without any dimpled or winding in them, and a little dented about the edge, somewhat sharpe and hot in taste: the toppes of the stalkes are divided into two or three small branches, each sustaining divers small greene heads, composed of many small leaves set together, one about another, which in time open themselves into flowers of as large a size as the tall, but with a smaller thrum in the middle, and narrower leaves compassing them, parted or divided at the end.

6. *Aster luteus humilior.* Starwort with woolly leaves.

This woolly Starwort hath divers small and strong greene or browne stalkes, somewhat woolly, rising from the roote (which is spead under ground, and fastned with many long and strong fibres, shooting yearely new sprouts for encrease, but nothing so much as the tall) befet with no order, with many long and narrow greene leaves, growing to the ground, and covered over with a soft woolly downe, compassing the stalkes at the bottome of them, and are somewhat rough, and somewhat bitter: at the toppe of the stalke standeth a large head, made as it were of many scaly leaves, which fall open into large round flowers, consisting of many long, narrow, and pale yellow leaves, as they do to the middle, which are a number of small mosty flowers set together, of a deeper yellow than the border; the whole flower doth resemble that of Hieracium, and without any head or crowne crowned: the stalkes are parted low from the toppe upwards, into three or four branches, rising higher than the middle seed, every of them bearing such a flower, as hath been described: when they are fall, the seed contained in their heads, with the woolly or downy substance therein, is carryed away with the Winde.

7. *Aster luteus angustifolius.* Narrow leafed Starwort.

This narrow leafed Starwort hath a great creeping running roote as the fourth, and giveth a plentifull encrease, from whence spring up many small hard greene stalkes, not much above a foote high, whereon grow many long and narrow leaves, without any order one above another, nor dented at all about the edges, but are very like unto the leaves of the wilde Rosemary or *Peucedanum*, up toward the toppes, where they are divided sometimes into two or three small branches, every one bearing a greene scaly head, and out thereof a yellow starrelike flower, as the other have, and is likewise many times very double, that there be five or six rowes of leaves one within another, the inner row following is very like unto the other, and carried away with the wind in the same manner.

8. *Aster luteus angustifolius, Virginianus.* Narrow leafed yellow creeping Starwort of *Virginia*.

This Starwort maketh up many stalkes, some two or three foote high, bearing at the joynts two faire broad leaves, like the first and second, but somewhat pointed at the ends and being harder in feeling, full of veines: at the toppe of every stalke (which doth seldome divide it selfe) standeth one large flower (rising out of a greene huske made of many greene leaves) compassed about with many long and narrow yellow leaves, with a small thrumme in the middle, which being pull'd out, is found like unto a small *Flos solis* as it is said for I never saw it beare seed: the roote is woody, spreading under ground, and spreading much: it loseth both stalke and leafe every yeare, and springeth anew in the spring.

9. *Aster*

6. *Aster luteus angustifolius.* Narrow leafed yellow Starwort.

7. *Aster luteus longifolius.* Starwort with woolly leaves.

8. *Aster Virgineus latifolius serratus viscosus.* Yellow creeping Starwort of Virginia.

6. *Aster Virgineus luteus, humbe saticaule.* Yellow Starwort of *Virginia* with a slimy stalke.

This yellow Starwort groweth to be 6. or 7. foote high, with many stalkes, whose lower part thereof almost to the halfe, is round, hard, and strong, the other parts upward having a small slime or skin on foure sides thereof (as is to be seene in many other plants) up to the toppe which branches not, but beareth sundry small flowers as if they were rather at the first, but being blowne open, each is a yellow starre compoled of five or six small and long yellow leaves with small thicke yellow pointels in the middle, each having a blackish tippe or point resembling flowers, and afterwards turne to be like seed, broad as the head, which are so separately set together, that they resemble the head of seed of a *Dandelion*, but greater: the leaves stand singly on each side of the stalke, being very like unto the former, of a deadish sollow greene colour, but not altogether so large and broad, a little longer pointed also, and more rough in handling, yeelds small foode stalke under earth: the roote is knobbed and woodily, with sundry long strings fastned unto them, and encreaseth much at the sides, but creepeth not, holding strongly in the ground: this flowereth late with us, and that not but in a warme yeare, whereby we seldome observe the seed: divers doe take it to be the *Widerick*, or *Wiseck* of the Virginians, but if *Gerards* information be right, as it is most probable, that which he calleth *Wiseck*, beareth crooked pods, and such doth the *Tarpatan* of *Virginia*, as I first well observed in Maller *Frostgreenius* garden, whole roote creepeth farre under ground, and therefore in my judgement this cannot be their *Wiseck*: this also loseth the stalkes as the former, and springeth fresh every yeare.

7. *Aster Virgineus luteus alter minor.* Another yellow Starwort of *Virginia*.

The other yellow Starwort of *Virginia* groweth up last with one upright small round stiffe stalke, foure or five foote high, bearing two fayre greene long slinning leaves at every joynt, dented about the edges, but smaller then the former, standing on small foote-stalkes, and some what hard in feeling: at every joynt with the leaves on both sides, from the very bottome come forth branches, halfe a yard long at the least, with the like leaves on them: at the toppe of each stalke and branch standeth one flower, whole greene small round button under it, hath divers small greene leaves on the head thereof, out of which breaketh the flower, consisting of a dozen yellow small and long leaves, compassing a middle deepe yellow thrum: this although I and some others have had it growing with us, yet flowred and seeded with none but Maller *Tradescant* at South *Lambeth*. The seed by reason it flowereth late we have not yet well obtained: the roote is composed of sundry white and long hardish things, with small strings them, and abideth divers yeares, encreasing by the sides, but perisheth to the ground, shooting new heads every yeare.

11. *Aster Conyzoides.* Heabane like Starwort.

This kind of Starwort hath long and narrow leaves growing on the branched stalkes, which are a foote high or more, singly thereon without order: the flowers grow singly at the toppe of every stalke and branch, composed of many duskie yellow leaves, with a browner thrum in the middle turning into downe, which with the small seed is soone tied away with the wind: the roote is threaddy.

We have had from *Virginia* another sort of this kind, very like unto it, but with smaller flowers.

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

12. *Aster Indicus Conyzoides Africanus.* Fleabane like Starwort of *Africa*.

This hath sundry woodie branches rising from a slender long white roote, with divers small and long hoary leaves set thereon without order, both stalke and branches bearing each but one yellow Star-like flower thrummed in the middle, which after it is ripe turneth into downe, which with the small seed enclosed together, flyeth away with the winde.

13. *Aster Asiaticus Italorum flore purpureo.* Purple Italian Starwort, or the purple Marigold.

The Italian Starwort hath many woodily round and brittle stalkes rising from the roote, about two foote high, whereon are set without order to the toppes many somewhat hard and rough long leaves round pointed, and is divided into sundry branches, bearing single flowers like Marigold, the outer border of leaves being of a bluish purple colour, and the middle thrums of a brownish yellow, breaking out of a greene scaly head, like unto those of Knapweed, but lesse: these flowers abide long in their beauty, and in the end wither and turne into a soft downe, wherein be small blacke and flat seeds, somewhat like unto Lettice seed, which with the downe is carried away with the wind; the roote is compacted of sundry white long strings which perish not, but abide many yeares with greene leaves on their heads, and spring afresh every yeare.

14. *Aster Alter purpureus latifolius.* Another blue Starwort, or another purple Marigold.

This other purple Marigold or blue Starwort, is a sorte or differing sort of the other *Aster Asiaticus Italorum flore purpureo*, so like thereto in stalke, leafe and flower, that one would thinke there were no difference, and indeed it is not much, but considered shortly in their particulars: the leaves of this are narrower than the other, and pointed at the ende: the stalke riseth not up so high, & withereth some what earlier before the other, and is of a paler purple colour, and sometime have a white edge.

Of this Narrow-leaved kinde there is one also which groweth lower than this, and is therefore called a dwarfe kinde. *Aster Pumilus.*

15. *Aster Montanus caule magno flore.* The great blue Mountaine Starwort.

From among a number of small long and narrow leaves, hoary as well on the under as upper side, of the forme of garden Thrift leaves, being small and narrow at the beginning, and growing broader to the end, which is round pointed lying flat on the ground, upon the Mountaine Starwort, upon the ground, riseth up a stalke scarce a foote high, leafed with the like leaves in a greater measure, but smaller up to the toppe, where there standeth a round head, compacted of many (small pointed) scales set close together, in the midst whereof breaketh forth a large great flower, consisting of many long narrow leaves of a purplish blue colour, standing as a pale or border, about a middle yellow thrum, which quickly falleth away, and perisheth by the same, wherein the seed lyeth, and both together are dispersed with the winde: the roote is somewhat long, growing aslope in the ground, with many small white fibres annexed thereunto, and covered with the fibres of the leaves of Lillies dead.

15. *Alter Asterium Austriacum caruleum magno flore.* Great blue Starwort of *Austria*.

This Starwort hath the tuberous leaves lying upon the ground, about the coppe of the roote, but they are thicker, broader, rougher, yet with a fold in the middle, somewhat sharpe about the edges, and ending in a sharpe or prickly point: from the leaves there next ariseth also the stalke up to the toppe, where it is divided or reacheth into one or two branches, each sustaining one flower at the top, which is very large, of a pale yellow colour, and compassed about with a number of small long leaves, of a pale blue colour, which pointe downe like unto the other: This although it be somewhat like the last, yet is not the same, but a manifest differing kinde thereof.

16. *Alter minor angustifolius.* The lesser purple Starwort.

This purple Starwort ariseth up with many slender, but straight upright stalkes, of a foote and a halfe high, or with many leaves upon the same, longer and narrower then any of these blue or purple Starworts hath yet come somewhat like unto the leaves of *Linaria* or Toad-flaxe: at the toppe of each stalke stand three or foure flowers smaller then the two last Starworts, and somewhat fuller then the last of these blue kindes, compacted of many small leaves standing in a starre, of a very pale bluish purple colour, and the middle thrum yellow, which pearcheth into downe, and carried away with the wind as the other doe. I should adioyne unto these the *Tripolium*, both for the likenesse of the flowers, and the English name of Sea Starwort, and although it be a Sweet heather, yet because it is a plant that delighteth better to grow in watery places, I will referre it to bee spoken of among the *Paludosa* or watery heathes.

17. *Alter Pyrenaicus latifolius purpureis storibus parvis.* The earlier and broad leafed purplish Starwort of *Pyrene*.

The leaves of this Starwort which stand singly on the sundry hard tuffe brownish greene stalkes, of a yard high with short foot-stalke under them, are broad and round at the bottome, growing narrower to the point, and finely dented about the edges, of a fresh greene colour on the upper side, and somewhat yellowish underneath: and greene stalke towards the toppe brancheth forth into many flowers, which stand in a tuft or spike, with divers small greene leaves below them on the stalke, and the flowers being many, set on severall small branches, have a small greenish scaly huske, and a small pale purplish flower spanning out of it, consisting of sundry small leaves laid open like a Starre, with divers pale yellow threads filling up like a thrum, which turne into a downe with small seed therein: the roote is living, sending greene leaves all the Winter, when the stalkes are withered and dead, but hard and woody at the head, sending forth long whitish strings: this flowreth with us once or twice before the next, that is about the end of August, or first in the yeare, prove not so warme.

18. *Alter Pyrenaicus angustifolius foliorum parvo alterato flore.* The narrow leafed and later flowred Starwort of *Pyrene*.

The many stalkes of this Starwort grow higher then of the other, bearing single leaves at every joynt, being long and narrow, without any dent at the edges, and without any foot-stalke at the bottome: at every joynt from about the

the middle upwards it throweth very long branches, and they oftentimes branched againe, at each ioint whereof stand single leaves, but much smaller and narrower set than below, the flowers stand singly also at the ioynts and toppes of every stalke and branch, which are small and starre fashion, of a pale white colour, with a single purple thrum in the middle, rising out of a small greene huske which turne into downe like the former; the roote is compoſed of sundry long white stringe, which live long, and encreaſeth much, loſing all the ſtalkes in the Winter, and holding a cuſt of greene leaves, vnder it whose new ſtalkes the next yeare; thus flowreth much later than the other, ſometimes not vntill the end of October, or beginning of November, yeare moneths ſooner in a warme yeare.

The Places.

The firſt kind of Starwort groweth in *Provence* and *Narbone* in *France*, in *Lombardy* alſo. The ſecond on the Mountaines in the kingdome of *Naples*. The third in *New Caſtile* in *Spaine*. The fourth at the foote of the Alpes of *Auſtria* and *Styria*, and on *Leopoldberg*, and other hills neare *Vienna*. The fifth in *Oſtericia*, and on the hills neare *Vienna*. The ſixth likewiſe neare *Vienna*, at the foote of divers hills, and on the woods that were felled there. The ſeventh likewiſe in the fields neare *Vienna*, and in a ſmall Wood neare the River *Danow* or *Danubius*. The eighe hath becne many yeares growing in *England* ſince it was firſt brought out of *Virginia*, and ſo hath the ninth alſo, but the tenth we have had ſcarſe time enough to obſerve it ſufficiently ſince we came from *Virginia*, by the meanes of Maiſter *George Gibbes* Chirurgion of *Barbe*, who brought in his returne from thence, a number of ſeeds and plants hee gathered there himſelfe, and flowred fully only with M. *Tradeſcant*. The eleventh groweth in many places of our owne land, in moiſt or ſhadowy places. The twelfth *Guillaume Boel* many yeares agoe brought out of *Italy*, with him. The thirteenth in many meadowes both in *Italy* and *France*. The fourteenth in many places of *Hungaria*, *Auſtria*, and *Moravia*. The fifteenth in the graſſy fields on the Alpes of *Auſtria*. The ſixteenth groweth about *Genoua* in *Auſtria*, and other parts of the Alpes there, as alſo on the Mountaine *Iura* in *Switzerland* neare *Geneua*. The ſeventeenth on the dry Rocky hills and Olive yards about *Montpelier* and *Caſtrum nouum*. The eighteenth and laſt were ſent us from *France* growing firſt in *Candia*. Some of them are hardly nourished up in gardens eſpecially the eighth and ninth, which are unwilling to change their naturall habitation.

The Time.

They doe all flowre in the Summer moneths of June and July, ſome earlier or later than others.

The Names.

It is called in Greeke [illegible] in Latine *Aſter Atticus*, *Bubonium* & *Inconcinnus*, both for that the flower is like a Starre, and that as it is likely, it grew plentifully about *Athens*, and of the effect to cure the ſores that happed in *Ducaine*, the groyne, *Herba Stellaria* alſo of ſome. The firſt is called by all *Aſter Atticus legitimus*, but *Lobelius* to diſtinguiſh it, added *foliolis ad flores ſerratis*. The ſecond is called by *Fabius Columna Aſter Lacteus*, becauſe the flowers bend downe their heads, and by *Bauhinus Aſter Atticus ſolijs coriaceis exiguis*. The third is called by *Cæſalpinus Aſter ſecundus Lugduni*, and by *Dodoneus*, *Dalechamp*, *Lobel*, and *Lugdunenſes*, and *Tabernæmontanus*, *Aſter Atticus tertius*. The fourth is called by *Clusius Aſter tertius*, *Italicus primus*, or *Aſter Hippomanes cordifolius*, of *Italianes Aſter Italorum maior folijs ſcabris*. The fifth is *Clusius* his *Aſter Italicus primus*, *Tabernæmontanus Italorum Cacomeri*, or *Cucumeri Aſter Italorum* but falſely, of *Lugdunenſes Bellidiaſtrum*, or *Bellium*. *Aſter montanus luteus glabro folio*. The firſt is *Clusius* his *Aſter Lonicerij primus*, or *Tabernæmontanus Aſter Lonicerij pars*, of *Dodonæus Aſter ſerratus*, of *Lugdunenſes Aſter Lonicerij minor ſerrato folio*. The ſeventh is *Clusius* his *Aſter Lonicerij ſecundus*, or *Tabernæmontanus Aſter Lonicerij*, *ſerratis foliis*. The eighth came firſt to us by the Virginian name *Appalamena*, done thinke that the Virginian name of the ninth is *Wighand*, but falſely: but the tenth and eleventh without names, and therefore we have given them ſuch names as ſeemed to us moſt convenient, and are in their order ſmall ſome higher in ſize then other. The eleventh *Lobel* in his obſervations calleth it *Aſter Canadenſis*, and all others doe, but the twelfth was ſo entituled by *Bauhine*, as it is here ſet downe. The thirteenth is called generally *Aſter Acris Italorum primus* or *Cacomeri ſpecies*. The fourteenth is a ſpecies of the firſt *Aſter Atticus Italorum primus* or *Cacomeri ſpecies*, whereof both *Cæſalpinus* and *Tabernæmontanus* make mention. The fifteenth is *Clusius* his *Aſter Alpinus purpureus*, which he doth not ſo call *Aſter Alpinus*, in that it doth reſemble the *Amellus* of *Virgil*. *Lonicerus* calleth it *Aſter Alpinus purpureus ſerratus*. *Dodonæus Aſter montanus cæruleus magno flore ſolis oblongis*. The ſixteenth *Bauhinus* onely remembreth it by the name of *Aſter Sicilianus*, *Aſtro ſive Tripolio maior flore*. The ſeventeenth *Lobel* calleth *Aſter montanus Narbonenſis Cæſalpini flore ſecundi ſolijs ſerratis purpureis*. The two laſt have their names given by us, as we thinke fitteſt. There hath beene formerly ſome controverſie among Writers, what plant ſhould bee *Aſter* of the Ancients, whereof there is mention of this *Aſter Atticus* flos, which is ſet forth in this & my former Booke, wherein the [illegible] hath no purple colour in the flowers, which that of *Dioſcorides* hath, both in the deſcription thereof by him, (as many doe as well the beſt part in the deſcription of the flowers, to be *purpureum & luteum*, whereas the new Editions have *Purpureum luteumque*) and in the picture, where he ſaith that divers say, that the purple of the flower, or in the flower, is good to make the haire of the groyne; and rather all ſwerving of the 12 kinds here ſet forth, likewiſe in my other Booke (whereto thoſe with purple flowers are referred as ſpecies) to be both the true *Aſter Atticus* of *Dioſcorides*, and the true *Amellus* of *Virgil*, which he deſcribeth in the fourth Booke of his *Georgicks*, and that moſt plainely in theſe Verſes.

Sit mihi mollis in pratis, cui nomen Amello
Fecere agricolæ, facilis quæ gramina herbis
Non magno interjecta valet decerpere fetu
Amellus, cui purpureus, quæ plurima circum
Fundit humo, radix fulmen corpora nigra,
Folia & quæ arvensis ornata rotundior acer,
Asperaque folia: tenuis in calathis thorus
Pectora mollior ea lenunt prius, humina Mell.

Yet *Gesnerus* notwithstanding, he saith, and although he allow of it, to be *After Antiquis*, yet not to be *Amellus*, whom I take it, *Columella* doth commend: he misseth no man, but saith, that Ione would make that hearbe, which to the judgement of all men, he *Veliciosa vanis*, to be the *Amellus* of *Virgil*; which neither the flower, being of a yellow, though standing like a Starre, nor having any purple colour therein, which *Virgil* saith *Amellus* hath, for his words *Aster ingo*, which is the flower, hath *in folijs quæ plurima circumfusa humor*, the purple colour of the violet, but not so faire, and cannot be referred to the leaves of that plant: neither the stature or forme of *Chrisanthemum*, which is low lying upon the ground, and *Amellus* rising high, and bearing a bush of flowers at the toppe of his stalke, as *Virgil* saith, *Nec sinit esse rudis silvis*: neither the time of the flowring, for *Chrisanthemum* flowreth in the Spring, and *Amellus* in the mid of Summer, when the fields are mowed, as he saith, *Tempus in aestivos*. *Postores legere prope flumina Amelli*. *Pena* and *Lobel* in their *Adversaria* also, would make *Tripolium* to be the proper unto *Amellus* of *Virgil*, because the flower is purple, starre fashion, and yellow in the middle, and that it usually groweth in moist places, neare unto Rivers, as *Virgil* saith of his: which hath the greatest probability next unto it, of any other hearbe, by reason of his words, *after hoary vapor*, which is harsh or binding, agreeth not unto *Tripolium*, and because I find no other Author agreeing thereunto, and that this is most commonly received of all, I dare not forsake so great reasons, and so many judgements, and adhere to this one of *Pena* and *Lobel*.

The Vertues.

Dioscorides saith, that the purple leaves of the flowers boyled in water, was held to bee good for the paines before in the groine, as also the use of the herb hearbe moyle to anoynt the place, and likewise the dryed flowers, to be taken into the right hand of the patient, is found to the place that is grieved, it easeth paines in the places, it helpeth children affected with the falling sickenesse: and those that are troubled with the Quinsey, it helpeth perfectly, it mollifieth the inflammations of the eyes, and the fundament when it is fallen downe, it an ointment made of the greene hearbe, and oile of Hogs grease, it helpeth them that are bitten by a mad Dogge, as *Crateuas* saith, it consumeth the kernelings of the throat, and driveth away Serpents if it be burned. *Galen* saith it is called *Asteris*, not onely because safe, that being annointed, but also that being hung or tyed to the places, it *heareth* the *Stars* the groine, for it hath not onely a digesting, but also no small cooling quality, and repelling, being of a mild property like the Rose. *Pliny* addeth that being bound to the place, it is profitable for the paine in the huppes.

CHAP. XLVI.

Ruta. Rue, or Hearbe grace.

THere are foure or five speciall sorts of hearbes called by the name of Rue, having little likenesse there unto, but onely some few in the vses, which are these. First *Ruta Canina*, whereof I meane to speake among the *Seregalinaceis*. The second is *Ruta præcox*, called also *Thalictrum*, which you shall see in the next Chap. The third is *Ruta Montana*, which shall bee spoken of among other Capillar hearbes, and the fourth is *Ruta Capraria seu Rodigia*, which shall be declared among the *Alexipharmacis* Counterpoisons. Divers other hearbes have beene entituled *Ruta*, by singular Authors, as you shall finde among the names of them, whereof to make mention here were needlesse, I rather referre you to the places specified. Of our ordinary or garden Rue, common enough through all this Realme, there are some other sorts to bee, which are here to be remembred with them, although not usually kept, or to be easily kept in the gardens of our land.

1. *Ruta hortensis major.* The greater ordinary garden Rue or Hearbe of Grace.

This ordinary garden Rue groweth up with hard woody stalkes branching forth on all sides, and bearing thereon sundry long leaves, divided into many small ones, being some what thick and round pointed, and of a darke blush greene colour: the flowers that stand at the toppes consist of foure small yellow leaves, with a great button in the midst, compassed about with sundry small yellow threads, which growing ripe, containeth within small blacke seed: the roote is white and woody, spreading farre in the ground, and abiding many yeares.

2. *Ruta Hortensis minor.* The lesser garden Rue.

This Rue is so like the ordinary garden kind, that it will deceive many that doe not heedfully regard it, and I my selfe am fully perswaded that it is the next sort of Rue, which is the greater sort of wild Rue, transplanted and nourished in gardens. It riseth not up so high, neither beareth so great stalkes: the leaves are very like the common garden kind, but that they are smaller, and of a blacker or darker greene colour: it doth more seldome give the flower with us, and the smell thereof is not so strong, nor the taste altogether so bitter as the other, and herein consisteth the difference betweene them.

3. *Ruta Sylvestris major.* The greater wild Rue.

This wild Rue is in all things like unto the garden Rue, but that the leaves are somewhat longer and narrower, and the colour of them are darker, more tending to greene: the stalke is strong and woody, in hote countries much more than in these colder climates, but riseth not fully so high as our garden kinde, where it growes also to any woodinesse: the flowers also are yellow, compoled of foure yellow leaves like unto it, and small seed

Public Domain / http://www.hathitrust.org/access_use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

1 *Ruta hortensis vulgaris.*
The grave or ordinary garden Rue, a denizen of Gerards

2 *Ruta graveolens major.*
The greater wilde Rue

some square heads (and sometimes in three square heads) like the other. This is of a more strong and virulent scent and taste than the garden kind.

4 *Ruta sylvestris minor.* Small wild Rue.

This small Rue, is also like unto the former, but that the leaves hereof are much more finely cut than it, both shorter and smaller, but as strong, or rather more than the other, both in scent, taste, and quality: the stalke hereof riseth not so high as the other, but branches at the toppe, bearing yellow with small flowers, and small seed in square-square heads, like thereunto: the roote is long and woodie.

5 *Ruta montana.* Mountaine Rue.

This Rue is the smallest of all the rest, whose leaves are the finest cut, and divided of them also, so that it hath scarse the face or forme of any leafe of Rue; they are also much whiter in colour than any of them, and the most virulent and pernicious of all the rest, both in scent and taste: the flowers and seed are like unto the other sorts, but the smallest of them.

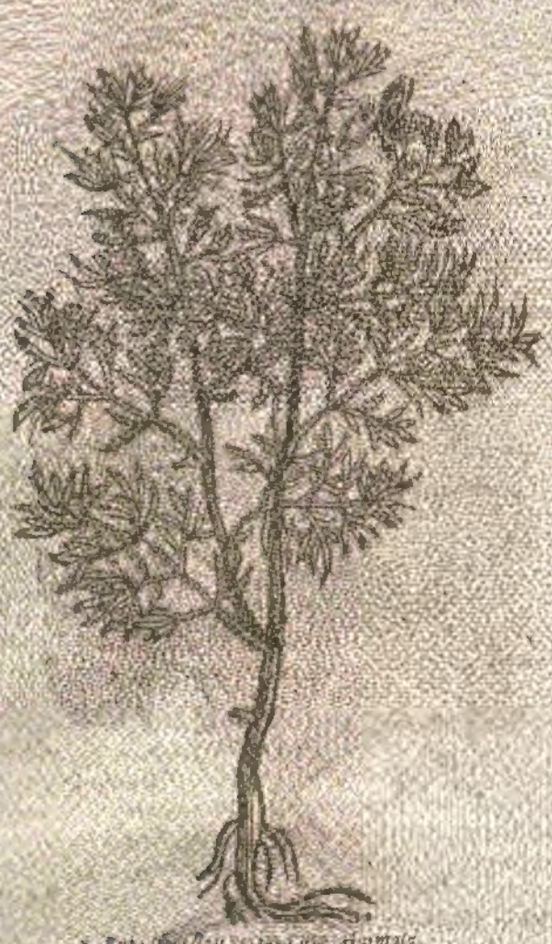
6 *Ruta sylvestris Syriaca sive Haemala.* Wild Assirian Rue.

The Assirian wild Rue riseth up with many darke round greene stalkes, about a foote high or more, whereon are set divers long leaves, divided into many parts, each whereof is longer, thicker, and greener than the small wilde Rue, but not of so strong or virulent a savour as it, yet somewhat strong, and a little sharpe and bitter: at the tops of the stalkes stand many flowers, consisting of five white leaves, larger than in any of the other sorts of Rue: in the middle whereof riseth up a greene three square head compassed about with many yellow threads: in which three square head when it is ripe, is contained small brownish cornered seed: the roote is thicke, and somewhat yellowish, with divers small fibres annexed to it.

The Place.

The two sorts of Garden Rue are onely nurtured up in gardens in all places, yet the second is not so common as the first, but onely kept by a few. The other two wild sorts grow upon the Mountaines in *Spaine* and *Italy*, and about *Montpelier* in *France*: but how we should believe *Gerard*, who saith some of them grow on the hills in *Lancashire* and *Yorkshire*, you may easily gather by their abiding our Winters in gardens, for being of so hot and burning qualities, and growing in hot Countries, not enduring any cold; how should they be naturall to our climate, especially the more Northerly parts: the fifth in *Spaine* also, *France*, and other hot Countries. The last groweth in *Syria*, from whence it was first brought into Countries: as also in the fields, and about the bridges neare unto *Constantinople*, as *Bellonius* saith, in the fifth Chapter of his third Booke of observations.

The Time.



The garden kindes especially the yellow, doth seldome flower in our land, and therefore scarse ever beare good seed. And the wild or Mountaines kindes doe the like.

The Names.

It is called in Greeke [illegible] *Peganum quasi caliditatis vel ferens genitale vulnus*, the roote of the fifth kinde, as

1. Ruta sylvestris minor. Small wild Rue.

2. Ruta montana. Mountain Rue.

3. Ruta sylvestris Assyriaca minor. Wild Assirian Rue.

Dioscorides saith, was called in his time, *Ruta montana*: and the roote of the Assirian wild kinde, was also as hee saith called *Ruta*, for the ill smelle thereunto, being bitter wilde, and white within: and *Ruta* in Latine, *a Rue*, for the violent fierce vapours it sendeth forth, raising the spirits, &c. In English, Rue, and Herbe Grace, or Herbe Grace, for the many good properties wherewithall it serveth but without doubt it is a most wholesome hearbe, although bitter and strong, and could our dainty stomacke brookes the use thereof, it would worke singular effects, being skilfully and carefully applyed. The first is called *Ruta sativa*, or *hortensis*, or *latifolia* or *major* by all Authors. The second is called by *Tragus Ruta hortensis minor*, and by *Cordus Ruta foliis minus tenuifolia*, *Dodonæus* calleth it *graue olens*. The third is called *Ruta silvestris* of *Matthiolus*, *Lobel*, *Dalechampius*, and others, and is the first of the wilde kindes with *Dodonæus* and others, as the fourth is the second wilde with him. The fifth is the smallest wilde Rue, called of *Lobel*, *Ruta* and *Peganon Narbonensium*: of *Dodonæus Ruta silvestris minima*: of *Clusius Ruta montana tenuifolia*: of *Lobel*, *Ruta montana*, and others *Ruta silvestris tenuifolia*. The last is called *Harmala* even in *Dioscorides* his time, as he saith, and *Serapio* and others, and so it is called still with most Writers of *Harmel*, yet some *Ruta sylvestris*, and *Syriaca*. The Arabians call it *Sadab*: the Italians *Ruta*: the Spaniards *Arruda*: the French *Rue*: the Germanes *Rauten*: the Dutch *Rupten*: and we in English, Rue, or Herbe Grace.

The Vertues.

Both sorts of Rue (that is) the garden and the wilde, as *Dioscorides* saith, doe heate, burne, and exulcerate the skin. It provoketh urine and womens courses, being taken in meate or drinke. The seed thereof taken in wine is an Antidote or Counterpoison against all dangerous medicines or deadly poisons: the leaves hereof taken either by themselves or with

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

with Figges and Walnuts, is called *Mithridates* his counterpoiſon, or Mithridate againſt the plague, eaſeth all venemous things, as well as of Serpents, to become harmeleſſe; being often taken either in meate or drinke. it abateth venery, and deſtroyeth the ability of getting children: a decoction made thereof with ſome dryed Dill leaves and flowers, eaſeth all paines and torments, inwardly to be drunke, and outwardly to bee applied warme to the place affected. The ſame being drunke, helpeth the paines both of the cheſt and ſides, as alſo coughes, hardneſſe, or difficulty of breathing, the inflammation of the lungs, and the vexing or tormenting paines of the Sciatica, and of the joynts being anoynted, or laid to the places, as alſo the ſhaking of agues, to take a draught before the fit come: being boyled or infuſed in oyle, it is good to helpe the wind collick, or the ſwelling hardneſſe or windineſſe of the mother, and ſtayeth women from the ſtrangling and ſuffocation of the mother, if the ſtone and the parts thereabout bee anoynted therewith: it killeth and driveth forth the wormes of the belly, if it bee drunke after it is boyled in wine to the halfe, with a little honey; it helpeth the gowt, or paines in the joynts of hands, feete, or knees, applyed thereunto; and the ſame with Figges helpeth the dropſie, which is a running of ſharpe water, betweene the fleſh and the skin, being bathed therewith: being bruiſed and put into the noſtrils, it ſtayeth the bleeding thereof. It helpeth the ſwellings of the cods, if it be boyled with Bay leaves, and they bathed therewith. It taketh away wheales and pimples, if being bruiſed with a few Mirtle leaves, it be made up with waxe, and applyed thereon. It cureth the Morphew, and taketh away all ſorts of warts, on the hands, face, neck, or any other parts, if it be boyled in wine, with ſome Pepper and Niter, and the places rubbed therewith: and with Allome and Hony, helpeth the dry ſcab, or any fetter or ring worme: the juyce thereof warmed in a Pomgranate ſhell or rinde, & dropped into the eares that are full of paine, helpeth them: the juyce of it and fennell, with a little honey, and the gall of a Cocke put thereunto, helpeth the dimneſſe of the eye-ſight: an oyntment made of the juyce thereof, with oyle of Roſes, Ceruſſe, and a little vinegar, and anoynted, cureth Saint *Anthonies* fire, and all foule running ſores in the head, and thoſe ſtinking ulcers of the noſe and other parts. The eating of the leaves of Rue taketh away the ſmell both of Garlike and Leekes. The Antidote that *Mithridates* the King of *Pontus* uſed to take every morning faſting, thereby to ſecure himſelfe from any poyſon or infection, was this. Take twenty leaves of Rue, a little ſalt, a couple of Walnuts, and a couple of Figges, beaten together into a Maſſe, which is the quantity appointed for every day. Another Electuary is to be made in this manner. Take of Niter, Pepper, and Cominſeed, of each equall parts, of the leaves of Rue cleane picked, as much in weight as all the other three weighed, beate them well together as is fitting, and put thereto as much honey as will well make it up into an Electuary, (but you muſt firſt prepare your Cominſeed, laying it to ſteepe in vinegar, for 24. houres, and then dry it, or rather toaſte it in an hot fire ſhovell, or as others would have it in an Oven) is a remedy for the paines and griefes of the cheſt or ſtomacke, of the ſpleene, belly, and ſides, by winde or ſtitches, of the liver by obſtructions, hindering digeſtion of the meate, of the reines and bladder, by the ſtopping of the urine, and helpeth alſo to extenuate fat or corpulent bodies. The leaves of Rue firſt boyled, and then laid in pickle, are kept by many to eate, as ſawce to meate, like as Sampire is, for the dimneſſe of ſight, and to warme a cold ſtomacke. The diſtilled water thereof, is effectuall for many purpoſes aforeſaid. Our garden kindes worke all theſe effects, but the wild kindes are not uſed ſo often with us, not onely becauſe we have them not uſually, and that they will not abide our cold Country, but their fiercenеſſe is ſcarce tolerable, except for outward griefes and applications, for the falling ſickneſſe, palſies, gowts, joynt-aches, and the like, wherein they worke more forceably than the garden kindes, for taken inwardly by women with child, it deſtroyeth the birth, and mightily expelleth the after-birth. *Antigonus* in his Rhapſody or huddle of memorable things, relateth a ſtory of a Weaſell, that being at fight with a cruell Serpent, eateth Rue, and rubbeth her ſelfe therewith, before hand, to be the better defended from the poiſon; whereby it was found to be powerfull againſt the ſting or byting of venemous creatures. The ſmall Mountaine kind is ſo violent, that it may ſoone kill one, if it be not carefully looked unto, or too great a quantity given at a time.

CHAP. XLVII.

Caryophyllata. Avens.

THere are divers ſorts of Avens more than formerly hath beene knowne, to bee ſet forth together in this Chapter.

1. *Caryophyllata vulgaris.* Ordinary Avens.

Our ordinary Avens hath many long rough darke greene winged leaves, riſing from the roote, every one made of many leaves, ſet on each ſide of the middle ribbe, the largeſt three whereof grow at the ends, and ſnipt or dented round about the edges; the other being ſmall pieces, ſometimes two, and ſometimes foure, ſtanding on each ſide of the middle ribbe underneath them: from among which riſe up divers rough or hairy ſtalkes, about two foote high, branching forth divers with leaves at every joynt, not ſo long as thoſe below, but almoſt as much cut in on the edges, ſome of them into three parts, and ſome of them into more: on the toppes of the branches ſtand ſmall pale yellow flowers, conſiſting of five leaves, very like unto the flowers of Cinque-foile, but larger: in the middle whereof ſtandeth a ſmall greene head, which when the flower is fallen, groweth to be rough and round, being made of many long prettily purple ſeeds, like graynes, which will ſticke to any bodies cloaths: the roote is made of many browne with ſtrings or fibres, which ſmell ſomewhat like unto Cloves, in many places, eſpecially in the higher, hotter, and dryer grounds, and ſweet cleare ayre; but nothing ſo much, or not at all in many other places, eſpecially if they be moiſt, and are of an harſh or drying taſte.

Of this kind *Cornutus* ſaith, there is another found in Mountaines, that is larger than it, not much differing elſe in any thing. *Major.*

2. *Caryophyllata montana.* Mountaine Avens.

The Mountaine Avens ſheets long browniſh round roote, of the bignеſſe of ones finger, creeping under the upper crult of the earth, (and not altogether ſo ſtringy as the former) with ſome ſmall fibres ſhooting downewards in ſeverall places, and ſmelling and taſting like the other, ſendeth forth divers winged leaves, made of many ſmall leaves one-wards the bottome, ſtanding on both ſides of the ribbe, the end leaves being largeſt and whole, not divided,

1. *Caryophyllata vulgaris.* Ordinary Avens. 2. *Caryophyllata montana.* Mountaine Avens.

but somewhat deeply cut in on the edges, of a fresher greene colour likewise, softer also and greener in handling from among which rise slender stalkes, seldome branched, having very few leaves thereon, at the toppes whereof stand usually one flower apeece, yet sometimes more, made for the most part like the former, consisting of fives or five leaves, much larger than they, and of a deeper yellow colour, and sometimes with a white flower, as *Gesnerus* saith *in horto*, tending to rednesse, having many yellow threads in the middle, compassing a greene head, which when the flower is pall, increaseth to be a round head, beset with flat seeds, not so rough, or ready to sticke to our garments, but every one of them having a long featherlike haire or thread at the end: the whole plant as well leaves as flowers, and seed, are covered with a small soft hairy downe, which is not much or easily discerned, unlesse one heed it very well.

3. *Caryophyllata Alpina minor.* Small Mountaine Avens.

There is a smaller kinde hereof found on *Mons Baldus*, little differing from the former, but in the smalnesse thereof, being covered with a soft downe, and of a darker greene colour, the flowers being large for the smalnesse of the plant, and consisting of five leaves for the most part.

4. *Caryophyllata Alpina minor altera.* The other small Mountaine Avens.

This small Mountaine Avens hath much longer leaves than the last, lying upon the ground round about, and more divided, or cut into divers parts, making each part of the leafe to resemble that of Smallage, being somewhat in length, from among which rise up two or three weake trayling stalkes, with foure leaves thereon, much lesse than the lower, but more finely cut in, on the toppe whereof standeth one large flower, consisting of five, and sometimes of eight leaves, standing in a greene husse, whose ends reach to the height of the flower, which is of a pale yellow colour than the former, and turneth into such like heads, of long hairy seeds as the former: the roote is somewhat long and slender, branched forth, and with divers fibres at them.

5. *Caryophyllata montana sive palustris purpurea.* Purple Mountaine or marsh Avens.

The Marsh Avens hath leaves somewhat like the second sort, but with longer foote stalkes, and somewhat hairy: the stalkes rise as high as the first many times, with fewer leaves set here and there on them, and more divided, at the toppes stand two or three small flowers apeece, hanging downe their heads, of a purplish yellow colour, tending to purple, standing above the huskes that containe them: after which come such heads, but more soft and downy: the root creepeth in the ground, and smelleth much lesse than the former, and some little or nothing.

Virginia. Wee have had from *New England* another of this kinde, brought by *John Newton* a Chirurgion of Colchester, that is taller and greater than this, differing little in any thing else, giving flat thin blackish seed in huskes.

6. *Caryophyllata aquatica altera.* Another Marsh Avens.

This other is like unto the first, but hath the husk that containeth the flower, spreading beyond the brim thereof, which is in some more reddish, and in some more double than in others, not differing in any other thing.

Original from UNIVERSITY OF MICHIGAN

7. *Caryophyllata Pentaphyllea.* Cinque-folie Avens.

The Cinque-foile Avens hath the leaves thereof divided into five parts, like unto a Cinque-foile leafe, dented about the edges, the stalkes are about a foote high, having some such like leaves thereon, at the joynts where it brancheth forth; at the toppes whereof stand pale yellow flowers, like the first sort, but smaller, with many yellower threads, somewhat downy in the middle: the roote is compoſed of many brownish stringe, smelling somewhat like unto the former kindes.

The Place.

The first as I said before, is found wilde in many places of this Realme, under hedge sides, and by the pathes in many fields, and delighteth rather to grow in shadowy than Sunny places, yet is usually brought into gardens to be at hand, to be used as is any occasion. The second is found upon divers Mountaines, as *Carinthia* in *Bohemia*, by the Springs of the River *Alen*, as *Matthiolus* saith: upon *Mons Baldus*, at *Pona* saith, and in some other places. The third and fourth upon Mount *Baldus*, as *Pona* reporteth, both in his Latine and Italian descriptions thereof. The fifth and sixth grow by moist sides, and in moist and wet, or marish grounds, on the Mountaines. The last was found by *Pona* hard by *Clusius* on the Rhetian Alpes in *Switzerland*, whereas he saith, hee tooke it for a kinde of Cinque-foile or Tormentill at the first, untill by the smell and colour of the roote, he judged it a kinde of Avens.

The Time.

These doe flower in the moneths of May, and June, for the most part, and their seed is ripe in July at the farthest.

The Names.

It is generally called in Latine now adayes *Caryophyllata* and *Caryophyllata*, for it is not found to be knowne to any of the ancient Greeke or Latine Writers, except it bee *Geum* of *Plinie*, as most of the later Writers doe confidently, and not without good reason (suppose) from the scent of the roote, so neare resembling

Cloves.

Cloves, which are called *Caryophylli*, yet some have called it *Herba Benedicta*, of the excellent or smelled qualities thereof, and others *Sana-omnia*, for the like effects. *Tragus* would have it called his *Nardus agrestis*, not only for the sweet scent of the rootes, but for the cordiall properties it hath. The first is as I said, called of the most of the later Writers *Caryophyllata* & *vulgaris & hortensis*. *Brunfelsius* as I thinke first, and after him *Gesner*, *Tragus*, and *Tabermontanus* call it *herba Benedicta*, and *Benedicta*. *Camerarius* saith the French call it *Sana-omnia*, and *Tanacetum*, as I thinke, or *Gesner* first, and after them *Lobel*, call it *Geum Plinij*. The second is called of *Matthiolus* (who first set it forth) *Caryophyllata montana*, and so doe *Dodonæus*, *Lugdunensis*, *Anguillara*, *Tabermontanus*, and *Gesner*. *Camerarius* calleth it *Caryophyllata Alpina*. *Tragus Benedicta sylvestris*; *Lobel Caryophyllata major rotundifolia*, and *Gesner Geum Alpinum quartum*, in his *horto Germaniæ*; *Bauhinus* calleth it *Caryophyllata Alpina altera*. The third and fourth being the lesser sorts of this kind, were found by *Pona* on Mount *Baldus*, and called by him, *Caryophyllata Alpina montana minima*, and *minima altera*. The fifth is called by *Lobel Caryophyllata Septentrionalium rotundifolia purpurea flore*; by *Clusius Caryophyllata montana prima*; by *Gesner in horto*, *Geum rivale*; by *Camerarius in horto*, *Caryophyllata palustris*, and in his Epitome upon *Matthiolus Caryophyllata aquatica*; by *Iohannes Thalius*, *Caryophyllata major seu purpurea*; by *Lugdunensis Caryophyllata montana Dalechampij*; and by *Bauhinus Caryophyllata aquatica purpurea flore*. The sixth is mentioned by *Bauhinus* in his *Matthiolus* under the title of the former, and calleth it in his *Pinax*, *Caryophyllata aquatica Anglica*, the flowers whereof are expressed by *Clusius* under the name of *Caryophyllata montana tertia*. The last is called by *Pona* and *Lobel* in their *Adversaria*, *Caryophyllata Alpina Pentaphylla*. *Castor Durantes* giveth the same figure, with the name and description of *Matthiolus* his *Caryophyllata montana*. *Tabermontanus* calleth it *Caryophyllata Alpina quinquefolia*, and so doth *Bauhinus* in his *Pinax*, who also setteth it downe as if it were the *Polyrrhizos latifolia in Lugdunensi*, which there is set forth to have a white flower, growing on some hills in *Savoy*, but *Gerard* in translating *Dodonæus* his supposition, that the *Caryophyllata montana* should be the *Baccharis* of *Dioscorides*, excepting the colour of the flowers, and the smell of the rootes, which yet he endeavoureth some what to reconcile, therein onely *Dodonæus* his minde, and not fully his owne, unlesse you will beleeve that, all that he translateth out of *Dodonæus*, was still his owne opinion.

The Vertues.

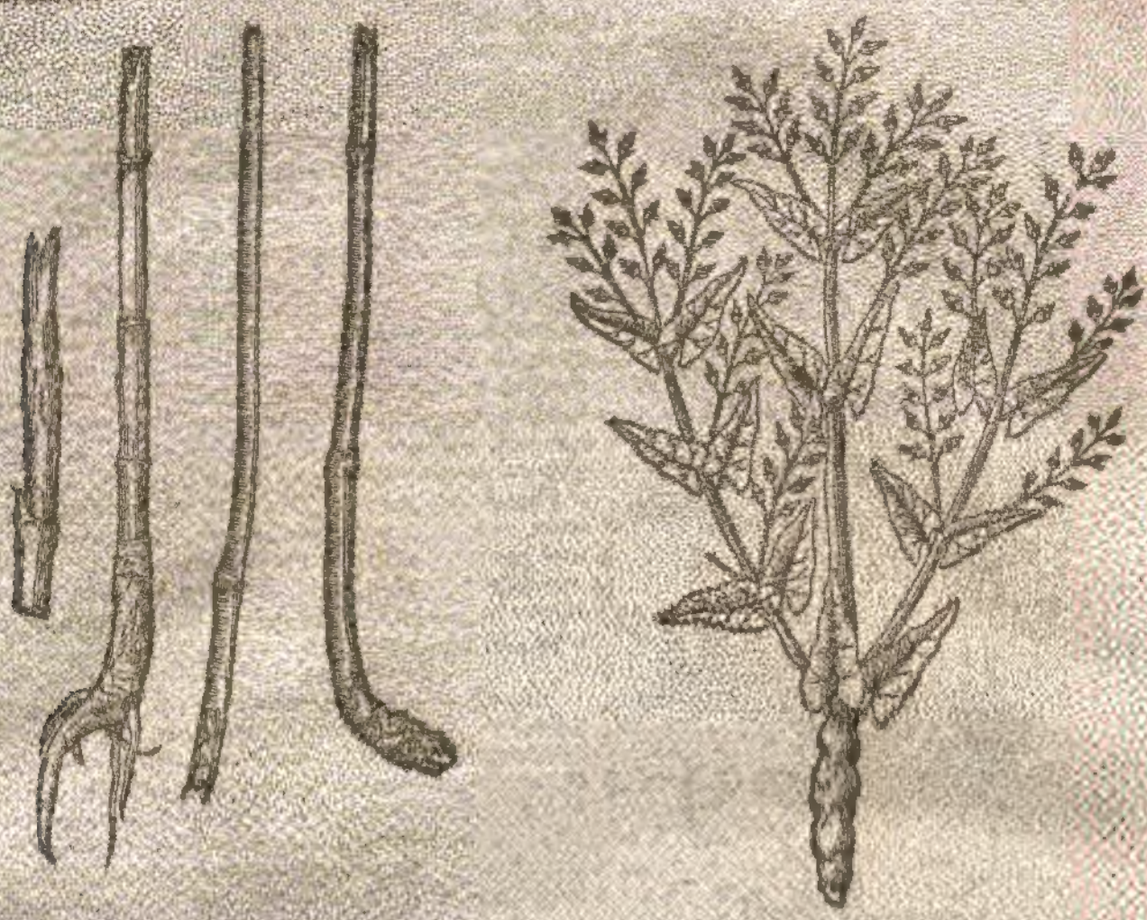
Being accounted by the latest best Writers (as I said before) to be the *Geum* of *Pliny*, it is as hee saith, not onely good for the diseases of the chest or brest, but good also for stitches or paines of the sides, and to expell crude or raw humours, from the stomacke and belly, by the sweet savour, and warming quality, for which purposes *Avens* is found by all to be effectuall. It also dissolveth the inward congealed or clotted blood, happening by falls or bruise or the spitting of blood: the rootes especially either greene or dryed, being boyled in wine and drunke; as also all manner of inward wounds, or outward if they be washed, and bathed therewith, or if they be fistulous to bee injected. The same decoction also drunke, comforteth the heart, and strengthneth the stomacke, and a cold braine, and therefore is good in the Spring time to open the obstructions of the liver, helpeth the winde collicke by dissolving the wind, and stitches and paines in the sides, and being of a binding quality, helpeth also those that have fluxes, or are burstен, or have a rupture. If foule spots or markes in the face, or other parts of the body be washed therewith, it taketh them away, and leaveth the skin well coloured. The powder of the dryed rootes, or the juyce of them when they are fresh, worketh the same effects that the decoction doth: and in callous ulcers, with the juyce of the rootes, if a little verdigrease be added, it worketh a singular good effect. Some use in the Spring time to put the roote to steepe for a time in wine, which giveth unto it a delicate savour and taste, which they drinke fasting every morning, to comfort the heart, and to preserve it from noysome and infectious vapours of the plague, or any other that may annoy it; as also to helpe digestion, and to warme a cold stomacke, troubled with grosse or raw humours, and to open the obstruction of the liver and spleene. Some doe use to lay the rootes dryed among garments, to perfume them with the smell thereof, and to keepe away Mothes, &c. from them. The Cinque-foile *Avens*, because it participateth with the other, both in smell and taste, although weaker, cannot but likewise partake with them in the qualities aforesaid, yet not so effectuall, although I know not any Author hath made mention of any experimentall effect thereof. The Mountaine *Avens*, as *Matthiolus* saith, is found to be as good as the ordinary, for all the diseases whereunto it is applyed, and worketh more forceably and speedily in them all.

Chap. XLVIII.

Calamus Aromaticus. The Aromaticall Reed; and *Acorus legitimus Dioscoridis, sive falso Calamus odoratus officinarum*. The true Acorus of *Dioscorides*, or sweet smelling Flagge, untruely called *Calamus* in the Apothecaries shoppes.

I Have joyned both these plants in one Chapter, for the transposition of the names, and the sweet smelling properties the one doth enjoy, although falsly appropriated to the other, & much differing both in kind and manner of growing.

1. *Calamus Aromaticus Matthioli*, *Matthiolus* his Aromaticall Reed.



This Aromaticall Reed groweth with an upright tall stalke, set full of joynts, at certaine spaces up to the top, (not hollow as divers other Canes and Reeds are, but stuffed full of a white spongious pith, which is of a gummy taste, somewhat bitter, and of the bignesse of a mans finger) and at every one of them, a long narrow leafe, of a darke browne greene colour, smelling very sweet, differing therein from all other kindes of Reeds: on the top whereof groweth a bushy or Featherlike panicle, like unto those of the common Reed: the roote is knotty, with divers heads thereat, whereby it encreaseth and shooteth forth new heads of leaves, smelling also very sweet, having a little binding taste, and sharpe withall. This is the description thereof extant in sundry Authors since *Matthiolus*, which because it so neare resembleth the common Reed, is supposed by divers to bee but still reserved by *Matthiolus*, although all others follow him therein, therefore I give you not their figure: but the figure of the dryed stalkes that *Camerarius* and *Clusius* set forth, that all may see what manner of thing that *Calamus* is, and the whole figure of the plant, as *Alpinus* setteth it forth, in *lib. de plantis exoticis*.

2. *Calamus*

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd

2. Calamus Aromaticus Syriacus vel Arabicus fupposititius. The dry Stalkes of the true Aromaticall Reed as it is supposed.

2. Calamus Aromaticus officinarum vel Arabicus fupposititius. The supposed true Syrian or Arabian Aromaticall Reed.

2. *Calamus Aromaticus Syriacus vel Arabicus fupposititius.* The fuppofed true Syrian, or Arabian Aromaticall Reed.

This plant which is fuppofed by many to be the true Indian *Calamus aromaticus*, (but much fuſpected by others) riſeth up from a thicke unprofitable roote, three or 4. inches long, bigge at the head, and ſmall at the bottome, with one, and ſometimes more ſtalkes, two cubits high (ſaith *Bauhinus*, who deſcribeth it from the ſight of the plant he received from Doctor *Dalechamp*, but halfe a cubite high, or ſomewhat more, ſaith *Alpinus lib. de plantis exoticis*) being ſtraight, round, ſmooth, and eaſie to breake into ſplinters, full of joynts, and about a fingers thickneſſe, hollow and ſpongy within, of a whitiſh yellow colour (like the pith of an elder, ſaith *Alpinus*, or like other Reeds, as *Bauhinus* ſaith) the ſtalke is divided into other branches, and they againe into other ſmaller ones, two uſually ſet togethes at a joynt, with two leaves under them likewiſe, very like unto the leaves of *Lyſimachia*, the Willow hearbe, or Looſeſtrife, but leſſer, being an inch broad, and an inch and a halfe long, compaſſing the ſtalke at the bottome, with ſundry veines running all the length of them: from the joynts riſe long ſtalkes, bearing ſundry ſmall yellow flowers made of leaves, like alſo unto *Lyſimachia*, with a ſmall pointell in the middle, after which follow ſmall blackiſh long heads, or ſeed veſſels, pointed at the end, containing within them ſmall blackiſh ſeed: the ſtalke hath little or no ſcent, yet not unpleaſant (ſaith *Alpinus*, being bitter, with a little acrimony therein: but *Bauhinus* ſaith, it is of an aromaticall taſte, and very bitter. This (ſaith *Alpinus*) the Arabians and Egyptians doe uſe and call it *Caſſabeldarum*, that is *Calamus Aromaticus*, & from them all other Chriſtian nations have it accepted it is ſtrange how improbable ſet any others judge that will beleeve. *Theophraſtus*, *Dioſcorides*, *Galen*, *Pliny*, and others who doe all call it a Reed, when as this you ſee is none, and as *Theophraſtus* & *Pliny* ſay differeth not in forme from other Reeds: for *Pliny* reckoneth up 24 ſorts of Reeds, whereof this is one in their times, and for the ſweetneſſe thereof onely uſed in ſweet ayarments: for the taſte alſo; *Dioſcorides* ſaith it hath ſome aſtringency, and a little acrimony therein, but mentioneth no bitterneſſe, when as this hath more bitterneſſe in it than any other taſte, which could not be forgotten by *Dioſcorides*, if it had any in it. This plant groweth both in ſundry moiſt places in *Egypt*, as alſo by the lake *Lacus Asphaltites* in *Iudea*, and in divers places alſo of *Syria* and *Arabia*: and for ought that we can perceive, differeth nothing at all of yellow *Lyſimachia* than any other plant.

3. *Acorus verus ſive Calamus odoratus.* The ſweet ſmelling Flagge.

This ſweet ſmelling Flagge hath many long and narrow freſh greene leaves, two foote long apeece, at leaſt, ſtanding edgewiſe faſt to the braunch at the bottome, the one rising or growing out of the ſide of the other, in the ſame manner as the leaves of Flowre-deluces grow, which are thin on both ſides, and ridged or chicke in the middeſt, the ſtalke of the leafe ſtanding in the midſt, and ſome of them as it were curled or plaited towards the ends or points of them, ſmelling very ſweet, as well when they are greene and freſh, as when they are dryed, and ſo kept a long time, which doth alſo abide in a garden a long time, as though it never did, or never would beare flowres: the leaves every yeare dying downe to the ground and ſhooting out freſh every Spring, but after two, three, or foure yeares abiding in a place without removing, beſides the leaves it ſhooteth forth (not any ſtalke

as

1. Calamus fragrans Officinarum
The Sweet smelling Flagge

as other Flower-deluces doe) a narrow long leafe by it selfe, flat like unto the other leaves, especially from the middle thereof upwards; but from the bottome to the middle it is thicker, narrower, or rounder, where it beginneth to grow flat, at which place commeth forth one long round head, very seldome two in forme & bignesse like unto the Catain or Aglet of the Hasel-nut tree, growing upright, and of the length thereof sometime of ones finger, or rather bigger; set with severall small ihues and divisions, like unto a greene Pine apple, of a purplish greene colour for the most part, out of which launches, thoote forth small pale whitish flowers, consisting of foure small leaves apeece, without any so good scent as the leaves, falling quickly away, and not giving any seed, that ever I could observe or understand: the roote is thicke and long, lying under the upper face of the ground, shooting forward, and with small roots & suckers on all sides like unto the garden Valerian, whitish on the outside, or greenish if it lye above the ground; and more pale or whitish on the inside, with many joynts thereabouts, and whereat it hath or doth shoote forth long ducke feete underneath, whereby it taketh strong hold in the ground, of a firme or fast substance, yet not hard or woody, but easie to be cut, of a sweet scent, and somewhat bitter taste.

The Place.

The first is thought by *Matthiolus* and others, to grow in *Iodea, Syria, & Indea*. The dry stalkes of the 2. are said to grow at the foot of Mount *Libanus* in *Syria*, not far from *Tripoli*, in the wet grounds there; the other as is said before. The other *Calamus* of the shops, or true *Acorus* groweth in many places of Turky, (in moist grounds I meane) it joyeth and flourisheth better than in dry: from whence the largest roots, the fairest, whitest, & sweetest are brought unto us: but it groweth also in *Russia*, and those other places thereabouts, in very great plenty: but the roots being dryed, are more lanke or small, not so firme or white, nor of so singular a good scent.

The Time.

These Reeds are strangers not growing with us, we having no further knowledge of them: the sweet smelling Flagge beareth his eares in the beginning or middle of July and August.

The Names.

The first and second have their names in their titles, as their Authors have called them, but whether either of these be the true *Calamus Aromaticus* of *Dioscorides*, *Galen*, and others, it were very hard to know; for although it be commonly so taken to be, yet *Clusius* in part improving it, and the wrong one's doubted, doe make it the more improbable: and it is very certaine, that we have no true *Calamus Aromaticus* brought unto us in these dayes, to even thorow all *Turkie*, with both Physicians and Druggills, or Merchants. (For they have no Apothecaries shops as are in Christendome) it is not seene or knowne, for the Arabian word of *Cassab odoriferum*, which is *Calamus Aromaticus*, they understand not what it is, and being demanded for it by that name, (although the Arabian tongue be very frequent among them) they still will give contrary names for it, as *Matthiolus* to his Epistles, and *Belonius* in his observations doe declare. Now whether it should be called *Calamus Aromaticus*, or *odoratus*, it is worthie scanning also: because very many doe thinke the word *aroma*, from whence commeth *Aromaticus*, is the same with *odor* and *odoratus*; but I finde *Gorraus* a very learned Writer, and others also to contrary that opinion, saying that the Arabian words, *derire* or *dhorire*, signifying *aroma*, (as *Cassab* doth *Acorus* or *Calamus*) is properly a sweet spice or drugge, whether they be spices that smell sweet, or any other thing used in medicine, that hath either sweet smell, or no smell, for (saith he) the Hebrew word *deror* signifyeth also, as *Mor deror*, *Myrrha aromatica*, or *aromaticum*, the sweet Myrrhe, in the Scripture *Exod.* the 30. chapter, and 23. verse, was appointed among other spices to make the holy anoynting oyle, and in the 24. verse of the same Chapter, with *Galbanum* which hath no sweet scent, as I think every one knoweth, and other gums to make perfume to burne: and Myrrhe although it be reckoned with Aloes and Cassia, as a sweet thing, in many places of the Scripture, yet it is not sweet to us, as wee account sweet things in these dayes, and Myrrhe and Aloes are called *Aromata*, in the 19. chapter of Saint *Johns* Gospell. *Cordus* knew *Calamus aromaticus* he knew well, and was of much use in *India*, both with himselfe, and other Physitians, as also with many persons of high and low degree, but any to be *odoratus* (sweet) he knew not, but only *fragrans* (sweet) and I thinke *Pliny* first broached that errour in authorizing up his sorts of Reeds, called one *odoratus*, and therefore judged to be true, and therefore *Hippocrates* called it *Myrsephoes*, that is *myrrhamens* or *myrrhatus*, perfumed, and whether that roote that is generally called, *Calamus odoratus* and *Aromaticus* of the Apothecaries and others nowadayes, be the true *Calamus Aromaticus* of the ancient Writers, *Brasavolus*, *Fuchsius*, *Tragus*, and *Turner* in their Writings, doe hold that opinion, that the *Calamus odoratus* of the shops, which is a roote and not a Reed, or stalke of a Reed, is the true *Calamus aromaticus* of the Ancients: which, that it cannot be so, let us first learn the name which is *Calamus*, or *Arundo* a Reed, which the Ancients always speake of, and name no roote thereof to be used, but the stalke or reed it selfe, and which *Theophrastus* and *Pliny* say, differeth not, but is like unto other kinds of Reeds; although it groweth in *Arabia* and *Syria*, as well as in *India*, and all men plainely see that this roote

Calamus

Calamus is called in Hops, is neither a reed, nor like of a reed, for being green growing green as it is now & dayes in many places, and as it is delineated before, there is no correspondency of it with a reed, (and truely in the face of thing growing, hard it might many things to knowledge, which we would have him to perpend for the face of thing growing, hard it might many things to knowledge, which we would have him to perpend for the ignorance and darkness of how much he did ignore the yeelds indeed to those that are diligent searchers out of the genuine plants of the Ancients, both by taste face of stems, and by their properties and vertues, let the good and learned judge, let the vile or base neglect or contemne, we only the less understanding the other notes, whereby it may be known for this manner, that which is the yellower and fuller of joynts is the best, (the thicker and shorter saith *Pliny* somewhat plaine) breaking into long shivers, (not brittle or bressing short) she should have a pipe being *three women one*, or as *Pliny* in the *first book of his Nature or matter and forth every joynt other pipes summeriter of numerous*, which can be no other wise interpreted, then that the pith in the middle of the cane or pipe, which they call the flower, the more the better, is like unto a spiders cobweb, (that is full of threads) and clammy in the wring of an astringent taste, somewhat astringe, and biting upon the tongue although some of these notes or marks may be found in that bad and *Calamus* of the shops, yet that is not enough, for that hath deceived most men, to judge it cane to be right, because of one or two notes appearing, the rest being not answerable, (but all the notes must agree for the true *Calamus Aromaticus* and not mere shivers, it is not clammy or chewing, nor hath it any stalks or pipe full of threads like unto it by which conclusion all men may plainely see, that our *Calamus* is not that of the Ancients, and that we are utterly destitute of the true *Calamus Aromaticus* of *Dioscorides* and the rest of the ancient Writers: and yet so perverse are many in these dayes, that they will still persist in their old errours, because they were bred to them, and will know no other, although they bee told them: but what may be the best substitute there of in medicines, many have thought severally, in the booke of substitutes that is fully attributed to *Galen*, *Spignonia* that is *Meum athamanticum*, the muske that groweth upon trees) is appointed, which divers have accepted, and *Matthiolus* among the rest, but as to their cunning, and considering the matter more seriously, he is not ashamed to revoke that opinion, and condemne it quite, as erroneous, judging no correspondence, but rather a meere contrariety, to be betweene *Calamus Aromaticus*, a simple of that worth, variety, and quality, and the muske of trees, which although it be a little sweet in smell, yet of no other quality equall thereunto. Some therefore appoint the seed of *Nigella Romana*, both for the taste and sharpe quality of it, and other properties incident thereunto, others would have the *Calamus* to be the substitute, for his heating and opening qualities, they thinke it hath: but truely the one and the other are hotter in their degree, by much, than the *Calamus* of the Ancients are. *Mesue* the younger shall not do much amisse, that saith the leaves of *Angelica* in the head thereof, because it expelleth both wind and worms in the guts, and besides the many other good properties therein, it is found by manifest proofe to be singular good to expell any poison of venemous creatures, or otherwise, and a soveraigne remedy against the plague, and pestilentiall ayres. But the most and best doe agree, that the *Squinanth* or *Juncus odoratus* commeth nearest both in degrees and qualities unto, or else that fatte *Calamus* of the shops, is the next best and nearest substitute thereunto, although it doe exceede it in heate, the lesse being to be taken, agreeing in many qualities therewith, and may also safely be used, untill the true *Calamus* bee better knowne, and brought in use. *Acorus* is called in Greeke [illegible], because *vehementer visum, lucidi pupillas facit, aciemque oculorum celeriorem reddit*, it helpeth to cleare a dimme eyesight. *Mesue*, *Turner*, *Matthiolus*, *Cordus*, *Gesner*, *Camerarius*, *Lobelius*, *Fuchsius*, and *Clusius*, doe all call it *Acorum*, or *Acorum Veterum*, and *Acorum Calamus dictum quod in aquis nascitur*. *Angelica* called it *Calamus sylvestris*. *Amomum*, *Adipsanum*, *Bracchelus* and *Fuchsius Calamus aromaticus vulgo*. There hath been formerly great ignorance of the true *Acorus* of *Dioscorides*, for in that it was generally taken and used for *Calamus*, it did amuse them the more, not imagining it to be *Acorus*, until some more industrious and diligent, finding it growing in *Cambridge* and about it with that they had read thereof, perswaded themselves certainely to be the one and right *Acorus*, and *Matthiolus*, but after them that found it, as I thinke published it to the world, and *Lobel* and *Clusius* after him, have now so well perswaded most men, (certainely the most unlearned, or the most wilfull, that love make any doubt or scruple thereof, yet some still would make the *Cambridge* weed to be the true *Acorus*, but it is knowne certainely, that the *Calamus* never groweth in *Syria*, and hath neither leaves or rootes like unto a Flower-deluce, as *Theophrastus* describeth his *Acorus* to have, but rather hath leaves like unto Reeds, nor doe the ayre of the Countrey agree [illegible]

The Vertues.

If this *Calamus Aromaticus* be the right *Calamus* of *Dioscorides*, then he saith it hath these vertues. It provoketh urine, and boyled with grasse rootes and small age seed, it helpeth those that have the dropsie. It helpeth the defects of the reines, is profitable against the strangury, or making water by drops, it also for those that are bursten bellied it provoketh women termes or courses, either drunke or applyed to the place. The fumes thereof taken thorow a Reed or Cane or pipe, either by it selfe, or with some oyle of Turpentine, cureth them that have a cough: it is profitable for women troubled in child birth with sharpe pains. It is used in medicines, that serve to warm and mollifie humours, as already we have shewed heretofore. *Galen* saith that because of its temperature, betweene heate and cold, and that it is astringent, and having a very little acrimony, it is profitable among other things, that helpe the liver and stomacke, drunke orderly to procure urine, and is put with other confections for the same effect, it is profitable for those that are troubled with inflammations of the mouth and throat, and gently to procure the courses, it is good with barley meale boyled together, to make more plentiful the milke, and hath therein a little quality of parts, as is in all sweet smelling herbes. That *Acorus* known to many by the name of Sweet Flagge or Sweet Rush, is good to provoke urine, if the decoction thereof be drunke, it openeth the passages of the liver, heart and breast, and also eases the griping paines of the belly, it is good for those that are troubled with the yellow jaundice, it helpeth the wife to bring forth her child, it helpeth the stranguary, and those that are bitten by any venemous serpent, it is very profitable for those that are troubled with the wormes called *Teredines*, as the *Iris* or flower-deluce roote are, the juice dropped into the eares, helpeth the paines thereof, and easeth the tooth, taking away all filmes or skin like flea bites from the eyes, if the roote be taken fasting every morning for some time together, it is a present remedy to help stinking breath, if the roote be taken fasting every morning for some time together. The decoction made in water, and taken in at the mouth thorow a funnell, eases the aking paines of the head, if they are troubled with the cough, a dram of the powder of the roote of

Acorus,

Acorus, with as much Cinamon, taken in a draught of Worme-wood wine, is singular good to comfort and strengthen a cold weake stomache. The decoction thereof drunke is good against exulcerations or crampes, and for falles inward bruises. An oxymell or Syrupe made of *Acorus* in this manner, is wonderfull effectuall for all cold stomaches and cold livers. Take of the fresh rootes of *Acorus* one pound, bruise them after they are cleane washed and picked, steepe them for three dayes in vinegar, after which time let them be boyled together, untill the consumption of the one halfe of the vinegar, which being strained forth set to the fire againe, putting thereunto as much honey as sufficient for the vinegar to bring it into a Syrupe: an ounce of this syrupe taken in the morning with a fasting draught of the decoction of the same rootes, is sufficient for every dose. The whole rootes preserved either in sugar or Honey, is effectuall also for the same purposes, but the greene rootes preserved are more desired than the dryed rootes that are steeped, and afterwards preserved. The rootes boyled and boyled in wine, and applied warme to the kernicles that are swollen, dissolveth the tumour, and easeth the paines; likewise mollifieth hard tumours in any other parts of the body. It is verily beleeved of many, that the leaves or rootes of *Acorus* tyed to the love of Bees, stayeth them from wandring or flying away, and draweth a greater resort of others thereunto. It is also affirmed, that none shall be troubled with any flixe of blood, or paines of the crampe, that weareth the leaves and roote about them. The rootes of *Acorus* or *Calamus*, avit is usually called, are used among other things to make sweet powders, to lay among linnen and garments, and to make sweet waters to wash hand gloves, or other things to perfume them.

CHAP. XLIX.

Juncus odoratus sive Schœnanthos. The sweet Rush or Camels Hay.

BEcause through all the sorts of Grasses and Rushes, I finde none sweet, fit for this *Chapter*, but this which I bring here to your consideration, let me, following the like method of *Dioscorides*, insert this Rush, and the other that shall follow in the next Chapter, in the end of this part of sweet hearbes, as a compleate number to the same. Of this sort of sweet Rush, I finde two sorts, a finer and a coarser, or the true and bastard kinde, although the ancient Writers have made mention but of one sort, which is the best and truest.

1. Juncus odoratus tenuior.
The fine sweet smelling Rush.

1. Juncus odoratus tenuior. The finer sweet smelling Rush.

This finer Rush hath many tufts or heads of long cuthe-like leaves, thick set together, one compassing another at the bottome, and shooting forth upwards, the outermost whereof are bigger and grosser than those that grow within, which are a foote long or better, small, round and pithie, or hard, and much smaller from a little above the bottome of them, than any Rush, (without) of a quicke and spicy taste, somewhat pleasant, and of a low sweet gentle or soft scent: this hath growing with it, (as I have noted) flower, nor shewed any appearance of Bulbe, by reason the Winter drawes perished it quickly: but in the naturall places it beareth divers strong, round, hard jointed stalkes, having divers thick brownish or purplish huskes on the toppes, containing within them mossie whitish short threads or haires, wherein the chaffie seed: the roote is firmie or full of long fibres, which are very hard as they are brought to us, from their naturall habitations, which have the smallest scent or taste, of any other part thereof, for so much as ever I could observe, either by the green or dryed leaves that have been brought unto us: yet *Mathiolus* saith, he had some plants, that rose with him of seed, whose rootes were sweet, some losing their scent, but the leaves and tuffes of his were bigger than ours here described, having at last saith leaves like Sedge, which is *Carex* or *Asperginum*, or like *Zea*, which is a large or great kinde of wheat; whereby I gather it to be of the greater or grosser kinde next hereunto following.

2. Juncus odoratus crassior. The grosser sweet smelling Rush.

This greater or grosser Rush, groweth in the same manner, as the former doth, but is greater in every part thereof, and little sweet also, as well as lesse sharpe and hot in taste; whereby it seemeth to be a kinde of it selfe, altho grown to greater in the naturall as well as forraigne parts; in that it being the same kinde, by growing in moister places, acquireth thereby the larger latitude.

The Place.

They grow naturally in *Arabia, Syria, Mesopotamia*, and all that Tract of the Easterne Countries, as also in sundry places of *Africa*.

The Time.

As I declared in the description it commeth not to flowring in these colder Countries, and therefore *Clusius* and others

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

others have thought it to be an annuall plant, but adiudged it liveth not every yeare in those hotter parts, and flowreth in the Summer time.

The Time.

It is called in Greeke [illegible] *Cyperus*, and of some *Cyperus unguentarius, quia unguenta odore*, in Latine *Cyperus, Zingiber*. Some doe call it *Schenanthus small Schenanthus for Spice*, and corruptly in shops *Squinanthum*. Some also call it *Iuncus odoratus rotundus*, to put a difference betweene this, the *Iuncus odoratus longus*, and the sweet *Cyperus*, that is called *Iuncus odoratus angulosus triangularis*. It is called also *Palea de Mecha* and *Pabulum Chamelorum*; in English the sweet smelling Rush, or Camels Hay, according to the Latine names, or Squinant if you will. There hath beene much diversity among the later Writers, concerning the true Squinant, some thinking it not to be that which we have in shops, some making the great Galinga to be the roote of the sweet Rush of *Dioscorides*, as the Monkes that wrote Comentaries upon *Avicen's Euchyr*, likewise and *Aegineta* alledge many reasons, why they thinke that those small Rushes that are used now adayes in the Apothecaries shops, are not the true *Iuncus* of *Dioscorides* and others, both for that they are small greene of colour and (as it were) not flowers or stalkes, or rootes, which *Dioscorides* saith are to be had in use, and that they have (they say) not any quicke biting taste, nor sweet scent of a Rose, all which *Dioscorides* saith (namely may be found in his *Iuncus*) concerning whole reason this I say, that the flowers are truely seldome brought over into us, and when they are brought, they are found of little quicknesse in taste, or sweetnes in smell: and *Galen* complaineth that in his time they were very scarcely to be found: and indeed it seemeth probable, that the tender small Rushes, which are now usually in the Druggists and Apothecaries shops to be had, are found to be more quicke and hot in taste, than either the other stalkes, flowers or roote, that are brought us, these are and have been received into more use, and the other flowers are left of, or quite neglected to be used, which hath caused the Merchants likewise, not to seeke or looke for them to bring them.

The Vertues.

Dioscorides saith it provoketh urine and womens courses, discusseth all swellings and wind, but troubleth the head a little: it gently cutteth or breaketh humours, and digesteth them, and openeth the breathing places of the veines: the decoction of the flowers (saith he) drunke, stayeth the spitting of blood, and is conducible to the griefes and diseases of the stomake, lunges, liver and reynes. It is also put into Antidotes against poison and the venome of Serpents. The roote hereof is held to be of an attractive property, and therefore is more effectuall for those that have a loathing in their stomackes to their meate, a dram thereof taken with the like quantity of pepper every morning fasting for certaine dayes together, is a very good remedy for those that have the dropsie, and for convulsions or crampes: the decoction thereof is profitable for women to sit ouer in, that are troubled with the mother, for as *Galen* saith it openeth obstructions, digesteth crudities, expelleth corrupt humours, cutteth tough flegme, and consumeth congealed matter in the body, and therefore it is of excellent good use, for the stopping of urine or womens courses, taken either in drinke or by fomentation, it allayeth the inflammations of the liver stomacke, and body: the rootes doe more or lesse, and the flowers are more hot, but in all the parts thereof there is attraction, in some more, in others lesse, and therefore it is very profitably mixed with those medicines that serve to allay fluxions. It is said to be boyled in the broth of a chicken (I meane the whole plant) as very helpefull to ease the paines of the wombe, that women feele after their childing, the powder thereof is singular good for the sores of the mouth, and for all creeping ulcers; and taken with wine and vinegar, it is effectuall for those that have an ulcer in their stomacke, if the stomacke or belly be fomented with the decoction thereof, it taketh away all inflammations therein, and easeth the paines.

CHAP. 3.

Cyperus. Sweet Cyperus, or English Galinga.

THese (saith this first part of sweet hearbes, I have some sorts of sweet Cyperus to describe unto you, others which are not sweet, I shall speake of in their proper places: yet unto these I thinke good to adjoyne the *Bastard sorts*, for the neere resemblance in face and forme unto the others, and for the pleasantnesse in taste, though not in smell.

1. Cyperus rotundus odoratus vulgaris. The more common round rooted sweet Cyperus.

The round rooted sweet Cyperus shooteth forth many heads of long and narrow leaves, somewhat folded in the middle, every leafe seeming thereby to be three square, and somewhat hard and rough in handling, and sweet in scent: among these leaves rise many smooth square stalkes, about three foote high, filled with a white pith, and not hollow, without any knot or joynt therein, unto the toppes, where there stand a few short leaves, and many small purples, in chaffie greene spikes or eares of small leaves above them, which after ripenesse scatter them the seed: the roote is reported of many long and round blackish brownish small roots, falling together by long strings, of the bignesse of small Quills, or greater *Liquorish* rootes, of a sweet scent even while they are greene, but more when they are dry, and of a bitter taste, somewhat like unto Galinga.

We have had a smaller sort sometimes brought us from *Spaine* by *Bauhine*, not differing from this, but in the lownesse of the stalke, not being a foote high, and in being smaller also in leafe and roote.

2. Cyperus rotundus odoratus Asiaticus major. The greater Affrican sweet Cyperus.

Of this kinde of Cyperus there hath growne in our Gardens, brought out of *Syria* and *Egypt*, whose rootes and leaves were somewhat larger than the former, our stalke being somewhat shorter, the scent of the rootes somewhat stronger and quicker, and of a more fervent taste: in the rest also not differing in any thing.

3. Cyperus rotundus odoratus Asiaticus minor. The lesser Affrican round rooted sweet Cyperus.

There is also another lesser sort brought both from *Syria* and *Candy*, being more rough, whose rootes and leaves are taller by a cubit, than the small Italian, fresher also than the small Spanish, but not differing in any other thing.

Original from UNIVERSITY OF MICHIGAN

1. *Cyperus rotundus odoratus vulgaris.*
The rare common round scented sweet Cyperus.

1. *Cyperus rotundus odoratus peregrinus.*
The lesse African round rooted sweet Cyperus.

4. *Cyperus longus odoratus.* The ordinary sweet Cyperus, or English Galingale.

This ordinary sweet Cyperus hath his leaves long, and as it were three square like the former, and as rough hard in handling also; the stalkes are smooth, stuffed with a white matter, like as the others are, and three-cornered like the other, rising somewhat higher, and having some short narrow leaves at the toppes of them, and small bushie panicles like unto the other in all things, so that they are hardly discerned asunder above ground; the onely difference consisting in the roote, which in this is long and round, of a blackish browne colour on the out-side, and white within, full and firme, creeping under the superficies of the earth round about, whereby it is quickly increased, and hath also a very good sweet scent, as well greene as dry, yet more being dry than when it is greene and fresh.

3. *Cyperus dulcis radicibus esculentis, Trifolii dulces vocatus.* The most delicate sweet Cyperus, or Rush Nut.

The leaves hereof are long and narrow like the other, with a thicke ridge in the middle, and sharpe pointed, a foote and a halfe in length; among which rise up the stalkes, smooth, without joynts, three square, and a cubit high, or more; at the toppes whereof stand five or six short narrow leaves, compassing the stalke, and standing like a starre, from among which come forth pale yellowish sinked cases, which are the flowers, wherein lyeth the seed, when their colour is withered and decayed: the rootes are small, long and round, and many of them smaller at the one end than at the other, hanging or growing at the ends of long strings, somewhat like unto the manner of growing of the Virginia Potatoes, of a pale reddish colour on the outside, and white and firme within, of the bignesse of beanes; of no sweet scent, nor bitter or aromaticall taste like the others, but pleasant to the eating like Chesnuts, or rather more delicate.

The Place.

The last is found in moist and moorish grounds, both on Mountaines, and at the foote of them, in sundry places in *Italy* and *Spaine*, as also by *Nylus*, and other places in *Egypt*, as *Alpinus* saith, but is not rather sowne and planted in the gardens of the curious, either in *France*, *Germany*, the *Low countries*, or *England*, where they hardly endure the Winters, without great care. The second groweth in *Syria* and *Egypt*. The third in *Syria* and *Candy*. The fourth groweth in many Countries, and as well in *Spaine* and other hot Countries, where the rootes are sweeter, although bigger, as in these colder Northerne parts on this side the Alpes: it groweth well in our gardens, especially if they be somewhat moist and not too dry. The last is reported by many Writers to be found naturally growing not onely but neare unto *Verona* in *Italy*, but *Dioscorides Lobelius* saith they are brought out of *Arabia* and *S. Thomas*. And it is probable by *Dioscorides* in *Sicilia*, for *Baptiste Confutus* in his *Miscellanea Medicinalia* meaneth that he take it: but are planted in *Spaine* and other hot Countries for their delight and use. It hardly groweth with

1. Cyperus rotundus. The round rooted Cyperus or Bulbous Cyperus.

2. Cyperus rotundus flore purpureo. The round Nut flowring Cyperus.

stanly perfection, neither will it abide the extremities of our Winters, for as Camerarius saith it will rot, if it be not taken up before Winter, and new set againe in the spring, after it hath been well steeped in water.

The Names.

All these round rooted Cyperi doe flower or carry their bushy toppes in August with us, but the ordinary long rooted kinde, giveth his tufted head in the end of July for the most part.

The Names.

The Greeke words [illegible] Cyperus, [illegible] Cyperus, and [illegible] Cyperus, are taken by divers good Authors, to be one and the same plant, others to be different, especially Cyperus longus Cordi; because that Dioscorides, lib. 1. cap. 28. maketh Cyperus called Chufa, whom Cato in his translation of Theophrastus doth in all places follow, and Pliny in another place calleth the long rooted sweet kinde Cyperus: but I taught (how any opinion) it would say that Cyperus is the three round rooted kinde, then which no other was known to Dioscorides, and that Cyperus is the long sweet kind as Pliny doth alike: and that Cyperus in the water as saith Camerarius, we opinion herein be also confirmed by Anguillara in Dioscoridem, where he maketh the figure of Cyperus to be Dodonæus his Cyperus of Pliny as we have set forth hereby Cyperus must of necessity be here understood to be the sweet or marish kinde, as Pliny also, among which the Veggees are conversant, [illegible] is called [illegible] and [illegible] one of the Veggees, which is like a small bent or reed, in Latine also Cyperus and [illegible] in divers Countries, according to the [illegible] ordinary Rushes, yet Canadine Cibus calleth it Juncus quadrangulus, because it is still ply in those places where he observed it, it did peradventure bear three-square stalkes, but it is not so in many other places: in English rushe doe call it Galling or Gallingale after the name the Dutch give it, because the round knots are like unto the knots of the small Gallings, and yet that kinde with round roots is not so frequent in our land as the other with long roots, to be so called for the likenesse thereof between them. Matthiolus the diligent searcher and painfull observer of plants, called Cyperus rotundus Syriacus, and Pena Adversaria calleth the Egyptian sort Bulbosus. Lobel calleth it Cyperus Orientalis major aut Bulbosus. The third sort Cyperus [illegible] Cyperus minor, and Camerarius in Matthiolus calleth it Cyperus minor Creticus. [illegible] calleth it Cyperus radice oblongiore. The fourth as I said before, is called by Plinie Cyperus, by Dioscorides Cyperus longus, and by others Cyperus longus. Lobel and Lugdunensis Cyperus [illegible] Cyperus Italicus longus. The last is called by Cæsalpinus and Lobel-

Cyperus Cyperis dulce; and to it probable *Theophrastus* doth in his 6. booke *de causis plantarum*, 16. & 17. chap. reckoning *Cyperos*, (which *Gaza* translateth *Gladiolus* in all places following *Pliny* herein as is aboue said) among other sweet rootes to be eaten. *Dalechampius* upon *Pliny*, *Caesalpinus*, *Clusius*, and *Fabius Columna*, take it to be *Matticabalis* of *Theophrastus*, and *Aarmalcum* of *Pliny*. The Italians generally call it *Trefo*, and *Trefo dolce*, *Dolcefino*, and *Hetherigmo* as *Clusius* saith, from *Bellonius lib. 2. cap. 25.* and thereafter diuers Writers doe call it so, and *Dulcehonum*, as *Cherobosco*, *Valerius*, *Dodonaeus* and others; it may fitly bee called Rush nuts, from the Spanish *Iunco redondo*, of the forme of leaues and rootes. *Baptista Confetio* saith, *Cyperis* (if this bee true) is called *Fuscifes* and *Acalmum*, and by the Arabians *Calmasar*, because the rootes taste like Cloues. *Pena* in the description of Mount *Baldus* saith confidently, that he hath found it by experience in suffering the rootes to grow unremoued for three or foure yeares, that it beareth neither stalke, nor flower, nor seed. But *Matthiolus*, *Caesalpinus*, *Lobel*, *Dodonaeus*, and *Columna*, doe all say, that it hath both stalkes, flowers and seed, and so doe giue the figure thereof in all their Workes: and *Clusius* in his annotation upon *Bellonius lib. 2. cap. 42.* giueth a figure without flowers, as if it bore none; but assuredly both be (if he thought so) and *Pena* might be as much deceiued herein, as they that wrote the *Colocasia* neuer bare flower, which *Columna* disproueth. Here remaineth one thing more to be spoken of, and that is, that many of our Apothecaries, are not onely so ignorant, that they doe not know, that onely the round sweet Cyperus, is that Cyperus and no other, which all the ancient Authors haue appointed to be put into the medicines that they appoint: but are without care also, or desire to be furnished with those things, that are the genuine drogues of the Ancients; because the false is better cheape, and easier to be had, and put into their shoppes and chiefest medicines, as well as others, the common long rooted Cyperus in the stead thereof; which although in an extreme necessity, may supply the want thereof; yet as we all know, is in deede not able to effectuall to all purposes, as the genuine is. The Arabians call it *Sahareke*: the Italians *Cypere*: the Spaniards *Iunco de olor*: the French *Souchet*: the Germanes *Hoe galgan*: the Dutch *Welde Galigaen*: and we in English as I said before, Galingall, and sweet Cyperus.

The Vertues.

It is of a warming quality saith *Dioscorides*, and giueth breathing to the veines: It prouoketh urine, and helpeth to breake the stone in the bladder, and to consume the water in the dropsie, if the decoction thereof be drunke: and is a remedy against the sting of the Scorpion: it prouoketh womens courses, and is good for the fretting paines and strainglings of the mother, if the parts be bathed with the decoction thereof, or they sit ouer the fumes thereof, or in the decoction. The powder thereof is a most especiall remedy for all foule sores and vlcers of the mouth, although they be spreading and deuouring cankers. It is also vsed in sweet ointments and sweet oyles that are warming and comforting. *Galen* saith the rootes of Cyperus are of greatest vse, being of an heating and drying quality, without sharpnesse: whereby it wonderfully helpeth all vlcers, that by their ouer-much moisture doe hardly admit any cure, and by the astringent quality it hath, it helpeth all manner of sore mouthes. It hath a cutting quality also, whereby it helpeth those that are troubled with the stone, and prouoketh urine and womens courses. The roote of Cyperus and Bayberries, of each a like quantity beaten to powder, and made vp with the urine of a Boy vnder yeares, and laid vpon the belly of those that haue a dropsie, doth helpe them very much: and both of them boyled in wine, and drunke often while the other is vsed outwardly, doth worke effectually. *Hieron* saith the Egyptians doe much vse both the powder of the rootes, and the ashes of them when they are burnt, to cure the vlcers of the mouth and secret parts, and the decoction of them to be drunke, to comfort and warme the stomacke, trembling, lipothymies, sorrow, and the wombe; and if it be taken for some time together, it warmeth and strengthneth the naturall vigor of the spirits, it is also an especiall remedy for cold and moist braines, and the distillations thereof, by warming and comforting the sinewes and the senses it conduceth helpe to the crudities, humidities and windinesse of the stomacke and belly, and to helpe the shortnesse of breath and coughes: as also for all cold and moist wombes, and the griefes and diseases comming thereby. It bringeth much comfort to those that by reason of the coldnesse and moisture in their stomacke, haue lost their appetite, and are much pained in their stomacke, and faintings of their spirits, by warming, quickning, and comforting them, by helping and strengthning the digestion, and procuring wholesome to the blood, and good colour to the face; it helpeth those that haue strong or stinking breaths, drinking the decoction thereof made in wine. The long sweet Cyperus commeth somewhat neare to all the faculties formerly recited, yet performeth them not so effectually. There is much hereof vsed in sweet powder, and sweet washing waters, and to perfume Gloues, &c. as also into Perfuming-pots with vinegar and Rose-water, with Cloues and Bay-leaues to perfume Chambers. The *Tesh* or Iuncus nuts, are for the most part vsed as pleasant meates for dessert, rather then vsed Phylically for medicine: yet it is found to bee good, vsed for the paine of the head and sides, if a creame bee made thereof and drunke; and therefore very profitable for those that haue a cough, to helpe to expectorate the flegme: the same also drunke conforteth the heate of vrine, and allayeth the sharpnesse thereof, it helpeth also the sharpnesse of humours in any dilentery, or fluxe, and hereof it, (if needs be often) is vsed in the decoction thereof and drunke. It is also thought by many to further conception, by taking the creame thereof, when it is thereof stamped, and strained with the broth of fat flesh, for it is of a subtile windy and nourisheth well, as by the sweetnesse thereof may bee perceiued, and the qualities of hot moisture conioyned therewith.

Hauing now bestowed vpon you the chiefest of these sweet herbes and plants that grow with vs, it is time to conuert my speech to another forme, that you may there vnderstand what will be vnto vs vsefull,

PLANTÆ CATHARTICÆ SIVE PVRGANTES.
PVRGING PLANTS.

CLASSIS SECVNDA.
The Second Tribe.

CHAP. I.

BEing to shew you here the chiefest sorts of purging plants that may grow within, I must as well speake of them that worke upwards, as downewards, as also of those that are conducing or helping the same: although they be not so forcible in working as the others, I say the chiefest or most, because, that as in the former *Classis* some are omitted that are deperdically related to in other places of this Worke, so likewise it will fall out in this and some of the other following Classis, and begin with the hearbe Aloes, whose bitter juyce is so frequent to use every where knowne by the name of Aloes and Aloes Succotrina.

1. *Aloe vulgaris Herba Aloes, sive Sempervivum marinum.*
Sea Houseleeke.

This hearbe hath divers long fleshy pale greene leaves, of the thickenesse of ones finger, with divers hard prickes or pinnes on both sides of them, and pointed at the end likewise, the one enclosing the other at the bottome, and standing round, the outward-most bending for the most part backwards, especially in those wee see brought to us; but in the naturall places standing all of them straight and stiffe, or rather bowing inward than backward, whose leaves are withall bitter in taste in the places either natural or planted, but rather cold: In the middle of these leaves riseth up a sheer stalke, bearing forth into a tuft, grows little more than a foote & a halfe, or a foot high, bearing many small bunch-like flowers of a whitish colour, with us: to *Pedacius Dioscorides* also in the Better Countries withall, as we are certainely informed, diversified at the ends, into five parts, every one hanging downe round about the stalkes, from the middle part of up to the top is smooth seed in husks like unto an Hyacynth, after the flowers are gone: the roote is thicke and about a foote long or lesse within the ground, growing outward, these hangs at the end, and some small roots round about the sides, especially in the naturall places, but are seldome seene to grow within, neither hang up in our houses, that ever I could discerne, if any of them be put into the ground in the Summer time, the stalkes rest in the roote will have the tuftes of the withered leaves when they are cast and fallen away, as other plants use to doe: divers of these that are brought from other countries, and dwell with us, bring forth a number of heads round about the roote, which may easily be parted.

2. *Aloe Americana. Hearbe Aloes of America.*

The manner of the leaves of this hearbe doe much resemble the former, but are much broader, and not so long, for I have seene very large plants leaves of a span broad, and not above a foote long, of a light greene colour, and somewhat whitish withall, and of a more thicke substance, with sharper prickes on the edges, and of a more distance one from another, and not so many in a round, and the edges of the leaves are thinne all the way from the one prickle to the other, and ending sharpe round about, not hooked backward at the ends as the former, but as

a. Aloe domestica. Hostibus Aloes Dioscoridis. Aloes americanæ caulis cum floribus & fructibus. flos & siliqua seminis.

The ſtalke and the flowres of the Aloe Americana, a Flower & head of Seed by themſelves

ous taſte, which leaves are round on the under ſide, and chamelled or made hollow like a gutter on the vpper ſide, and as the bottome encompaſſe one another, but growing flat when they are elder after a foote & length, in the end: the innermoſt ſtill abiding chamelled and hollow: theſe leaves are full of iuyce and full of threads running thorow them, but are no more bitter than the other: in the middle of theſe leaves after a long time abiding, riſeth a ſtrong great ſpungy ſtalke, of the bigneſſe of a mans arme, with a few ſmall dry and browniſh leaves, ſparſedly ſet thereon, and of the length of a Horſemans ſtaffe in ſome places, but riſing higher than two ſpeares length in others; as at *Amſterdam*, whereas it is reported, within the ſpace of 45. dayes, the greene ſtalke grew to the height of 22. hands breadth: that is, about nine or ten foote: and about twelve cubits length, in the Duke of *Florence* garden, and fifteene cubits at *Rome*, branched almoſt from the middle thereof up to the toppe, into diuers braunches, and each of them againe into others, the great branch ſtanding out for a good ſpace, and then turning vpwards, at each whereof are ſet a number of flowers, euen two or three hundred, being no other then long and large great three-ſquare hard huſkes, ſhutting out ſixe great yellow hard and crooked threads, tipt at the toppes with yellow pendents: and in the middle amongſt them another yellow round headed pointell, *Lobel* ſaith, of a purpliſh ſea colour, which is not true, for they are of a whitiſh, or yellowiſh greene colour, and of a ſweet ſcent: theſe huſkes that beare the flowers, after they are dry become the ſeed veſſels, which being ripe, are diuided into three partes or cells, each containing abundance of white haſſe round light biparted ſeed, cloſely compact together: the roote very great, comparable to the reſt of the plant, two or three cubits long, harder than the former, giuing a number of young ſprouts yearely, which being ſeparated and planted, will quickly take roote in the ground, and grow: but muſt be kept from cold in the Winter, and will not deſire to be much watered.

The Place.

The firſt groweth in *Arabia Aſia, Syria*, and all the Eaſt Countries, and in *India*, as well a great way within the land, as neare the Sea ſide, and in the Hands there, as in *Socotora* as *Garcias* ſaith, where the beſt is made, as alſo in many places of *Italy*, and in *Spaine* about *Andaluſia* neare the Sea ſhore in ſuch plenty, that diuers thought to haue made good ſtore of Aloes there, but after triall was made, it was not found any way to effectuall as the *Indian*. The other ſort grew firſt in *America*, (which being brought into *Spaine*, was from thence, ſpread into all Gardens, and in that abundance about *Mexico*, as Vines doe in *Spaine*, which they there uſe to plant, to ſerue them for kind of hedges, as well to ſeparate as to defend the limits of their grounds.

The Time.

They flower in the hotter Countries, in the firſt Summer Moneths, but never in theſe colder, for they are preſerued with great care from the froſts in Winter, which will cauſe them quickly to rotte, if they ſcape not from the almoſt.

The Names.

The firſt is the *Aloe* of *Dioſcorides*, and all others both ancient and moderne Writers, and as *Pena* ſaith, becauſe

it moſt commonly groweth neare the Sea, many doe ſuppoſe it tooke the name either from ἅλς that is, ſalt, or from ἀεὶ νάειν, the Sea is ſelfe, with whoſe breath it is much delighted. The hardned joyce thereof is alſo called, or from ἀεὶ νάειν, the Sea is ſelfe, with whoſe breath it is much delighted. The hardned joyce thereof is alſo uſually called Aloe, and becauſe the beſt and pureſt is made, as *Dioſcorides* ſaith, in the Iland *Socotora*, it is called *Aloe Socotorina*, and corruptly in the Apothecaries ſhops *Aloes Succotrina*, or *Succotrina*. It is alſo called *Aloe Hepatica*, becauſe the beſt is browne and red like a liver. It is called alſo *Spicata*, becauſe it not onely groweth in the ground, but will ſhoot alſo out of the ground. Some of the moderne Herbariſts doe call it *Sempervivum maximum*, from the thicknes of the leaves and likenes into *Sedum*, called *Sempervivum*. *Columella* in his verſes by naming *Sedum* among the bitter joyces, is thought to meane this, and called it *Sedum amarum*, for there is no *Sedum* that hath a bitter joyce but this onely. Another ſort of Aloe was formerly wont to be brought, (before wee became ſo daintie, to chuſe onely the beſt for our uſe) which was called *Cabellina*, either becauſe they gave it horſes, being the courſeſt, or becauſe it was not fit for men but horſes, the knowledge as well as importation whereof, is almoſt utterly forgotten and neglected. It is called in Engliſh hearbe Aloes after the Greeke and ſea Hoorſeeke after the Latine name, and Aygreene, that is Evergreene. *Pliny* and others have written of an *Aloe metallina*, or *foſſilis* in *India* and other places, but it is found by divers Writers to be an errour in them, and no ſuch thing to be found. The ſecond as *Dioſcorides* in the end of his Materia in Hillary ſaith, is called of ſome of the Indians *Mitil*: and of ſome others *Adigenes*: of ſome Spaniards *Cardon*, becauſe of the prickes about and at the end of the leaves, and of others *Filum Agaues*, that is to ſay, thread and needle, becauſe it ſupplieth both their uſes; the ſharpe and thorney ſetting as an aule or needle, and the threads running within the leaves being ſtrong, ſerving as thread. *Clusius* calleth it *Aloe Americana*, and ſo alſo all other Authors after him, onely *Lobel* calleth it *Aloe folio murronato*. *Dioscorides* ſaith that the pricke of the thornes hereof are venemous.

The Vertues.

The herbe hearbe Aloe is uſually hung up in houſes to bee ready at hand upon all occaſions, to apply a little of the joyce of a leafe prefently cut of, or the peece of a leafe it ſelfe, upon any cut or freſh wound, which is found to bee ſingular good to ſolder and heale them: even as *Dioſcorides* ſaith, that that ſort which grew in *Afra*, *Arabia* the *Fortunate*, is of more force to glue or ſolder wounds, than that which commeth out of *India*: the leaves alſo are found to be exceeding cold in the hot Countries, and of very great uſe and effects for all manner of ſcalding with water, or burning with fire, gun-powder, or the like, healing them quickly: the iuice of the joyce, or Aloes it ſelfe, is fit to thicken, to dry, to procure ſleepe, and moderately to heate; it openeth the belly, purgeth the ſtomacke, and the yellow jaundiſe, and ſtayeth the ſpitting or vomiting of blood, if a dramme thereof be taken in faire water: it is not onely a good purger of it ſelfe, but is added alſo with other purgers to caſſe the ſame trouble in the ſtomacke: it healeth greene wounds, and bringeth old ſores to cicatrizing, as alſo thoſe of the genitors, it healeth the chapped of the fundament, the piles and breaking forth of blood from them, being uſed outwardly: but aſſuredly it is found not conuenient for thoſe that are troubled with the piles, to take thereof inwardly, becauſe it heateth, and maketh the blood of them to be the more ſharpe and fretting. It is alſo found to be more helpefull to flegmaticke, than to hote, dry, and cholericke conſtitutions. It cureth the paines of the head to bee taken in pills, or being diſſolved to anoynt the forehead and temples: diſſolved in wine and honey, it helpeth the toothache of the rotten and gums, and all ulcers in the mouth: being tempered in a cleane earthen veſſell, it is an eſpeciall good medicine to be uſed with others for the eyes. *Galen* ſaith that it is hot in the firſt degree compleat, or ſecond indeare, and dry in the third, and hath a little aſtringent faculty therein alſo, but exceeding bitter: it openeth the belly and purgeth moderately the ſtomacke chiefly, wherevnto it is moſt friendly and comfortable above all other medicines. (for whereas all other purgers doe trouble and weaken the ſtomacke, this onely is found to comfort and ſtrengthen it) and thoſe humours that are in the lower parts next unto the paſſage, for it is no ſtrong or generall purger of the whole body, to expell groſſe humours, but thoſe onely that be in and about the belly. And for this purpoſe the Aloes ſimply it ſelfe, is firſt to be uſed, for if it be waſhed, it looſeth the moſt part of the purging quality, and hath onely a comforting and ſtrengthening property left. And therefore if Aloes that is waſht be given to thoſe that are feverish, howſoever it may doe ſmall harme to ſome, yet it is found to doe much to others. Maſticke or Cinamon are accounted the beſt correctors or helpers to be mixt therewith when it is given. It healeth alſo thoſe ulcers that are hardly cured, and eſpecially thoſe in the fundament and ſecret parts. *Oribaſius* ſaith it cleanſeth the head and ſtomacke, and eaſeth thoſe paines are in them: and that the continuall uſe thereof preſerveth any from dangerous and deadly diſeaſes, and with Myrrhe preſerveth the bodies not onely of the living but of the dead, from all putrefaction and corruption: which effects long before his time were well knowne to the world. for the manner of embalming the bodies of the dead, with Aloes and Myrrhe, which was uſed among the Iewes, as appeareth in the 19. Chapter of Saint *Iohn* the laſt, the 39. verſe, where it is ſaid that *Nicodemus* brought about 100. pound weight of Myrrhe and Aloes mixed together which was laid with the body of our Saviour *Ieſus* in the Sepulchre: for the Aloes that is mentioned to be in that place of the Scriptures, is underſtood to bee the *Lignumaloes*, which the Apothecaries uſe in their ſhops, in many medicines, appointed both by Greeke and Arabian Authors, as well inwardly as outwardly, for ſweet odours, perfumes, and other compoſitions: and the Aloe tree is onely once or twice mentioned in the whole Bible, and that in the 4. of *Numb.* and the 6. verſe. The parable of *Balaam* concerning the beauty of *Iacob*, or the children of *Iſrael* in the fore ſpreading of their habitations, to be like vallies ſtretched forth, like gardens by the Rivers ſide, like the Aloe trees (which Saint *Ieroms* tranſlation calleth Tabernacles) that God planted, as the Cedars beſide the waters. And in the 45. Pſalme where Saint *Ieroms* tranſlation hath *Myrrha Gutta & Casia*, it ſhould be *Myrrha Aloes & Casia*, for the Hebrew word *Ahalim*, which the moſt iudicious doe tranſlate *Agallochum* into Greeke, and *Lignum aloes* into Latine. It is often given to children for the worms, either of it ſelfe, or in a few Pilules of the ſame, opened, and the ſtones taken forth and ſome put therein, or outwardly applyed to the belly, under the navill, made into a plaiſter with a little oyle of Wormewood, or ſome other fitt thing. Aloes alſo is often uſed in medicines for the eyes, with a little honey to allay the heate in them: to cleanſe the inward roughneſſe of the eye-lids, and cleare the darkeneſſe of the ſight, that commeth by moiſt humours diſtilling into them, by drying it up without ſharpneſſe or vehemency, it healeth alſo the itching in the corners of them. Being mixed with a little vinegar and oyle of Roſes, and the temples and forehead anoynted therewith, aboue the time of reſt, doth much helpe the headach, and is a maruellous pleaſure to thoſe that want: if it be diſſolved in wine, and the head waſhed therewith, it helpeth the falling and ſhedding of the haire: uſed with honey and wine, it cleanſeth all foule ulcers,

that

dom happen in the mouth of the ore, as Aphthæ is, that happen in the yard of a man, or in the fundament: and afterwards ingendereth flesh therein, to fill up the cavity. Lastly, Aloes is of so much use in the Apothecaries shops, as (or should be, if our delicacy and niceness did not hinder it, as either Honey or Sugar: but the bitterness of the one, is so unpleasant and unwelcome to this delicate age, and the sweetness of the other so much pleasing and acceptable thereto, that the rotting and corrupting sweetness of it hath overcome and overprowne the wholesome bitterness, that preserveth from corruption of the other; yet notwithstanding the effects are the same, they formerly have seene, and I have used, being three or foure times washed with the departed juyce, or strong infusion of Damaske Roses, and dryed up againe, it is then called *Aloes Rosata*, Rosed Aloes) which is a safe and gentle Medicine for tender bodies, familiar and comfortable to the stomacke, helping more to strengthen it than other Aloes, and purgeth a little lesse than it, yet sometimes openeth the belly, and is good against surfeits. The Aloes (that is to say, the dryed juyce taken from the leaves) that is used in all these Christian Countries, commeth from the East Indies, and even here it is made: yet *Johan Columna* saith, he made as good Aloes in *Naples*, from the leaves that grew there, as may that ever came out of the *Indies*, which thing how he brought to passe, were I thinke worthy to be knowne, and might be beneficiall to this Realme in time to come; if in any of our remote plantations (as in the Summer-Ilands, or other such like hot Countries) the Aloes were planted in that plenty, that thereof such quantity of the dryed juyce might bee brought to us, both to require their travell, and to serve so much more cost, to bring it from the East-Indies. The manner whereof as he relateth it is thus: It came into his minde to make some Aloes out of the leaves that grew with them in sufficient plenty at *Naples*; and finding that the juyces of the leaves boyled according to the vsuall manner of all other hearbes, was unprofitable and unsavory also, or that the fearefying of the roote, did not yeeld any juyce bitter like Aloes, or of any worth, hee tryed that way, to take the juyce out of the leaves of Aloes, which he had formerly tryed and found effectuall, to have the red or bloody juyce out of the hearbe or thistle called *Acanthus*, (as I shall shew you, when I come to speake thereof in his proper place) which was, that the juyce was to be drawne or taken, not out of the fleshy substance of the leaves, but out of the veines, that runne thorow them: the therefore pulling divers leaves from the roote, while they were fresh, he laid their ends downewards, round about the brimme of a broad stone pan, that was gilded or leaded, (such as our cookes pans are) from the mouths or ends of whole veines, dropped forth a yellow liquor by drops, which gathering together into one, when they had dropped well of themselves, hee stroaked a little harder with his hand, to draw forth what might be had from them, and tooke that also that grew thicke from the ends of the leaves, and this he laid in the open and hot Sunne: having thus taken a reasonable quantity of this yellow juyce, he let it stand in the hot Sunne, for three or foure dayes, but let it abide, and covered it in the night time, and as that juyce dryed in the sides of the pan, he often every day, scraped it downe into the midst, and all it became thereof dry and hard, as easie to be diuided as any: which from being yellow at the first, became somewhat duskish in the drying, and blacke almost like dryed blood, yet cleare or thorow shining, light in feeling and yet brittle, of a sweet and aromaticall savour, but extreme bitter, that even the ayre was infected therewith, and became so bitter, while he was thus in doing, that it was scarce to be endured, by piercing into the mouth and throat. And thus he (with no little delight and content to himselfe, he found out the way, not known to any before how to make pure, sincere, translucent, brittle and hard Aloes, of the colour of a liver, and was easie to grate, the onely and readiest way to impart it to others, that they also might take the pleasure and profit thereof, to know and use it as well as I am having given directions to some that failed in not doing right, they have had it not as it ought to be done. The Aloes of *America* is much bitterer and sharper in the hot Countries, where it groweth, than here in these more temperate parts of the world, where it is nursed up of doores. The juyce of the yonger leaves and of the tops mixed with the juyce of the Wyer-thwood, that groweth in the same Country, is very peculiarly put into the wounds of those that have been shot with poysoned arrowes, for it doth not only quickly heale the ingreene wounds and old sores of the youngest and tender leaves, they are likewise good to make pottage: and this is for the purposes aforesaid. Some also say it healeth the French disease, to be taken in this manner. Take a good peece of the roote hereof one handfull, and boyle it in a large stone pot, with a good quantity of faire water, for three houres space at the least, stopping the pot very close with clay, or some other such like matter, that no fumes breake forth, which pot after it hath been so long in boyling, being placed nigh unto the fire, that they may receive the hot fumes thereof, when it is opened, will cause or procure them to sweat abundantly. Else if a leafe hereof be roasted under hot embers or coales, and the hot juyces thereof taken, will provoke sweat extremely, that it is able almost to overcome the fiercest disease, although this remedy bee used but three dayes onely together. They of *Africa*, and other parts of *America*, where it groweth naturally have great use of this plant, and serveth them to as many purposes, as the Cocar Nut-tree doth to them of the East-Indies: and that is more by many, than any other plant or tree growing upon the Earth, for of the higher tall and strong stalkes thereof, after it hath given his flower and seed, and becommeth dry, is also the leaves after they have been dryed, are gathered and laid up to serve them instead of wood to burne: the hollow or channelled stalke serve them instead of tiles to cover their houses, to defend them from raine, which they can so aptly do for no other thing with them there can better perform that office. They use to cut it downe before it grow great, to cause the roote to grow into the greater substance, from whence, a hole being made therein, they gather a certain liquor, which will quickly grow into the forme of a Syrope, and being boyled a little on the fire, will be as thicke as Honey, a little cleared and settled will become as sugar, dissolved with water it will serve as vinegar, and with grade into wine; if *Oegarli* (which is a roote they use to call the medicine of wine) bee put into it: which they much use, but nothing wholesome: for it soone intoxicateth the braine, and causeth drunkennesse, and moreover causeth to faule and stinking breath to them that use it, that no person whatsoever can endure to be smelled to healthfully. The Priests and painters of those Countries, doe use the leaves, both as fleed or parchment to write upon, and to draw any figure thereon: the Priests also use to prick and wound themselves with the sharpe ends thereof, which are so sharpe and strong, that although they can easily thereto pierce how large they please, will they not breake in the flesh, no not in other harder substances, for those pricks serve them instead of needles to make any hole, and the long threads in the leaves, serve instead of thread, to sow or tye any thing they would therewith, yea it hath been found into so good and strong thread as any hempe can make, and cloth hath been made thereof and made into shirts, &c. *Gul. Clusius* reporteth the Daughter of his Host at *Cracow* in *Poland* [illegible]

formes and shew to him, while he was resident there,) and often brought into the markets to bee sold: and being made into a courser thread, serveth as cords or ropes in Ships, or other such like purposes, and with it also they use being platted together, to worke into Sandals (a kinde of shooes in much use with the Spaniards, as well as the Indians) two mattes to lay on the ground to sit upon, or to lay any thing thereon to dry: and into short coarse garments, such as Shepheards and Shipmen use, to be thereby defended from heat and raine.

CHAP. LI.

Yucca sive Yuca Indis prima. The supposed Indian Yucca.

WHo these kindes of Aloes may most fitly in my judgement bee referred, that plant which is usually in the shops called *Iuca* or *Yuca*, for once no other plant that I know can it better bee adjoyned, the fortune of the leaves especially being so like, and although the flowers be differing, as may be perceived by the figure and description, yet that letteth not, for so also are the flowers of that of *America*, much differing from those of the true Aloes, whose description is on this wise.

Yucca sive Yuca Indis prima. The supposed Indian Yucca.

Yucca sive Yuca Indis prima. The supposed Indian plant.

This Indian plant hath a great thicke tuberous roote spreading at time into many tuberous roots from whence the root sendeth many long, hard and narrow gutted or hollow leaves, very sharpe pointed, compassing one another at the bottome, of a grasse greene colour abiding continually, or seldome falling away, with soundry hard threads running in them, the which withered, become plant withall to bind things: from the midst whereof

(from

(some yeares for it doth not every yeare with us) springeth forth a strong round stalke, divided into sundry branches, whereon stand divers some what large white flowers, hanging downwards, consisting of five leaves with diuers veines, of a weake reddish or bluish colour spread on the backe of the three outer leaves, from the middle to the bottome, not reaching unto the edge of any leafe, which abide not long, but quickly fall away without bearing any seed in our Country, as farre as could be observed by any hath growne in this land, or in *France*, &c.

The Place and Time.

This groweth in divers places of the West-Indies, and in our English plantations also, of *Virginia* & *New-England*, as it hath beene confidently affirmed to me. It floureth not untill the middle or latter end of July, the flowers falling away within a while after they have beene blowne open.

The Names.

That is cannot be the true *Nuces* of *Ovidius*, *Tibullus* and others, whereof the bread called *Cateia* is made, but they and *Alexander* shew plainely for the true *Nuces* beareth leaves divided into seven or nine parts, standing on long foot-stalkes. Yet not knowing what other or fitter name may be given it, let it hold still that name of *Nux*, or *Nucis*, or *Nuces* if you will, untill a fitter may be knowne. *Radonius* calleth it *Iuglans foetida Alpini*.

The Vertues.

There hath not beene knowne any property conducible to any diseases yet found out, or related of by any Merchants or others have attempted, but more probable I know not that it groweth in some parts of *Turkie* naturally, and that they make a kinde of coarse cloth from the threads in the leaves, which are strong and hard: but the Relators were finely deceived herein, for it is not growe there, it hath beene onely brought to them, as unto us and planted; the natives formerly in *Virginia*, as I heare, did and doe make bread of the rootes hereof, as they of *Hispaniola* doe of the true *Nuces*, and much after the same manner, and it is said likewise, that the raw juyce is dangerous, if not deadly: *Thevet* reporteth that the *Canibals* and *Anthropophagi* commonly the sharpe point end, of one of these leaves in his owne hand, wrought such unspeakable pains, that he was almost beside himselfe, untill by applying some of his owne *Balsame* thereto, it miraculously eased him of the anguish, and all ache thereof.

CHAP. III.

Lapathum sativum & Rha. Garden Dock and Rubarbe.

BEcause both the true and the ballard *Rha* or Rubarbe are sorts of Dockes, as shall be shewed; I have therefore placed them together with the Patience or garden Docke in one Chapter, and unto them for the names sake, rather than for any knowne vertues correspondent, I have adjoyned two other plants called also *Rha*, although they have no resemblance unto the Dockes, as the other sorts of *Rha* have.

1. *Lapathum hortense sive Patientia.* Garden Patience or Monkes Rubarbe.

Garden Patience is a Docke bearing the name of Rubarbe, for some small purging quality therein, and groweth up with large tall stalkes ten foot high, with some what broad and long fatte green leaves, not dented at all, the toppes of the stalkes being divided into small branches, bearing reddish or purplish flowers, and three-square seed, like unto other Dockes: the roote is long, great and yellow, like unto the wilde Docke, but a little redder, and if it be a little dried, sheweth yellow spots of circles and veines then the rest doth when it is dry.

2. *Hippolapathum vulgatius radice rubente exterius.* Common Great round tasted Docke, or ballard Rubarbe.

This ballard Rubarbe hath divers large round thinne yellowish greene leaves, rising from the roote, a little waved about the edges, every one standing on a reasonable thicke and long brownish foote-stalke, from among which riseth up a pretty bigge stalke, about two foote high, with some such leaves thereon as grow below, but smaller, at the toppe whereof stand in a long spike many small brownish flowers, which turne into hard three-square seed, like unto the garden Docke or Patience: the roote groweth greater than that of Patience, with many branches of great fibres thereat, yellow on the out side, and somewhat pale yellow within, with some discoloured veines therein, like to the Rubarbe new to be described, but much lesse than it, especially when it is dry, which then hath quite lost the fresh colour, which the other alwayes be holdeth perpetually.

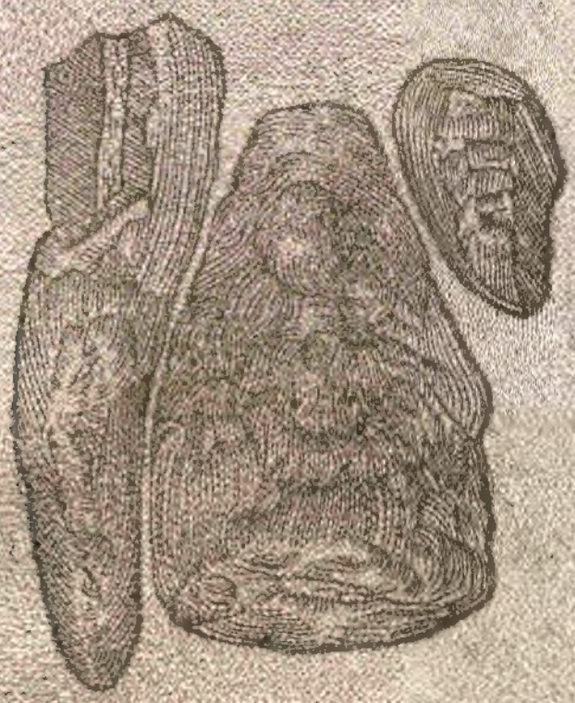
3. *Hippolapathum maximum rotundifolium vulgatius, four Rhagonticum Theophrasti forte vinum Rabarbarum verum.*

True Rubarbe, or Rubarbe of *Pontus*, or English Rubarbe.

Because in my former Booke, I made onely a short relation of this Rubarbe, and the effects thereof, it is good here to give you a more ample declaration thereof, for it deserveth to be worthily accounted of. At the first appearing thereof out of the ground, when the Winter is gone, it hath a great round brownish head, rising from the middle or sides of the roote, which openeth it selfe into sundry leaves, one after another, very much folded or folded together at the foot, and brownish, but afterwards spreadeth it selfe, and becommeth smooth and large, and almost round, every one standing on a brownish stalke, of the thicknesse of any mans thumbe, whose leaves are growne to their fulnesse, and most of them two foot and more in length especially in any moist or good ground, and the stalke of the leafe also from the bottome thereof, next unto the roote, unto the leafe it selfe, is long as that is to say, two foote more: the breadth thereof also in the broadest place, from edge to edge being equall, is much of a red or darke greene colour, and thinner in substance than the last, of a sour tart or towrish taste, much more pleasant than the garden or Wood Sorrell: from among these riseth up time, but not every yeare, a strong thicke stalke, not growing so high as the Patience or garden Docke, with such round leaves as grow below, but smaller at every joynt up to the toppe, and among the flowers, which are white, contrary to the last recited Rubarbe or any other of the Dockes, spreading forth into many branches, and consisting of five or six small white leaves peece, hardly to be discerned from the white threads that are in the middle, and seeming to be all three cornered, which come brownish three square seed, like unto other Dockes, but larger: whereby it may be plainely known to be a Docke: the roote groweth in time to be very great, with divers and sundry great spreading branches from it, of a darke brownish or reddish colour on the outside, and with a pale yellow thin skin under it, which covereth the inner substance or roote, which inside and skin being pared away, the roote appeareth of so rare and lively

colour,

1. A Rhubarbo plant from Italy, with its flowers and seed. 2. A Rhapontick plant with its flowers and seed.



colour, with fleshy coloured veines running thorow it, that the choisest of that Rubarbe, that commeth to us from the Indies and Cathay, cannot excell it; which roote, if it be dryed carefully, and as it ought (which ought be in our Country by the gentle heate of a fire, in that we want the heate of the Sunne to dry it, as is used in the naturall places, and every peece kept from touching one another, (which thing may be observed, is also done by the Indians, in the dryed rootes that come to us, who put them upon strings to dry them apart;) will hold his colour almost as well as when it is fresh, and gives a yellow tincture to the spittle when it is chewed, but not so much, nor hath that bitternes, and astriction therein that the Indian root hath, as I have said before. I have divers yeares taken up of these rootes, and dryed them carefully as I have shewed you, and they have beene shewed to the best and most skilfull, who have approved them, and divers of our Physitians have often times used them, and very many others to good purpose.

4. The Authors & Fathers generall opinion. The true Rubarbe and Rhapanticke of *Galen*, and the Shops.

Matthiolus hath guessed at a figure of Rubarbe, which he fetcheth forth for the true, but from whom or whence he had it, he saith not, and it might be a conjecture out of his owne braine, as some others of his are: although hee seemeth to have had it from certain Merchants, that it did grow in the Country of *Sacoco*, which is subject to the great Cham of *Cathay*, in the Mountaines, nigh the chiefe City thereof, called also *Sacoco*, whose figure and description divers others Authors have followed. *Trincavell* in his first Booke and 52. Chapter, of the compounding of Medicines, reports also, that a Merchant, who had formerly beene an Apothecary, and trades to *Persia* 3 times yeare, did report unto him, that there grew true Rubarbe in great abundance, upon the hilly parts in *Persia*, and that it was carried from thence into *Syria* and *Egypt*, and from thence unto divers other Countries. Of these sorts and qualities, that Rubarbe, which is used now adayes in all the world, I will here in three Chapters, treate at large of the same, which commeth chiefly from the Country of *Cathay* in the East-Indies, and hath before beene brought by Arabian, Turkie, and other Merchants, in former times from thence over land by Caravans (as they call them) that is a number of Merchants and others, having Camels laden with it,

and

A Natural draw of the true Rhubarb growing all in drum.
The true Rubarbe and Rodpontick of China, and the like.

The true Rhubarbe Rodpontick Rated Dandelion.

and all other manner of drugges and spices there to be had, where with they serued all this other part of the world vntil *Cabo* and *Aden* were in *Egypt*, *Damasco*, and *Tripoli* in *Syria*, and from thence (as from the store-houses) to other Countries: but now since the passage into the East-Indies by Sea hath been knowne, and that it hath become brought more in this way, there hath little or none been brought by the Caravans every land, as in the former times. The forme of the roote, as all know that have seene and obserued it, is some what great, round, and long withall for the most part, yet there are smaller and shorter peeces, as well as the greater that come together, whose colour on the outside is not all alike, no more than the substance within, for that some is better coloured and founder than other: the best is firme and some what heavy, not spungy and light, to meete her browne, but reddish on the outside, without many blackish (which are sulphurous) peeces, where oftentimes being broken it is rotten, corrupted and naught, I say many, for the best peeces have sometimes some (spots, which doe not runne farre inward, and if they doe yet notwithstanding, the rest is excellent good, and not to be refused for a little bad, which must be cut away as not it, or at least not to be vsed as the better, which is very much discoloured with fleshy colour veines running thorow it bitter in taste, and some what astringent withall in smell, especially if it be fresh, and causes the spittle to be yellow, being a little chewed in the mouth. Their properties belonging to the true Rhubarbe, so manifestly to be seene and discerned in the roote of the former kinde, (excepting onely those things which the nature of the Climate produceth) may for reasonably perswade any of reasonable inquirity, that the former is the same true Rhubarbe with this, and a very Dock proper to the Country of *China*, and peradventure to some other Countries besides also. And if they all were made thereof in some hotter and dryer Countries, of our Forraine Plantations abroad (as I have of late to diuers of them put it in practise) I verily believe it would come much neare to the other qualities of the true China Rubarbe than it doth, and is wanting in ours, according to the heate and climate thereof, wherein it is planted. That I thought good to intreate here, both to shew the correspondence of this Rubarbe of our English prouerb, with that of the Indies, which is more probable to be a Docke of our Country than any such plant as *Matthiolus* setteth it out for both by figure and description: and besides further to excite some more of our Nation, if there be any toogenuity in them, to make the tryall of it among it in diuers other their Countries, what else that will produce, and how much it will better our English breeding. The true Rhapontick which hath formerly come to us with Rubarbe (and not that little kind of the great Century roates) is onely the lesser and longer peeces of the roote of the true Rubarbe, whose figure is set forth with these others.

5. *Rhapontica Radice folio Lapathi*, The broader Dock leafed Rapontick.

I have adjoyned this and the next plant, for the leaues sake onely (as I said before) because *Lobel* hath so named and referred them: but to another place they might be more truely referred for any quiddities, and that is vnder the Docke Knapweeds, or *Centaurium magna*, great Century, both for the likenesse of flower and seede, although the stalkes of the head be different; yet at this time take the description of them in this place. It hath diuers leaues rising from the roote, some of the large and long, yet nothing so large as the leaues of *Hieracium*, greenish on the vpper

upperside, and grayish or white and woolly underneath, like the cinquefoyle or five leaves of Elecampane, every one standing on his owne stalke, broadest at the bottome, and pointed at the end, and dented about the edges; from among which riseth up a reasonable bigge round stalke, about halfe a yard or a foote high, bearing at the toppe thereof one great leafye head, consisting of very broad and loose or open browne scales, or the fruit shewe representing a small Artichoke head, but that the scales doe not stand close together, but are much more open and loose, especially after the flower is past, which standeth in the middle, composed of many blewish red or purple threedes or strainers, very delicate to behold: after which come blackish round and long seede, very like unto the seede of a Docke or great Centorie, or a little longer and roe altogether: the roote is somewhat long and thicke, blackish on the outside, and of a deadish colour on the inside, more loose and spongye then either any Docke or great Centory, which hath in former times been used among the Apothecaries for *Rha Ponticum*.

6. *Rha Ponticum alterum angustifolium*. The narrower Elecampane leafed Rubarbe.

6. *Rhaponticum angustifolium*. The narrow Elecampane leafed Rubarbe.

There is small difference betweene this and the last described but only in the leaves, which are alittle narrower and longer then it, being as hoary white underneath and greene above as the other, and a little unevenly waved on the edges: the head and flowers are alike but a little larger, and so is the roote, so that it is very likely the naturall place of their growing, causeth the chiefest difference betweene them.

The Place.

The first groweth about *Lausanne* in *Savoy* at *Tygus* falsly, but only in gardens with us: the second naturally upon the hils not far from *Carle* in *Germany*, as also neere *Perigueux* in *Xaintonge*, and on the mountaines of *Auvergne*. The third as it is reported grew in *Thracia*, and from hence brought to *Prosper Alpinus*, at *Padua*, from whence some Apothecaryes in *Venice* had it: and Master Doctor *Harrison Lister*, one of the Kings Physitions being in *Venice*, obtained not a feedes, which he sent me with some other seedes that he procured; and with me (as I thinke the first in this Land) they sprung up grew and seeded within two or three yeares, and from them I sold and many other my friends as well in England as beyond sea have bin furnished. The fourth groweth chiefely as I layd in *Greece*, or *Candia* (for they are held to be but one Country) as *Alpinus* his *Persian Merchant* saith, and in the Mountaines of *Persia*, if ye will believe *Prosper* his Apothecary turned merchant, as is before declared: the fift groweth both on Mount *Baldus*, as I am informed, neere *Pavia* in *Italy*, and also upon the hils in *Switzerland*, and in some craggie places in Savoy; though *Lobel* saith the seede thereof was first brought out of *Turkie*, and that the last was brought out of *Italy*.

The Time.

All these sorts of Rubarbe doe grow with us in our gardens and doe flower about the beginning or middle of June, and the seede is ripe in July. The rootes that are to be dryed and kept all the yeare following, are not to be taken up before the stalke and leaves be quite withered or gone, and that is not untill about the middle or end of October, for if they be taken either alittle before the leaves doe spring, or when they are springing up, the rootes will not have halfe so good a colour in them.

The Names.

The Greekes doe call the Dockes *λαπαθα Lapatha*, from *λαπτειν*, *purgare*, *quod folia ejus detergendis ulceribus conducant*, in Latine *Rumex*, which is rather attributed to those Dockes are sowre, thereto those are wilde, and chiefely unto Sorrell, because the leaves are used to be eaten or sucked, to coole the heate and quench the thirst, even as children doe sucke a sore, which was called amongst the old Romans *Rumex*. *Dioscorides* in his 3. booke of *Simples* saith *Lapathum* might be called a wilde Beete, it is so like unto the garden kinde, but because the Beete is more pleasant then the Docke, no man but will more willingly eate the Beete. The first here is called of most men *Lapathum latifolium*, *Patientia* & *Rhabarbarum Monachorum*, meaning those that commende it upon Physick. The second *Rhaponticum hortense*, to put a difference betweene it, and the former garden Docke, which is also called *Rhapontica*, it is also called of *Lobel* and others *Rhaponticum Romanum*, of *Cesalpinus* and others *Lapathum rotundifolium*, and of *Gerarde* in his *Herball*, *Rhabarbarum*, to *Pena* and others *Rhabarbarum Germanicum*, and of *Gerarde* in his *Herball*, *Rhabarbarum*, or Ballard Rubarbe. The third *Alpinus* calleth *Rhaponticum Thracicum*, because as most of all the writers hitherto out of that Country of *Thracia*, and in his testimonie thereupon he will by no meanes be perswaded that it is true Rubarbe, but so entituleth it, and the rather because he only saw the rootes while they were young & no bigger then a finger, but not so great as the true Rubarbe, such as I have expressed: unless (as I think) they were dryed away the outer barke or skin of the rootes to make the inside appeare the fairer, but as great many with us as they grow old and the roots as they tooke them out of the ground, and then they shewed both blacke and brittle. Master Doctor *Lister* also sent it me by the name of *Rhaponticum verum*, but because the roote is so like, both in colour, forme, and quality unto the true Rubarb, and the small long roots unto the *Rha Ponticum* or Rubarbe of Pontus, I account it true Rubarbe and *Anguillara* saith they are both one, the difference consisting chiefely in the greater or lesser long pieces, and to the climate which giveth the true Rubarbe, or Rubarbe

of Pontus, a more solide and fome substance, a more bitter taste and aromaticall smell, and an astringent or restoring quality after the purging: all which are the effects from the climate, as being hotter and dryer: and therefore growing into the rootes fo meneesse bitternesse and attraction, which are all wanting in fome fort in the rootes of this Rubarbe growing with us: yet it hath the purging quality, onely in a double proportion and the forme and colour fo like the one as may be, which maketh it to be had in respect and good use, befides the beauty of the plant it felfe, and may well be called English Rubarbe, to diftinguish it from that which cometh from China. The fourth is thought by the moft and beft writers to be the *Rha* or *Rheum* of *Diofcorides*, *Galen* and the other ancient writers, which was diverfly named in our former times, as *Rha Barbarum*, *Rha Tuscanum*, *Rha Pontieum* and *Rha Scythicum* or *Scythicum*: many thinking them to be feverall things, becaufe of the names impofed, as comming from feverall places, when as the goodneffe or badneffe, newneffe or oldneffe of the roote might make this variation. For the Arabians did call it Rayed or Rai and Seni, or Seni as fome write, but I think it fhould be rather Cani, which corruptly the Portugalls firft pronounced Chini, according to their Language, and from them all our parts of the world. Doe call that Country China, which was formerly called *Sinarum regio*. Much controverfie there is among writers, concerning the name *Rhabarbarum* or *Barbaricum*. Firft for the name *Rha Barbarum* the *Rha* of Barbaria, what this name of Barbaria fhould fignifie, fome thinking it to be that part of Africa, where and Carthage ftood, as *Fuchfius* who faith *Rha, de compofitione medicamentorum*, that the Carthaginenſians that went with the Emperour *Charles* to Tunis, brought true Rubarbe of that Country home with them: others thinke that it was brought from Barbaria a City in India, above the River Indus, and that *Rha Indicum* and *Barbaricum* were all one: and others thought that it came from an Iſland in the red Sea called Barbaria, whereunto fhippes for Merchandize doe much refort: but *Matthiolus* refuting all thefe opinions would fome induce the opinion that Barbaria fome often mentioned in *Italian* is a Citie in Ethiopia, that Ginger was brought out of Barbaria which *Diofcorides* and *Plinie* fay groweth among the Troglodites, and from thence brought to us: and againe he faith that *Ginger Lemonium* or *Nova Rosa* is brought out of the Country of Barbaria, which *Diofcorides* faith groweth in *Aethiopia*, in which Country the Troglodites do inhabite: and *Plinie* lib. 12. cap. 14. faith it groweth with the Troglodites. *Plinie* alſo writes fome bookes and 19 chapters fhewing the reaſon of the fcarfity of Cinamon in his dayes, faith it was becaufe the Barbarians in their hafte burnt the woods where it grew: whereby as *Matthiolus* faith, it may plainely appeare, that the name *Barbaria* do fignifie no other Country than the Troglodites of Ethiopia: which as *Strabo* in his fifteenth booke of Cosmography faith, is as plentifull in fpices as the South parts of India: but by the trafficke of our Merchants in thefe times there is no Rubarbe growing in thofe parts that they can heare of, and if I might ghefle as formerly I have done, I would fay that the name *Barbarum* was joyned with *Rha*, in that both Grecians and Romanes counted all remote nations from them to be Barbarians. Now for the names, *Scythicum* and *Sericum*, *Matthiolus* faith it is all one with *Indicum*, whofe faying *Matthiolus* contradicteth, faying it fhould be rather *Sinicum*, which is a Country of India, for the *Seres* be a people of the Eaſtern of Arabia, and are utterly deſtitute of all manner of Spice and drugges of worth. The name of *Rha Ponticum* and *Ponticum*, is thought alſo to be all one in deed: fome Turkiſh Merchants brought it from Pontus: and for the word *Rha*, it tooke the name as fome write from the River *Rha*, now fayd to be called *Volga* in *Pontus*, where thofe rootes did grow: but I rather think it came from the Arabian *Rawend* or *Rawand*: whether the *Rha Barbarum* and *Rha Ponticum*, be one thing or diverſe, is next to be fhewed of. *Matthiolus* contradicteth againſt *Ruellius* and others, with many words of reaſons to prooue them differing: I will that *Rha Ponticum* as *Diofcorides* and *Galen* deſcribe them, are without fenſe, then that Rubarbe hath in it a purging quality by nature, which *Rha Ponticum* hath not, being fayd by *Diofcorides* and *Galen* to have rather an aſtringent quality therein: and there is not bitter as Rubarbe, but fomewhat fharpe & quicke, it is not ſolide and heavie but ſpongie and light, it is not dive but tough or ſtringie, it is not yellow as Rubarbe, but blacke: by which reaſons he is perſwaded that they differ, and that *Ruellius* was in a great error to fay, that they differed onely in the ſcent, which happed by the coldneſſe of the Country where *Rha Ponticum* grew. *Matthiolus* alſo ſaith that *Mahumetha Tetrachinſa*, having beene formerly of that opinion, was afterward otherwiſe perſwaded, upon ſight of the true *Rha Ponticum*, that was brought out of *Scythia*, agreeing in all things with that of *Diofcorides*, as the ſayd *Mahumetha* relateth, in the laſt Epiſtle of the 4. booke written to *Leonicenus*. Surely thus we may well ſay, that *Diofcorides* and *Galen* never ſaw or knew the Rubarbe, as we have brought us now a dayes, and I am halfe in doubt that were in theſe times cannot well tell what ſort of *Rha Ponticum* that was of *Diofcorides* and *Galen*, but if we ſcanne the reſt of *Diofcorides* words, we ſhall finde him to ſay, that the *Rha* or *Rheum* called by the name *Rha Ponticum*, is a roote like unto the roote of the great Centory, (and if it be but like, it cannot be the ſame) but ſmaller, on the outſide of a blackiſh red colour, ſpongie, light and without fenſe, and that it grew in the Countries beyond the *Boſphorus*: the beſt as we ſaide that which is found, without rottenneſſe or worme holes, and doth ſticke in the mouth with a little aſtriction in the talling, and giveth a yellow colour in the chewing, tending to a Saffron colour: this commendation of the roote to be blacke like the roote of great Centory, but leſſe, and of a redder colour, ſpongie and without ſap, cannot agree with any of the qualities of that *Raponticum*, we have formerly ſeene brought unto us, unto like unto the Rubarbe that wee have now, and for the rootes of the great Centory, they are very long and great, almoſt like unto a great Parſneppe roote, but blacke on the outſide and very rugged, which made thoſe in ancient times, and unto our dayes ſtill obſtinately to take the very rootes of great Centory and uſe them as if they had beene true *Rha Ponticum*: So that to ſimple this doubt wee may ſay that it is probable, that thoſe rootes which were uſually brought in thoſe times, when *Diofcorides* and *Galen* lived, were the ſmall rootes, or the long branches of the greater rootes of Rubarbe, unpeeled or pared, that is the outer skinnes taken away, which are blackiſh being dryed, and not ſuch great rootes as we have now a dayes, and that they were adulterate, as *Galen* mentioned: ſome were of his mind, that the rootes were boyled or ſteeped in water for ſome time, to take out the ſtrongeſt juyces, and then dryed up againe, which then it is probable, might be of a blackiſh red colour and ſpongie, light and without ſent, not having any purging quality, but onely an aſtringent left in them: for I doe verily thinke that *Rhabarbarum* (ſuch as I have ſeene, hath beene brought over to us, being in colour taſte and qualitie, the ſame with Rubarbe, but in ſmaller and longer peeces) is either but a ſmall kinde of Rubarbe, growing not greater in the

places, from whence it is brought, or that it is but the bigger branches of the great roots of Rubarbe, the colour and properties as I layd being so like. The first and last, *Lobel* and *Pena* have only set forth, under the titles before expressed, whom all other writers that have mentioned them have followed: and it is probable that the Turkes, with whom as it should seeme it is called *Rhapontica*, used it in steede of the true *Rhapontica* of *Dioscorides*, and to note the difference betweene them, *Lobel* addeth *Helenij folio*. But some of latter times have called it *Consolida horsensis folio*, for by that name I received the seedes thereof from beyond Sea: but that quality yellow, in the true *Rhapontica* of *Dioscorides*, and not to be found, either in this or the great Century, doth easily convince their obstinacy, that will still persist in an opinion so contrary to truth.

The Vertues.

The leaves of these kindes of Docke, boyled in broth, doe a little (some more, some lesse) mollifie or loosen the belly; but the roots have a more opening or purging quality in them, and some more or lesse also according to their quality. The first round leafed one, somewhat more than the garden Patience or Monkes Rubarbe, although weaker than the next thereunto by much. The Ballard Rubarbe hath almost worne out the use of the Patience or Monkes Rubarbe it is grown so common & plentiful; so that unlesse some that are wilfull & will not use it, but Patience, or that are too cripple, not to be at any cost to have the best, or have little care what they use, but take what commeth next to hand, there is (or should be) none, but will use it in their diet Beere, or Ale, or in decoctions to purge the Liver, and clense the blood, before the others: yet that I may relate the properties that are found therein (that thereby you may be allured this Ballard Rubarbe will doe the same more effectually) are these. *Tragus* saith, a dramme of the dryed roots of the first sort called of some Monkes Rubarbe, with a scruple of Ginger, made into powder, and taken fasting, in a draught or messe of warme broth, purgeth choler and flegme downeward very gently, and safely without danger; the seede thereof contrarily doth binde the belly, and thereby helpeth to stay any sort of laske, or bloody flixe; the distilled water thereof is very profitably used to heale scabbes, as also take ulcerous sores, and to allay the inflammation of them. The juyce of the leaves or roots, or the decoction of them in Vinegar, is of very many used as a most effectuall remedie to heale all scabbes and running sores. The round leafed Docke or Ballard Rubarbe, hath as I layd all the properties of Monkes Rubarbe, but more effectuall, both for inward and outward diseases, and moreover healeth the lung of Scorpions: and as *Dodonæus* saith, he that shall take the roote thereof, shall feele no paine after the stinging: the decoction thereof with Vinegar, sulked or dropped into the eares taketh away the paines, gargled in the mouth, taketh away toothache, and being drunke healeth the tremblers: the seed thereof taken, easeth the gnawing and griping paines of the stomacke, and taketh away the loathing thereof unto meate, which commeth by evill sharpe humours gathered to the orifice of the stomacke: the roote thereof, helpeth the ruggy chaffe of the nayles, and being boyled in wine, it helpeth the swellings of the throate, called the Kings evill, as also when the kernells of the throate be swollen and helpeth them that are troubled with the stone; provoketh Vrine, and helpeth the dimnesse of the sight. The roots of this Ballard Rubarbe, is used in opening and purging Diet drinkes, or in Diet Beere or Ale, with other things, to open the liver and clense the blood, and to allay the heate thereof. The properties of the other round leafed Docke, which we have conceived English Rubarbe, are the same with the former, but much more effectuall, and hath all the properties of the true Indian Rubarbe, excepting the force in purging, which is for of halfe the strength thereof, and therefore needeth, as I layd, to be taken in double quantities, and likewise hath not that binding or astriction, in other things it worketh almost in an equall quality. The true Indian Rubarbe is an excellent and safe medecine, to purge the body of choler and flegme, being either taken of it selfe, made into powder, and drunke in a draught of white wine, or steeped there in all night, and taken fasting, or put among other purgers as shall be thought convenient, clensing the stomacke and Liver, and thereby the blood: opening obstructions, and helping those grieves that come thereof, as the Iaundise, the Dropsie, the swelling of the Spleene, tertian and day agues, and the pricking paine of the sides, as also it easeth the stirring of blood, comming as well from the Lunges, as any other parts: the powder taken with Cailla dissolved, and a little white Venice Turpentine, clenseth the Reines, and helpeth to strengthen them after wards, and is very effectuall to stay the *Gonorrhœa* or running of the reines. It is also given for the paines and swellings in the head, for those that are troubled with melancholy, and helpeth the Sciatica and Cotore and the paines of the Crampe: for which purpose one dramme or two, of the extract thereof, made in this manner, and given in broth doth work effectually. Take a little more quantity of Rubarbe be steeped in Cinamon water, which is then strongly prest forth, let it be filled in a glasse Limbeck *in balneo*, untill the water be drawne forth, and the substance remaining, be of the thicknesse of honey, which keepe in a close covered pot or glasse, for the use aforesaid. The powder of Rubarbe, taken with a little Annis and Madder roots, in some red wine, dissolveth congealed or clotted blood in the body, happening by any fall, or bruise, and healeth burstings, and broken parts, as well inward as outward, the roote taken before or whereon it hath been boyled, being anointed worketh the same effect: it helpeth the paine in the backe, and all parts of the belly, if it be washed or dryed a little by the fire, but much more if it be more effectually boyled burnt, and taken in wine after this manner. Take a pint of good Rhenish wine, and sweeten it with fine Sugar, and a teaspoone or two of Rosewater, into which put a dramme and a halfe of Rubarbe rasped, or pared by the fire as aforesaid, and one dramme of *Cebuli Myrobolani*, all the broken or bruised, let them stand in the same wine all night by the fire, and strain it for use in the morning, giving that at two times fasting, which will in three or foure dayes stay any flowing or loose, strengthening the stomacke and inward parts thereunto. It is used to heale those Vlcers that happen in the eyes, and eye lids, being steeped and strained, as also to assuage the swelling and allay the inflammations, and applyed with honey or suite, that is to say boyled wine, it taketh away all blacke and blew spots, or markes that happen therein. This Rubarbe is so gentle a medicine, that it may be given to all sorts of gentle constitutions, fear, or rebellious or strong bodies: it purgeth little or nothing, whether they be children, or women with childe, and that safely as all sorts of sore eyes, the whey of milke, but especially of Goates milke, is the best and most accommodate liquor, wherein it is to be steeped & taken, as also in white wine, and it worketh thereby the more effectually in opening obstructions, and in purging the stomacke and Liver, from choler and flegme; and most doe use a little Indian Rubarbe at the last corrective thereof. The other two last sorts of Rubarbe are not much or often used, and those qualities are more astringent then opening, little experience having been made with us, to use it, you have need of them.

CHAP. III.

1. *Colocynthis vulgaris. Coloquintida* or the bitter Gourde.

THis bitter Gourd runneth with his branches upon the ground, as a Gourd or Cowcumber doth, having diverse rough hairy leaves thereon, every one by it selfe, which are lesser and somewhat longer, than those of the Cowcumber, and more divided or cut in at the edges, most usually into seven or eleven parts, each partition also dented in, or notched round about, the leaves of the forme doe very much resemble those of the Citrull Cowcumber; as the joynts with the leaves come forth the flowers which are yellow, of the same fashion with them, but somewhat smaller, and also small tendrils or twining stalkes as the Vine hath, wherewith it windeth about any plants, or other things that stand neere it, thereby strangling or killing them: the fruite that followeth is small and round as a ball, many of them no much bigger than a great Crabbe or Peare-maine, greene at the first on the outside, and afterwards growing to be of a browne yellow, which shell is as hard as any Pompion or Gourde; and is usually pared away while it is greene, the substance under it being white, very light, spongie, or loose, and of an extreame bitter taste, almost undurable, and provoking loathing or casting in many that taste it, having therein like orders or rowes of white hard seede, of the bignesse of Cowcumber seede, but fuller, harder and rounder, and nothing so bitter or forceable in working, as the white pulpe or substance is: the roote is not very great but fleshie, and quickly perishing with the first cold approach of winter.

Colocynthis Pomiformis & Pyriformis.
The round and Peare fashioned bitter Gourde.

2. *Colocynthis maior rotunda.* The greater Coloquintida, or bitter Gourde.

This sort of bitter Gourde differeth not from the former but in leafe or flower or manner of growing, but onely in the fruite, which groweth to be twice as big as the former, and round; greene at the first, but of a pale yellow when it is ripe, whose pulpe or inner substance is also white and spongie, and in a manner as bitter, with such like seedes as are in the former, and disposed for the most part into eight rowes, or partitions: the roote perisheth as the former.

3. *Colocynthis oblonga.* The long bitter Gourde.

This kind of Coloquintida differeth not from the last sort, for either manner of growing, forme of the leaves or flowers, but onely in the fruit, which is as great almost as the last, but is not so spherical or round like a ball, but somewhat long with the roundnesse, and being a little flat at the head: the shell or outer rinde thereof, is greene at the first, and afterwards groweth to be whitish, with many spots thereon: it is also bitter but not so extreame as the first.

4. *Colocynthis pyriformis.* Peare-fashioned Coloquintida or bitter Gourd.

This Peare-fashioned kinde, hath many trayling branches like the first, and such like long and round pointed leaves, cut in also on the sides but not so deepely, neither so large or great, and of a darker greene colour, at the joynts and the leaves, come forth the flowers, being yellow, but smaller than the first, and likewise small twining tendrils as the other which taketh hold on every thing: that it may comprehend the fruite is small, not bigger than a large Catherine Peare, and many smaller, yet all fashioned like a Peare, the head whereof is somewhat rounder than a Peare; the shell or outward rinde whereof is greene but whiter when it is ripe with many long lines or streakes thereon; the inner pulpe or substance, being almost as white, light, and spongie but lesse bitter than any of the rest, at the least in those have growne in my garden, having but two rowes or rankes of white seede like the rest.

The Place.

The first commeth as a Merchandise to us from *Arabia, Egypt*, and *Syria*, yet is nourished up in the gardens of those that are curious. The other sorts some have beene found in *Spaine* and *Italy*, but we sow their seede every yeare in our gardens, if wee be desirous to see them, for they never come up of their owne sowing.

The Time.

They flower late, and so doe they ripen with their fruit, which unlesse the yeare proove kindly, hardly come to perfection, should it be very late: but the first worth of all.

The Names.

The first as that which only was knowen, or at least mentioned by the ancient writers, is called in Greeke κολοκυνθις *Colocynthis*, and of some σικυος αγριος *Sicyos agrios* and *Cucumis amarus*, the bitter Cowcumber. *Hippocrates* calleth it σικυαριον πικρον of the Latines *Colocynthis* and *Cucurbita silvestris*, in the Apothecaries shops *Coloquintida*, and we in English, either *Coloquintida*, or the bitter Gourde, which you will. The rest of the

Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

have their names in their titles, as moſt writers do call them that mention them, and as much as can be ſaid of them, onely *Tragus* calleth the *Pyriformis*, *Colocynthis Germanica*, becauſe it is leſſe dangerous, and more eaſie to grow in theſe colder Countries. *Belleſes* that ſee but the Biſhop of *Eyſtot* in *Germany* his garden, calleth both the Peare faſhioned *Colloquintida*, and the greater that beareth round fruite like an Apple *Pſeudocolocynthidis*. It is the ſame that in the Scripture in the 2 of *Kings* and the 4. chapter, is called a wild Vine, whereof one gathered wilde Gourds the Arabians call it *Chendell* and *Handal*, and thereof *Trochiſci Alhandal quibuſdam Colocynthidis* name.

The Vertues.

The inner white lofe ſpongie ſubſtance, under the outer ſhell or rinde, is that onely without any ſeede, which is uſed, and being extreame bitter purgeth violently, even to excoriation and blood offentimes, eſpecially in tender bodies: but the doſe or quantity which was given by the ancients, and is yet continued in the hoter climates of *Europe*, (their dry conſtitutions better enduring it) doth farre exceede the proportion, that our mother bodies, are poſſible able to endure without manifeſt danger, unleſſe it bee in theſe that are robuſtious, and uſed to continuall ſtrong labour: *Ioſ. Dioſcoridis* appointeth 4. *obols*, that is 2 ſcruples or 40. graines, of the inner ſubſtance to be made with honey, Myrrhe and water into pills, when our Phyſitians dare ſcarce give one *obolus*, that is 10 graines or halfe a ſcruple, yea they thinke halfe this quantity, mixed among other purgers, is a ſtrong purgation, and it is ſo found by dayly experience, and therefore to avoyd the danger that often happeneth, being a great enemy to the ſtomacke and bowels, although *Pliny* ſaith the contrary, it is beſt to correct the violence thereof with oyle of Roſes, *Gum Tragacanthe* and *Bdellium*, as it is appointed in the *Trochiſci Alhandall*, which ſenſibly ſmelleth the ſharpeneſſe thereof by the gummes, and cooleth it by the ſubſtance of the oyle, to paſſe the more eaſily. The ſafeſt way to take it inwardly at the mouth, the ſubſtance of the ſeede in powder, or the decoction, is not of halfe that force, as the pulpe it ſelfe, is found by *Fabels* experience, and others, if the ſeedes be taken forth out of an apple, and it overruſted with ſoame or clay, and ſome Vinegar and Nitre put to be heated therein, the liquor doth eaſe the paines of the tooth-ach, and faſteneth looſe teeth, if they bee waſhed therewith: and if in an Apple ſo ordered, ſome old ſweete wine, or new boyled wine, be put to ſteepe for a day and a night (which ſome have falſely interpreted that the Apple ſhould be ſteeped in the wine) and the wine ſtrayned forth to be drunke warme, purgeth the body more gently. *Dioſcorides* order was to boyle the wine or boyled water, in the Apple, and let it ſtand open all night to coole in the ayre. It purgeth ſtrongly flegme and choler, and other tough or clammie groſſe humors, from the further or more remote parts, as the braine, ſinewes, muſcles and joynts, or alſo from the lungs and breaſt, and from the veynes alſo; and is therefore very helpefull (if it be wiſely applyed) to all the diſeaſes that happen to theſe parts, as all old paines in the head, the megrime that is inveterate, the falling ſickneſs, the apoplexie, the turning or ſwimming diſtiness in the head, the watring of the eyes, the could Gout, the Sciatica or hipgoute, and other paines of the joynts and ſinewes: it is helpfull alſo for the Iaundiſe, and for putride or rotten fevers, for an old cough, the ſtraightneſs of the cheſt, thorneſſe of the breath, and above all theſe, it helpeth the cholicke, whether it proceede from flegme or from winde, as alſo the dropſie, being taken either in glifters, or ſuppoſitories: it is not good to bee given to the aged or weake, but to the ſtrong, young, and luſty bodies; neither to women with childe, for it if it bee applyed to the weake it deſtroyeth the childe. Being ſteeped in vinegar, it taketh away all diſcolourings of the ſkinne, as morphew, and leprye, dry ſcurfe and ſcabbes, if the places affected, be often rubbed therewith. Pure oyle being put into an hollowed or clenſed apple of *Colocynthida*, and ſet upon warme aſhes or embers, to be throughly heated, both maketh the haire blacke, that was not ſo afore, ſtayeth it from falling that is diſpoſed thereunto, and kreepeth it long from growing gray: the ſame oyle dropped into the eares, taketh away the paine, and ſlaying noyſe of them: and mixed with a little Oxe gall and anointed, on the belly warme, killeth the wormes and cauſeth them to avoyde, and oftentimes purgeth the belly, being onely ſo applyed: *Galen* ſaith, that the bitternelle thereof, which ought be availeable for many griefes, ſuffereth it not to exerciſe them, but is overcome by the vehemente purging quality it hath: If when it is taken it ſhould worke overmuch, and bring forth excoriations and blood, to the danger of the patient, a decoction of Raiſins of the Sunne, given with Oyle of ſweete Almonds, or the Oyle of Walnuts, mittigateth the violence thereof. Rats and mice doe much delight to eate ſeedes, and the ſeede hereof alſo: if therefore they be ſet, or layd, in diverſe corners of the houſe, trobled with them, it will kill and deſtroy them all: The decoction of them alſo ſprinkled in Chambers, is ſayd to kill fleaes: The other ſorts of *Colocynthida* are ſeldome or never uſed with us, yet *Tragus* commendeth the uſe of *Colocynthis Pyriformis*, as being leſſe bitter and violent in purging, and therefore ſafer to bee taken inwardly.

CHAP. IIII.

Cucumis agreſtis ſive Aſininus. The wilde or ſpirting Cowcumber.

THis wilde Cowcumber (as well as the former wilde or bitter Gourde, differing from all the reſt of the ſame kindes) is likewiſe entreated of apart by it ſelfe, as alſo to be now remembred, being as like or well all the qualities thereof, as the Former, or rather more: It creepeth on the ground like unto the former, with many rough trailing branches, whereon are ſet very rugged and rough all coloured greene leaves, ſomewhat whitiſh underneath, little or nothing divided or pierced at the edges: at the joynts betweene the branches and the leaves, come forth ſmall pale yellow flowers, ſpringing into five leaves, at the end of ſmall greene heads for the moſt part, as all other ſorts of Gourds, Cowcummers, &c. doe: but thoſe that have flowers onely without ſuch heads, fall away quickly without fruite, for that greene head, as in all others, groweth to be the fruite, which is ſmall, rough, round and long, and ſome like unto a graye in greene, when they are ripe: the ſmall tough foote ſtalkes, being crooked, and bending the fruite downwards, which with a little touch, when they are throughly ripe, will quickely open at the end next the ſtalke, and ſpring out the juyce, and ſome ſeede, into their faces or hand, or other places againſt

Cucumis agrestis
The Wilde Cowcumber

it that touched it: the seede being ripe, is blackish and somewhat ragged, but otherwise white, lying in a greene jelly substance, very bitter and loathsome to taste: the roote is white, and grave, thicker, and shorter, than in any other sort of Gourde or Cowcumber, with some fibres thereat, very bitter as is all the rest of the plant.

The place.

It groweth naturally wilde in Italy, as *Matthiolus* saith: in many places by the way sides, and in untilled and moorish places, we onely preserve it in gardens, throughout the whole Land, where it is used.

The Time.

The roote hereof doth often abide in the ground, all the winter long, if it stand reasonably defended, or the ground tende with soyling, shooting then forth leaves betimes: in colder grounds not defended, they perish every yeare: the fruit is usually ripe in August.

The Names.

It is called in Greeke ἐκβάλλιον, in Latine *Cucumis asininus, cucumis agrestis*, or *silvestris*, as many writers doe, or *anguinus*, *Turner* and *Cordus*, but not properly: *Matthiolus*, *Tragus*, *Dodonæus*, and some others, call it *Cucumis sylvestris*. The dryed or hardned juice of the fruit, is called, *Elaterium*: translating *Theophrastus* calleth it *Agitatorium*.

The Vertues.

The roote hereof and the dryed juice of the fruite, artificially and not rudely prepared, which is called *Elaterium*, is chiefely used in medicines and scarse any other part: Concerning *Elaterium*, there is difference betweene *Theophrastus*, and *Dioscorides*, of the age and durability, and in extinguishing or conceiling the flame of a lampe or candle. *Theophrastus* in the ninth booke and foureteenth chapter of his history of Plants saith *Elaterium* is the most durable medicine of all others, so that the best is the eldest, for as he saith a Physition of sufficient credit, kept by him some *Elaterium* that was two yeares old, which he received of one as a gift; which notwithstanding the age, was of wonderfull force: and untill it was 50 yeares old, it was so aboundant in humidity, that put to the flame of a lampe or candle it would put it out. And *Dioscorides* saith that *Elaterium*, is fit to be used as a purging medicine, from two yeares old, untill it be twelve: and that is the best, which being put to the flame of a lampe or candle, will most burne the more bright. Unto *Theophrastus*, *Pliny* subscribeth the same thing, and saith that it is found true by experience, that untill it be 10 yeares old, it will cause a lampe or candle, to sparkle further and further, when put it out; whereupon *Matthiolus* giving credit to the relations of *Theophrastus* and *Pliny*, is perswaded that the text of *Dioscorides* is corrupted, but I verily believe they both say true, the reconciliation of their repugnancy, being made in the manner of making of *Elaterium*. *Theophrastus* his *Elaterium* being greene, as I suppose, and made of the substance of the inner pulpe of the fruite; yet in the tenth chapter of his fourth booke he saith it is made of the seede, which I never saw or heard of any to be so made with us, and that of *Dioscorides* being white, (which is the saith himself is for best, and condemning the error, made onely of the more thin watery, and wheyish part). *Matthiolus* also saith that the best is white: my selfe having made of both sorts of late, that *Elaterium*, made of the substance of the fruite; although very gently pressed through a fine fine, will be greene, and continue moyst many yeares, after it is evaporated and dryed up hard, relenting with the aire, and will require many yeares to consume the humidity therein, when as the other sort, made of the whitish, whitish liquor, that droppeth through the fine of it owne accord, in the cutting of the fruite, without any manner of pressing, will be white when it is dryed, and so remaine white, hard and dry, for many yeares, unlesse it be kept open to the moyst aire, or stand in a moyst place to cause it to relent: the greene sort likewise is not of so violent force or violence, to purge either upward or downeward, as the white *Elaterium*; whereof one grain weight dissolved in liquor, worketh forceably in any tender body: yea I have oftentimes seene, that halfe a grain weight put into a purging medicine, to quicken the weakenesse thereof, hath troubled the stomacke very much by vomitings, and much disquiet, and working also downeward with more violence, then it could be thought the whole grains given of a fellow could doe. This narration although somewhat tedious, I was the more willing to declare, because I thinke none hath shewed it before, and my little experience may set an edge unto others, to polish that which I have here shewed you, but rough hewen. The dose or quantity thereof (saith *Dioscorides*) is a whole *obolus*, and the least quantity is halfe an *obolus*, (some value the *obolus* to weigh 12 grains, but the most usuall is but 10 grains,) which (saith he) I have said before, the most dose, which the ancients were wont to give of purgers in their medicines, which we dare not follow: It purgeth choler and flegme from all parts of the body, and as he saith, is the best medicine to purge those that are purslie and short winded: to procure a vomit, he adviseth to dissolve it in water, and with a feather dipped therein, to touch the lower part of the tongue, as low as you can; but milke or rather creame which is more unctuous, is fitter to give it in, for it will not suffer it to sticke to the rumples of the stomacke, but will cause it slippe away: the juice onely helpeth also the falling sicknesse, being put into the nostrels with milke, and mixed with honey and vinegar, it cureth the Kings evill, being annointed therewith: It bringeth downe womens courses that are stayed

and

and killeth the birth if it be applyed to the secret parts: It purgeth clammie and watery humors from the joynts, and that brought the juyce of the roote doth the same likewise, and therefore used in glisters, or layd as a plaister or pultis upon the place payned with the Sciatica, easeth the paines thereof, the same juyce of the roote, boyled with wormewood in water and oyle, cureth an inveterate megrime, if the temples be often bathed therewith, and some of the leaves and rootes, be beaten together, and layd as a pultis thereunto afterwards: the juyce of the roote with a little milke, cast up into the nostrils doth the same: for it wonderfully purgeth the braine from watrinesse, and easeth the evill savour of the nostrills caused thereby: It cureth also the old paines of the head and the Epilepsie: and being mixed with Goates dung, and layde as a plaister upon any great or hard swellings, or kernells, it resolveth them. The juice of the roote, as well as of the fruite (and so doth the decoction of them also, saith *Matthiolus*) purgeth dronkie dolts being the dropsie, for they mightily draw forth watery humors, and the yellow laundice, and all obstructions both of the liver & spleene: *Dioscorides* also sheweth this medicine to cure the dropsie. Take (saith he) halfe a pound of the rootes hereof, and being bruised, let it be put into three quarters of a pint of strong wine, giving the rest three ounces, for 3 or 4 dayes together, untill the tumour be discerned, for it abundantly walleth and falleth; which thing it worketh (saith he) without any troubling of the bodie at all. A few graines of *Staphisagria* mixed with conserve of Roses, and some thereof taken will doe the like, and herewith *Castor Durantes* saith he cured many. The powder of the roote mixed with honey, and layd upon any fowle scarre in the skinne, doth attenuate it, and taketh away the markes or blew spots, that come upon bruising or blowes: the roote boyled or layde to steepe in strong Vinegar, easeth the morphew and cleanseth the skinne of all foule spots, freckles, and other discolorings thereof, and the powder of the dryed roote (saith *Dioscorides*) cleanseth the face and skinne from all fearfe, and taketh away the blacke or ill colour from any scarre: the juyce of the leaves dropped into the eares, easeth them of the paines and noyse therein, and helpeth the deafenesse: the decoction of the roote gargled in the mouth, taketh away the paines of the teeth; the powder of the roote mixed with honey, and put into old fores and ulcers, cleanseth them throughly, and thereby further eth their healing wonderfully. Our Apothecaries doe most usually take the roote of this wilde Cowcumber as a substitute for the roote of Coloquintida or the bitter Gourd, that not being so frequent or easie to be had as this.

Chap. V.

Scammonea. Scamonye.

Having shewed you in the two first Chapters, some purging plants that runne, or spread upon the ground, or climbe up by those things that are set by them: let me conjoyne some other like, but growing naturally in our owne and part in other Countries, and first of *Scammonye*, which is properly a *Convolvulus* or winding Bell flower, which we call Bindeweede: I will comprehend in this Chapter also, those onely that in forme and force in working, come nearest unto the true: the rest that differ shall follow.

1. *Scammonea Syriaca legitima.* The true Scammonie.

3. *Convolvulus major alter.* The great white Bindeweed.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Original from UNIVERSITY OF MICHIGAN

1. *Scammonia Syriaca legitima.* The true *Scammonye.*

The true Scammony hath a long roote of a darke ash-colour on the outside, and white within, and of the bignesse of an arme, (for such hath beene brought us from *Troyes*) with a pith in the middle thereof, and many fibres thereat, (which being dryed as *Matthiolus* saith, the pith taken out, seemed so like unto the roores of *Turbith*, which are brought us, from the farre eastern parts, none knowing what plant it is, nor whereunto it is like, some thinking it to be the roote of *Filipendula* or Sea-Scarre-worte, which *Matthiolus* confuteth; others a kind of *Ferula* or *Ferulacea* plant, altogether improbable, but that they are not so tough, but more brittle, that otherwise it might be thought, to be the right *Turbith* of the Apothecaryes shoppes) from whence ariseth many long, round, greene, branches, winding themselves like a Bindeweede about stakes or trees, or any other herbes or things that stand next unto it, unto a good height without any clasping tendrells, like the true or wilde Vines: from the joynts of the branches, come forth the leaves, every one by it selfe, (yet I have seene dryed plants that have had two leaves one against another,) upon short foote stalkes, somewhat broad at the bottome, with two corners neat thereunto, and some also round that I have seene, and then growing long and narrow to the end; being smooth, and of a faire greene colour, somewhat shining: towards the tops of the branches at the joynts with the leaves, come forth large whitish Bell flowers, with wide open brimes and narrow bottomes, after which come round heads, wherein are contained 3 or 4 cornered blacke seede; for such I have had given me, from whence hath sprung plants, which perished quickely, not abiding a winter with me: if any part of the plant be broken, it yeeldeth forth a milke, neither hot or burning, nor bitter, yet somewhat unpleasant, provoking loathing, and almost eating.

2. *Scammonia Monspeliaca Cretica.* Long rooted Scammonye of *Candye.*

Prosper Alpinus, in his Dissertation, saith, that he in his former times received from Candie, another sort of Scammonye, differing nothing from the true Scammonye here before described, but in the fashion of the roote which is long and slender, of about a fingers thicknesse: but purging as strongly as that of *Syria*, and this in my judgement doth very neere resemble our common white greater Bindeweede, that shall follow next: the Country making the difference onely as I thinke.

3. *Convolvulus major albus.* The great white Bindeweede.

Our great Bindeweede commeth as I think so neere unto the former Scammonye, that excepting the largenesse of the roores, and the greater force in purging, which may both proceede from the climate; you would say they were *alterae eadem*, whole many slender winding stalkes runne up and winde themselves upon hedges, or whatsoever standeth neere unto it, having diverse large leaves growing severally thereon, somewhat long, and pointed at the further end, and parted into two points at the broad part, next to the stalke, making it seeme almost three square, being smooth and of a pale greene colour, yeelding a milke being broken, but not so plentifully as the Scammonye: at the joynts with the leaves towards the toppes of the branches, come forth large white Bell flowers, without any division in them, after which rise round skinnie huskes or heads, containing within them diverse blackish, three cornered seede, like the former, but lesser: the roote is whitish, and small, of the bignesse of Couchgrasse, or somewhat greater, running much under ground, and shooting forth in sundry places: both stalkes and leaves perish every yeare, the roote living in the ground, and shooting a fresh every spring, which yeeldeth milke, being broken.

4. *Scammonia alba folio oblongo.*
French bastard Scammonye.

5. *Virginia.*

4. *Scammonia Monspeliaca altera.*
French Bastard Scammonye.

The neere resemblance of this plant, unto the former in many particulars, but especially in the seede, shewing it to be a Bindeweede, hath caused me to joyne it likewise in the same Chapter, which hath sundry twining branches rising five or six foote high, twining or clasping the neere other things that it can reach, whereon are set two long and almost round, yet pointed leaves at a joynt, of a blewish greene colour: from betweene the leaves and the branches as also at the toppes of them, come forth many small white flowers, clustering together (after fashion), consisting of five narrow pointed leaves with threds in the middle: after which succeede such like heads, and blacke cornered seede as in the former sorts: the roote hereof is small, of the bignesse of ones finger, with many fibres thereat, beewaught on the outside, and pale within, that yeelderh more plenty of purging milke than the last, resembling somewhat neere therein unto the last.

5. *Scammonia rotundifolia Virginiana.*

We have had a kind of *Volubilis* from *Virginia* very neerely resembling this kinde of French Scammonye, both in growing and forme of leaves (as you may perceive by one set by the plant) but the flowers being small and white doe open like a Bindeweede, and not like a lilly into five leaves, like unto the last, the seede groweth not in pods, but in small heads, being small and blackish like other Bindeweeds, and therefore if not to the family of Bindeweeds, I know no better place than to insert it here. And peradventure this may be the Indians *Hololuckis*, that *Aldrovus* mentioneth in his *Farragines* to be so dangerous.

The Place.

The last groweth in *Syria*, and the farther Easterne parts, where no frosts are felt in the winter, but are quickely

Original from UNIVERSITY OF MICHIGAN

quickly perish with the leaft approach thereof, and therefore to be kept fafe in thefe cold climates, it requireth fome vault, or ſtove, or other fuch convenient place. The ſecond groweth in Candy as *Alpinus* ſaith. The third is frequent in fundry places of the Land, growing by the hedges ſides and running thereon. The fourth groweth neere the Sea ſide, as well by *Mompelier*, as the kingdome of *Valentia* in Spaine, where *Lopez* ſaith he found it; and the laſt in *Virginia*.

The Time.

They flourifh in thefe Countries in June, July, and Auguſt, but the firſt, and two laſt, doe ſeldome perfect any ſeede with us.

The Names.

The firſt is called in Greeke Σκαμμωνία, and in Latine alſo *Scammonea*: the dryed Juyce which is moſt in uſe, is called Σκαμμωνία τὸ ἀποξυσμένον *Scammonium*, both in the Druggifts, and Apothecaries ſhoppes, as alſo with moſt writers, yet ſome call the plant to two: the ſame being prepared, that is, baked in a quince, under the embers, or in an Oven, or any other way, is called of the ancient writers *Diagrydium*, which ſhould onely be uſed in medicines, according to the appointment of all Phyſicians, who are led by the tradition of their elders: but all Apothecaries ſo generall, doe vſe the Scammonye it ſelfe, as it commeth, without any other preparation, ſo as it be of the pureſt, and beſt, which by their dayly experience, they finde to worke more certainely, and more ſafely, than the *Diagrydium*, which is much dulled in the baking or other preparations and beſides, whereas the ancient writers doe appoint it to be diſſolved, and ſo mixed with their medecines, or to be boyled in the Electuarie, ſo to bee diſſolved, wherein it is appointed to be put: the dayly experience of Apothecaries, who are chiefe maſters in their profeſſions, or ſhould be, if they be worthy of their name, doth teſtifie there againſt, finding that if Scammonie come to never ſo little heate almoſt in the mixing thereof, it will curdle together and lye in knots in the medicine, ſeare yee it almoſt never ſo long after it is mixed; and therefore they alwayes in their Scammonate medicines, rubbe it finely into powder of it ſelfe, without other preparation, and ſo put it laſt of all other things into any medicine, that hath beene boyled or heated, and that when it is almoſt cold, for feare of curdling or gathering together in knots, as I ſayd before; and being thus mixed, the medicine ſhall worke more ſafely without perturbations of the ſtomacke, &c. and more ſurely without tediouſneſſe or protractionation, than if *Diagrydium*, were put into it: let not this be imputed as an errour in our profeſſion, or a lacke willingneſſe to reverence ſo great and ancient authority, for we know that true experience hath unaltered reaſon and authoritie, and we alſo know, that the experience and diligence of our times, hath in many more things, not onely taught us to vary from the Methode and order, appointed by the ancient writers of Phyſicke and herbary, but to contrary them alſo, when we have found either by reaſon or experience, that there is cauſe ſo to doe, as in the doſe of this Scammonie is plainely to be obſerved. For *Dioſcorides* appointeth a dramme to be given at once, when as Phyſitian with us dare ſcarſe give halfe a ſcruple, or not above. The ſecond *Alpinus* ſo calleth, as is in the title, and that is as much as can be ſayd of it: the third is called *Falcatilis major* or *Convolvulus major* by diverſe, as alſo *Smilax aſpera* by others. *Helxine Cliffortiana* by *Cordus* in *Diſcorides*, and *Malacoxillon Dioſcoridis* by *Dodonæus*: the fourth *Colutea* in *Fuchſius* called *Scammonea Monſpeli*, and *Tubri Scammonium Monſpelienſe*, but *Cluſius* who in his Spaniſh obſervations, firſt called it *Scammonea Valentina* doth not his hiſtory entitle it, *Apocynum latifolium*, yet referreth it to that of *Mompelier* as both one: *Camerarius* and *Lugdunenſis* doe call it *Scammonia montana Monſpeliaca* as the learned of *Mompelier* doe, and vſe it accordingly: the laſt is remembred onely by my ſelfe, who ſuppoſe it by being like in forme to the laſt, to be neere alſo in quality thereunto.

The Vertues.

Scammonye being the beſt as I may ſo call it, of thoſe medecines wherein it is put, there had needs of eſpeciall care to be taken in the choiſe thereof, that onely that which is ſincere and pure, without droſſe or adulteration be uſed in Phyſicke; which may be knowne if it be neat heavie, or cloſe compact together, but that it be moderately light, with ſome ſmall holes or hollownes in it here and there thereof, and that it be ſmooth and glitter in the breaking, and not in graines or knots, or having ſmall ſticks or ſtones in it, ſomewhat deere and blackiſh alſo, but not of a deadiſh darke or evill favored colour, and that will be made quicke by mixing a very fine and white powder: this I miſlike comparatively, for it will be a very hard matter, for any to know the laſt by relation, but by inſpection, and chiefely by compariſon of the good and bad together: that ſo you may learne to know either of them at the firſt ſight. The doſe hereof as it is appointed by *Dioſcorides* and others, doth farre exceede the proportion of our moderne Phyſitians, that it hath pride *Pena* to ſcorne, that the Scammonye in *Dioſcorides* time, was more corrupt, and entreated with other things than ours is, becauſe he gave ſo much: and we doe give ſo little; and *Matthiolus* on the other ſide to doubt, whether wee have any ſincere Scammonye brought unto us at all, or elſe that the reſt of *Dioſcorides* is corrupt, where he appointeth a dramme or foure *obolos*, that is, three ſcruples to be taken at a time; and he feareth downe alſo, that if a purging medicine be required to be exhibited, you ſhould take 3 *obols*, that is halfe a dram, of Scammony, 2 *obols*, that is one ſcruple of black Helle bore, and one dram of Aloes, all theſe to be taken together at one time: our the greateſt doſis now alayes exceedeth not halfe an *obolus* to ſtrong luſty, and leſſe to the weaker, or more tender. *Pena* in his diligent obſervations, and declarations hereof he doeth ſo his *Adverſ.* 100. doth caſtie all whom it may concerne, both to underſtand the choyſe of this Scammonye, as alſo thereby to beabhorre them of the ſincerity of other druggs, and that as he ſayeth, the quantity of Scammonye is ſo great, that is ſpent in all countries, which is made onely in one, that unleſſe the quantity were augmented by meanes, there could not be ſufficient ſincere and pure Scammonie to ſerve them by much: and although in former ages, and even in our fathers times, there hath beene much falſe and corrupt Druggs, brought into Europe, and all the countries thereof farre and neere: yet the skill and curioſitie of theſe times is ſuch, that our Merchants taking onely the beſt for us of all ſorts, and refuſing the courſe, hath I thanke them, if not worſe can, doe ſophiſticating ere in the exaltes thereof, when they ſee that none but true and ſincere is affected and bought, the world to lye on their hands until it grow better: It purgeth both ſtrong yellow choler, and watery humours very ſtrongly: but if it bee indifferently or carelefſely given without due reſpect, it will not onely trouble the ſtomacke more than any other medecine, but will alſo ſcowre, fret and rake the guts in working too forcibly, oftentimes into blood, and oftentimes cauſing ſwimings and ſwoonings: Our Phyſicians therefore doe ſeldome give, to any tender and gentle body any Scammoniate Electuary,

and

and but in pills seldome any at all, to avoyd the dangerous symptomes that often happen thereupon, for *Plinie*, *Paulus Ægineta*, and others shew the dangers thereof, and *Mesue* also declareth three severall hurts or harmes that come to the body thereby, and the remedies of them, which is not from the purpose to be here set downe. The first is saith he, that it engendreth certaine gnawing windes in the stomacke, so much offending it that it procureth a disposition to vomite. To be baked therefore in a quince, and some parsley, fennell, or wilde carrot seed or *Galanga* mixed with it, is the remedy hereof. The next is that it enflameth the spirits, by the overmuch sharpnesse or hetenesse therein, whereby it readily inclineth feavers, especially in those that are subject to obstructions & repleate with putrid humors; which inconveniences are taken away by putting those things into your decoctions, that doe coole and quench the heate thereof, and such are the mucilage of the seedes of *Psyllium*, or Flea-wort, Prunes boyled or rather the pulpe of them, the juyce, or the julep, or the water of Roses or Violets, or if before the boyling thereof, (that is the *Scammonye*) you steepe it in the oyle of Roses or Violets, or in the juyce of a sowre sweete quince, and mingle with it a little *Sumach* or *Spodium*. A third is that having a strong opening and drawing facultie, it causeth immoderate fluxes of the belly, by opening the mouth of the veines more than is fit. This harme also is taken away, by mixing astringent and refraining things with it, such as Mastick is, and especially yellow Myrobolanes and quinces, or the juyce of them. Againe, it taketh or shaketh the intrailes and gutts, by reason of that sharpe juyce wherewith it doth abound, and by which it procureth the means and paines therein, the disease called *Dysenteria* which wee call the bloody flixe, and *Tenesmus*, which is a disease, when one desireth to goe often to the stoole, and can doe nothing; but this danger is remedied, if moyst, fat and slippery medecines be used, as *gum Tragacantha*, *bdellium*, and oyle of Almonds and Rose, as also the pulpe of prunes, made up with sugar, the mucilage of *Psyllium* or Fleawort seedes, Mastick and quinces taken afterwards; and warme water last of all; all which cause it to expelle the quicklier from the stomacke and bowels, and thereby stay it from doing harme; whereby those that are wise, are taught to give the broth of barly, sweetned with sugar, to drinke to those that have taken thereof: This fault also is helped, a cold medicines as well as hot being mixed together be given, thereby to yeeld helpe to the heart, liver, and the stomacke: thus farre *Actuarius*. The juyce saith *Dioscorides* applyed to the wombe, destroyeth the birth, being mixed with honey and Oxe gall, and rubbed on wheales pimples and pusshes taketh them all away: and boyled in Vinegar and annointed, taketh away the Lepry or outward markes in the skinne: being dissolved in Rosewater and vinegar, and the head moystned therewith, easeth the continuall paines therein. A dramme or two of the roottes of Scammonye purge in the same manner that the juyce doth, if some of the things appointed thereunto be given with it: the roottes boyled in water, and made into a poltis, with barly meale, easeth the Sciatica, being layd thereon: it taketh away scurfes and scabbes, if they be washed with the Vinegar, wherein the roots have beene boyled, and also healeth apostumes. Our English Bindweede hath beene experienced to be purging the roots especially being boyled, and the decoction thereof taken in a reasonable proportion. That of Candy is mentioned in the description. They of *Montpelier* have often used the dryed juyce of the fourth, in stead of the true Scammonye when it was wanting, but in a double quantity, which yet did not worke so effectually.

Chap. VI.

Scammonia Ioppæsitis, Supposed or Ballard Scammonyes.

There be some other plants to be joyned next unto the true *Scammonye* for the strong purging quality in them, but not either deadly or dangerous: as the *Apocynum* is, which else for the outward likenesse might be referred unto them.

1. *Scammonia Monspeliensium adsitia*. Spanish Ballard Scammonye.

This Spanish kinde of Climer is very like unto the great Bindeweede, in the branches, leaves and roottes, but the leaves being somewhat longer, are of a grayish greene colour, growing alike more abundantly than any, and the roottes being small white and brittell, runne also and easily creepe under ground, and quickly overspread any place where it groweth, a little peece being left in the ground, will spring up quickely into many reeds in time; so that many being weary thereof, doe strive rather to destroy it cleane out of their gardens than keepe it any longer: the flowers are white and starre fashioned, but there come foure goddes after, somewhat like unto *Periploca* or *Asclepias*, this looseth both leaves and branches, and springeth a new every yeare.

2. *Scammonia Ægyptiaca*. Ballard Scammonye of Egypt.

This likewise seemeth to be of the same kindred with the former, as by *Alpinus* his relation may be gathered; for as he saith, the Egyptians with whom he saw it, reckoned it a kind of Scammonye, yet made no great use in Physicke thereof. It climeth he saith with many winding branches, having long and hard greene leaves on them, greater than the leaves of *Bryonie* or *Asclepias fruticosa*: the flowers are white but larger than the former sort, and bring hard crooked coddes afterwards, two alwayes growing together, like unto the coddes of the *Oleander* or Rose Bay tree: from the leaves or branches of this plant, floweth a pale yellowish milkie juyce, no little heating and burning the throate than a spurge, this looseth his leaves, but not his branches every yeare, fresh springing a new in the spring.

The Place.

The first, grew about *Narcia* in *Spaine* as *Clusius* saith. The other in *Egypt*.

The Time.

They doe both flower in the latter end of Summer, and bring ripe fruite in the end of September.

The Names.

The first *Clusius* saith he received the seedes thereof out of Spaine, and calleth it *Apocynum sertum hortense*, *Lobel* calleth it *Scammonia Monspelica variata*, *Dodonæus* putteth it for his former *Periploca*, and *Thalmannus* calleth

1. *Solanum Sinuatum Aegyptium*, &c.
2. *Solanum Aegyptiacum.*
Scalloped ascommonwort of Spaine and Egypt.

calleth it *Solanum maius*. Lobelius in his Icones calleth it *Bonanomia Clusij affert. Solani manatilibus*. The other *Alpinus* saith the Egyptians call *Sesamum*, taking it as I layd before for a kinde of *Sesamoyde*, as by their name may appeare: *Dodonæus* seemeth to referre this to the other sort of the second kind of *Apocynon* or *Cynoctonon*, but in my judgement he is mistaken, the leaves of the being much longer, then in these, and the flowers differing, which in these is white, in the other reddish and greene, like to the narrow leafed Dogsbane for he saith they are alike, and indeede calleth it his third *Apocynon*.

The Vertues.

These doe purge a little, but to little purpose, none of them comming any thing neere the vertue or force of the true Sesamoyne; yet they of Egypt doe sometimes use the joyce of their owne kinde, in the stead of the true Sesamoyne, and to that purpose doe gather and harden the joyce thereof, and keepe it to use when they want better, allowing double quantity for a dose.

Chap. VII.

Soldanella sive Calabrella marina. Soldanella or Sea Bindweede.

Although this plant groweth by the sea side, and plentifully enough in our owne coasts, in many places, and might therefore be remembred among other Sea plants, when we come to them, yet because it hath a strong purging quality therein, I thinke it not unfit to joyne it unto the other of his nature: I will also adjoyne hereunto that kind that groweth upon hills, called *Soldanella Alpina* or *Montana*, because the leaves are round, somewhat like unto theirs.

The Sea Bindweede doth lack many weake, tender, trayling or lying upon the ground, rather then walking it selfe up, or climing upon other things, whereon are set divers leaves, not alwayes two together at a joynt, nor yet alwayes single, one at a joynt, which are almost round like unto the leaves of *Asarabacca*, or, but a little undernly dented about the edges, and thicker, every one standing on a long feede stalke, and of a grayish greene colour; among which come forth the flowers towards the ende, every one by it selfe, comming forth at the joynts, in fashion like unto the small low common Bindweede, that groweth upon the ground by the way sides, every where almost, but a little larger and of a reddish purple colour; after which come round heads, wherein is inclosed three or three round blacke seedes: the roote is small and long, spreading a little in the ground, and throwing up divers heads in severall places; if any part thereof be broken, there issueth forth a reddish water, which as well as the leaves are bitter, salt and unpleasant.

2. *Soldanella montana minor.* The greater Sea Bindweede.

This other kinde hath use a number of long tender branches, whereon are set larger leaves, many of them having a division or dimple like the leafe, next the bottome, and many of them but on one side, and many also that are tender for no round at all, yet all of them for the most part a little pointed on the edges, toward the ende, which ende is with a dent in the middle, making the point seeme double forked, with many veines running therein, the flowers are of a reddish purple colour, and are not bell or cup fashion, like the former, but smaller, of the bignesse that the greater sort is: the heades and seedes are like the other, and the roote creeping a little in the ground.

3. *Soldanella montana major.* The greater Mountaine Soldanella.

From the fibres of the leaves this Mountaine Soldanella tooke the name, which hath many hard round leaves, set upon long foote stalkes, a little unequally cut about the edges, greene on the upper side, and of a grayish greene underneath and somewhat reddish like the leaves of Sowbread, resembling the Sea Soldanella: the stalkes are slender, small, round and reddish, about a spanne high, bearing foure or five flowers at the toppe, every one standing upon their foote stalke, like unto a bell flower, consisting but of one leafe, platted into five folds

e e 2

each of them, ending in a long point, which maketh the flower seeme to have five leaves, having a round greene head in the middle, with a prickle or point at the end thereof: the flower is of a faire blew colour, in some greener or paler, or white as nature listeth, without any smell at all: the middle head after the flowers is fallen, is found to be a long round pod, bearing that pointell it had at the end thereof, wherein is contained small greenish seed: the root hath many fibres, shooting from a long round head or roote. There is a diuersitie found hereof as I doe finde, little differing in bignesse one from the other, but in the greatnesse or smalnesse.

The Place.

The last groweth in our owne Sea coasts, in many places plentifully, as well as in other Countryes. The two greater are onely vsed to bee in gardens in *Spaine*, as *Ramirez* saith, as also on the coasts of the kingdome of *Naples*, as *Imperatus* saith: the last groweth on the snowye hills in *Hungary*, as *Clusius* saith.

The Time.

The two former flower toward the end of Summer, and their seede is ripe in *August*: the last in the cooler places flowreth not vntill *July* or *August*, as the snow melteth sooner or later, but in *April* in *Candy*.

The Names.

The last is taken of all writers for the most part, to be the *Kappa* of *Dioscorides*, *Brassica marina* of *Pliny*, as all the markes and notes there agreeing with this: yet is hath no resemblance vnto any kinde of Cabbage, as the name should import, yet many authors doe call it *Brassica marina*, as *Matthiolus*, *Cordus*, *Gesner*, *Camerarius*, *Dodonæus*, and others, and some of them also call it *Soldana* and *Soldanella*, as well as *Lobel*, *Gesner*, *Tabernæmontanus*, and others. *Bauhinus* calleth it, *Soldanella marina minor*: we in English doe call it by diuers names, as some call it *Sea cole*, according to the Latine name, others more properly in my iudgement *Sea Withe*, *Sea marigold*, or *Sea Bindweede*, because the branches winde themselues, and the flowers are like the small kinde of *Bindweede*, and that it groweth generally neere the Sea coasts, as also Sea Beets for the smalnesse of the flowers, and some also call it *Tuftilona maritima*, Sea Hole-foote, for the resemblance of the leaues. The other *Rauwolfius* calleth *Brassica marina genuina*, as it is graunted in the Appendix of the great Herball of *Gerarde*; and *Imperatus* calleth it, *Convolvulus Marinus maritimus*: *Bauhinus* calleth it, *Soldanella vel Brassica marina major*, and hath set forth the figure thereof in his *Matthiolus*: the last is called by most, *Soldanella Alpina*, and some *Lotos montana tertia*, in *English Mountaine Soldanella*, (but not *Mountaine Bindweede*, as *Gerarde* doth call it, as it is no *Convolvulus*) or the *Blew Lunary* or *Moone wort*.

The Vertues.

The herbe and every part thereof, as *Dioscorides* saith, is an enemy to the stomacke, being sharpe in taste, it openeth the belly verie powerfully, and violently, and therefore not to be given, but vnto strong and robuste bodies, and that boiled also in the broth of fat meate, to hinder the violence of its working: the decoction thereof with some Rubarbe, is commended by some to helpe the Dropsie and Timpanie, and the powder of the leaves with Rubarbe, and a few *Cubebes* drunke in wine, is of the like operation: the iuyce also not vnlike

Original from UNIVERSITY OF MICHIGAN

bee chewing leaves of it are to be scored when it is broken, gathered, and dryed, and afterwards relented; and layde as a plaister to the cancrome of the belly, wrought upon that disease (the Dropsie I meane) mightily, drawing forth thole watery humours: diverse also doe use to save the greene herbe salting, to purge them, even as others doe Scamony: the powder of the dryed herbe is of very good use, to bring or raise up flesh in deepe and hollow Vlcers, helping also to heale them. The Mountaine Soldanella, is of a drying or binding property, good to consolidate wounds and helpe the Sciatica and Gowte.

Chap. IX.

Convolvuli, sive Volubilis majores. The great Bindeweedes or Bellflowers.

THere are diverse sorts of Bindeweedes or Bellflowers, some greater, others lesser, of the greater in this Chapter, whereof some of them have beene made mention by former authors, but others not spoken of by any before.

1. *Convolvulus Asiaticus flore cæruleo major.* The greater blew Bindeweede or Bell flower.

The greater Bindeweede riseth up with many winding branches, climing and spreading on whatsoever it can take hold on, that standeth neere it, winding it selfe alwayes contrary to the course of the Sunne, on these branches grow many faire, great, round leaves, pointed at the ends of a sad greene colour, at each joynt, where the leaves are set come forth flowers on pretty long foote stalkes, two or three set together, which at the first are long and pointed, almost like a finger; but being blowen open are like great bells with broad open mouthes or brimmes, made of one whole leafe, ending in five corners and foulded or plaited so also, and small at the bottome, standing in small greene huskes: these flowers are of a pale blue colour being in buddes: but being open are of a very deepe azure colour, or blue, tending to a purple, the foulds or plaites being deeper or redder; which open for the most part in the evening, abiding so all night and the next morning, untill the Sunnes heate clozed them, never opening againe after: these flowers are pale, the stalkes of them bend downewards, and beare within the husks three or foure blacke seedes: the roots are stringy, and perish every yeare.

2. *Convolvulus major purpureus flore trifolium.* The greater purple Bell flower with cornered leaves.

The growing of this Bellflower is all one with the former, the chiefest difference consisting in the leafe which is three cornered, and in the flower which is deeper, tending to a deepe purple violet colour, and more reddish in the plaites and bottome.

3. *Convolvulus volubilis Virginus.* Blew Bell flower of Virginia.

This Bell flower or Bindeweede climeth and spreadeth on pales, &c. like unto the former, having leaves very

1. 2. 3. *Convolvulus cæruleus major sive rotundifolius. Nil. Peregrinus. Volubilis purpurea. Et Virginus.*
The great blew Bindeweede, with a round and cornered leafe purple, and that of Virginia.

4. *Convolvulus peregrinus Americanus.*
The 4th Bell flower of America.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Original from UNIVERSITY OF MICHIGAN

like unto the laſt, but ſmaller, and cut rounder in the diviſion of the leafe on each ſide, and one ſide alſo alone longer, bending downe wards: the flowers alſo are much ſmaller, of a watchet or pale blew colour, changing upon the fading thereof to be of a reddiſh purple: the ſeede is like the former but ſmaller, and the roote alſo ſucth like the reſt.

4. *Convolvulus Arabicus ſive Ægyptius.* The Arabian or Egyptian Bindeweede.

The *Arabian* or *Ægyptian* likewiſe climeth and ſpreadeth like the other, with a leafe at every joynt ſtanding on a long foote ſtalke, parted ſometimes into five ſmall long leaves, ſometimes into more, each one ending in a ſmall pricke, and the one or the other lower peece of the leafe, divided into two parts; at the joynts with the leaves come forth ſuch like Bellflowers, as are in the former, of a purpliſh blew colour.

5. *Convolvulus tenuifolius ſive pennatus Americanus.* The red Bell flower of America.

This Indian kinde riſeth up at the firſt with two double forked leaves, abiding a long time without falling, betweene which ſpringeth up a ſtalke, three foote high in ſome places, branching forth diverſe wayes, being of a brownish colour, and ſpreading it ſelfe as the others doe: the leaves that are ſet at each joynt, are winged, that is, ſundry ſmall, narrow, and long, darke greene leaves, but freſher being young, ſet on both ſides of the middle ribbe, and one at the end: from the joynts likewiſe riſe long ſtalkes, with two or three or more ſmall long hollow flowers at the ends of them, of the faſhion of Tobacco, or the white Iaſmin flowers with five points, and ſo much layd open as the other Bell flowers, being of a bright red colour, and plaited like the Bell flowers, with five chives or threads in the middle, tipt with ſo many pendents which turne into long pointed pods, containing long and blacke ſeede, taſting hot like Pepper: the roote is ſmall and ſtringie periſhing every yeare: the leaves taſte a little ſweete and mutous, and yeeldeth a thinne pale milke, when it is broken.

The Place and Time.

All theſe are ſtrangers, the two firſt are thought to come out of the Eaſt Indies or the Eaſt Countrey townes, the reſt are ſpecified in their titles from whence they came. They all flower late, and therefore we can ſeldome get ripe ſeede from any of them.

The Names.

The firſt is taken by moſt, to be the *Nil* of *Avicen* and *Serapio*, which they call *genuinum Nil*, and *Habad*: for there is another *Nil* or rather *Nin*, becauſe of the blue colour, which is the *Anil* or *Indico* of *Dioſcorides* our times, which ſhall be ſpoken of in his place, it is called by ſome *Flos Noctis*, becauſe his chiefeſt beauty is in the evening, night, and morning; others call it *Convolvulus ſcandens & cæruleus*, as they call the ſecond *minor & purpureocæruleus*: the third and fourth have their names in their titles, as much as can be ſpoyl of them: the laſt is called *Dyanechlit* by the Indians, and *Iaſminum folio Millefolii* by *Caſalpinus*, who was the firſt author that wrote of it, *Camerarius* next unto him in *Horto Medico* ſaith, it may not unfitly be called *Convolvulus millefolius*: and *Fabius Columna* ſaith it cannot be more fitly referred to any tribe, or family of plants, than unto the *Convolvuli*, and therefore calleth it himſelfe *Convolvulus pennatus exoticus ruber*: he that ſet forth *Clusius his Curæ Poſteriores*, referreth it to the *Iaſmines*, calleth it *Iaſminum Americanum*, and ſo doth *Bauhinus* alſo: for in the flowers onely is the likeneſſe of the *Iaſmine*, and in no other part of the plant, or manner of growing, all *Iaſmines* being woodie and *perennes plantæ*, and this as the other *Convolvuli* herbacous & annuall: ſome have taken it to be the *Liguſtrum nigrum*, that *Columella* ſpeaketh of, but with little judgement in mine opinion: the Italians call the firſt and ſecond, *Campana Indorum*, that is, *Campanæ ſcandes*, the Arabians in *Syria* and *Ægypt Hadeg*.

The Vertues.

The ſeede of the firſt and the ſecond alſo (for they are *congeneres*) doe purge very ſtrongly, but ſlowly: often times with great trouble to the ſtomacke, cauſing vomitings, yet it avoydeth raw undigeſted flegme, & melancholy humors, from thoſe that can endure it, and killeth the long flat wormes of the belly.

CHAP. X.

Convolvuli ſive Volubiles minores. The ſmaller Bindweedes.

THe leſſer ſorts of Bindeweedes remaine to be intreated of in this Chapter, whereof there are many and ſundry varieties, all of them having a purging quality, more or leſſe, as you ſhall preſently heare in this Chapter.

1. *Convolvulus Altheæ folio.* Mallow leafed Bindeweede.

This ſmall Bindeweede groweth not high, nor climeth much upon any thing, but for the moſt part, lyeth with his ſmall ſlender hayrie branches upon the ground, having diverſe leaves very thinnely or ſparingly ſet on them; ſomewhat broade and long, like unto the leaves of Marſh Mallowes, but ſmaller, crumpled and cut in on both ſides at the lower ends, deinted about the edges, and of an hoarie or duſky grayish green colour, clammye or ſticking like gumme to the teeth, ſharpe and ſomewhat bitter in taſte, when they are chewed in the mouth: the flowers come forth one by one, at the joynts with the leaves, all along the ſtalke up to the top, every one upon a long ſtalk, which are very like the ſmall wild Bindweede, that groweth upon the ground, conſiſting of one whole leafe yet plaited, as it were before the opening into five plaites, and being open have ſo many, as if it had five leaves, broad like a cup or Bell at the brims, and ſmall at the bottome, of a fine delayed purple colour ſometimes, and ſometimes deeper: the roote is ſmall and browniſh, creeping under ground, and ſhooting up heads in other places.

2. *Convolvulus minor albus Vulgaris.* The common ſmall Bindweede.

The common ſmall Bindweed that groweth every where in fields by the wayes and hedge ſides, ſometimes climbing up and windeth it ſelfe, but uſually ſpreadeth on the ground, with long trailing and winding branches, one within another, and leaves ſet thereon ſomewhat like unto the greater white Bindeweede, but much leſſer, the flowers is for forme like the other white Bell flower either wholly white or the plaites purpliſh but leſſe, made of one leafe plaited as it were into five ſoulders, and opening wide at the brims, after which come ſmall blackiſh ſeede in ſmall long and round heades: the roote is ſmall and ſlender, running both very deepe downe into the ground

and spreading farre abroad likewise, especially if it get into garden mellow grounds.

3. *Convolvulus spicæ folius.* Lavender leafed Bindeweede.

This small bindeweede is as great a plague to the fields, where it naturally groweth as the last: the leaves are long and narrow, resembling Lavender, and the flowers of a deepe purple colour, wherein it differeth from others, for else it is like the last.

4. *Convolvulus minor flore luteo.* Mellow leafed Bindweede.

2. *Convolvulus minor flore vulgaris.* Common small Bindweede.

4. *Convolvulus minor purpureus.* Small purple Bindeweede.

This Bindweede is in all things like the second, saving that the flowers are either of a pale purplish, or bluish colour, the foulds being white or of a deeper purple, without and white within, and the bottome so likewise, which is of much beauty.

5. *Convolvulus minor Africanus.* The small African Bindeweede.

There is small difference in this from the former for the manner of growing, the leaves onely make the variety, which are not divided at the bottome, but whole, and the flowers purple, but bell fashion like the rest.

6. *Convolvulus Africanus minimus.* The least African Bindeweede.

This sort creepeth not as the former, but standeth a little upright, or leaneth somewhat downe upon the ground, like the next Spanish kinde, the smalnesse beeth of leaves and flowers from the last maketh it noted to bee a severall species.

7. *Convolvulus minor Hispanicus cæruleus.* The blue Spanish Bindeweede.

This *Spanish* kinde shooteth forth sundry small branches three foote long or more, from the small threddie roote which dyeth every yeare, having sundry leaves set singly thereon, small and long at the bottome, and broader, and almost round at the end, somewhat hayrie as it were all over: at every leafe for the most part, from the middle of the stalkes upwards, commeth forth a flower like unto the common sort, folded into five plaites, which open into so many corners, of a most excellent faire skie coloured blue (so pleasant to behold, that it amayeth the spectators) with white bottomes pointed upwards and yellow in the middle, which turne into small round white heads, containing within them small blackish cornered seede to be new sowen every yeare.

8. *Convolvulus minor Asteriscis folis.* Blacke Bindeweede.

If this small Bindeweede meeteth not with hearbes or other things whereon to clime, it riseth up but a little, and leaneth downe againe unto the ground, otherwise meeting with fit things, it will winde with his long slender reddish threddie branches about them to the height of three or foure foote or more, bearing his leaves singly at the joynts, as the others doe, rather somewhat like unto the leafe of an Artiche, or round like unto the wilde black Bryony leafe of such forts there are, but much smaller: the flowers are very small and many standing together along a small long stalke, that commeth from the joynt, where the leafe standeth, and are of a reddish greene colour, but so small that they are sometimes not heeded, and so quickely fadeth that they are lesse regarded: after which come small blackish three cornered seede: the roote is small and slender, perishing every yeare, and

Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

3. *Convolvulus spinosus foliis.* Lauender leafed Bindweede.

rising of the fallen feede every spring, unlesse it be continually weeded out of the garden.

9. *Helxine Cissampelos prima Cretica.* Branched blacke Bindeweede of Candy.

The stalke hereof is much branched, and the branches also much diuided, having two small leaues at euery ioynt, hoarie, and hairy very like unto Mouseare, the vpper leaues being smaller, and the flowers large, of a pale blew colour, spread open like the small Bindeweede: the seede that followeth is blackish browne, one in a little round head, the roote is very threddie and bushing, yet perisheth yearely.

4. C. 2. *Convolvulus minor purpureus, Caruleus Hispanicus & Africanus minimus.* Purple and Spanish blew Bindweede and the least *African*.

2. *Convolvulus minor Asiaticus folio.* Blacke Binde-
3. *Africanus minor.* The small African Bindeweede.
4. *Major Arabicus sive Ægyptius.* The Arabian or Egyptian Bindeweede. *folio 170.*

10. *Cissampelos altera Anglica minima.* Small blackē Bindeweede.

This onely in the smallnesse, rising not above a hand breadth high, differeth from the common blackē Bindeweede.

The Place.

The 8. *Clusius* saith he found in many places of Spaine: the second, third, and fourth, grow in sundry Countries

of this Land: the 4th and 5th were found by Doctor *Butler*, I often remembred both in my former and this worke) in *Barbary* and brought roots: the 7th was also found by him in *Spaine* and *Portugall*: the eight in many Countries of this Land, both in fields and elsewhere, and will bee also found as a weede in gardens, to be pulled out: the ninth in *Candy*, and the last groweth about *Perpignan* neere *Perpignan*.

The Time.

They flower in summer, yet some later than others of their kinde.

The Names.

They are called *Convolvuli & Volubiles*, *quasi* they are continually turning or winding, because *Pliny* calleth the first *Convolvulus arbori folio*, not knowing to what plant of the ancients it might be referred, unlesse it might be the *Tapsos* of *Pliny*, where he maketh mention in the 25. *Chap.* of the 21. *Booke*, for much sutlooke this plant, calling it *Caprea* or *Caprina*, but his corrector hath amended it: *Theophrast* is called *Convolvulus* & *Volubilis* most by most writers, yet some *Smilax* such more as *Dioscorides* and *Plinie* call *Cissampelos* as *Apuleius* & some others, and is taken to be the *Tamnos* or *Bryonia* of *Pliny*: the third is brought by *Caspar Hermanus* to be *Convolvulus Peruvianus*, and *Clusius* saith the same for the wife of *Carolus* called *Scammonea Peruviana*, of *Garcilasso* and *Hernandez*, *Bejuco*, of *Tabernamontanus* *Stramonium mordax*, and of *Lobel* as it is in the title: the fourth, fift, sixt, and seaventh, the other title, is their torchendes as much as is necessary to be layd of them: the eight is thought of many to be the *Helxine* of *Dioscorides*, which was called also *Cissampelos*, in Greeke *ἡ ἐπὶ τοῖς ἀμπέλοις ἕλικι ἐπιφυομένη*, *Helix* in Latine *Hedera Vitea*, because this *Helxine* should be knowne to differ from *Parietaria*, called *Helxine* also, this most commonly growing in Vineyards, creeping upon the Vines, with leafe like Ivie: *Pomponius* in *Gyecorum* calleth it *Chalcocissos*, *quasi* *Aerea hedera*: *Lobel* calleth it *Cissampelos alterius descriptionis effigie*: *Dodonæus* calleth it *Helxine Cissampelos & Convolvulus niger*: *Tragus* calleth it to be *Periclymenon* of *Theophrastus*, which *Gaza* translateth *Perycaptes* of *Theophrastus* in *Harengus silva*, *Bubbalis media*, *Periclymenos* *Clusius* in *Dioscoridem* taketh it to be *Elatine*, *Amydlare* to bee *Convolvulus Plinii*, and *Fabius Columna* calleth it *Polygonum Hederaceum*: the ninth is so called by *Pona* in his *Italian Balsus*, as it is in the title: the last hath not been taken of by any before.

The Nature.

They are all of the nature of the other small Bindweedes no doubt, which is to move the belly: yet *Cissus* saith the leafe is used in Portugall, as an herbe of singular effect to heale all sores or wounds: *Cissampelos* is said likewise to purge the body strongly, if either the juyce, or the leaves and herbe in powder, be drunke in wine or other drinke. The leaves being broiled and layd in hard tumors or knots in the flesh, dissolveth and consumeth the same.

CHAP. XI.

Smilax aspera. Prickly Bindweede.

THere are two sorts of this Bindweede, differing very notably both in leafe and fruite, as you shall heare by and by: but there is another plant referred unto them, which is the *Sarsaparilla*, that is brought from the West Indies, which I must adjoyne, and speake of it also here.

1. *Smilax aspera foetida rubra*. Prickly Bindweede with red berries.

This Bindweede groweth up with many branches, wherewith it windeth about trees and other things, set with many crooked prickes or thornes like a bramble, all the whole length, bending this way and that, in a seemely proportion; for at every joynt it bendeth or bowes it selfe, first one way and then another, having some what a broad and long leafe thereat, standing upon a long foote stalke, and is broad at the bottome, with two forked round ends, and then groweth narrower unto the point: the middle ribbe on the backeside of most of them, having many small thornes or prickes, and also about the edges: the lowest being the largest and growing smaller up to the toppe. Smooth and of a faire greene colour, and sometime sported with white spots, at the joynts with the leaves also, come forth clasping tendrels, like as the Vine hath, whereby it windeth it selfe: the flowers stand at the toppes of the branches, at three or foure joynts, many breaking forth together in a clothe, which are white, compoted of five leaves a peece, starre fashion and sweete in smell, after which come the fruits, which are red berryes when they are ripe, of the bignesse of a *Spanish* berryes or small Grapes, and in some taller, wherein are conceived sometime two or three hard blacke stones, like also unto those of *Asparagus*: the roote is slender white and long, in hard dry grounds not spreading farre, but in the looser and moister places running downe into the ground a pretty way, with diverse knots and joynts thereat, and sundry long rootes arising from thence.

2. *Smilax aspera fructu nigro*. Prickly Bindweede with blacke berryes.

This other prickly Bindweede, is like the former for the manner of growing in all points, his branches being joyned in like manner, with leaves and tendrels, but nothing so many, climing as the former: the leaves are somewhat like it, but not so sharpe, but smoother: stalkes as the former: of every leafe like it, but all wholly round and broad at the bottome, of a darker greene colour also, and without any or very fewe thornes or prickes, either on the stalke or edges of the leaves, with tendrels like a Vine also: the flowers come forth in the same manner, and are starre fashion, consisting of five leaves a peece like the other, but they are not white as they are, but of an incarnate or blush colour, with a round red umbone in the middle of every one, which is the beginning of the berry, the which (it being ripe) will be blacke and pozed, being more loppie or fleshie than the other, with stones as it seemeth rather than like Grapes: the roots here of are bigger and taller than the former for the most part, and spreading farther abroad in the ground.

3. *Smilax aspera Peruviana*. Sarsparilla of America.

The Sarsaparilla that commeth from *America* into *Spaine*, and from thence into other Countries, hath diverse forme both, as on the whole plant as it hath beene brought from *Spaine* to the Duke of *Florence*, from *Clusius* his Physician, being by us at Venice, was in all things it did resemble the prickely Bindweede, and differed in nothing

Smilax aspera Germanica sive Pseudochina.
French, Esquine bastarde, ou Salsepareille de Boheme.

Smilax aspera Germanica sive Pseudochina.
With kidney Sarsaparilla.

Smilax aspera Hispanica. The berries with red spots of the true Sarsaparilla were wanting.

resting vpon it. *Matthiolus* setteth downe this relation in his Commentaries, in the 144. chapter of his first booke of *Dioscorides*, speaking of *Sarsaparilla*, what plant it should be, and agreeth with *Clusius*, that the *Smilax aspera* (with red berries, for so now speaking of the other he declareth that he knew it not) was the true *Sarsa*, which both *Clusius* and others likewise had proved by many trials, to be as effectuall to cure the French disease, in the Surfeit of the Indies, *propter Aliquam* likewise in his booke of *Egyptian* plants, declareth that he found in the Island *Zacynthus*, the roots of *Smilax aspera*, whose leaves be setteth forth to bee without prickles, growing by a running river side, to be greater larger and fuller of substance, then ever he had seene them, in any other place in *Italy* before; and being so like the true *Sarsa* of the Indies, that he was fully perswaded the *Sarsaparilla* that commeth from *Peru*, was the roots of *Smilax aspera*, the difference betweene them, in greatnesse or goodnesse, if any be, to be onely in the climate and soyle, and such that an Apothecary in that Ile, had gotten much money thereby, both by his owne practise, and the sale of them to others for *Sarsa*: and furthermore that he saw himselfe, in some bundles of the Indian *Sarsa*, some of the roots, that had the knots them, as the *Smilax aspera* hath, and some leaves thereon also like it, which any sclfe have sometimes seene them likewise. *Gabriel Fallopius* likewise in the booke that he wrote of the cure of the French disease, in the chapter of *Sarsaparilla* saith thus; I was perswaded saith he, and stood in that opinion a long time, that the *Sarsaparilla*, was the roote of *Ebulus* or Wall worte, vntill a Spaniard that brought the whole plant into the Duke of *Florence*, made my errour knowne unto my selfe, for I saw it to be the roote of that *Smilax aspera*, that *Dioscorides* and other the ancients make mention of in their writings: and was better confirmed in my opinion by the experience I had thereof, in curing diverse about *Pisa* as perfectly of the French disease, by the meanes of this *Smilax aspera*, which I caused to bee digged up for my vse, growing on the hill of *S. Julian*, as with the roots of *Sarsaparilla* for two yeares while I stayed there to practise Physicke, which opinion also *Amatus Lusitanus*, a Physician of good note, although a Jew, confirmeth in the 111. booke of his Centuries. *Mizaldus* doth weth another note of difference, in the rootes of *Smilax aspera*, whereas many in his time stumbled, for they saw the roote of *Smilax aspera* growing in *Italy*, to be short and full of knots, with small fibres at the end, and the roots of the other to be long and smooth without any knots: to enforme you therefore throughly herein, and take away this doubt; he sheweth that the full roots of *Smilax aspera*, are downe right fibres, and hard

Original from UNIVERSITY OF MICHIGAN

joynts or knots, from which joynts or knots, shoote other roores or strings, which in dry grounds, are but small and short fibres, and in the more moyst and mellow, are greater and longer, without any joynt at all in them, (as it is to be seene in the roores of many other plants, whose roores have many strings) and that these roores are they, which are like the *Sarsaparilla*, and not the first, which are short and full of joynts: and that the smaller be of the roores of *Smilax aspera*, growing in *Italy*, or other dryer Countries, doth (rather) impute to the climate and soyle, rather than any thing else: by this narration you may perceive the judgement of the elder times, and likewise their practise to use *Smilax aspera* instead of *Sarsaparilla*, for the diseases whereunto *Sarsaparilla* is proper: but I verily believe that the plant of *Sarsaparilla*, that groweth in *Peru*, and the West Indies, is a peculiar kind of it selfe, differing from the *Smilax aspera*, as nerably as the *Herba mea* from our *Bryony*: and may very well be that plant that *Simon de Tovar*, chiefe Physitian of Seville in *Spaine*, sowed the seedes of, and had it growing with him: and of the seed that he sent to *Clusius* under the name of *Convolvulus peruvianus*, did one plant likewise spring for a yeare with *Honorius Lopez*, in the low Countries, to whom *Clusius* had imparted some of *Tovars* seede, but perished at the first approach of winter: the defect whereof both *Tovar* and *Clusius*, in their manner of growing, are set forth by *Clusius*, in the second booke and 28. chapter of his *Exotickes* or strang things, which I thinke not amisse here to relate unto you, yet contracted somewhat, lest it should bee too tedious to set them downe both particularly: Having put the seede into the ground, the first two leaves that spring (say *Tovar* and *Clusius*) were very like the first two leaves of *Campanula Indica*, the blue Bindweede (and such like wise doth the seede of *Alchekengi* yeeld, at the first springing forth *Tovar*) the roote afterward (saith *Tovar*) shot forth many branches, which wound themselves very much about the poales that were set for them to climbe on: like unto *Smilax aspera*, having such like leaves also, but greater and softer: the branches had crooked thornes or prickes, growing on them likewise as the *Smilax aspera* hath, but fewer and nothing so sharpe: that of *Honorius Lopez* saith *Clusius*, sprung up with many branches, winding it selfe also about the poales, that were thrust into the ground by them: having some tender prickes like thornes growing on them, especially at the joynts, which were (saith he) nothing but the soft sprouting of roores, which no doubt would have taken hold of the ground, if earth had come put unto them: it had very greene leaves (saith *Clusius*) like unto Bindweede, but longer, and cornered like Ivie leaves, ending in a long point, like to the leaves of *Smilax aspera*: the flowres (saith *Tovar*) were great and white, every one as bigge as a middle sized dish, which opening in the morning did fade at night: from whence the Spaniards called the plant *Buenas noches*, that is, good night: the plant of *Honorius Lopez* (saith *Clusius*) brought forth buddes for flowres, but could not bring them to perfection, the cruell frosts destroying the whole plant: *Clusius* (saith that he had a small branch with three heades of seed thereon, whose figure I here give you) the largest that ever he saw in that kinde, for it had five leaves a peece, every one almost an inch broad and long, which seemed to be the cup of the flower and fruite, every head which was three square and roundle, had within it three round seedes, as bigge as great peale, of a smoakie or brownish colour. The report of Master White a Painter, unto Master *Gerarde*, as before-time is downe in the chapter of *Sarsaparilla*, is to this purpose, that it is the roote of a shrube or hedge tree, like unto Hawthorne trees with leaves like vyne, the comparison unto Hawthorne is rude, according to his skill, but it seemeth the branches are soft and pyrill not, there spreading very much the leaves are before resembled: but flowres or fruite he remembred not. These descriptions doe seeme unto me, (although no mention of roote be expressed in the relation) very probably to set forth the growing of *Sarsaparilla*, whereof no doubt *Simon de Tovar*, if he had lived longer, had given *Clusius* better information: *Ramusius* in his *Peruu*, maketh it a third sperie of *Smilax aspera*, calling it *tertia Smilax aspera Indiæ Occidentalis*: time no doubt will declare the truth hereof more plainely, yet it might be hastened, if there were in any eminent person, any such ingenuity of spirit, as to seeke such things diligently to be searched out, and brought home: and many such there are in *Italy*, as at *Florence*, *Rome*, *Venice*, *Padua*, and many other places, that have their gardens floored with all the rarest plants they can heare of, and brought thither: and then if such diligence and experience had the ordering of them, after they were brought, they might make them famous that procured them, and be the meanes of a great deale of knowledge to ensue, for the true declaration of such things, as are either doubtfull or hidden in the course of Physicke.

The Place.

The two first grow in *Italy*, *Spaine*, and other the warmer Countries, whether the continent or Iles, throughout *Europe* and *Asia*: but the third is found onely in the West *Indies*, the best commeth (as it is layd) from the *Honduras*, others not so good from other places there, as the fertility or barrennesse of the ground, and the temperature of the climate, affordeth occasion thereof.

The Time.

In the hotter Countries these flower, and bring forth their berries timely enough in the yeare, but in these colder Countries, without convenient meanes to keepe them in the winter, the frosts will soone confume them.

The Names.

The word *Smilax* is diversly taken and much doubtfull amongst writers, it is taken for two sorts of trees, as like as the nature of two sorts of herbes. *Theophrastus* maketh mention of one of the trees, in the 3. booke and 18. chapter of his historie, calling it *Smilax arborea*, the Oake, which is like unto an *Ilex* or Holly Oake. The other *Smilax* or *Smilax arborea* sett simply, is called in Latine *Taxus*, the Yew tree, the berbes, are both the best expressed, as well as Dioscorides more gentle sort, which is the common Rindeweede, this the Greekes call *Smilax aspera*, as they call the other *Smilax laevis prædicta*, and the other the Greekes call *Smilax laevigata*, which is *Bryonia* or *Physalys*, the French or Kidney Beane, as shall be layd in their seuerall places. That *Smilax aspera* is called also *Caprea* in the Italian booke of simples is plaine, *Matthiolus* calls the smallage of *Theophrastus*, lorte presseth it. *Hadrianus Junius* following *Pliny*, is his mind, &c. is that the herbe called *Smilax* which is like unto Ivye, and runs but out of *Cadmia*, but is more frequent in Gardens, hath fewer branches, &c. *Turner* also calleth it *Asparagus* &c. *Taxus* or is called some sort of all *Smilax aspera*, onely *Lonicerus* calleth it *Pulsatilla aspera*, and *Clusius* as I thinke first of all distinguished it as the Greekes, calling the one *vitalba fructu*, and the other *aspera*, *asper*, as they might as well be distinguished by their leaves, the one beeryed as I take it having thorne leaves, and the other smooth

Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

smooth and without thornes or prickles, yet *Gerarde* figures have both of them prickles on the leaves, calling the one *Lusitanica* and the other *Saxonica*, whereas it is but one and the same plant, growing in severall Countries: *Tragus* seemeth to bee doubtfull of *Smilacis hirs. Smilax aspera*, thinking *Lupulus* the Hoppe to bee *Label* calleth them with blacke berryes *Smilax aspera altera seu Sarsaparilla nostratibus*. And it is very likely to be that kinde that *Alpinus* saith, he found with so large and great rootes, as is before expressed, and otherwise much commended to be used instead of *Sarsaparilla*. The *Sarsaparilla* or *Salsaparilla* it selfe, is a Spanish word which the Spaniards imposed upon this, when they first saw it in the West Indies, because they judged them to be both one thing, that is *Smilax aspera*: for so they call it in their language *Zarza*, or as some write it *Zarca*, signifying *Rubus* a Bramble, and *Parilla virgula*, the diminitive of *Vitis*, a Vine, as if one should say a small Vine like Bramble, and so *Garcias ab Horto Lusitanus* saith, the name the Indians call it by, doth signifie as much. Some call it *Salsaparilla*, and some *Smilax Peruana*. *Matthiolus* giveth us a figure of *Sarsaparilla*, neither branches nor leaves having any thorne or prickles at all upon them, which as he saith he received from *Cyprus*; and hath a knot or head, from whence the long smooth roots should spring, such as is in the true *Sarsaparilla*, which I have before I have often seene my selfe in diverse bundles thereof: but attiredly there are diverse sorts of *Sarsaparilla*, the best being very large & full, with a white pith in the middle, which will rend or flive in the middle very easily, and this most commonly is brought without head or knot, but with a number of fibres on all sides thereof, which must be taken away before it can be tied, another sort is not so full and great, yet tendeth or cleaveth readily, and is the most spent, because the most store thereof is brought: the third is a hungry sort, and is of no request and use, this being usually brought with the heads or knots, to be seene from whence the rootes spring, I say usually, for sometimes you may finde a head or two among the middle sort.

The Vertues.

This prickly Bindweede saith *Galen* if the leaves be tilled they have some sharpenesse in them, and heate any way they heate. *Dioscorides* saith that both leaves and berryes being drunke before or after any deadly poyson taken, are a remedy there against, serving to expell it. It is sayd also farther he, that if to a new borne child some of the juyce of the berryes hereof be given, it shall not be hurt by poyson ever after: It is given as an antidote against all sorts of poysonous or venemous things. Ha dozen or fourteene of the berryes being beaten to powder, bee given in wine, it procureth Urine when it is stopped. The distilled water of the flowers being drunke, worketh the same effect, and cleanseth the raines, and allayeth inward inflammations. If the eyes be washed therewith, it taketh away all heate and redneste in them, and if the sores of the legges be washed therewith, it healeth them throughly. The rootes as you have heard before, are used by diverse learned and reverend men in stead of *Sarsaparilla* with as good successe, as if they had used the true: for *Sarsaparilla* doth not purge the body of humours manifestly as other purgers doe, being generally held not to heate, but rather to dry the body: yet it is well perceived that it spendeth the humors by a secret and hidden property therein, whether by purging, wasting & consuming them: which worke is performed by sweating which it provoketh notably: it remedieth now adayes in many kinds of diseases, namely in all cold fluxes from the head & braine, rhumes and catarhes, so all cold griefs of the stomach, and expelleth winde very plentifully, both from the stomache and mother: it helpeth not onely the french disease but all manner of aches in the sinewes and joynts, all running sores in the legs, flegmaticke swellings, scabbes, or ring worme, and all manner of spots and foulenesse of the skin: it is not convenient to be given to those whose livers are over hot, nor to such as have agues. The manner of using it is diversely according to mens severall opinions, for in former times it was used beaten to powder and so drunke: others use to boyle it so long until it became tender, which being beaten or broken, was afterward strayned into the broth, making a kind of thicke drinke like a creame. Some againe and that as it usually boyled it in water, wine, halfe, or to the consumption of the third part, as they would have it stronger or weaker, and that either by it selfe, or with other things meete for the disease as aforesayd, others also put it among other things into their beere or ale new tunned up, to drinke after it hath stood three or foure dayes for Physicke drinke, for remedy of those griefes, it is conducible as aforesayd.

CHAP. XII.

Lupulus sive Lupus salitarius. Hoppes.

THe Hoppe is found to be of two sorts, one manured for the use and profit of the coppe herds, the other wilde growing in hedges, and other such like places of it owne accord, and was made so by ordering and manuring brought to be larger in every respect, and more fruitfull for use, than the manured is: I thinke it not amisse to speake of them both in this place, being so neere to the forme and quality the one unto the other, and not to separate them, or trouble two places with them.

1. *Lupulus sativus.* The manured Hoppe.

The manured Hoppe riseth up at the first, with diverse great browne heades, like unto *Asparagus* but very thicke, which afterwards spreading into rough branches, climbe upon great high poles, that are set for them to runne on, having many hard and rough darke greene leaves on them, cut into three or five divisions, somewhat like to Bramble leaves, and dented also about the edges: at the toppes of the branches, which hang downe, against the moist part come forth many scaly heads, being as it were a number of small yellowish, greene leaves, growing thicke together: from among which come forth the flowers, of a whitish yellow colour, which being past, the heads changing their colour, turne somewhat whitish yellow, they are to then to be gathered & kept: for then there is a small round seede found therein: the roote is great at the head, shooting forth many long strings, taking fast hold of the ground.

2. *Lupulus sylvestris.* The wilde Hoppe.

The wilde Hoppe groweth up in the same manner, ramping upon trees or hedges, as standeth next unto them with rough branches and leaves like the former: this giveth both smaller heades, and in lesse store seede then the manured doth, yea many times, there is scarce a head or two seene in a yeare upon diverse, and herein differeth the chiefe difference.

Lupulus sativus. Hoppes.

The Place.

These plants are more frequent in these colder, than in the hotter countries, which foreseeth the goodnesse of God unto us, to provide for every Country, such things as are fit for the sustentation of life; for where Vines grow not, and the water too cold and raw, to drinke simply of it selfe, there are these Hoppes chiefely bred to make drinke to serve instead of wine or water. They delight chiefly, or rather onely to grow well, in low moist grounds, where they may have moysture enough, and yet not too much, for therefore where they are planted on hillocks, as it were, there are trenches made to receive any great quantity of water, and bee conveyed away, that the plants stand not drowned therein.

The Time.

These spring not up untill *Aprill*, and flower not untill the latter end of *June*, the heads are not gathered, untill the middle or end of *September*.

The Names.

It is observed and much wondred at, by our ordinary writers, that this plant should not be remembred by *Dioscorides*, *Galen*, or any other of the ancient Greeke or Latine writers except *Pliny*, who doth but onely name it and number it among those herbes that grow of themselves, and that are used for meate with diverse nations, calling it *Lupulus salictarius*. The *Arabians* have not onely remembred it, but commended the use of it highly for many diseases, as you shall heare by and by. *Mesues* maketh it his third kind of *Volubilis* with rough leaves, among his purging plants: the Greekes at this day call it ἄγριον ἀμπέλι, *Agrion* and *Agrioni* it is likely for the forme of the leaves and running of the branches. It is called *Lupulus* & *Lupus salictarius*, & *repulus equus salix* & *serpat per arbores*, *vel quia scandit salices*) of all our moderne writers, onely *Lobel* calleth it *Vitis septentrionalium*, the Vine of the Northerne regions, and *Tragus* as I layd before thinking it to be *Smilax aspera*: the *Italians* call it *Lupolo*: the *Spaniards Hombrecillos*, the *French Houblon*, the *Germaines Hopffen*, the *Dutch Hoppe*, and we in *English Hoppes*.

The Vertues.

The first buds of the Hoppes, being layd a while in sand, maketh them the tenderer, and being boyled are used to be eaten, after the same manner that the buds of *Asparagus* are, and with as great delight for the taste, yet they have little nourishment in them: their Physicall operation therefore is to open the obstructions of the Liver and Spleene, to clense the blood, to loosen the belly, and to clense the Raines from gravell, and to cause them to make water in whom it is stayed: the decoction of the toppes of the Hoppes, of the raine as well as of the wilde, and so also the roots doe worke the same effects, but that they are somewhat hotter than the young buds, which have more moysture in them: in clensing the blood, they helpe to cure the French disease, and all manner of scabbes, itch, and other breakings out in the body, as also all tetters, ringwormes and spreading sores, the morphew like wise and all discolourings of the skin, and are used in Agues: the decoction of the flowers and tops, are used to be drunke to helpe and expell poyson that any one hath drunk: halfe a dram of the seede in powder taken in drinke, killeth the wormes in the body, it likewise bringeth down womens courses, & expelleth Urine. The flowers and heads, being put into bathes for women to sit in, take away the swellings and hardnesse of the Mother, and is good for the Strangurie, or those that very hardly make their water; the juyce of the leaves dropped into the eares, clenseth the corrupt sores, and the pech arising from the corruption in them; *Mesues* saith they purge choler, but worke more effectually, being steeped in whey of goates milke: A Syrupe made of the juyce and sugar, cureth those that have the yellow jaundise, easeth the headach that cometh of heate, and tempereth the heate both of the liver and stomack, and is very profitably given in long & hot agues, that rise of choler and blood: Those bakers that will use the decoction of Hoppes, to mould up their bread, that make thereby their bread to rise better, and be baked the sooner. *Dioscorides* reciteth the manner of a medecine used in *Spaine* by women leeches, to cure the falling of the matrix, called by the French disease in this sort. A pound of the roots of Hoppes, well washed & boyled in 8 pints of fayre water, to the consumption of the third part, or a helfe if they see cause, whereof they give half a pint to drinke in a morning, adding thereto two ounces well dryed into the decoction they put fourtimes, two or three roots of parsly, and a quantity of coriander seede, with a few Raysins of the sunne. The Ale which in the Netherlands were accustomed onely to drinke, is become a meere drinke of thicker drinke than heere I called a stranger to say of it, *Nil longius dum bibitur, nil fortius cum semel potum, nil difficilius multis locis in venere relinquitur*, that is there is no drinke thicker that is drunke, nor stronger when it is made from it, it must needes be therefore that it leaveth much behinde it in the belly, whereof almost come lets off to be made, the use of Hoppes to be put therein, altering the quality thereof, to be made more wholesome, or rather physicall, to preserve the body from the repletion of grosse humors, which the Ale ingendred. The wilde Hoppes are generally used Physically more than the manured, either because the Wilde is thought to be the more opening, and effectuall, or more easily to come by, or that the owners of the manured will not spare, or lose so much profit, as that which would be taken away might yeild; yet allowedly they are both of one property, take which you will, or can get.

Chap.

CHAP. XIII.

Bryonia sive Vitis sylvestris. Bryonie or Wilde Vine.

VNder the title of Bryonye I muſt comprehend diverſe and ſundry plants, ſome whereof are of our Land, and found plentifully therein: others are ſtrangers comming from other parts: Among which I muſt remember the *Abronicon* of *America*, a plant neereſt reſembling the white Bryonie, as you ſhall heere when we come to it, and ſome others alſo that are ſtrangers of thoſe parts.

1. *Bryonia vulgaris ſive Vitis alba.* The common white Bryonie or wild Vine.

The white Bryonie or wild Vine that groweth commonly abroad, ramping up on the hedges, ſendeth forth many long rough, very tender branches at the beginning, growing with many very rough broad leaves thereon, cut into five partitions for the moſt part, in forme very like a Vine leafe, but ſmaller, rougher, and of a whitiſh or hoarie greene colour, ſpreading very farre upon trees or bushes, or whatſoever ſtandeth next it, and twiſting with his ſmall claſpers, that come forth at the joynts with the leaves: at the ſeverall joynts alſo with the leaves and claſpers come forth, (eſpecially towards the toppes of the branches) a long ſtalke, bearing thereon many whitiſh flowers together in a long tuft, conſiſting of five ſmall leaves apeece, layd open like a ſtar, after which come the berries, ſtanding more ſeperate one from another then a cluſter of grapes, greene at the firſt, and very red when they are through ripe, of the bigneſſe of Nightſhade berries, of no good ſent, but of a moſt loathſome taſte provoking vomit: the roote groweth to be exceeding greate, with many long twines of branches growing from it, of a pale whitiſh colour on the outſide, and more white within, and of a ſharpe but loathſome taſte.

2. *Bryonia alba vulgaris fructu nigro.* Common white Bryonie with blacke berries.

This Bryonie differeth from the former white kinde, neither in the running rough branches, or in the leaves, or in any other thing from it, but in theſe two particulars: the berries hereof are blacke and not red, when they are through ripe, and the roote is of a pale yellow colour on the inſide, and ſomewhat brownish on the outſide.

3. *Bryonia Cretica duplicata.* Candie white Bryonie with double berries.

The white Bryonie of Candy, ſhooteth forth many long rough trayling branches, in the ſame manner like the former in all reſpects, with claſping tendrells winding it ſelfe upon any thing as the other doth; bearing like leaves with ſuch divitions therein, as it hath; but that they are ſomewhat ſmaller, greener, and ſtriped with white lines thorough the middle, as likewiſe in the veynes that goe to the corners: the flowers likewiſe are ſomewhat greater than the former, of a pale whitiſh colour, ſtanding every one upon a little longer roote ſtalke, which give berryes in their places, greene at the firſt, but red when they are ripe, and formed in a differing manner from the others; for ſtanding ſemicircular upon the ſtalkes, they are joyned at the bottome, as if it were

1. *Bryonia alba vulgaris.* White Bryonie.

2. *Bryonia ſylveſtris nigra.* Common blacke Bryonie.

Original from UNIVERSITY OF MICHIGAN

one cleere, but are parted at the toppes into two parts, wherein are conteined two seedes, from whence rose the name: the roote is very long, but neere growing to be bigger than a mans arme, of a browner colour on the outside, and not so white within as the common.

3. *Bryonia nigra Dioscoridis.* Blacke Bryonie with blacke fruite in clusters.

This blacke bryonie sendeth forth many long greene branches, whereon are set diverse broad leaves, somewhat long pointed and not deuided on the edges at all, of a fad or darke greene colour, having at the joynte with the leaves a spring tendrosle, whereby it windeth it selfe about whatsoever it meeteth with, towards the toppes come forth like wise long bunches of whitish mosse flowers, which afterward runne into berryes, greene at the first, and blacke when they be ripe: the roote is somewhat great and blackish on the outside, but of a yellowish colour on the inside, full of a clammie moyst humour or juyce, that will cleave to your fingers.

4. *Bryonia nigra baccifera.* Blacke bryonie with single red berries.

This kinde of Bryonie hath many long and square branches, more hard or woodly than the last, winding themselves about every thing that standeth next unto them, but both no clasters at all, the leaves are somewhat like unto the great white Bindeweede, of a shining colour, a little unevenly dented about the edges, and standing upon long foote stalkes: towards the toppes of the stalkes, at the joynts with the leaves, come forth white flowers, every one standing on a short stalke, which afterwards give single berries, greene at the first, and red when they are ripe, little lesse than Cherryes, wherein are conteined foure or five somewhat large round and blacke seedes: the roote is great thicke and long, somewhat like the last, and having such like clammie juyce within it as it hath.

5. *Bryonia nigra sylvestris, sive Syriaca Matthioli.* Common blacke Bryonie or our Ladies seales.

This kinde of Bryonie hath also long trayling branches, without any clasping tendrills, (in all places that I have seene) whereby it mingle fallen and winde it selfe, the leaves are somewhat broade and like unto the leaves of the rough or prickely Bindeweede, ending in a sharpe point: the flowers come forth at the joynes upon long stalkes, many clustering together, in long thinne or sparsed clusters, every one consisting of five small white leaves, and after they are fallen, there come in their places, small berries, red when they are ripe for the most part, or changing somewhat blackish, in some places by standing long: the roote is brownish on the outside, and white within, somewhat great if it grow in moyst grounds, but much smaller or whiter, in hard drye or stonie places, as *Daiechampius* thinketh of a little hot and sharpe taste.

7. *Bryonia alba Peruana sive Mechoacan.* The Mechoacan of Peru.

The *Mechoacan* of *Peru* that hath growen in these parts, sendeth forth divers darke grayish long branches, winding themselves about Poales that are set for them, or any other things that are next unto them, whereon doe grow faire broad leaves, pointed at the ends, very like in forme, unto the leaves of the last recited Ladies seale, but of a darke greene colour, thinner and harder in handling, seeming so dry as though they had no juyce in them: the flowers are many, standing in long clusters, yet every one bigger than any of the former, (of a fullen yellow colour in the Indies as *Monardus* saith, and as large as an Orenge flower, with an unbone in the middle, which afterwards becommeth the fruite, and being ripe is as big as an hasell nut, divided by a thin skinne in the middle, in each side whereof lye two blacke seedes of the bignesse of peafe) of a darke whitish colour in the warmer Countries of *Europe*, but not with us, yeelding berries and seede but not so large: the roote groweth to be as great as any Bryonie roote, being not bitter or loathsome to taste, as it is, but rather altogether without either taste or smell, having many circles in it, as may be discerned in the dry rootes, that come over to us, and may easily be brought into powder.

7. *Bryonia alba Peruana sive Mechoacan.*
The Mechoacan of Peru.

Mechoacan radix.
The roote of Mechoacan.

8. *Mechoacan sylvestris.* Wild Mechoacan.

This wild kind of Mechoacan is altogether like the other,

both

both in manner of growing, with branches, leaves, flowers and roots, but lesser in every particular, and the root (wherein is the chiefest difference) being sharpe and loathsome procuring vomiting and troubling the stomach when it is taken, as much as any ordinary Bryonie can doe.

9. *Mechoacan nigricans sive Ialapium.* Blacke Mechoacan or Ialap.

Although we have not seene this Ialap grow within us, or have heard it to grow in any theis parts of *Europe*, neither are assured that the plant thereof is of this family more than by conjecture, and sight of the dryed roote (brought into us as a Merchandise and a purging roote) being somewhat like in vertue and in forme unto smaller peeces of the former Mechoacan: yet I thought good to make mention of it in this place, among the rest of this kinde, both to let it be knowne to the world, and to excite some one or other to get the seede, or a greene roote, that by sight thereof growing fresh, we may know to what tribe or family it doth belong: it commeth to us in small thinne peeces, some greater some smaller, yet nothing so large as the greater, but rather as the smaller peeces of *Mechoacan*, of a brow with blacke colour, somewhat more solid, hard, compact, and grosse in substance, for out of it will rise a black gum, being layd on a quick or burning coale, but not flame to any thing (beeing dryed) and of no pleasant taste, but sticking a little in the teeth when it is chewed.

The Place.

The first groweth on bankes or under hedges throughout this whole Kingdome. The second groweth in the Countries of *Germany*, *Bohemia*, &c. where the former white doth not. The third groweth plentifully in *Candy*, from whence *Honorius Belluc* sent the seed thereof to *Clusius* and others. The fourth *Gerard* saith groweth in bushes and hedges, almost every where, but herein I am sure he is much mistaken, thinking that our ordinary blacke Bryonie is this of *Dioscorides*, for I have neither found it my selfe in any place, nor understood of any certainty from others, that they have found any with blacke berries and a blacke roote; and I finde some good authours doe doubt, whether the right be to be found or no. The fift *Bauhinus* saith was found in the woods of *Hannigen* a village in *Germany*. The sixt is found wild in many places of our owne Countrie as well as in Italy as *Matthiolus* saith, or in *France* and *Germanie* as *Lobel* saith. The seaventh as *Monardus* saith, groweth in the Province of *Mechoacan* 40 miles beyond *Mexico*, from whence it was first brought into *Spaine*: but after was both more plentifully, better conditioned and of more effect, was brought from the Iroise or maine land of *Nova Hispania* and *Quito*. The eight *Monardus* saith was brought from the promontory of *S. Helena*, which is on the Iland continent with *Nicaragua*. The last is likewise brought from a place in the *Indies*, called *Thelapa* or *Calapa*, from whence also it tooke the name.

The Time.

They doe all flower in the monthes of *July* and *August*, some earlyer or later than others, as their originall is from colder or warmer countries, and their seede (if they give any ripe with us) is perfect soone after.

The Names.

It is called in Greeke [illegible] *Vitis alba* & *Ithalba* & *alia non quod sit vitis sed quoniam folia* [illegible] *Bryonia altera forte quod sit pallida, exalbo, exalbo, quod in vere cum primum frondere & exoriri arq; late pullulare* is likewise called [illegible] *gelotinum quod exigue admodum cerae depingat ne exsiccet pallent*, in Latine of some *Vitis alba*, of others *Bryonia*, of *Apuleius Apostellum* & *Vva Taminia*, but of most *Vitis alba*, *Bryonia*, and *Bryonia alba*. The second is called *Bryonia nigra*, *Vitis nigra*, & *Vitis alba baccis nigris*, and onely distinguished from the first by the colour of the fruite and roote, for that it is but one kind, differing by the nature of the climate where it groweth. The third is called *Bryonia Dioscoridis* of *Honorius Belluc*, who as I said before, first sent it from *Candy*. *Bauhinus* calleth it *Bryonia Cretica maculata*. The fourth is called in Greeke [illegible] in Latine *Vitis nigra*, (*quod dicta ab atrore radicque nigris, & quod vitis similitudinem habet*) *Bryonia nigra* & *Vitis Ethiopica*, the true kinde of *Dioscorides*, whose tranches having tendrels, whole leaves being Ivye like, the berries and roote blacke, is knowne to very few. The fift is called by *Bauhinus* in his *prodromus Bryonia sil. baccifera*, in his *Pinax Bryonia laciniosa sive nigra baccifera*. The sixt is taken of most writers to be *Vitis nigra*, or *Bryonia nigra* of *Dioscorides*, as *Matthiolus*, *Anguillara*, *Lacuna*, *Gesner*, *Cæsar Dureanter*, *Lugdunensis*, *Tabernamontanus*, and *Lobel*. *Dodoneus* calleth it *Tamus* & *Vitis sylvestris*, but saith it differeth from that *Vitis sylvestris* that is called *Labrusca*, who differeth little from the true manured Vine; but that it groweth wild and beareth few or no grapes. *Dodonæus* call it *Vitis Taminia*, and the berries *Vva Taminia*, yet some would appropriate that name to the *Bryonia alba*: it is in most of the Apothecaries shoppes in *Italy*, *France*, and *Germanie* called *Sigillum Sanctæ Mariæ*, *Rotæ*, *Mosæ*. Some likewise would have it to be the *Cyclaminus Cissanthemos* of *Dioscorides*, which it cannot be, for he saith the roote is unprofitable, which this is not, and others to be *Elaterium*, both which more truely referred to the *Balsamina* or *Solanum hypnoticum*. *Gerard* is much deceived in thinking *Cyclaminus altera Dioscoridis*, to be a kinde of *Cyclamen*. The seaventh is called of most men *Mechoacan*, from the place where it grew, yet *Monardus* saith the Spaniards that used it, called it *Rhabarbarum* from the effects, and so calling it, called it *Mechoacanum Indicum*, or *album Rhabarbarum*, and *Rhabarbarum Mechoacanense*: *Bauhinus* saith it doth neerest resemble the *Bryonia sylvestris*, and therefore calleth it *Bryonia Mechoacana alba*, *Dodonæus* rather taketh it to be a kinde of *Scammonye* calling it *Scammonium Americanum*, but not rightly. The eight is called *Bryonia Mechoacana sylvestris*, as a wild and worse kind of the former, and as *Monardus* saith, they that do drinke of it, will not yet take it againe, in regard of the violent paines and symptomes it doth procure, and therefore *Monardus* thinks it to be rather a *Scammonye*, and is called of *Bauhinus Bryonia Mechoacana sylvestris*. The last is called *Ialap*, and *Ielapo*, in different places. *Bauhinus* calleth it *Bryonia Mechoacana nigricans*. The *Arabians* call it White English, *Alfidra*, the *Italians Vite bianco* & *Zucca salvatica*, the *Spaniards Nueza Blanca Bryonia* or *Nueza blanca*, the *French Colevrees* and *Couleuvree*, the *Germanes* [illegible] *Hund, raben* & *Teufels Kopfle*, the *Dutch* [illegible] *Bryonie* and we in *English Bryonie*, *White Bryonie*, *White wild Vine*, and *Terne berries*.

The Vertues.

The roote of the white *Bryonie* purgeth the belly, with great violence, troubling the stomacke and hurting the liver, wherefore it is not rashly to be taken, but as *Mesue* adviseth, some spice is to be added to it, as Mastiche, Quinces, or other such like astringent and strengthening thing. The first and tender shootes, as *Dioscorides* and *Galen* say, were used in their times to be eaten in the spring, both to purge the belly and to prouoke urine, and is layd to be also used in our times in other parts, but not in our countrie, who delight not in to [illegible]

but in more pleasant labors: By the strong purging quality of the roote, it may bee profitable for the diseases of the eares, as the filling helmeth, the dissiness and swimmings in the head and braine, by drawing away much flegme and rheumatick humors oppressing those parts, as also the joynts and sinewes, and is therefore good for palsies,

Chap. XIIII.

Ricinus sive Palma Christi. Palma Christi, or great Spurge.

Because there be many sorts of Spurges, and that the kinde of great Spurge doth much differ from all the other sorts, hereafter set forth, I thinke it fittest to ranke it in a chapter by it selfe before the other, as a supplement to all the rest, for although the properties be conformable to the Spurges, yet to any other forme of leaves, flowers, or seede, of any of the foure or five sorts, I shall here shew you: for that therefore is the first kinde.

1. *Ricinus sive Cataputia major vulgatior.* The more ordinary Palma Christi, or great Spurge.

This great Spurge, which doth grow in the warme and hot countries, of *Europe* and *Asia* to be as great in bodie as a man, and as tall as a reasonable great tree, and is used to be lopped every yeare, whose leade cannot be gathered without a ladder set thereto, and whose leafe falleth not away in the winter as *Dodonæus* saith, the first booke of his observations, the 18 chapter) springeth up in our countries, to the eight or ten foote high, whose stemme will be hollowed as bigge almost as our ordinary canes, of a brownish colour with an eye of blew hoarinesse upon it: the leaves that stand both upon the stemme, and upon the branches, spreadeth forth every one severally, on all sides upon long foote stalkes, are very broad, and divided into five, seaven or into more divisions (representing the hand of a man, with the fingers spread abroad) of a darke deepe greene colour on the upperside, and whitish greene underneath; the flowers are many round buttons, bursting forth together, and stand all along upon a long stalke, at the toppes of the stem and branches, consisting of many pale yellow threades, which fall away without bearing any seedes: but lower upon the stemme or the stalke, and sometimes also upon the branches, breake forth other heades, which are the seede upon long stalkes, being three square or three seedes joyned together, rough and asli coloured on the outside, or outer rinde which opening it selfe, or being opened, there lyeth within it the seede, whose outward huske is discoloured as it were spotted and shaped like unto a ticke, which containeth within it, a pretty large, shining round somewhat long and flat seede, of a browne colour, having a white pulpe or kernell within it: of a fiery hot taste, burning the mouth and throate, of whomsoever shall taste it, but very unctuous or oylie, whereof an oyle is pressed which is onely used for outward remedies, for as *Dioscorides* saith it is *nihil foedum*, but serveth to burne in lamps in those hot countries, where it is naturall and plentifull, the roote consisteth of many long and great strings, & small fibres, which perished with us quickely, after it hath felt the first frosts, and must be new set every yeare by them will have it, but abideth in the warme countries, as I sayd in the beginning of the description many yeares.

1. *Ricinus sive Cataputia major vulgatior.*
The more ordinary Palma Christi or great Spurge.

2. *Ricinus Americanus de fructu serpente.*
Palma Christi of America, and else of the East Indies.

Original from UNIVERSITY OF MICHIGAN

3. *Ricinus Indus. Africanus Syriacus* and *Aegyptius*. Palma Christi of Syria, &c.

Camerarius in his *horti medici*, maketh mention of another sort whose seede was twice so bigge as the former, the colour whereof was not so pale or spotted, and came as he saith out of *Syria*. This is very probable to be that hot violent sort, that *Alpinus* in his *Egyptian* garden remembreth, being brought from *Egypt*, the halfe part of whose seede being taken by a strong young man of twenty yeares, mightily troubled with the headache, purged him very forcibly and eased his paines, but in that he chewed the seede in his mouth (and did not swallow it whole without chewing as it should have beene) it inflamed his throate and mouth of his stomacke so vehemently, that after he had endured an ague, intolerable thirst, and fainting of the spirits, nine dayes after the taking thereof he dyed notwithstanding the care of three Physitions with all the remedies they could use. Of the seede being set growing up a plant greater than the former, whose leaves were larger more crumpled and redder in other things little differing.

4. *Ricinus Americanus* Palma Christi Americk seede.

3. *Africanus.*

There is another kinde also but lesser in every part thereof, although it grow in the same ground, whose seede being ripe is evidently observed to be much lesser: This is not remembred by any Authour that hath written thereof, before *Clusius* in the second booke of his *Exotickes* and 21 chapter, and *Bellonius* that set forth the Pictures of *Lobel* his garden, in a great large volume, whose seede that we first saw came from the *Barbaries*, where they made oyle thereof, and grew with us in that manner before expressed.

4. *Ricinus Americanus*, Palma Christi of America.

The *Palma Christi* of *America* differeth from the first, and second sorts principally in the greatnesse, for as *Oviedo* & *Acosta* say it groweth to be a much greater tree than any growing in *Africa*, whose first leaves were almost round, & bigger than the first that those that follow are broad and torne on the edges into sundry corners, in the seede there is some difference also, which although they be three alwayes joyned together, yet the outer huske is not rough or prickely, but smooth and of an ash colour, the inner most seede is selfe, being somewhat like the other, but more blacke and not spotted at all, and is as oyle as the first, for thereof as I there since was made good store of oyle which serveth in the seede of oyle for any outward uses. *Clusius* remembreth a very small sort of this *Indian* kind, whose seede is the smallest of all other, even smaller than the former small kinde, which was brought from *America*.

The Place.

The first groweth in *Spaine* as *Clusius* saith, to a great largenesse as is before sayd, and in *Candy* as *Bellonius* saith, the greater kind, whereof *Camerarius* maketh mention, groweth in *Syria*, & *Africa* and as *Alpinus* saith in *Egypt*. The first lesser sort in *America*, and *Guinea* as *Clusius* saith, in the place before remembred. The great kind of *America* *Monardus* saith groweth in *Gelicia* a province of new *Spaine*, from whence an ogle made of the seede thereof is brought, of such use as you shall heare by and by: and the last and least of all other, was brought from *Brasil* as *Clusius* saith in the 25 chapter of his 2 booke of *Exotickes* the ninth sorte.

The Time.

Those that grow with us flower not untill the beginning of *August*, and their seede doth seldome come to perfect ripenesse in this Country.

The Names.

It is called by *Dioscorides* in Greeke *κρότων ὁ μέγας, καὶ ὁ κρότων ὁ μικρὸς, καὶ ἡ κυνὸς σικυὸς ἀγρία, ὁμοιότητα, ἔχουσα κατὰ τὸν καρπὸν τοῖς ἐπὶ τῶν ἡμέρων ἀμπέλων φυομένοις*, *Aetius Alexandrinus* in his Commentaries upon *Ionas*, saith that the Hebrew word *Kikaion* (which is there the Greeke *Kολοκύνθη*) doth signifie this plant, although S. *Jerome* did translate the word to be *Hedera*, and our *English* bibles have it, a Gourd that was rayled upon by God to shelter *Ionas* from the heate of the sun. *Jonahe*. 4. of some *Ricinoides*, by others *Cratonis Regium*, *Catapuna* from the *Italian* name. *Gratiola* would it to be *Heliotropium Theophrasti*, but most commonly it is called *Ricinus* & *Palma Christi*, and in the Apothecaries shops *Catapuna minor*, the oyle wherewith is known to the most of them, by the name of *Oleum de Cherva*, yet it is also called *Oleum Catapuna*, as well as that oyle made of the *Indian* seed, brought from thence. In *Spaine* they call the seede of the ordinary as well as the *Indian* sort, *Pepe del infierno*, and the greater sorte call it *Flor cruz de sole*. The lesser kinde *Cortusus* saith in the first place before mentioned is called *Enxuat* by the *Indians*. The great *Indian* kinde, *Clusius* saith is called *Cacca* in *America*, and we to distinguish it from the former kind, do call it *Ricinus Americanus*, or *Americanus*, *Palma Christi* of *America*. The *Arabians* call it *Cherva*, the *Italians Albi Apio*, *Herbolo*, or *Catapuna maggiore*, the *French Palma Christi*, the *Germanes Wunderbaum*, the *Dutch Olieboom* and *Wonderboome*, and we in *English Palma Christi*, or great Spurge.

The Vertues.

The seede of *Palma Christi* is almost wholly used, and the leaves but seldome, yet so seedes cleared from the huskes, being brused and taken in drinke saith *Dioscorides*, but *Cortusus* in his Commentaries upon *Aetius* judgeth this to be a fault in the writers or the copyest. *Dioscorides* setting so lot 3. and 4. graines (according to the dose of *Aetius* antecessor *Thessalus*) and the seede (one before) doth purge choler and deume, and draw waters abundantly from the belly, provoking urine also, which manner of purgings as *Dioscorides* himselfe confesseth, doth trouble the stomacke and so enforme it mightily: yet with good advise it may be given to strong and able bodyes, with Antidotes or Treacle seede, who are troubled with the dropsie, joynt aches, the gout and sciatica, for it draweth water and humors very strongly, from the more remote parts. *Dioscorides* adviseth some of the

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

seede to be boyled in the broth of an old cocke, for the same purpose: the oyle he saith of the seede is profitable put into glisters, to open obstructions, to ease the paines of the collicke and windinesse of the mother. *Clusius* saith he knew diverse Lapericke: give of the small seed, that came out of *America* in a small quantity as a purger in diverse diseases, because by purging the body well, they found good successe, they held it as a secret of worth, which they kept to themselves. *Monardus* saith that the oyle of the *Indian* seede, (and other authors say the same of the oyle of the former kinde) is found by dayly experience, to bee helpefull to many diseases, as well in the *Indies* as in Spaine; for as he saith it helpeth all diseases proceeding of cold causes, it dissolveth tumours and swellings, dispersseth winde especially of the collicke and mother, if the places grieved be anointed therewith, and some few drops thereof also taken in a little chicken broth that is fat: it wonderfully helpeth the cramp and convulsion of the sinewes: being gently rubbed on the places grieved, and thereby easeth the sinewes to stretche forth, that were shrunken by anointing the stomacke the belly at the left side, where the spleene lyeth it easeth them of the obstructions in them: it killeth the wormes in children, if either you give a droppe or two thereof, mixedly in milke or fat broath, or anoynt the lower part of the belly there with, it taketh away also the hardnesse of the belly in children, that are apt thereto, or have wormes: the oyle also helpeth all scabs or running sores of the head: dropped into the eares, easeth the deafenesse, and taketh away the paines and noyse thereof: it mightily cleanseth the skinne from all manner of spots, markes or blemishes therein, as also the deformed scarres and of the pearl: the greene leaves bruised and applyed of themselves, or else with barly meale, allwayes the inflammations as well as the swelling of the eyes, and the swellings also of women's breasts, after childe-being applyed likewise to womens breasts, they doe helpe to encrease milke in them: It hath beene formerly set downe by good authors, that *Palma Christi* planted in a garden, was a sure remedy against moales, to keepe them from working in the ground: but *Camerarius* disproveth that asseveration saying, that they will work in the like manner, although they be planted therein, yea or although the branches be thrust into their furrowes or trenches

CHAP. XV.

Tithymalus sive Lactaria. Spurge or Milkewoorte.

THere are many other sorts of Spurge, that are remembred by diverse authors, with whom there is much variation about the true names of diverse of them: some of them are of the Sea, as particularly to be found there about: others in the woods and mountaines properly belonging to them: some againe rarely growing in gardens in these parts, and for the most part not well known where to be found, others also of the fields: they have also obtained sundry names according to their formes or natures, yet all of them Spurges or Milkeworts: for some sort is particularly called *Tithymalus*, some others *Lathyris* or *Cataputia*, others againe *Esula* or *Pityusa*, and others *Peplus*, *Peplis* and *Chamepeplus*: and because they are all of them *congeneres*, that is of one family or kindred, and one quality or property, which is to purge, I thinke it fittest to remember them all together, yet in severall chapters.

1. *Tithymalus Pes-ursinus, Sea maritimus.* Sea Spurge.

The Sea Spurge riseth up with diverse reddish woody, hairy stalkes a foote or halfe a yard high, set thicke with leaves, from the roote to the toppe, which are small long and narrow, yet cleft in the middle, somewhat like unto the leaves of Ling or Flax, but thick and whitish, full of a white milke if any part be broken, which is so hot, that being tasted, it burneth the mouth and throate intolerably; at the toppes of the stalkes stand many pale yellowish flowers with two leaves under them compassing the stalke, as it is usuall in all the other sorts of Spurges containing them, after which come three square small heads wherein is contained round dimpled seede: the roote is long and woody, abiding long, and so doe the leaves on the stalkes not falling away in winter.

2. *Tithymalus maritimus Venetus.* Sea Spurge at Venice.

This Sea Spurge hath longer or taller and thicker stalkes somewhat hollow and reddish, standing forth into diverse parts set with small long leaves, but somewhat larger and more fat rare than the former, two always standing together about the branches like Licorice: the flowers are small, pearled tufts of a fair purplish colour, standing of five small leaves (set like a small flarre, without any round leaves under them as the former, after which come such like heads and seede: the roote is great long and woody withall, sending forth many branches every yeare.

3. *Tithymalus spinosus Cretensis Bauhini.*
Thorny Sea Spurge of *Candy*.

The Thorny Sea Spurge of *Candy*, feedeth forth diverse brownish round stalkes, whereon are set many whitish hearie leaves, being small thick and long, as plentifully yeelding a cauticke or burning milke as any of the former: upon the branches stand diverse thornes with the leaves, and likewise the ends of the stalkes and branches are in sharpe thornes, under which come forth the flowers, in some whitish, in others purplish like unto the last but small for the former, and without any cups of leaves under them, which give small round seede like the former: the roote is not woody as the former but very fleshie, especially while it is young, and shooting many rootes.

4. *Tithymalus*

3. *Tithymalus maritimus spinosus.* The Spungious Venice Spurge.

3. *Tithymalus monstrosus flagris Cretensis.* Thornie Sea Spurge or Candye.

4. *Tithymalus linifolius Paralio congener.* Baſtard Sea Spurge.

This Spurge, riſeth up with browniſh ſtalkes, having many narrow leaves growing thereon, like unto the firſt Sea Spurge, but ſomewhat larger and a little broader: the flowers ſeede and roote are not much differing from it.

The Place.

The firſt of theſe groweth by the ſea ſide, as well in divers places of our owne Country, as beyond the Sea: The ſecond groweth on the ſhores of the *Adriatike* ſea in many places, and in the Iſland *Lio* that pertaineth to the *Venetians*. The third in *Candy* as *Honorius Belius* ſaith. The laſt in *Provence* at *Frenichead*, neere unto the bankes of the river of *Mayne*.

The Time.

They flower in July for the moſt part, and their ſeede is ripe in Auguſt.

The Names.

Tithymalus in Greeke is ſo called as it is thought from τῆς θηλῆς τὸ γάλα, *quia lactem ac uberibus exiſtens non reddit*, in Latine *Tithymalus* alſo and *Lactaria* or *herba Lactaria* of giving milke, which is common to all the reſt of the Spurges. Some call it alſo *Lactuca marina* & *caprina*, both for giving milke as Lettice doth, and that Goates delight much to eate it. They are all in generall called Spurges in *English*, from the purging quality, and Milkewort likewiſe from the milke they yeeld, which as I ſayd is common to all the ſorts of them. The firſt of theſe is called almoſt by all writers *Tithymalus Paralius* or *maritimus*, agreeing with that of *Dioſcorides* (which he ſayd was called in his time *Tithymalis* and *Adecma*) in all points. The ſecond *Anguillara* thinketh to be *Myrſine* of *Dioſcorides*, and *Pona* and *Lobel* ſay, that at *Venice* it is uſed as a kinde of *Peplus* or *Ceraſta*; the Phyſitions & Apothecaries there, whereupon they called it in their *Adulterina, Eſulas rara* & *Lac Venetorum ſolida*. The third is remembred onely by *Belius* in his third Epiſtle to *Cluſius*, ſaying that in *Candye* (becauſe it is of the kindred of the *Tithymals*, giving abundance of milke, they call it *Galeſtrides*, as differing from another of that name, which I have ſhewed you before, in the 21. chapter, of the former part, under the name of *Blatta in Creticæ ſpinoſa*, which *Cordus* called *Echinatum ſpinoſum Creticum*, and was judged of others to be a *Verbaſcum ſpinoſum*. The laſt is called by *Cæſalpinus Tithymalus linifolius Paralio congener*, and by *Bauhinus* in his *Pinax*, *Tithymalo marino affinis Hiſpanicus*, &c. by *Tabernæmontanus*, *Tithymalus amygdaloides anguſtifolius*.

The Vertues.

The firſt of theſe Sea Spurges is not commended by any author either ancient or moderne to be uſed in Phyſicke, for the vehemencie and ſharpe cruelty lying couched thereof is ſuch, and ſo great in purging exceeding other ſpurges, that it is not ſafe to uſe it inwardly, and outwardly applyed it doth burne the ſkinne, and therefore unguent it bee to take away ſcarres, blemiſhes, or warts, or the like it is not uſed at all: onely *Galen* ſaith of it, that the milke thereof mixed with meale and caſt into the water, ſtupifieth fiſh ſo much, that it maketh them to ride to the top

Original from UNIVERSITY OF MICHIGAN

of the water. The second is as I said before used at *Venice*, by the Physicians and Apothecaries instead of *Ipecacuanha* the roote; in *Rondeletius Lauanus*, purging pils and other medecines, because it purgeth forcibly and with great violence, as *Dent* termeth it downe. The third is used in *Candy*, of the poorer sort as a thing ordinary when they have occasion: but the last is not mentioned by those authors that have written of it, what soeuer quality or purging it hath.

CHAP. XVI.

Tithymalus Characias, Wood Spurge.

OF this kind of Spurge there are diverse sorts, which I name Wood Spurge as a difference to know me from others, although all of them doe not naturally grow in woods.

1. *Tithymalus Characias vulgaris*. English wood Spurge.

The English wood Spurge hath diverse rough woody brownish red branches, two foote high or more, bare or naked of leaues, for a space next to the roote, and afterwards set vpon the toppe with many narrow and long leaues, yet broader than those of the Sea Spurge, and nothing so large as they, somewhat smooth in handling, and without any denties about the edges, turning reddish in the Spring, and more in the Summer time: at the toppes of some of the stalkes, (for all of them doe seldome flower at once, and are very much branched) stand many yellow flowers, whose vnder cups, that is the two almost round leaues compassing the stalke, are yellow likewise: after which come small round heads, almost three square, standing vp a little higher in those cups than the flowers did vpon little stalkes, every one by it selfe; wherein are conteined small brownish round seede, the roote is long and somewhat woody, spreading well vnder ground, but not creeping.

2. *Tithymalus Characias Monspelliensium*. Great French Wood Spurge.

This kinde of Spurge is somewhat like vnto the former, but groweth larger and bigger, having but one or two stalkes at one time standing vpon the roote, which are reddish, bare of leaues at the bottomes of them: the stalke that flowreth standeth harder, and larger leaues than the former, which is diuided at the toppe into sundry small branches: whereon grow the flowers, standing in cuppes as the former doth: which are more yellow in some places, and more blackish in others, the seede and rootes are correspondent vnto the other.

3. *Tithymalus Characias folijs longioribus*. Hayrie or downie white wood Spurge.

This white wood Spurge, hath stalkes and leaues somewhat like vnto the last, but that the stalkes doe not

1. 2. & 4. *Tithymalus Characias, Mas vel Mas Monspe-liensium, Characias angustifolius.*
Wood Spurge, Great French wood Spurge, Narrow leafed Wood Spurge.

3. *Tithymalus Myrsinites latifolius.*
Broad Myrtle Spurge.

Original from UNIVERSITY OF MICHIGAN

ouer red, but downy: stande whitish, and are vnpeached: the leaues alſo being almoſt as large, are white and ſofter in handling, with a kind of coulen or hoarineſſe on them, which maketh them to be the eaſilier knowne, by that difference: the flowers are of a paler yellow colour, not differing as to the ſeede or roote.

4. *Tithymalus Cheiri folio vt Theophraſtus.* Dented Wood Spurge.

This wood Spurge meeteth with many greenish ſtalkes, 2 or 3 foote high, whereon are ſet ſmall long thick fat greene leaues, ſomewhat like vnto the leaues of the largeſt Myrtle, but more pointed at the ends and a little dented about the edges, the ſtalks are branched very much at the tops, that beare yellow flowers like vnto the other, but ſmaller, whoſe ſeede differeth not from them. The roote is white and very long, nothing ſo hard or woodie as the former, but as *Pena* ſaith having a more pithy iuice in the middle, and a more ſoft ſubſtance without, where barke doth ſo neere reſemble the *Turbith* of Alexandria: as no roote can doe more.

5. *Tithymalus Paralias anguſtifolius.* Narrow leafed Wood Spurge.

This ſmall Wood Spurge hath diuerſe weake branches, that ſtand not vpright, but ſet thicke with leaues which are white long and narrow, much like vnto the firſt wood Spurge, but nothing ſo great; the flowers ſeede and roote differ little from the other.

6. *Tithymalus exiguus flore Cornuto.* Small wood Spurge with horned flowers.

This wood Spurge ſheeth vp to no great height, with hayrie ſtalkes, bare at the bottome, thicke ſet about the middle, with ſomewhat hairie leaues, ſmaller and ſofter than the laſt, of a blewiſh greene colour, and ſmaller vpwards: the flowers ſtand in cuppes as the others doe, of a greenish yellow colour, conſiſting of foure leaues a peece, bowing outwards like vnto an horne or halfe moone, ioyning together at the backe of them, with yellow threads in the middle: the ſeede is like the other: the roote is very ſmall in reſpect of the plant, and blacke on the outſide.

7. *Tithymalus Myrſinites.* Mirtle Spurge.

This Spurge hath diuers whitiſh branches, leaning downeward, not ſtanding vp right, whereon are ſomewhat thicke ſet without order, many ſmooth and whitish greene leaues, ſmall at the bottome, and larger in the middle, ending in a point ſomewhat ſmall and ſharpe, ſomewhat like for forme but not for bigneſſe, vnto the leaues of Knee holme, or Butchers Broome: the flowers are ſmall and yellowiſh, not ſo many ſtanding together as the other, elſe alike, as the ſeede and rootes are.

8. *Tithymalus Myrſinites incanus.* Hoary Mirtle Spurge.

This white or hoary Spurge hath many vpright reddiſh ſtalkes, about a foote or more high, whereon are ſet without order, ſuch like leaues as the laſt recited Mirtle Spurge, but a little larger, and of an hoary white colour and hayrie withall: the flowers are yellow ſtanding at the toppes of the ſtalkes like vnto it, and the heads triangled bearing the like ſeede: the roote is ſmall and differeth not much from the former.

9. *Tithymalus verrucoſus Dalechampij.*
Wartlike Mirtle Spurge.

This kinde of Spurge hath ſmall tender ſtalkes, halfe a yard high, diuided into branches, whereon are ſet without order, ſmall broade whitiſh greene leaues, like vnto ſmall Mirtle leaues: the flowers are ſmall and yellowiſh, after which come round heads, ſtanding like ſmall warres, whereof it tooke the name, wherein are ſmaller ſeede, than any of the former: the roote is ſmall and not long, with diuerſe ſprayes running from it.

10. *Tithymalus arboreus.* Tree Spurge.

The ſtemme of this tree ſpurge groweth vp right, as bigge as a mans thumbe, from the bottome, and being there bare without leaues for almoſt halfe a foote, then ſhooteth forth diuerſe

7. *Tithymalus Myrſinites.* Myrtle Spurge.

10. *Tithymalus arboreus.* Tree Spurge.

branches,

branches, of a fingers thickenesse, whereon are set narrow long leaves, somewhat like unto the Sea Spurge, or rather the marsh Spurge, or great *Esula*, having larger yellow flowers and seedes, but like the other former toward the rootes are not so great and long as some of the former, yet sufficiently comprehending in the ground, to sustaine the whole plant, which *Lobel* compareth to a Myrtle tree, for the bignesse and fashion of growing but not to the leaves.

11. *Tithymalus latifolius Hispanicus.* Broad leafed Spanish Spurge.

This broad leafed Spurge springeth up sometimes, but with one stalke, halfe a yard high or more, and not branched, and sometimes with more, and spreading forth many branches, from the bottome up to the toppes: the leaves that stand on them, are large and long, of a fresh greene colour round pointed, somewhat thicke or fat in handling: and like to the younger leaves of Woade, the flowers are of a purplish yellow colour, like in forme unto the others of this kinde: and standing in cuppes after the same manner: the roote is great thicke and white.

12. *Tithymalus palustris sive Esula major Germanica.* Great Marsh Spurge.

This great Spurge (which is usually called *Esula major*, to distinguish it from other Spurges) riseth up with many great round reddish stalkes, whereon are somewhat thicke set, many long and somewhat broad greene leaves, neither so broad or long as those of wood Spurge, else somewhat alike: the tops of the stalkes are furnished, with fewer and smaller yellow flowers, than so great a plant, would beare shew to have: some flowers breake forth also below the toppes, at the under joynts, standing upon their stalkes, three or foure together: the moist: afterwards come small round seede like unto the others, the roote is of a blackish colour on the outside, and white within, great thicke and spreading diverse wayes: the barke whereof is thicker and more fleshy than in any of the rest, and endureth the extremities of the winter, although the branches for the most part passe every autumne, and rise a new every spring.

13. *Tithymalus Helioscopius.* Sunne turning Spurge or Wartwort.

The Sunne Spurge or Sunne turning Spurge, hath for the most part but one reddish stalke, halfe a yard high, full of leaves at the bottome almost halfe way upwards, and then spreading into two or three small branches, where grow sparsedly, diverse yellowish greene leaves, smaller at the bottome, and broader at the ends, somewhat like unto Purslane leaves: the flowers are yellow like unto the rest, standing in hollow cups of two leaves a piece, the stalke running through them, as is to be seene in most of the others: the whole toppe or head of flowers is sayd to turne with the sunne, whereof it tooke the name, the seede is small but round and like the rest: the roote is small and threddy, perishing every yeere after seede time, and rising againe of its owne sowing.

14. *Esula dulcis Trag.* Sweete Spurge.

This sweete Spurge riseth up, but with one browne stalke for the most part, not above a foote high, where grew not very many leaves, yet without order, which are somewhat long and narrow at the bottome, and broader to the middle, yet not sharpe but round pointed, and of a pale greene colour, giving milke when they are broken, but not sharpe or hot, like all the other: the toppe of the stalke is furnished with many flowers, somewhat large, in some places yellow, and in others reddish, which after give yellow seede, smaller than the last: the roote is great than it, whose milke is sweete like the leaves and not hot or sharpe, and abideth not large after seede time.

The Place.

The first groweth most usually in woods:

11. *Tithymalus latifolius Hispanicus.*
Broad leafed Spanish Spurge.

12. *Esula major Germanica.*
Great Marsh Spurge.

The Tithymalus Myrtifolius. Myrtle Spurge.

well in our Land as in *Germany*, *Hungary* and other places. The second at *Montpelier* and other places in *France*, as also in the kingdome of *Valentia* in *Spaine*, as *Clusius* saith. The third groweth likewise in *Spaine* and *France*, as also in *Germany* and to *Barcelona*. The fourth *Lobel* and *Pena* say, groweth no where, but in the Country of *Narbone* or *Languedoc*, yet *Clusius* saith he found it in the kingdome of *Valentia* in *Spaine*. The fift is said by *Lobel* to grow in *Narbone* and *Provence*, and not to be seene any where else but in gardens. The sixt *Clusius* saith he found on the hils of *Apennine* in *Naples*. The seventh groweth in *Germany* such as come into this land, but in their gardens, chiefly in the gardens of the curious. The eighth was sent out of *Italy*. The ninth groweth in the dry sandy grounds, high unto *Ewer* by the river *Rhodanus*. The tenth is found onely in the best Countries of *Spaine*, *Italy*, and *Narbone* in *France*, and is kept with great care and regard from the frosts of our cold winters. The eleventh was found by *Clusius* in *Spaine*. The twelfth groweth in many places of *Germany*, and by *Lobel* saith he his observations, in a wood belonging to Mr. *John Gerard*, neighbour *Lobel* very plentifully. The thirteenth groweth wilde with us in many and diverse places, as well as in other Countries. The last groweth as *Tragus* saith, in the open grounds upon some of the Alpes in *Switzerland*, and *Pena* and *Lobel* say in the gardens of the Low Countries, with them that are lovers of plants.

The Time.

All these flower in the Summer months of June and July, some earlyer or later than others, and their seede is ripe some after: the full Myrtle leafed spurge is observed by *Lobel* to abide the winter better, than some other that come from hot Countries.

The Names.

The first is called in Greeke *κύπαρισσος γαλαία ἢ Τιθύμαλος Cham-aeuce* also, Latine, that is to say *Vallesia*, because it usually groweth in the low moyst places of the woods, or in trenches that have beene made to drayne the water, and is the first *Tithymalus Characias* of *Dodonæus*, and with *Lobel Tithymalus Characias Amygdaloides*; yet call it in English Wood *Tithymall* or wood spurge, because it is more usually found in woods than any where else. The second is called by *Lobel* and *Pena Tithymalus Characias Monspel. Characias*, simply by *Matthiol. Lacuna*, *Dodonæus*, *Lugdunensis*, and *Tabernæmontani*, by *Clusius Tithymalus Characias legitimus*, called also *Myrtifolius angustus & parvus tomentosus*, *Amygdaloides folium forme*, by *Dodonæus Tithymalus Characias alter*, the third *Clusius* thinketh to be another sort of this second kind, but differing in the smoothnesse and woollinesse of the leaves. The fourth is called by *Lobel Tithymalus serratus Monspeliensium*, which is the first *Characias* by *Dodonæus*, and by *Clusius* called *Tithymalus Myrtus Folio serrato*, for he saith the true *Myrsites* of *Dioscorides* is neither known nor in *Spaine* nor in *France*. The fift *Lobel* in his observations calleth *Myrsinites altera*, yet saith it neere agreeth with a *Characias* or Wood Spurge, then Myrtle Spurge: it is the fourth *Characias* of *Dodonæus*, who saith they are in smile, that call it *Myrsinites*; *Lugdun.* calleth it *Tithymalus Characias serratus Anfractuosus*: it is the third *Myrsinites Matthioli & Lobel* & *Tabernæmontani*, and by *Bauhinus Tithymalus Characias angustifolius*. The sixt *Lobel Coronopi* calleth *Tithymalus humifusus*, from the likenesse of the flowers, and *Tabernæmontanus* thereupon calleth it, *Tithymalus Coronopi folio serrato*, taking it to be the *Coronopus* of *Cordus* upon *Dioscorides* and the *Plantaginella* of *Ruellius*, but with no reason that I know, for it answereth unto neither as you may perceive by the description. The seventh is called *Cyparissias* by *Dodonæus*, and *Myrsinites* by *Matthiolus*, *Cæsalpinus*, *Dodonæus*, *Lobel* and others. The eighth *Dodonæus* calleth *Tithymalus arenosus hirsutus*, and thinketh it may be the plant, that *Cæsalpinus* calleth *Peplus*, *Portulaca sylvestris*, for unto *Dodonæus Peplus* seemeth it not, but hee cannot, for it hath leaves unlike unto the former Spurge, with Mantles also, I have found it neere thereunto. The ninth is called by *Dale Tithymalus verrucosus*, and by *Bauhinus* in his *Prodromus*, *Tithymalus Myrtifolius sextus verrucosus*, and saith *Cæsalpinus* was wont to call it *Peplus*. The tenth is called *Tithymalus Dendroides* by *Matthiolus*, *Cæsalpinus* and others. *Lonicerus* letteth it to his *Myrsine* and *Ostrya*, *Dendroides fere arborescit Bauhinus*, *Myrsites Folio non e folio serrato*, which text Bauhinus made *Dodonæus* to account it a kind of *Characias*, and let it for his third of that kinde. The Eleventh is called *Pityusa* of *Clusius*, who judgeth it to be the right or true *Pityusa* of *Dioscorides*, and so all others since him, because there is not any of these Spurges found to have so great and large leaves as this herb, although *Pena* and *Lobel* make the *Characias Monspeliensium* and *Pityusa* which strangers growing neer unto, they acknowledged this of *Clusius* to be the most probable. The twelfth is called *Tithymalus*, and *Myrsinites* by *Tragus*, *Dodonæus*, *Lobel*, and *Lugdunensis*, and by *Bauhinus* in his *Pinax Tithymalus palustris foliis lini*. The thirteenth is generally by all writers, taken to be the true *Helioscopius*, that is *Tithymalus Solisequus* of *Dodonæus*, and by *Brunfelsius* and *Tragus* called *Eiula vulgaris*. The last is called by *Tragus Eiula altera*, but the reasons thereof he shewed in the description, whom diverse others since have followed: *Tragus* himselfe saith that many would referre it to *Myrsites* of *Plinie*, but this may bee plainely seene to be a kinde of *Tithymall*. *Cæsalpinus* in his borne-worke numbereth a kinde *Tithymalus arvensis annuus*, which hee saith is like hereunto,

hereunto, but fuller of branches, and but an annuall or yearely plant, and that it is not without sharpenesse which *Bauhinus* referreth to the *Cyparissias* with spotted leaves, as is hereafter shewed: in his *Pinax* he referreth hereunto also, the *Pityusa sive Esula minor foribus variis* of *Lobel*, and calleth it *Tithymalus montanus annuus*, but I cannot so thinke, but take it to be a sort of the small *Esula*, as you shall finde it in the next chapter following. The rootes of diverse of the Spurges, and of some other plants also, are taken by diverse writers, to be the *Turbith officinarum*, and of the ancients, as the *Myrsinites altera* of *Lobel*, being the fift in this chapter, which he also is taken of some to bee the true *Turbith*, that commeth from *Alexandria* into these Christian parts of the world: of the *Characias Monspeliensium*, *Lobel* saith to the same place againe, that the rootes be the most like to the true *Turbith* if any be like it. The *Esula vera Venetorum* set forth in the last Chapter, is also called of some, *Turbith nigrum* of *Actuarius*: but all the best writers say, that the small common *Esula*, is the true *Tithymalum nigrum* of *Actuarius*; whom *Mesues*, *Rhasis* and *Avicen* follow; the roote of *Atropon Narbonense*, *herba terribile*, is likewise called *Turpetum album* by the same *Actuarius*, in diverse places of his booke *de medendi ratione*. *Mesues* againe saith that *Turbith* is the roote of an herbe that giveth milke, whose leaves are like unto *Thapsia* or *Ferula*, Fennell giant, and there upon diverse have taken the rootes of *Thapsia* to be true *Turbith*. *Serapio* taketh the roote of *Tritolium* or Sea Starwort, to be the true *Turbith*: and lastly the roote of *Scammonie*, taken of some, to come nearest the true *Turbith*, as hath beene shewed in the chapter of *Scammonie* here before. *Matthiolus* saith that all the sorts of *Tithymall*, were indifferently taken and used for *Esula* by Physitions and Apothecaries in his time; but allthough the *Turbith officinarum*, which is most likely to be the same of the ancients, is not the roote of any of the *Tithymales*, or Spurges, because all of them are hot and sharpe, when fresh or dryed, and the true *Turbith* is almost insipid, and because they being dry break short without any stringy threds that are in the true *Turbith*: neither can it be *Atropon* or *Esula*; for they are not likewise: It can be the roote of *Thapsia*, which besides the heate and sharpenesse is too white also, and the roote of the true *Turbith* is somewhat blackish on the outside and not so white within as *Thapsia* is. That *Tripolium* cannot be it, *Dioscorides* and *Galen* declare sufficiently, who say it is sharpe in taste, and hot in the third degree, which qualities are not to be found in *Turbith*. Lastly, that *Turbith* should be the roote of *Scammonie*, I cannot thinke, because these quickly grow greater than the rootes of *Turbith*, are ever seene to be. The *Arabians* call *Tithymall Lanbon*, *Thuria*, *Mesues Sechran* & *Alsechras*, the *Italians Tithimalo* or *Torsomiglio*, the *Spaniards Lecheretnaga* or *Lengua*, the *French Herbe au laict*, the *Germanes Wolffs milch*, the *Dutch Wulfs melck*, and we in *English* Milkewort or Spurge in generall, and particularly Sea Spurge, Wood Spurge, &c. as is extant in the title.

The Vertues.

All these Spurges except the last, are hearing and exulcerating the skinne, if they be outwardly applyed, are vehement and excoriating purgers taken inwardly, without great care and caution: for as *Mesues* in his booke of purging Herbes, they are all offensive to the heart, liver, and stomacke, they breake the veines, fret the guts, and heate the whole body so much that thereupon they raise fevers many times: the first ill quality therefore he saith are taken away if those things be put thereto in the taking, that doe strengthen the heart, liver and stomacke. The second and third are taken away, by putting thereto such things as have a glutinous quality, and such are *gum Tragacanth*, *Bdellium*, and the mucilage or expression of the seedes of Fleawort and Psillium. The fourth evill quality is taken away, by mixing cold and moyst things with it, and such are the juyce of Sowthistle, Endive, Purslane, Nightshade, or the seedes of Quinces well beaten with Vinegar. These Tithymals or Spurges doe purge with great violence, both upward by vomits, and downeward by the stoole, flegmatick humors, both from the stomacke, and from the joynts, as also blacke choller, melancholy, and the dregs but they waste and macerate the body, and consume generation; 3 or 4 droppes of the milke taken fresh and put into a dry figge, which is taken by strong Country people, to purge them; but it requireth some carefull gathering of the milke, that they stand with their backes, and not their faces to the winde, and especially that they touch not their face or eyes with their hands. The milkie juyce of them is the strongest worker, the stalke and leaves are weaker in quality thereto, and the rootes of all are of the same operation, but not so strong, for they being boyled in Vinegar helpe the toothach, especially if they be hollow, and the milke put into the hole, so as it touch not any of the other teeth or gummes, doth worke more effectually and speedily; the same milke also upon any hairy place, taketh away the haires; but it is necessary that it lye not long at a time, & that the place be anointed with oyle of roses and Nightshade quickly after: the same also taketh away callous knots, and all other callous or hard kernell, or cornes of the feete, or other parts of the body, if they be first pared to the quick, some thereof dropped on or layde to: the same also boyled in some oyle of bitter Almonds, cleareth the skinne, the markes or scarres that come of sores, as also other deformities and discolouring of the skinne, and the scabbe and scurfes of the head: The Myrtle leafed Spurge is effectuall in all these things, excepting vomiting, wherein it is weaker. The rest are all of a like quality, but the *Helioscopius* is the weakest, yet the leaves of the greater sorts in generall, although some attribute it to the broad leafed Spurge only, cast into the water, stupifie the fish therein, so as they rise up to the toppe thereof, which lying thereon as halfe dead for a while, may be easily taken with ones hand or otherwise. A lye made of the ashes of them, and the ashes themselves also are answerable to the same effects before set downe in many things. The sweete Spurge as *Trago* saith doth strongly provoke vomitings, if the roote thereof be taken inwardly. The outer barke of the roote, being steeped a day and night in Vinegar, and then taken forth dryed and powdered, halfe a dramme of that powder taken in white boyled water, doth purge all waterish humors downewards, as also choller, and is very profitably given to them that have the dropsie, the roote also wonderfully soldereth and healeth all manner of greene wounds. *Trago* so sheweth the manner of making certaine pills, that are very effectuall for the dropsie, and those that are bruised, which may be taken as he saith without either paine or danger. Take of the rootes of *Esula* prepared aforesayd halfe an ounce, of aloes one ounce, of Mallicke one dramme, these being beaten into powder severally by it selfe, are to be made up with Fennell water into great or small pills.

Cast

Chap. XVII.

Lathyris sive Catapotia minor. Garden Spurge.

Next to the greater Spurges I muſt adjoyne this other kinde of Spurge, which by all authors both before and since this time, was accounted to be referred unto them, and yet differing from them, and therefore muſt to be expreſſed in a Chapter by it ſelfe: yet hereof there are two or three ſorts obſerved, one greater than another, as ſhall be preſently ſhewed.

1. *Lathyris major hortenſis.* The greater garden Spurge.

The greater of theſe garden Spurges riſeth up, but with one hollow ſtraight whitiſh ſtalke, as big as a finger, ſhadowed as it were over with browne, on which grow up to the toppes for the firſt yeare, many thicke fat long and ſomewhat narrow leaves, of a blewiſh greene colour on the upperſide, and more whitiſh under, yeelding milke as plentifull as any of the reſt: the next yeare after, it diuideth it ſelfe into many ſmall branches, with ſmaller leaves at every ioynture, every part thereof yeelding milke, as the other doe: the flowers are of a pale yellow colour, and ſtand in cups like the former ſorts, but are ſmaller than many of them, yeelding ſweete, and nothing ſo hot and burning ſeede, in three ſquare heads, ſomewhat like unto thoſe of *Lunaria Lobelij*, but rounder and bigger, than any of the former: Tithymalls or Spurges, which in the hot Sunne will cracke and ſhoote out of their places: the roote is long and woodily, periſhing as ſoone as it hath given ſeede, and ſpringeth againe of it owne ſeede that is ſuffered to fall.

Lathyris maior vulgaris ſive Catapotia major. Ordinary garden Spurge.

2. *Lathyris minor.* The leſſer garden Spurge.

The leſſer kinde of garden Spurge is ſo like unto the former, that I muſt needs but only to tell you, that it is the very ſame, but leſſer in every part thereof; for whoſoever hath ſeene the greater ſort, will preſently ſay when they ſee this, it is the ſame, but a leſſer kinde, and ſo much I hope will ſuffice to declare and diſtinguiſh theſe two ſorts.

3. *Lathyris minima.* The leaſt garden Spurge.

This ſmall garden Spurge hath many ſlender branches, lying upon the ground, ſet full of ſmall leaves, no bigger than thoſe of Knotgraſſe; among which riſeth up a ſtalke, about a foote high, with ſuch like leaves on it as grew below: at the toppe whereof ſtand many ſmall yellow flowers, cluſtering thicke together on their ſmall foote ſtalkes, but not ſpread abroad like unto the former ſorts: this yeeldeth milke as the others doe: the roote is ſmall, ſpreading many ſmall ſtrings, with ſtrings at them.

The Place.

They all grow in ſome places wilde about the borders of fields, but moſt uſually in gardens, where, when they are once planted they will hardly be rid out againe.

The Time.

They flower in July, and the ſeede is ripe in Auguſt.

The Names.

They are called in Greeke [illegible] *Lathyris, quia cingentem [illegible] ſeu [illegible] ſeu [illegible]*; in Latine *Catapotia minor*, as it is before ſaid, the *Ricinus* or *Palma Chriſti* ſeede, is called *Catapotia major*, and it is likely it was ſo called *[illegible]* for the ſimilitude *catapotia* is in Engliſh garden Spurge, that they may differ from all others. The firſt and ſecond are generally by all writers called, either *Lathyris* or *Catapotia minor*. The laſt is called by *Lobelius* *Lathyris minor Dodonæi Pempt.* and *Ruellius* thereupon *Lathyris minor conglomerata flore*, and it is likely alſo to be the ſame that *Cordus* calleth *Catapotia ſpiſſa*. The *Arabians* call it *Alhenna* and *Alhenne*: the *Italians Catapuzia, Lathyri* and *Catapuzia minore*, the *Spaniards Tartaga*, the *French Eſpurge*, the *Dutch* and *Low Dutch Spurgie* and *Tichelkruyt*, the *Dutch kornkraud* & *Spurge*, and we in *Engliſh Spurge* and garden *Spurge*.

The Vertues.

The ſeede of this Spurge, and the moſt part onely it uſe with us, whereof 5 or 7 or 9 in the greateſt, at the moſt are taken of a ſtrong body, purgeth by ſtoole and vomit, tough flegme, choller, melancholy, and water, as *Dioſcorides* ſaith: the ſmall weakeſt is to ſwallow the ſeedes whole, without breaking either huſke or kernell and then they worke the more gently and weakely, but if the huſkes be broken, and the kernels ſwallowed whole or chewed, or in the ſame ſtirred with drinke or broth, they will then worke more violently, and therefore to be taken with the more caution: the milke is more violent, even as the former Tithymals or Spurges are to be taken inwardly. Some use it outwardly applyed and ſay fully, it helpeth to take away haires on the eye-browes, forehead or temples: it will not touch any other part of the face or ſkinne, the ſame alſo cautelouſly applyed, taketh away the proud fleſh in ſcabs, hard callous knobs, cornes or warts in the fleſh, (if they bee firſt pared to the quicke and then applyed) running ſcabs and ſores, and the blemiſhes ſcarres and ſpots of the ſkinne: it is put into ſome hollow tooth to take away the paine, but you muſt beware that it touch no other of the teeth or gummes, or other part of the mouth: the milke made up into *Troſciſci*, or little balls, with the meale of beanes or peaſe and kept dry, doth ſerve all the yeare to uſe, as occaſion is offered, for the purpoſes aforeſayd, the diſtilled water of the whole plant, is of eſpeciall uſe, to cleanſe the ſkinne from freckles, morphew, or any other diſcolourings, either of it ſelfe, or mixed with the water of beane flowers, and ballard Dictanie, and being

gently bathed on the places troubled with the itch, taketh it away in a very short space. The Lone simple was also cleanseth foule vlcers and sores. The leaves being boyled in fat broath, worketh to some purposes more lightly, though more weakely. It is held by many good authors, to be effectuall for all the purposes, the greater Spurge or *Esula Christi* is applyed unto.

CHAP. XVIII.

Tithymalus seu Esula minores. The smaller Spurges.

HAving shewed you all the sorts of the greater Spurges, there remaine diverse other small kinds which I will comprehend in this chapter, that so I may accomplish, and set forth the whole story of them together.

1. *Pityusa, Tithymalus Paralias sive Esula minor.* Pine spurge or small Esula.

This small Spurge hath diverse weake and slender stalkes, some a yard long, whereon grow many small long and narrow pointed leaves, without order round about them, very like unto the leaves of Flaxe: at the toppes of the stalkes grow yellow flowers, sometimes dasht over with purple, like the former, but lesser, and standing in the like cuppes, which falling away, the seede groweth in small three square huskes wherein is contained small round seede: the roote is small and long, of the bignesse of ones finger, some blackish on the outside, but white within, and abiding many yeares, yet the extremities of the winter sometimes rot it and cause it to perish: both milke, roote and seede, are somewhat like in heate and sharpenesse unto the garden Spurges, but not altogether so violent: the roote of this *Esula* is accounted of the most, to be the truelt *Esula minor*, and the extract out of the roote hereof, rightly prepared and called *Lacca Esulæ*.

2. *Pityusa seu Esula minor floribus rubris.* Small Spurge with red flowers.

There is another of this kinde growing a foote high with such like leaves thereon, whose flowers are redde standing in the like cuppes, that the other Spurges doe.

3. *Tithymalus Cyparissias vulgaris.* Common Cypresse Spurge or Wellcome to our house.

The Cypresse Spurge is so like unto the first described, that it deceiveth many, that doe not marke them properly; for this hath also diverse slender brownish stalkes, whereon grow small narrow leaves, yet somewhat broader and thicker than the former, and thicker set upon the stalkes also: the flowers and seede are like the other, so is the roote also, whereupon diverse have mistaken it, and take it for the true *Esula minor*, and so have used it instead thereof.

1. *Tithymalus Paralias.* Pine Spurge.

2. *Esula minor alter a superioribus floribus.* Small Spurge with red flowers.

4. *Tithymalus Cyparissias vulgaris.*
Cypresse Spurge or welcome to our house.

5. *Tithymalus Leptophyllos.*
Small annuall Spurge.

4. *Tithymalus Cyparissio maculosis foliis.* Cypresse Spurge with spotted leaves.

This other Cypresse Spurge differeth not much from the former having smooth round reddish stalkes, two foote high at the least, the tops whereof doe a little bend downewards; the leaves are fat and soft like unto the former, but standing more together at spaces, which are greene on the upperside, and more yellowish underneath, thicke set with deepe yellow spots almost red, which are eminent at their first springing: the flowers likewise are of a little deeper colour, tending to a red or purple: the roote is smaller than those of the former, and more parted into sprayes or branches, with many fibres at them, of a brownish red colour on the outside, and pale within, not abiding as the other doth after seeding time.

There is another of this kinde taller in all parts thereof, else not differing from it. *Matth.*

5. *Tithymalus Leptophyllos.* Small annuall Spurge.

This annuall small Spurge hath many slender weake stalkes, bushing forth into many branches, and spreading farre upon the ground, whereon grow very small long and narrow leaves, standing upright, the uppermost whereof are somewhat broade at the bottome, and compasse the stalkes, ending in a long sharpe point or end: the flowers are yellow, like unto the other and very small, after which come three square heads, but very small, wherein is contained very small round greenish seede, not much bigger than poppy seede: the roote is small long hard and woody, perishing every yeare as soone as it hath given seede.

6. *Tithymalus capitatus sive Peplus.* Round headed Spurge, or Vineyard Spurge.

This Spurge shooteth forth round about the roote many small weake reddish upright branches with small leaves set by couples for the most part, somewhat like the leaves of Sun-turning Spurge, but rounder pointed and smaller, of a greyish greene colour on the upperside, and a little reddish or purplish underneath, oftentimes which will change to be wholly purple, in the Summer time: the flowers are very small and yellow standing more round, or close together, as it were in an umbell, otherwise like unto the rest: and so is the seede also very small, contained in three square heads: the roote is small and long, with many small strings and fibres at it, perishing also every yeare, and rising againe of it owne sowing.

7. *Peplus.* Small purple Sea Spurge.

This small purple Sea Spurge, forsaketh his small purplish branches upon the ground more plentifull than the other, and somewhat taller, whereon doe grow many small leaves like the other, but not so round at the ends: and purplish likewise underneath and above sometimes, especially in the beginning of the heate of the yeare: the flowers are small and yellow like the other, and so is the seede, but somewhat bigger and standing somewhether for the most part, not onely upon the toppes, but here and there upon the branches also: the roote is small and slender and of no use.

8. *Characias.* Perry Spurge or time Spurge.

The perrie spurge is one of the smallest Spurges that is, having very small slender branches, lying upon the ground divided sometimes into other smaller, with small pale green leaves set thereon, smaller than those of Tyme,

6. *Esula rotunda foe Penæi.* Round headed Spurge.

7. *Esula.* Small purple Sea Spurge.

or as *Penæ* compareth them unto Rapunce wort: the flowers are the smallest and so is the seede of all the set in heads by couples like the last: the roote is small and long, consisting of nothing but threds, and no life.

9. *Esula exigua folio obtuso.* Petty Spurge with broad pointed leaves.

This Petty Spurge likewise groweth close upon the ground, the small round branches not exceeding three breadth in length, with small long and narrow leaves, broad at the points or ends, as if they had been cut off without order on them, yeelding milke as the others doe: the flowers and seede is like the last, and so is the roote also.

10. *Tithymalus exiguus saxatilis.* Rocky pettie Spurge.

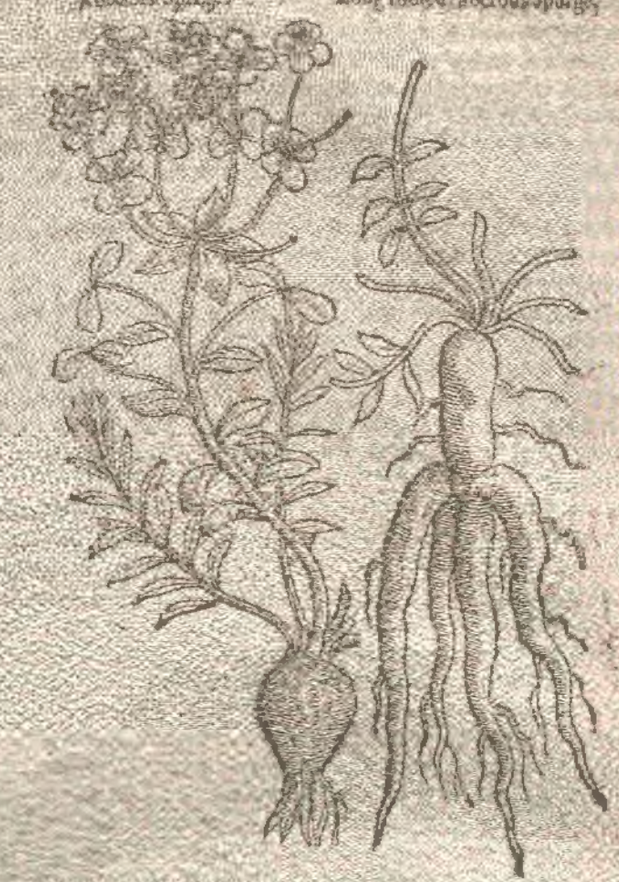
This is the smallest Spurge of all the rest, the small branches not extending two or three inches in length, the smallest and narrowest leaves of any set thereon: the flowers are small and somewhat reddish: the seede agreeable to the plant, and the roote as small as threds.

11. *Tithymalus tuberosus.* Tuberous or Knobbed Spurge.

Tuberous or Knobbed Spurge, hath diverse small reddish branches, lying upon the ground, with many leaves, somewhat like unto those of Saint *Iohns* wort set thereon without order, every one having the middle ribbe white therein: some of those beare a few small flowers at the toppes of them like unto the other Spurges, and seede likewise in three square heads: the roote is tuberous in his naturall place, blackish without and white within, and formed somewhat like a peare or figge, from whence the name thereof rose: but a little different in our climate, not keeping so proportionable a figure as it hath done over to us, even as the blacke Raddish hath done likewise, and therefore we may thereby plainely perceive the nature of the soyle doth alter and change the formes of roots, and leaves also in many things.

12. *Tithymalus tuberosus, radice longa.* Long rooted Tuberous Spurge.

This other Tuberous Spurge, the figure whereof *Clusius* had sent him from *Florence*, is so like the former, that I verily believe (as I said before of the former) the soyle and climate was the cause of the alteration: but yet briefely to shew you what he saith thereof, is this, it hath five or six branches rising from the roote lying upon the ground, somewhat reddish towards the bottome of them, divided into other smaller branches of greene leaves, that are set thereon by couples on both sides are small like the other, but a little rounder: the flowers that grow at the toppes are of a yellow with red colour, after which come three square heads somewhat rugged or set with knobbes, wherein is contained small round seede, like unto the other, the roote long and round, having many other small and long thicke roots, issuing from the lower end thereof, with many fibres thereat blackish on the outside and white within, like the former.



13. *Tithymalus tuberosus Germanicus.* Knobbed Spurge of Germany.

The knobbed Spurge of Germany, differeth from the former two sorts of *Tithymalus*, first in the roote which is full of many reddish knobs, set together with diverse long fibres among them, like unto the roote of *Scorzonera*, or great Piggewort: the branches are small and tender, whereon grow the leaves which are small and

3. Chamæpitys.
Ground Spurge, Tyme Spurge.

4. Myrsinites tuberosa. *5. Esula sive Aparines radice.*
Knobbed Spurge. Long rooted tuberous Spurge.

bow, somewhat like unto the leaves of *Meseureon* but smaller: the flowers are yellow, and the seede small and round, growing in three square heads, like unto the other sorts of Spurges.

The Place.

The first and third sorts, grow in some places of *Germanie* and *France*, both by the Rivers side and borders of fields, but no where naturall in *England* that I can heare, but in the gardens of those that are lovers of plants; the third is oftentimes found in the Country gardens of poore folkes in many places with us. The second is found in some Herbarists gardens in the low Countries; *Iacomus Tabine* remembreth the two sorts of the fourth kinde, which hee found in craggy stone places, lying open to the sunne, and in the borders of some fields, that were dry in Sauoye neere *Turin* in *Germanie*. The fift also is found in the fields in the same places of *Germany*, that the last are, but nearer the villages. The sixt groweth in the Vineyards of *France* in diverse places, as also in ditches and borders of fields there. The seventh groweth neere the Sea side in *Narbone* and about *Marseilles*. The eighth groweth about *Montpelier*, in the dry sandy Vineyards and Olive grounds, neere the Sea also. The Ninth and Tenth, grow about *Montpelier* and *Marseilles*, as also *Padua* as *Bauhinus* saith. The eleventh groweth on Mount *Adria* as *Bellonius* reporteth, in *Apulia* and the Kingdome of *Naples*, as *Ferrantes Imperatus* affirmeth, who sent some of the roots thereof unto *Clusius*, in *Candy* also and diverse other the warmer Countries, but they are all nourished up onely within the gardens of those that are curious. The twelfth is not expressed where it is naturall. The last is remembred by *Camerarius*, who saith it was found in certaine woods about *Lypsik* in *Germanie*.

The Time.

They doe all flower in the Summer Moneths of *June*, *July*, and *August*, some earlyer and some later than others; but the third kinde is often found in flower in *May*.

The Names.

Pityusa is called in Greeke *Orobos*, in Latine and in Shoppes *Esula*, or *Esula minor*, because there is a greater as hath before been shewed before; it seemeth to have taken the name from *Pityusa*, being derived thereof, and made *Diminutive*, as if it were *Pityusula*, and short *Pitula* or *Esula*, as a small *Pityusa* or Pine Spurge. The first is taken to be the *Tithymalus Myrsinites*, and called *Esula minor* generally in most Countries, although the seede appeare not at the declination of September; yet is often confounded with the third, which is called *Cyparissias* by most authors, but therefore *Valerius Cordus* noteth the first to be his second *Tithymalus Cyparissias*: that the roote hereof is taken by *Matthiolus* and others for *Turbith*, I have shewed before. *Nicolaus Myrepsicus* in some medecines and purging pultesses appointed to be put therein to *Esula*, by the name of *Chamapitys*: whereupon *Fuchsius* thinketh that *Myrepsicus* hath *Cognominated*, in the ordinary ground Pine and not any kind of *Tithymall*, being deceived by the *Homonymy* and double sense of the word: for *Chamapitys* signifieth a low Pine, which *Pityusa* doth also but *Chamapitys* doth resemble a Pine in sort in the crimons knots in the forme of the leaves, which *Pityusa* doth not, and also that *Pityusa* is a strong purger, fit for such medecines and pills, as *Nicolaus* appointeth it an ingredient, and therefore by *Chamapitys* cannot be only meant for that *Esula* with Pine tree leaves. The second is by *Lobel* in his observations for *Spherularides* that same herbe, is here expressed, and I have adjoyned unto the first as most likely to be a species thereof, rather than a sort of the *Esula minor Tragi*, as I have shewed you in the next chapter save one before this, as *Bauhinus* would make it. The fourth *Bauhinus* referreth as I layd before to *Camerarius* his *Tithymalus arvensis*, and to that which *Fuchsius Dodonæus* in his *Historia Sacra authore Tragio* calleth *Esula*. *Bauhinus* in his *Pinax* calleth it *Tithymalus Cyparissias foliis parvis crassis rotundis*. The fifth is *Matthiolus* his *Leptophyllos*, whom *Camerarius* and *Thalius* doe follow. It is *Tragus* his *Esula exigua*, and *Esula minor* of *Dalechampius*. The sixt is

called πιτυς & κυπαρισσος, *Peplus & Cyce*, and μικρα δενδρωδης *Mecon aphrodes* as *Dioscorides* saith, in Latine *Esula ramosa*, from the forme as well of the branches, growing up round about the roottes, and the umbell of fours which are round, which names hold withall writers. The seventh is called πιτυς ελαττων, *Peplus & Peplis*, of the red colour of the leaves, and δενδρωδης *Andrachne agria*, i. *Portulaca sylvestris*, of the face and forme of the whole plant: it hath no other Latine name than *Peplis*, yet *Bauhinus* calleth it *Peplis maritima folio ampliore*, and *Cæsalpinus Peplium*, and is *Dalechampius* his *Peplion*. The eight is called *Chamæpice*, χαμαι πιτυλη φυλλον ἐχουσα *similis fruticosa* generally of all writers. The ninth and tenth *Bauhinus* onely remembreth, and giveth the names they are in the titles. The eleventh is called κυπαρισσιας *Apios* of *Dioscorides*, and τροπικη *Ischas* of *Theophrastus*, by the forme of the roote, which is like unto a peare or egge; in Latine *Tithymalus tuberosus*, by which name either the one or the other, all writers call them; but there is an errour in *Fuchsius* and *Tragus*, in mistaking a kind wilde kind of Vetch, with small tuberous or elongge rootes, growing in woods and fields to be *Apios*, which *Matthiolus* doth reprove in calleth it *Glycyrrhiza*, and is the plant that *Gerard* doth call in *English* Peale Earth Nut, in Latine *terra glandes*, and of *Tabernæmontanus* and others *Chamæbalanus*: *Turner* also is in another errour supposing the *Balbocastanum* or *Nucula terrestris* to be *Dioscorides* his *Apios*. The twelfth *Clusius* saith he had the figure onely sent him from *Matthiolus*, and therefore calleth it *Ischas altera*. *Bauhinus* translating the name to *Tithymalus tuberosus oblongus radice*, and I to *Apios sive Tithymalus tuberosus oblongus radice*, but I verily thinke it to be, but some various kind of the former *Apios*. The last *Cæsalpinus* onely hath made mention of in his *Hortus Aretianus*, calleth it *Tithymalus tuberosus alter*, and *Bauhinus Tithymalus tuberosus Germanicus*, as it is in the titles.

The Vertues.

All these spurges are of the nature of the former, yet some more, some lesse violent in purging, and condite better to some speciall diseases, as you shall heare in particular. The first *Pityusa* which is accounted the true *Esula major*, (although the *Cyparissias* be taken of many for the same, and so used but with lesse successe, neerest thereunto) is accounted of force to heale the bitings or stingings of venemous serpents: it purgeth strongly downewards both choller and flegme, and taketh away the hardnesse and paines of the belly, and the lings of the breast: the seede and roote prepared helpeth the dropsie, being carefully and with good advise: the leaves (steeped a while in vinegar, and afterwards dryed and made into powder, which is the preparation them) may be given to the weight of three drammes saith *Dioscorides*, (which I hold proportionable, to that of the great quantities of purgers, given by the ancients where of I have spoken before, which is over large given to any in our time, or at least nation) the roote (prepared in the manner aforesaid) is given likewise to weight of two drammes saith *Dioscorides*, in meade or honeyed water: but one dramme is so strong, that not fit to be taken but with caution, and by a strong body) the seede saith *Dioscorides* may be taken to the weight of a dramme: but seeing 9 or 10 seedes of the garden Spurge is a sufficient strong medicine. I thinke so many those seedes are too many by much: and of the juyce or milke a spoonefull *Dioscorides* appointeth, being made into pills with flower, which is the strongest of them all: an extract made artificially out of the rootes is also commended by many in the dropsie, and other diseases before named, but it had needs of no small, as well in preparing as giving. The pills of *Esula* set downe in the 16 chapter before, doe properly belong unto this being to be made more properly of this *Esula* than of that. The small annuall Spurge is in purging like the flores, but is not so strong for the diseases aforesaid as the former are. The seede of *Peplus* the round *Esula* being beaten and drunke in hydromel or honyed water, purgeth flegme and choller. The leaves are used pickled up, and kept to be used in meates, and the powder of them saith *Dioscorides*, strewed upon meates loseth the belly: The small purple Sea Spurge hath the same properties, and is used to be pickled and eaten with the like effect that the former is. The Perty or Tyme Spurge, is used for paines of the mother, if the tops, branches and leaves be bruised with a little wine, and put up as a pessary: The same boyled and taken doth purge the belly even as the milke or juyce doth also, and is good against the stinging or biting of serpents, and taketh away all manner of warts and excrescences of the like nature. It is very effectuall for the dimnesse or mistinesse of the eyes, to cleere the sight, and also for watering or running eyes, and to take away filmes or tearnesse grow upon them, used with a little honey. The tuberous or knobbed Spurge saith *Dioscorides*, purgeth downewards, if the lower parts be taken, and upwards if the upper parts be taken: but the juyce to the quantity of half a dramme, purgeth both wayes, and so doth the plant being taken wholly together. The manner of drawing the juyce thereof (is somewhat rude in regard of the exquisite manner of preparing extracts chymically in these dayes) as *Dioscorides* teacheth it downe is this. Beate the rootes and put them into a vessell full of water, bruise them well therein, and with a feather gather the supernoll upon the water, which being dryed and kept, serveth for the uses aforesaid, and for those that have the dropsie. All these cleanse the skinne from discolouring, sores as the former doe, and with as good successe. There is none of them but are strong and violent, and therefore great caution and advise is to be had, in taking of them inwardly, and therefore some appoint to put divers cold herbes to them in the taking: but for outward applications there is the lesse feare of danger, because if the skinne be any thing exulcerated, and the parts inflamed, helpe may sooner be had and applyed thereto, than within the body.

CHAP.

Chap. XIX.

Hippophaes, Hippophaestum & Hippomanes. Thornie Milkewort or Fullers thorne.

BEcause *Dioscorides* speaketh of *Hippophaes* and *Hippophaestum*, making them both Thornie plants, yeelding milke and purging, before *Ruellius* and the *Tithymales*, and *Theophrastus* in his ninth booke, and eleventh chap. saith that *Hippomanes* is made of *Tithymalus*, or *Infantis* Milkewort, the best as hee saith, was knowne to be made in *Tegea* and was held to be of great worth; yet my *Theophrastus* in Latine, which is very ancient without name of the *Printer* or yeare of the Printing, hath in that place *Hippophaes* although I confesse I have seene Greeke copies which have had *Hippomanes*, but lately *Hippomanes* being declared by other authors, to bee a kinde of poyson made of the nature or thinne Sperme of *Mares*, as you shall heare by and by, could not in my minde be so unknowne to *Theophrastus*, that he should say, it was made of the *Tithymalls* or Milkeworts, but rather that *Hippophaes* was a Milkewort, or made thereof, for in his 6. booke and 4. chapter at the latter end he numbreth *Hippophyon* which *Gaza* translateth *lapsana*, among those plants that beare thornes as the leaves, and in the same booke and 5. chapter he nameth *Hippophaes* which *Gaza* translateth *lapsana* likewise, to have gentle smooth leaves, not like unto the Capers, which have sharpe leaves as well as stalkes, and in his 9 booke and 15 chapter, maketh no mention either of forme, having declared it before, or of purging or poysonfull quality thereof, but numbreth it among other things, the best whereof grow in *Arcadia*, and nameth it next after the *Elaterium*, made of the Wilde Cowcumbers, so that it is probable his *Hippophyon*, *Hippophaes*, *Hippophaes*, or *Hippomanes*, whether you will, for diverse doe thinke diversly, was an herbe or roote, that bore thornes as is before declared, whose condensate milke or juyce, was of much worth being made in *Tegea*: I thinke it not a misse somewhat to declare both what I thinke *Dioscorides* his *Hippophaes* and *Hippophaestum* are, and the derivation of the name: and what *Anguillara* and others say of it also, that say they have found it, to incite some industrious to attaine it also, if that which I shall shew you in my opinion be not it, and likewise to shew what diverse authors doe report of *Hippomanes*, that thereby the diversity of things might cleere *Theophrastus* from imputation of want of knowledge, what *Hippomanes* was, or variety from others, and that his *Hippophaes* and *Dioscorides Hippophaes*, was one and the same thing. This therefore is the text of *Dioscorides* concerning *Hippophaes*. *Hippophaes* wherewith fullers doe refresh garments, groweth in gravelly grounds and neere the Sea. It is shrubbish plant thicke of leaves, or well spreade, having long leaves like unto the Olive tree, but smaller and longer, and betweene them many whitish hard thornes distant one from another. The flowers stand in clusters like unto those of Ivye, but smaller and more gentle, somewhat reddish or bluish out of a white: the roote is thicke and tender full of juyce, like milke and bitter in taste, from whence as from *Thapsia*, a juyce is taken, which being dryed up either by it selfe simply, or with the flower of *Orobus* (or the bitter vetch) is kept for their use that needs it. *Hippophaestum* (saith *Dioscorides*) which some call *Hippophaes*, groweth in the same places, and is a kinde of Fullers thorne also. It is a low herbe having thorne small leaves, without either stalke or flower, with empty heads, it hath thicke and tender rootes: a juyce is drawne out of the rootes, leaves, and heads, and dryed up to be used. Thus farre *Dioscorides*. In comparing therefore *Dioscorides* and *Theophrastus*, I doe not finde them to vary more than in a letter or two of the word. For as you heare *Dioscorides* saith *Hippophaes* hath many branches full of leaves, and some thornes also, and *Theophrastus* doth intimate the same, saying that *Hippophaes* hath smooth leaves, and thornes by the leaves, or is a thornie plant as *Ptelea* (of which you shall heare in that part that speaketh of thornie plants) *Capers*, *Caltrops*, and *Rosa Hircina* are: *Dioscorides* saith the roote of *Hippophaes* is thicke and full of a milkie juyce, and *Theophrastus* saith *Hippophaes* (as I sayd my booke hath it, and *Columna* in his chapter of *Hippophaes* hath so also, or as others have *Hippomanes*, which as I sayd before cannot be) is made of a *Tithymall* or Milkewort, the best being made in *Tegea*, and is of great worth, *Pliny* maketh mention of *Hippophaes* in one place, and of *Hippophaestum* in another, as of one and the same plant, as likewise of *Hippophaestum* in severall places, which as yet in one place he calleth *Hippace*, but in that he doth but relate what he hath out of *Dioscorides*, yet somewhat different: it is probable he never saw the plant, but did deliver what he sayd onely upon the credit of the author, we shall not neede to insist more upon him. The Greeke name ἱππόφαες commeth either of ἵππος & φάος, or φάω which is interpreted *equorum salus aut lux, aut æquigenita*, for so *Pliny* in his 22 booke, and 22. chap. saith, *Debent accommodatæsse ex equarum natura ad vires, ex alia aut alia earum accepisse*: and ἱππομανὲς ἐστὶ ὃ & μανὲν quæ equarum mentem sive furorem agnoscit: but because *Dioscorides* saith it was called *Spina fullonia*, and that garments were cleansed thereby, it seemeth the *Etymon* of the word was rather derived from ἵππος taken *per adverbii accessionis*, & sic pro valde or multum, & φάος pro lumine or nitore, of the cleansing quality: for so *Pliny* saith of *Hippophaestum* in his 27 booke and 10 chapter *Hippophaestum nascitur in Italia ex quibus fiunt pilæ fullonia* (for with the plant or roote made into balls, those times of his used to scoure garments, like as if it were done with sope. *Anguillara* saith he found *Hippophaes* in the Iland *Peloponesso*, in the sandy grounds by the seaside, which had a roote of the length of ones hand or better, yeelding a thinne juyce, being either broken or wounded, like in colour to milke, of a very bitter taste: the flour saith he saw then neither flowers nor fruite) and strong smell, which the inhabitants call *Acantha Macedonica*, *Spina purgativa*, the purging Thorne, which *Anguillara* setteth downe in his *Pinax* for a kinde of *Rhamnus Coronopi folio*, and thinketh the *Hippophaestum* mentioned of *Lugdunensis* to be the same: *Fabius Columna* refuting the opinion of others that rooke the *Rhamnus primus* of *Dioscorides*, as *Lobel* supposeth that purging thornie plant to be growing in the Isle of *Ely*, *Penny* and *Holland*, supposeth that that kinde of *Rhamnus* which groweth in *Campania* and *Italie*, be the first flourish, called by the *Italians* in those places *Spina santa*, and which is the second sort of the fifth kinde of *Rhamnus*, set forth by *Clusius*, doth more neerely resemble the *Hippophaes* of *Dioscorides*: but in my simple opinion of such thicke shrubbes, wanting milke as the roote can be the *Hippophaes* of *Dioscorides* called also *Spina fullonia*, *Ruellius* likewise saith that *Hippophaestum*, was brought from *Narbone* in *France*, which had small whitish leaves among the thornes, by *Lugdunenses* it is said that *Hippophaestum* was sent to *Dodonæus* from *Italie* or *Africa*, and was a plant, spread full of thornie branches or rather the branches being wholly but thornes themselves, with small white flowers, standing close to-

gether at the joynts and partitions of the branches; but whether it were purging was not signified: this declaration, being onely taken from the dryed plant was lente: but if I may be bold to give my centure, what *Hippophaes* is, and whether it be to be found or no, I would furely conjecture, that the plant called *Galaſſiwedde Cretica* which I have ſet forth in the 15 chapter of this part, under the title of *Tithymalus maximus Cretenſis ſpinoſus*, and as I ſay there, is ſayd by *Honorius Bellus* to be a kinde of *Tithymall*, or Spurge having thornes, and giving milke, whoſe roote is thicke and fleſhy, might as neere reſemble *Hippophaes*, both for forme, for giving milke and purging quality, as any other plant whatſoever, and even the relation of the leaves and flowers ſet downe in that place, is not greatly differing, let others judge hereof as they ſee cauſe. Now concerning *Hippomanes* let me ſhew you alſo what diverſe authors have written thereof. Firſt it is imputed to *Theophraſtus* to ſay, as ſome copies (but I thinke) greeke copies have it as I ſayd before, and *Camerarius* as I thinke was the firſt that did ſo cauſe it to be read, that *Hippomanes* is made of *Tithymall*, but is miſtaken for *Hippophaes* as I ſayd before. *Theocritus* ſaith in *Pharmaceutris*, that *Hippomanes* is a plant whereby horſes are made furious madde. *Colluvella* ſaith that *Hippomanes* is a poyſon, which kindleth luſt in horſes like to that of men, but what it is, or whereof it is made or taken, he doth not expreſſe. *Virgil* alſo in his 18 booke and 11 chapter aſſermeth, that *Hippomanes* was of ſtrong power or force in witchery or ſorcery, that being but ſayd to the braſen figure of the mare at *Olympus*, would drive the horſes in extreame fury to cover it: which *Pauſanias* before *Pliny* his time, doth ſet downe more at large in his firſt booke: but *Ariſtotle* in his 6 booke and 18 chap. of the nature of beaſts, ſaith that mares doe let paſſe from them a certaine thinne humour, like unto their ſperme, when they are inflamed with luſt to be covered, which is called *Hippomanes* by ſome, and in the 22. chap. of the ſame booke he ſaith, that there ſticketh to the forehead of the foale, new fallen, a certaine round, and ſomewhat broad blacke peece of fells skinne, of the bigneſſe of a ſmall dryed figge, which the mare licketh up with the ſecondine, as ſoone as ſhe hath foaled, which if any ſhall take away before ſhe hath devoured, and afterwards offer it her to ſmell unto, ſhe not knowing the ſent thereof, will be ſtirred in to great fury or madneſſe, but will not ſuffer her foale to ſucke of that hath it taken therefrom; which thing *Iunius Solinus Polyhiſtor* confirmeth in the 42 chapter of his booke, onely he varyeth from *Ariſtotle*, in ſaying it is of a brownish yellow colour, which hee ſaid was blacke. And *Pliny* writeth alſo the ſame thing in his 8 booke and 42 chapter, although he ſaid alſo, it was an other thing as you have heard before. *Virgill* in his third booke of *Georgickes* hath theſe verſes, to ſhew what it is and what uſed, taken as it ſhould ſeeme from *Ariſtotle*.

Hinc demum Hippomanes, vere quod nomine dicunt
Paſtores, lenarum diſtillat ab inguine virus
Hippomanes, quod ſæpe malæ legere novercæ.

And *Tibullus* the Poet in his 2. booke and 4. *Elegie*, hath the ſame alſo in effect in theſe verſes:

Et quod, ubi indomitis gregibus Venus aſſuit amores
Hippomanes, cupidæ ſtillat ab inguine equæ.

Anguillara is of opinion that the *Hippomanes* of *Theocritus* is the leſſer *Stramonium*, or thorne apple, and *Crateuas*, whom *Theocritus* his interpreter doth cite ſaith, that it is a plant whoſe fruite is like the wilde Cowcumber fruits, but full of thornes: Now if the ancients have left theſe doubts, whether *Hippomanes* be an herbe or made of an hearbe, and ſhew not certainely what the hearbe is, or doe not all agree that it is the ſperme of mares, how ſhall we in their times compound the controverſie.

The Vertues.

Dioſcorides ſaith that the pure juyce of *Hippophaes* it ſelfe being dryed, and the weight of halfe a ſcruple thereof taken, or the weight of two ſcruples, if it be made up with the meale of the bitter Vetche, taken in meade or honyed water, purgeth downewards flegme, choller, and water: the whole plant roote and all bruiſed and put into meade, and about a quarter of a pint thereof taken, worketh in the ſame manner: the juyce taken from both the plant and the roote, as it is uſed to be done with *Thapſia*, a dramme thereof taken at a time is a purgation of it ſelfe for the ſame purpoſes. The juyce preſſed out of the rootes, leaves, and heads, of *Hippophaes*, is to be dryed and halfe a dramme thereof given to whom you will, in meade or honyed water, draweth forth flegme and water: principally and chiefely this purgation is fit or convenient, for thoſe that are troubled with the falling ſickeneſſe, ſhortneſſe of breath, and aches in the joynts and ſinewes.

CHAP. XX.

Alypum Monſpelienſium ſive Herba terribilis Narbonenſium. Herbe Terrible.

BEcauſe this herbe is of a moſt violent purging quality, ſharpe and exulcerating withall, very like unto the former *Tithymalls*, I thinke it fitteſt to joyne it next unto them and another whole which by *Pena* his judgement is very like thereunto, both for face and quality.

1. *Alypum Monſpelienſium.* Herbe Terrible.

This terrible herbe hath many wooddy ſtalks, riſing two or three foote high, dividing it ſelfe into ſmaller branches, covered with a thinne barke, the elder branches being of a darke purpliſh colour, and the younger more red, thicke ſet with ſmall hard and dry leaves without order, from the bottome to the toppe, which are ſomewhat long and ſmall at the ſetting on, broader in the middle, and ſharpe pointed, ſomewhat like unto ſmall Mirtle leaves, of a greenish colour on the upperſide, and whitiſh underneath: at the top of every branch ſtandeth a round flower in a ſcaly head, conſiſting of many purpliſh thrummes or threds, yellow in the middle than round about, ſomewhat like unto the head of a *Scabious* or rather *Knapweede*: the roote is of a fingers thickneſſe, long, wooddy and of a brownish colour, ſomewhat ſalt, if it grow neere the ſea ſhore, where it may drinke any of the Sea water, or elſe not ſalt at all, but bitter if it grow further off: the leaves alſo taſte after the ſame manner.

3. *For-*

1. *Alyssum Monspelliensium sive Herba Trentalis.* Herbe Trentale.

2. *Tartonraire Massiliensium.* Gutworte or Trouble belly.

Hippophaestum Valentinum Clusii.

3. *Tartonraire Massiliensium.* Gutwort or Troublebelly?

The herbe Gutworte or Troublebelly, hath very many hoary, or silver white slender and very tough branches, two foote high, divided into many other smaller, whereon grow many small white hoary leaves round about them, smaller than those of *Alyssum*: the flowers are white and small, set close together, in a long tuft, but so covered with the white woolinesse that they can scarse bee perceived: after which come small blacke seede, bitter and unpleasant, and so fiery hot, that if any shall either chew of them or the leaves, a little in their mouth, they will so heate the mouth, lippes, and jawes, that no washing will for a long time take it away: the roote is small long and woodly, with many fibres at it, yellow with on the outside and white within, nothing so hot, bitter or unpleasant as the leaves or seede, yet leaving a small hot taste at the end, without any sent, and not giving any milke: it is saith *Pena*, very like unto the *Turbith* of *Alexandria*, or of the shoppes, in the forme thereof.

The Place.

The first groweth in the mountaine or hill, called *Cestius* or *Cap de cesse*, and in other rockes and stony places, hard by *Marseilles* in *France*, as also in diverse places in *Spaine* as *Clusius* saith. The second doth likewise grow neere *Marseilles* by the Seaside, on a small hill neere thereunto, called *Mondroud*. as *Pena* saith, and all along the coast of *Liguria*, and the Iles of *Corsica*, and *Sardinia*, as *Lugdunensis* saith.

The Time.

They flower not untill it be late with us, but *Clusius* found the first in flower, in the moneths of *February*, and *March*, as he saith in *Spaine*.

The Names.

Alyssa in Greeke, *quale vocabulo insolentiamque remedium vel derivatum, per contrarium enim se habet, quam adnomodum in aliis; Graeci scribunt sylla, quasi sine dolore, Holostium totas esse, cum herba sit veneri applicata*: except it might rather be said to come from *ἀλυσσᾶν, falsum vel mendacium*, because it groweth neere the sea: in Latine it is called also *Alyssum* & *Herba rabiosa*, affording as the common people of *Provence* doe call it, from the effects it worketh. It is called also *Alyssa* by *Matthiolus*, yet some thinke that his *Alyssa*, which as he saith purgeth flegme, doth differ from his *Alyssum*, which purgeth blacke choller: but *Paulus* reconcileth this doubt in his seventh booke, and fourth chapter, where hee saith, that the seede of *Alyssum*, purgeth downewards blacke choller, taken with a little salt and Vinegar, in the same quantity that *Epithymum* doth: but if we credit *Dioscorides* saith he, it doth lightly exulcerate the guts: but is the same in my judgement saith *Paulus*, which is now called *Scrpyllum*: the roote hereof, as I sayd in the chapter of *Tithymalls*, is called by *Matthiolus Tuscanus* callus, as that of *Ulmus minor*, *Tuscanum nigrum*: There is some doubt with many, whether we have the true *Alyssum* of *Dioscorides* or no, for that some copies differ from others in the description of the forme of the plant, some having the word *ἀκρεμων*, that is like fennell, and *ἀκρεμων* somewhat red say others, whereupon

Original from UNIVERSITY OF MICHIGAN

whereupon *Lobel* and *Pena* are bold to affirme in their *Adversaria*, that our age knoweth no herb, that may fo well or more truely, both in the forme and purging vertues, refemble *Dioscorides* his *Alypum*, (except the *Pentaphyllon*) then this herbe here fet forth, altering that word onely, which as he faith may be a faute (fuch as is common in many other places of his worke) in the transcribers: and hereupon as it is probable *Matthias* grounded his opinion, that Turbith was the roote of a fertulous plant. *Clusius* faith that diverfe profeffors in the Vniverfitie at *Lenida*, did call an herbe which he there found *Hippogloſſum*, fuppoſing it to be the true *Hippogloſſum* of *Dioscorides*, whereunto it can as he faith be nothing like, the properties being fo differing, except in a little appearance of likenelle in the leaves: *Clusius* alſo doth not acknowledge it to be *Alypum* but mifliketh of their judgement, that doe referre it thereunto, becaufe the leaves are fo dry, that they feeme to be without any juyce in them; whereupon the *Spaniards* call it *ſiempre viuenta*, and from the round head of flowers, which is paler in the middle then round about, doe call it *Coronilla frayles*, *Coronula fratrum* the Friers Crowne, and of fome as he faith *Stoechas*, but others of good judgement doe hold them, to be both but one plant, the diverſity, if any be, to conſiſt in the climate. *Dalechampius* as *Lugdunenſis* ſetteth it forth, was of opinion, that it might be *Empetron* of *Dioscorides*, which others as he faith called *Thymeleas*, onely led thereunto, by the purging quality and growing neere the Sea, as *Empetron* doth, and becauſe that the *Crithmum* or *Fœniculum marinum*, is difproved by moſt not to be *Empetron*, which many heretofore thought to be ſo, (and among the reſt *Pandolphus Collenutius*, in his defence of *Pliny* againſt *Leonicenus*, for it is certainely ſeene, that *Pliny* hath confounded that *Empetrum*, which is a *Saxifrage*, with the other which is a purger) becauſe it hath no purging quality in it at all: but ſeeing we hold this *Alypum*, to be the right or neereſt it of *Dioscorides*, I cannot ſee what reaſon can move any, to think it to be *Empetrum* alſo, ſeeing *Dioscorides* maketh them two diſtinct herbes in ſeverall chapters, and placeth the one the very next unto the other: ſome alſo as *Lugdunenſis* ſaith, take it for *Pinaſter*, or for the third ſort of *Genſta*. *Bauhinus* in his *Pinax*, calleth it *Thymelæa folijs acutis, capitulo Succiſæ, ſive Alypum Monſpeliacum*. The other is called *Tartonraire* by *Lugdunenſis*, and *Lobel*, and is ſo called as hee ſaith, in the Iſles of *Corſica*, *Sardinia*, and all along the Sea coaſts of *Liguria* and *Marſeilles*. *Dalechampius* ſaith that many doe referre it to the *Sefamoides magnum* of *Dioscorides*, which he hath mentioned in his fourth booke, and 147 chapter, with leaves of Groundſell or Rue: and therefore *Dalechampius* in the deſcription hereof ſaith, the leaves are like Rue, which in my judgement doth very hardly agree thereunto, but much leſſe unto Groundſell, whereunto they are alſo compared. Furthermore he ſaith alſo, that peradventure this may be that *Helleborus* of *Theophraſtus*, whoſe ſeede is like *Seſamum*, and wherewith in *Anticyra* as he ſaith they uſed to make purgations: but the extreme purging quality herein, (the wing it as *Pena* ſaith, to be a new plant of our ages finding, and not well knowne to be mentioned by any of the ancient writers, Greekes, *Arabians* or *Latines*, hath cauſed diverſe to referre it, as fay, ſome to *Seſamoides*, and others to *Theophraſtus* his *Helleborus*, with the fruite of *Seſamum*, and yet whoſoever will advitedly conſider, the ſeede of all the ſorts of *Helleborus*, both the white and the blacke, ſhall not find them much unlike the ſeedes of *Seſamum* it ſelfe. *Alphonſus Pantius* of *Ferrara* tooke it to be *Cneorum* of *Theophraſtus*: the roote hereof as *Pena* ſaith, is like unto the Turbith of *Alexandria*, and hath not ſo much heate or bitternelle therein, nor other evill taſte as others have. *Bauhinus* calleth it *Thymelæa ſolijs radicalibus ſeminaſtri mollibus*.

The Vertues.

The ſeede of *Alypum* (ſaith *Dioscorides*) or herbe terrible, purgeth downeward blacke choller or melancholy, if it be taken in the like quantity with *Epithymum* and a little ſalt and Vinegar put to it in the taking, but he ſaith it doth a little exulcerate the bowells: the common people in *Narbone*, but eſpecially the Quackſalvers and women leeches, as *Pena* ſaith, notwithſtanding they find the effect to purge with ſuch violence, yet doe often times, making a decoction with the leaves flowers or ſeede, or otherwiſe make them into powder, and give it them with wine or broth: the ſmalleſt quantity thereof, to be taken in chicken broth, ſaith *Pliny* is two drachmes, a meane quantitie is foure drammes, and the greateſt portion to be given at once is five drammes. *Clusius* ſaith that the Landlopers in *Spaine*, doe uſually give the decoction hereof unto thoſe, that are troubled with the *Frenſh* diſeaſe, and that with good ſucceſſe as it is reported: the other Gutworte or Trouble belly is as violent moving as the former, or rather much more, for the violence thereof is ſo unbridled, that it oftentimes cauſeth immoderate fluxes, even to blood and excoriations; eſpecially if the dryed leaves be given unadviſedly in powder, and mixed with ſome potable liquor, and driveth forth cholericke, flegmaticke, and watery humors in abundance; the roote likewiſe worketh powerfully for the ſame diſeaſes, which if it were *Theophraſtus* his *Helleborus*, or *Dioscorides Seſamum*, were unprofitable or of no uſe; the ſeede onely with them and not the roote, having the propertie and power of purging. Advice therefore before taken, and preparation both of the phyſicke and body, the quantity alſo, the diſeaſe and ſtrength of the patiente conſidered, it may be adminiſtred to be given where better and ſafer things cannot on the ſuddaine be had.

Chap. XXI.

Thymelæa, Spurge Olive.

There remaine yet ſome other violent workers, which ſhall be declared in this and the next Chapters following, and firſt of the *Thymelææ*, and then all the ſorts of *Chamelea* and *Smmonia* of *Clusius*, becauſe they are ſo like both in forme and nature; and let me alſo adjoyne the ſmall *Sefamoides* of *Dalechampius*, for the neere affinitie with them.

1. *Thymelæa*. Spurge Olive.

This Spurge Olive hath diverſe tough ſtalkes, riſing to the height of two or three foote, ſometimes in the naturall places, and much lower in ſome other, of the thickneſſe alſo of ones thumbe, covered with an aſh coloured barke, and ſpread into many branches; whereon grow many ſmall, clammie, flat, pointed leaves, ſomewhat like unto Mirtle leaves, or rather unto the narrow leaves of the Olive tree, for they are larger and broader than the leaves of Flaxe, whereunto many doe compare them, and doe continually abide on the branches without falling

falling off as the *Chamælea* doth; at the toppes of the branches grow many small starlike flowers, consisting of foure white leaves a peece; after which come small berries greene at the first, and of a very red colour, like unto Corall when they are ripe, being a little more long than round, of the bignesse of a Mirtle berrie, with a pulpe or substance like unto a Cherry, wherein is one kernell covered with a blacke soft and brittle shell: the roote is soft and tender while it is young; very like unto a Raddish roote as *Clusius* saith, but wooddy when it is growne elder, covered with a rough thicke barke.

2. *Thymelæa minor sive Coccum Matthioli.* Small Rocke Roses.

This plant hath diverse long weake and slender but tough branches lying upon the ground divided usually into other smaller ones whereon grow many small long and somewhat thicke leaves neere unto those of *Mesereon*, set without order to the tops where it shooteth forth a tuft of many flowers together, consisting of foure leaves a peece, of a bright red or carnation colour, and in some plants white, very sweete, which turne into small round whitish berries, conteining small round seede, of a grayish colour: the roote is long and yellowish, spreading diverse wayes under ground, and abideth many yeares shooting forth new branches.

3. *Chamælea Germanica sive Mesereon vulgi.* Dwarfe Bay or flowring Spurge.

There are two sorts hereof, the one having a pale, and the other a deeper red coloured flower, they both rise up with a thicke wooddy stemme, five or six foote high or more, and of the thicknesse (if they be very old) of a mans wrest at the ground, spreading into many flexible long branches, covered with a rough grayish barke, beset with many small long leaves somewhat like unto Privet leaves but smaller and paler and in a manner round pointed, falling away every yeare: the flowers are small consisting of foure leaves, many growing sometimes together at a place, and usually before the leaves appeare, after which come small berries, greene at the first and very red afterwards, but blackish red being suffered to abide long on the bush, the roote spreadeth into many long and tough branches covered with a yellow barke.

4. *Chamælea Alpina incana.* Mountaine Spurge Olive.

This mountaine Laurell hath a small wooddy stemme three or foure foote high or more, branching forth towards the upper parts, into many slender and tough branches, covered with a rough hoary greene barke, beset at the ends thereof with flatter fuller and smaller round pointed leaves than the former, of a grayish greene colour on the upperside and hoary underneath, which fall away before winter as the last doth: the flowers are many, set together at the ends of the branches, greater than the last, consisting likewise of foure leaves a peece of a light bluish colour, standing in small grayish huskes, of as little sent as the other: the berries are small long graines of an excellent red colour, which afterwards turne blacke: the roote is long and spreadeth about under the upper part of the earth.

5. *Chamælea tricocca.* Widdow waile.

This triple berryed Spurge Olive hath no great stemme at all, but spreadeth from the ground into many flexible tough greene branches, whereon are set diverse narrow, long, darke-greene leaves all along them, which

1. *Thymelæa.* Spurge Olive.

2. *Thymelæa minor sive Coccum Matthioli.* Small Rocke Roses or Spurge Olive.

Abides

abide greene all the winter; the flowers are very small, scarce to be seene, and come forth betweene the leaves and the stalke, of a pale yellow colour, consisting of three small leaves, after which come small blackish berries three usually set together: the roote spreadeth not much in the ground but is hard and woodby, dying oftentimes if it be not well defended in the extremitie of winter.

6. *Sanamunda prima Clusij.* The fifth Spanish Spurge Olive of *Clusius*.

This kind of Spurge Olive hath diverse flexible pliant branched stalkes, rising up to a foote and a halfe high, covered with a blackish barke, and under it with a gentle smooth one, which may be easily separated into long threads: having many small and some what long hairie leaves thicke set on them, smaller sharper and thicker than those of *Chamelea* or Dwarfe Bay, and commeth some what neere in likenesse to the Sea *Tithymall*, or Sea Spurge, but somewhat hayrie, of a bitter sharpe and burning taste, somewhat clammie or gummie in chewing: the flowers grow with and among the leaves on the branches, consisting of foure small yellow leaves a peece: after which come small blackish berries some what like unto the last: the roote is thicke long and woodby. *Clusius* mentioneth another hereof with shorter leaves and whiter or downie, and small yellow flowers in tufts.

7. *Sanamunda 3 Clusij.* The third Spanish Spurge Olive of *Clusius*.

The third Spanish kind of Spurge Olive, hath whiter and more pliant stalkes, covered with a thicker barke, very hard to breake, the smaller toppe branches being almost wholly white with downe, which bend againe towards the ground, whereon are thicke set a number of whitish leaves, and thicke, covered as it were with cotten or downe, smaller than the last, and very like to those of Stonecroppe of a sharpe hot burning taste: the flowers are small and greenish or pale (saith *Clusius*) like unto the others, the roote is thicke and woodby like the former.

8. *Sefamoides minus Dalechampij.* A different Spanish Spurge Olive.

There is another sort of this plant as I thinke, that *Dalechampius* as *Lugdunensis* saith, used to call *Sefamoides minus*, that is in comparison of the greater kind, was set forth by him a little before, not understanding the minus of *Dioscorides*, which is a farre differing plant: but this *Sefamoides minus Dalechampij*, hath small pale greene leaves, set about the woolly stalkes: the flowers come forth at the joynts with the leaves, which are small and white, and not yellow, very sweete in sent, farre differing from all the rest in sweetenesse.

9. *Sanamunda Monspeliana glabra.* Smooth French Spurge Olive.

This greene or smooth Spurge Olive, hath a thicke white woodby roote, covered with a pale coloured gentle pliant thicke barke, from whence shoote out many small slender branches, full of joynts, and of an hand breadth high: on each side whereof are placed diverse small short and narrow greene leaves, seldome round pointed, some what like unto the leaves of *Polygala* Milkewort or Sanguliver: the flowers are small and yellow standing with the leaves and amongst them: the seede hath not beene observed.

10. *Sanamunda Africana.* Spurge Olive of Africa.

This *African* plant hath diverse pliant stalkes rising from the roote full of joynts, and two small and almost round leaves in them, which sometimes lye so close to the stalke, that they seeme to be onely thicker joynts than the others: the flowers are yellowish growing at the toppes of the stalkes: the roote is long and tough, with a rugged barke.

The Place.

The first groweth in many places in *Spaine*, as also in *Italy* in *Hetruria* and about *Trent* as *Matthiolus* saith, and like wise in *Narbone* of *France*. The second in *Germanie*, *Bohemia*, and *Austria*: The third in many places of *Germanie* also: The fourth in the mountaines of *Savoye*: The fifth in *Provence* and *Spaine*: the first in the Countries of *Granada* and *Valentia* in *Spaine* as *Clusius* saith. The seaventh both upon the hils, and neere the sea in some places of *Spaine*. The eight by the Sea side in the Iland of *Corsica*, and is seldome seene, either in *Spaine*, *Italy*, or *France*. The ninth was found upon the hill neere *Montpelier* called *Herba Dei*. The last by *Bootius* often remembred in this and my former worke in *Barbary*. All of them are very tender, having onely the warmer Countries, and will not without extraordinary care be kept in ours.

The Time.

The first flowreth not in Spaine until July and August, but the rest some in January or February, and some in March and Aprill, in their naturall places, and many with us not until June or July, if they be preserved in the winter.

The Names.

Chamelea in Greeke is called *Thymelea* in Latine also without varieties, *genus Tithymali, seu Tithymalo & Oleæ simile*. The *Arabians* call this *Alefersan* promiscuously with *Chamelea Germanica*, and *Tricocca*, the Greekes call the berries hereof (properly *Cnecos* which *Cnecos Cnidium* or *grani*, as some have it, but as *Dioscorides* saith, are not those of *Chamelea*, yet altogether the properties are not so farre differing, but that the berries of *Chamelea* may very well be used in the want of the others. *Dioscorides* saith that the leaves were called *Cneorum* in his time, which opinion *Gualtherus* broke thus to be *Cneorum nigrum* of *Theophrastus*, as he doth the *Chamelea* to be *Cneorum album* (which *Gesner* translateth *Cubi*) for hereof they made two kinds, the one white the other black. *Cneorum* is the kinde of plants called the *Cneorum Matthioli Thymelea minor* whom *Bauhinus* followeth (and so doe I) calling it *Cneorum saffua sive erectum*. But if I should in this place, upon this occasion, to save the often repetition in other places, shew you all the opinions of other writers concerning *Cneorum*, whereunto they doe referre them, and their contraries, I thinke I should not doe amisse: *Aquillara* maketh *Lavendula* to be *Cneorum sativum*, and *Turnerus* to be *Cneorum*, whom *Matthiolus* refuteth thus, that *Theophrastus* saith both sorts of *Cneorum*, have long roots into the ground, and the branches are pliant and gentle, fit to binde things withall: neither of which properties can be found in Lavander or Rosemary, *Matthiolus* in his last Latine edition, forceth foure figures of *Cneorum*, the one in the chapter of *Cinamon*, which he saith hath the true notes of *Cneorum album Theophrasti*, and the other in the chapter of *Thymelea*, which he thinketh to be *nigrum*: and in his second booke of Epistles, inserted into *Joannes Crato*, and in his fourth booke of Epistles, in that to *Bartholomæus Maranta*, as well against *Gesner* commentaries upon *Dioscorides*, in the Chapter of Cinamon he is perswaded that *Tragoriganum* the white is *Cneorum* is the *Cassia* whereof *Virgill* in his *Bucolicks* and *Georgickes* maketh so often mention, and which *Pope Pius* from the testimonies of *Pigonius*, calleth *Cassia* the sweete herbe and not the

Original from UNIVERSITY OF MICHIGAN

the Aromaticall tree, which is like to Canamon: *Lugdunensis* by correcting the greeke text of *Theophrastus* in divers places where he thinketh it is faulty, sheweth the figure of a Plant, accounted of divers, as he saith, for the *Cneorum alterum* of *Theophrastus*, which *Rubinius* judgeth to be the *Daryclinum Imperati & Ilstrani*, mentioned in *Clusius* his History of Plants. But *Bauhinus*, both in his annotations upon *Matthiolus* as he hath published them, and in his *Pinax* referreth both these plants of his, the hitherto *Oxymoides repens Polygoni folio* of *Lobel*, and the other unto the *Oxymoides repens* of *Camerarius*. *Alyconus*, as *Lugdunensis* saith, referreth his *Cneorum mas* to *Avicenne* his other *Oleander*, which he calleth wild *Oleander*, for as he saith it is like common *Oleander* in leafe, flower, and seed. The third is called *Chamelea* or *Alsefecanum* (fully now adayes) and to likewise be *Tragi*, *Dodonæus* and *Camerarius* call it *Chamelea Germanica*: by *Fuchsius* and others, *Daphnoides*, *Cotner in Tragi Bubi wides mellowm vulgare*; *Lugdunensis*, *Laureola femina*, *Angustifolia Pipericnianum*, and *Lobell*, *Laurea pulla*, *Alsefecon Germanicum*: some also take it to be *Thymelæa Dioscoridis*. The fourth is called *Chamelea Alpina* by *Lobell* & *Chamelea altera* by *Clusius*, and *Italica* by many with us, because *Clusius* said it came to them from *Italy*. The fifth is the true *Chamelea* & *Alsefecon* of the *Arabians*, & generally called now adayes *Chamelea Tricocca*. The sixt is called *Sanamunda*, by the *Spanish Moors* in *Granado*, as *Clusius* saith, and of the professed Herbarists here, or Herbarists there also, though the countrie people call them, as he saith, *Alterecaon* of the propertie of the strong purging. *Bauhinus* calleth it *Thymelæa folijs Chamelææ minoribus subhirsutis*, and *Thymelæa altera Species Mysoni* of *Lugdunensis*, & the second *Sanamunda* of *Clusius*, which *Bauhinus* calleth *Thymelæa Kali foemineis foliis*. The seventh is the *Erica Alexandrina* of *Lobel*, and the 2. *Sanamunda* of *Clusius*. The eight is called *Sefamoides minus Dalechampi* by *Lugdunensis*, who in my mind much confounded both himself and his readers herein, for he referreth this both to *Clusius* his second *Sanamunda*, which he saith is hot, sharp and somewhat salt, even as he saith his *Sefamoides* is: and also to the *Cneorum nigrum Mysoni*, which he describeth after the description thereof, that the taste of the leaves is somewhat binding, with a clammine the or gleamenesse therein also, which is quite differing in propertie, and yet he maketh them to be all one Plant: and *Bauhinus* following him herein, to setteth it downe in his *Pinax*: but both this description, as I have before told you, differeth from *Clusius* his second *Sanamunda*, which as *Clusius* saith, hath his flowers in clusters at the eye, and from the other which hath them at the joynts. *Clusius* again giveth unto his yellowish flowers like unto those of the Olive tree, and *Dalechampius* saith, it beareth small white flowers, very sweete: so that it may seeme to be a species thereof, and not the very same, but it cannot be also his *Cneorum nigrum Mysoni*, if the taste do differ as diverse others judge hereof after they have considered them both well. The ninth *Bauhinus* setteth downe in his *Pinax*, with the title *Thymelæa folijs polygali glabris*, in his *Prodromus* with the title *Sanamunda spicata, ex gimbra*, and referreth it to the *Thymelæa Species Mysoni* of *Lugdunensis*, who saith it doth well agree with the fift *Sanamunda*. The last is not remembred by any before.

The Vertues.

The first Sponge Olive cracked very churlishly with whomsoever, and in whatsoever manner you give it, the leaves prepared beaten to powder, and taken in wine or broth, or the berries swallowed, soddle or stewed and taken by themselves; for as *Dioscorides* saith, if twenty foure of the berries be taken in drinke (whose portion is answerable to the rest of the phisicke in those times as I have often said) or the inner pulpe of the ouely, it purgeth downewards very strongly, both Choller, Flegme and water, but as he saith, they burne the jawes and throate, and therefore they had needs be rowled, or otherwise given with flower or barlie meale, or swallowed in meate, or in raisins, the stones taken out, or taken with purified honey, being tempered with water and vineger, it is applied to them that are given to over much sweating. He that will give the juice of the leaves, had needs first to take away the strings that runne in the leaves, which may be done when it is gratelly beaten, before it be beaten finer, which prepared in this manner may be made into *Troches* or lozenges to keepe all the yeare, the leaves being gathered in Autumne. It is a remedy also for them that have eaten or drunken Hemlocke, the poysonfull herbe. All the *Sanamundas* likewise are violent purgers, for halfe a dreme of the juyce of the berries taken in wine, or in broth, which is the better, and the safer way, purgeth watrish humours aboundantly; and therefore if it be taken with good advise warily, it may doe good in Dropsies, Gouts, Joyne-aches, the *Sciatica*, and the like: in *Spaine* they usually give a dramme in the decoction of the Licore, which purgeth flegmatick and melancholy humors wonderfully, and consequently is available in all such diseases, as arise from such humours. *Lugdunensis* recordeth a cure of one in the Hospitall at *Lions*, who was generally tormented with the Crampe, performed by *Dalechampius*, by giving him a dramme of the leaves of the fourth kinde here set downe in powder, in a little barley water, which wrought as forceably as if he had taken Colocynthis, and thereby was restored to his health. The country people, as *Matthiolus* sheweth, do often take of these berries to purge themselves, thinking to be their owne Phylitions herein, and receive them their fee due for their counsell, but as he there saith, they often deceive themselves, by their unskilfull boldhardinesse, and make more worke for the Phisitions to cure them of the paines and torments, and other dangerous diseases that follow the taking of these violent purgers, if they free them not of further trouble in their owne deaths: *Pliny* is fully to be taxed for writing in his 17. booke and 9. Chapter that the *Cneorum* (which as I said before, is called by the *Greekes* the fruite of *Thymelæa*) doth stay or bind the belly (*Subducit* is the word in the generall Copie, which yet some would impute to be the errour of the Writer or Printer, whereas it should be *Ciet alvum*) when *Galen* and all other Authors acknowledge it to be a strong purger. *Mesue* adviseth that *Alsefecon* (which I said before the *Arabians* doe confound, and it is to be understood this *Thymelæa* as well as that *Chamelæa*, &c.) is not to be given without the correctors appointed for it, and yet not, but to strong able bodies: All these therefore are not safe to be given to weake bodies or stomackes, to women with child, or to children that are not strong, except they be strongly infected.

CHAP.

CHAP. XXII.

Laureola. Laurell or Spurge Laurell.

THis Laurell or Spurge Laurell (that it may be knowne from the Bay tree, which is of divers called the Laurell tree) riseth up sildome but with one stemme, yet sometimes with more, very rough and plaine, covered with a whitish thicke tough barke, branching forth into divers parts toward the toppes, whereon are set many long, smooth, thicke, somewhat broad and shining darke greene leaves, somewhat like unto Bayleaves, but longer, smoother, softer, and not with hard veines therein as Bayleaves have; the flowers come forth towards the toppes of the stalkes and branches, and at the joynts with the leaves many set together, which are somewhat long and hollow, ending or spreading into foure small leaves, of a whitish, yellow, greene colour: after which come small round, and somewhat long blacke berries when they are ripe, wherein lieth a white kernell; the roote groweth downe deepe into the ground, and spreadeth likewise tough long white strings, somewhat woodie; both leafe and flower, both barke and roote are very hot and sharpe in taste, biting and burning the mouth and throate of any that shall taste them: it keepeth the greene leaves all the Winter, and doth not shed them.

2. Chamædaphnoides sive Laureola Cretica. Candie Laurell.

From a crooked small white roote, rise up three or foure crooked and bending blackish stalkes, thicke set with leaves without order, covering them almost wholly, which are long and small towards the bottomes, and grow broader to the ends, being thicke and hard, greene above, and grayish below, tasting very hot, and burning both mouth and throate very notably; what flowers or fruit it beareth, hath not beene seene, but referred unto this Laurell for the forme and propertie, and groweth very low.

The Place.

The first groweth wild in many places of this realme, as well as beyond the seas, and being brought into gardens will there abide, and flourish sufficiently well, the other was sent out of *Candie* to *Prosper Alpinus*, who hath given this remembrance of it.

The Time.

The first floureth very early in the yeare, even in January or February, and sometimes before, if the Winter be milde, the berries are ripe about June; the other hath not floured, as is before said.

The Names.

It is called in Greeke Δαφνοειδὲς ἕτερον φυλλοις ὁμοιον, and the Latines accordingly, *Laureola quasi fossilis Lauri.* Some doe appoint two kinds of *Laureola, mas* & *fœmina*, some accounting this to be *mas*, and *Chamæleæ Germanica* to be *fœmina*, others this to be *fœmina* and *Chamælea* to be *mas*; so variable are divers in their opinions: *Matthiolus* taketh this to be *Chamædaphne* of *Dioscorides*, and the *Chamælea* to be *Daphnoides*, but in both

1. Laureola Flores.
Laurell the flower.

2. Laureola cum fructu.
Laurell with berries.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Original from UNIVERSITY OF MICHIGAN

he is much mistaken. *Lobel* and *Lugdunensis* doe take this *Laureola* which he calleth *Chamæ.* to be *Daphnoides*, and the *Chamælea Germanica* to be *Chamædaphne* or *Laureola fœmina*. *Tragus* also is much deceived in naming this plant, for *Dioscorides* his *Thymelæa*. Most of other writers doe call it *Daphnoides*, or *Laureola*, *Hodie*, as I said before, would make it to be *Cneorum tertium* of *Theophrastus*, and the *Chamelea* his *Cneorum Album*. In my former booke I was partly perswaded, that *Chamædaphne* of *Dioscorides*, was the *Chamælea Germanica*, or some what neere thereunto; but upon better thoughts, I thinke that *Chamædaphne* may be more truely referred to the *Laurus Alexandrina* of *Matthiolus*, whose leaves are small like unto Bay leaves, and the berries red when they be ripe, standing upon the leaves: and if you would aske me then, which is the *Laurus Alexandrina* of *Dioscorides*, I would answere you, that it is that *Laurus Alexandrina legitima* that *Lobel* hath set forth in his appendix, to his *Adversaria*, whose branch I communicated to him, to set forth, and I find it from time to time to come neerer unto *Dioscorides* his description, than either that of *Matthiolus*, or of any other as yours shall either understand in his proper place; the other is called *Chamædaphnoides*, *idest*, *Laureola* [illegible] *Tabernæmontanus*, *lib. de plantis exoticis*.

The Vertues.

The leaves and berries hereof are as violent a purger, and do heate and inflame the throat, bringing the flegme of whomsoever shall take thereof, and drive them into as many dangerous diseases, as any of the former taken advisedly it purgeth flegme from the stomack and oftentimes by vomit also, it procureth wholsome cough being chewed in the mouth, it draweth down from the head and braine much corrupt matter that would else. Many Emperickes doe give the berries sometimes, but the leaves more often, to evacuate the watery humours in dropsie, and think they finde good successe thereupon, as also to ease the paines of the collick, doe give the pouder of the leaves in a little broth: the berries and leaves hereof when they are fresh boyled in oyle, and after strayned forth, this oyle being annointed on the belly loosseneth the belly, and helpeth the collicke, and being rubbed on the backe and raines provoketh urine and helpeth the piles.

Chap. XXIII.

Laurus Tinus sive sylvestris. The Wilde Bay tree.

I Shall in this chapter shew you the wilde Bay trees, and joyne it next unto the *Laureola*, both for name and nature thereof.

1. *Laurus Tinus Lusitanica.* The first wild Baye of *Clusius* or of *Portingall*.

The wilde Bay tree riseth up to the height of an hedge bush, or the Dog-berrie tree; having diverse long square stalkes, full of branches, and faire large broad leaves, somewhat like unto Bay leaves, but in

1. *Laurus Tinus Lusitanica vulgaris latifolia.*
The first wilde Bay of *Clusius* or Portingall.

2. *Laurus Tinus altera vel 2. Clusij.*
The second Wilde Bay of *Clusius*.

der thereupon, two alwayes set togethers at a joynt, one against another, but of a darke greene shining colour, of no sent at all in them, and of a bitter sharpe unpleasant taste, troubling the stomacke, causing loathing, and casting withall: at the toppes of the branches and twigs, stand many small sweete smelling flowers in clusters, consisting of five white leaves a peece: after which succeede small berries, being somewhat long flat and corne-red, of an excellent pale bright blew colour, inflaming and burning the mouth and throate, of whosoever shall taste it, that it is almost insupportable, and not but in a long time, and by drinking milke, and holding it in the mouth, to be taken away or eased; this abideth greene all the winter.

2. *Laurus Tinus altera vel* 2. *Clusij.* The second wilde Bay tree of *Clusius.*

This other wilde Bay tree, riseth to be a bush, much about the same bignesse with the former, having stronger stalkes, and more plentifully branching forth, which are reddish being young, and more greene with the red-nesse when they are older: whereon grow the leaves in the same order, but somewhat longer, narrower, and more full of veines from it: the flowers stand at the toppes of the twigs and branches, in the same manner that the other doe, but are more purple and lesse sweete than they; which afterwards give smaller, fuller, and blacker berries, than the former: this also holdeth his greene leafe all the winter without shedding.

3. *Laurus Tinus sylvestris alter parvifolius.* The third wilde Bay tree.

This wilde Bay groweth seldome to be a tree of any height but abideth low shooting forth many slender bran-ches, covered with a darke greene barke, with red greene smooth leaves, set by couples thereon, somewhat resembling Bay leaves without any smell: the flowers grow in tufts or clusters at the ends of the branches, some-what reddish while they are in bud, but whiter being open with reddish edges, consisting of five leaves a peece, smelling sweete: there seldome followeth any fruite but are blacke round berries when it beareth, yet not perfect to spring againe in any that I have seene.

4. *Laurus Tinus Graeca frutescens.* The shrubby wilde Bay of Candye.

This Bay tree groweth low and shrubby, bearing many slender round short branches covered with a black bark with knotty joynts, whereon are set 5 or 6 or more leaves like the former, but smaller upon short foot stalks which are wholly without sent, but bearing the mouth and tongue with a little astriction: the fruite or seede is as small as a pepper corne, with a thin rind opening into three parts like a Sponge seed, containing within each part a small long whitish kernell like to a graine of wheate, smelling strong and tasting somewhat bitter and hearing or burning the mouth and tongue.

The Place.

The first groweth in *Portugall* and *Spaine* in diverse places, as *Clusius* saith, in *Italy* also on the hills of *Florence* and *Romania*: and in the wood *Caleno* in *Narbone*, and among the diverse leather Oakes, in many places of Mount *Ceres* or *Sedlius* neere *Montpelier* in *France*. The second as *Clusius* saith he found in the *Monastery* of *Pena longa* in *Portugall*, and neere the Seaside also, in other parts of *Spaine*: the third he saith he onely saw in *Baylor* his gar-den, raysed from *Italian* seede, which afterwards communicating the sucker thereof, became familiar in many other Herbarists Gardens there, as it doth also with us in our Country: and the last in *Candye*.

The Time.

The first flowred in July and August, and the fruite was ripe in October in some places of *Portugall*; when as in other places, *Clusius* saith he found it in flower in November, with the fruite on it then also: the second flow-reth also and beareth ripe fruite much about the same time: the third flowreth with us onely in December and continueth flowring Ianuary and February, if the winter be not too early or too extreame.

The Names.

It is called by *Theophrastus* in Greeke δάφνη ἀγρία *Laurus sylvestris*, in his first booke and 17 chapter, among those trees that are ever greene: which *Gaza* translateth onely *Laurus*, not naming *sylvestris* at all, for it is not remembred by *Dioscorides* or *Galen*, or other of the Greeke writers. *Pliny* maketh mention thereof, in his 15 booke and 30 chapter, and in other places, calling it *Tinus*, which some understand to be this *Laurus sylvestris*, wilde Bay: *Cato* also remembreth it in *De re rustica*, by the name of *Laurus silvestris* and no other ancient Latine writer besides: all the later writers doe call them *Tinus*, *Laurus Tinus*, and *Laurus sylvestris* as *Clusius* doth. The *Italians* call it *Lauro salvatico*, and as *Lobel* saith *Lauro regio* if he be not mistaken; the *Spaniards* and *Portingalls Lauro perro*, *Follado* and *Durillo*: the *French Laurier sauvage*; the *Germans* wilde *Lorberboom*; the *Dutch* wild *Laurier Boom*; and we in *English*, the Wilde Bay-tree.

The Vertues.

There is nothing recorded of them by any Author, to be used either inwardly or outwardly, but our late ex-perience hath found the berries, as I said before, to inflame and burne the mouth and throate, in as violent man-ner, or rather worse than *Laurell* or *Chamelea*, and worketh downewards likewise with trouble and pertur-bation of the whole body.

CHAP. XXIIII.

Sambucus. Elder.

Next among the number of these strong singers, the Elders must not be omitted to be spoken of, whereof there are many kindes, and the *Ebulus* Wallwort or Dane wort, is to be reckoned with them, for the likenesse both of forme and qualitie, as all Authors doe.

1. *Sambucus vulgaris.* Common Elder.

The common Elder tree groweth up sometime, if it stand alone and in good ground, to a reasona-ble great height, some-what standing backe together, as for the most it is found to be, it is a shrubbe of meane height, spreading his branches, farre and wide, covered with a grayish barke for the outside, but underneath it hath another that is greene, having a pith in the middle even of the Elder branches, but the young ones much more: at the joynts of the stalke doe come forth on both sides winged leaves, consisting of 7 or 9 upon a stalke, a little nicked or dented at the edges, of a faire sad greene colour, but smelling some what rancke and strong: the flowers stand at the toppes of the severall branches and twigs, many growing together in broad tufts or umbells, of a white colour, smelling more strong than the leaves, which being past, there rise up in their places

Original from UNIVERSITY OF MICHIGAN

1. *Sambucus vulgaris & laciniato folio.* The common and the jagged Elder.

4. *Sambucus racemosa rubra.* Red berried Elder.

small round berries greene at the first, and blackish when they are ripe, full of a purplish juyce within the wherein lie some small flat seeder or graines: the roote is great and thicke spreading farre about. There kinde of *Fungi* or excrelcence growing at the foote of the body, and on the branches of this tree, called tares, which I shall further declare among the other sorts of Mushroomes.

3. *Sambucus fructu albo.* White berried Elder.

This Elder is so like the former, both in growth, barke, pith, branches, stalk, leaves and flowers, that w come to beare fruit, it is very hard to be discerned from the other; the chiefe difference hereof, is that the ries are not blacke, but of a pale whitish yellow colour in most places, yet in some they abide greenish; hereby onely it is distinguished from the former.

3. *Sambucus laciniato folio.* Jagged Elder.

As the former Elders were distinguished onely by their berries, so the onely difference in this from is the forme of the leaves, which is so much jagged, and divided even to the middle ribbe, that unl small thereof declared his descent, no body by the present face would deeme it an Elder; in all other thereof as well flowers as fruite or berries, it differeth not from the common Elder.

4. *Sambucus racemosa rubra.* Red berried Elder.

The Mountaine Elder also differeth little from the full bare, for but that it groweth seldome so great that the flowers being somewhat yellowish, grow not in large spread tufts, but in small long branched clust like unto Privet, and that the berries following them are of a scarlet red colour, pleasant to be eaten and no lesse effectuall to any: it is like it in the growing, rugged white barke in the body and Elder boughes, and some reddish in the young leaves, as also in the roote: the wood being not so soft nor so pithy.

5. *Sambucus palustris sive Aquatica.* Marsh Elder.

The Marsh or Water Elder, hath his body and branches covered with a whitish barke, but they are soft and more brittle than any of the former: the leaves also differ much from them, being broad and somewhat ded at the edges, into three, or sometimes into five divisions or incisures, and dented round about, being like unto a Vine leafe, and comming somewhat neere unto the great Maple or Sycomore leafe, as ever I saw it: the flowers stand in tufts or umbells like the full Elders, but they are smaller and whitish, the outermost larger by much than any of the innermost, or of the former Elders, consisting of five leaves a peece, round pointed, which compasse the middle flowers round about, but leave no threds in the middle, of a reasonable good scent: after which follow very red berries, somewhat flat and full of a red juyce, bitterish in taste, ready to voke casting.

6. *Sambucus Rosea.* The Gelder Rose.

Of this kinde is this Elder or Gelder Rose, growing after the same manner with such like leaves, but the flow is composed as it were of many white, or pale bluish flowers, set together in a round tuftie ball.

7. *Ebulus sive Sambucus humilis.* Walewort, Danewort, or Dwarfe Elder.

Walwort is but an herbe every yeare dying downe with his stalkes to the ground, and rising againe and every spring, and is like unto the Elders both in forme and qualities, that deservedly it hath the name of Dwarfe Elder, which riseth up with a foure square rough hairy stalke foure foote high or more sometimes: the under leaves

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

6. *Sambucus Regia, vel Ebulus fructu nigro.*
The Golden Bore and the black Berry.

7. 8. *Ebulus vulgaris & laciniata folio.*
Ordinary Wallwort and rents leaved.

leaves, are somewhat narrower than the Elder, but else so like that it might soone deceive one not very well exercised or cunning; the flowers are white with a dash of purple, standing in umbels very like those of the Elder, but more sweete in sent; after which come small blackish berries, full of joyce while they are fresh, wherein there lye small hard kernels or seede: the roote doth creepe under the upper crust of the ground, springing afresh in diverse places, being of the bignesse of ones finger or thumbe sometimes.

8. *Ebulus folio laciniato*, Jagged Wallwort

This Wallwort is in all other things save the leaves, so like unto the ordinary kinde, that there can be knowne no difference: but the forme of the leaves, doth so deforme the whole face of the plant, and bring it out of knowledge, like the Jagged Elder, that none almost would thinke it should belong unto the former: the flowers and fruite and sent onely leading us to judge of the species, and whereunto to be referred, for the leaves are almost as much jagged and divided as the Jagged Elder, which is the onely difference in this from the former.

The Place.

The first or common Elder groweth not wilde but is planted in all places, to serve for hedges, and partitions of grounds, vineyards, &c. to hold up the bankes by ditches and water courtes, and to bee planted in places where Conies breed for shadow: every sticke or branch being thrust into the ground, serving as a stocke which will easily take roote and grow. The second as it seemeth *Tragus* first found in the woods of *Germany*. The third is found wild on hills in watery woods. The fourth is not knowne certainely from whence his original came, but is found planted in the gardens of those that are curious, and lovers of rare plants. The high is found by water sides and moorish grounds of *Germany*, *France*, *England*, *Italy*, and *Piemont* in *Savoye*, as *Pena* hath set it downe. The sixth is not set up onely in gardens, but doth delight to in moist grounds: The seventh groweth wilde in many places of *England*, where if it be once gotten into a ground, it will so creepe and runne therein, that it will hardly be gotten forth. The last is a stranger in *England* as yet, and kept onely in that curious garden of that *Prodigie* of simples *Master Tradescant*.

The Time.

All or most of the Elders flower in June, the Wallwort somewhat late, as his fruite is likewise later ripe, even not untill September, when the others are ripe for the most part in August.

The Names.

The Elder is called in Greeke [illegible]: in Latine generally *Sambucus*, of *Sambuca* a kinde of Harpe, as some thinke therof, but *Varro* de Lingua Latina, called it *Sabucus* in his verses, and thought to be derived from *Sabucus* or *Sambucus* a Spanish Fish, which is an hollow instrument of Musicke, called also *Pectis* & *Magadis*: The excrescence growing on the Elder is usually called *Fungus Sambucinus* of *Dioscorides*, *Spuma Sambuci*, and of some *Aurecula Judæ*, in English Jewes eares. The first is called *Sambucus vulgaris*, *Sambucus sylvestris*, and *vulgaris* of all writers, and of *Columna Sambucus foetida nonbella nigra*. *Tragus* called the second

Sambuci aliud genus, *Dodonæus Sambucus altera species*. *Lobel Sambucus fructu albo*. *Raubinus Sambucus fructu in umbella viridi*. The third is called *Sambucus Montana* of *Matthiolus*, *Gesner*, *Caſtor Durantes*, & *Camerarius* of *Tragus* and *Lonicerus Sambucus ſylveſtris*, and becauſe he ſaith it hath beene certainely obſerved, that the Hindes and Does doe greately affect the leaves thereof, when they are great with young, *Tabermontanus* calleth it *Sambucus cervina*, and *Gerard* after him *Sambucus racemoſa vel cervina*; of *Lobel Sambucus montana*, *racemoſa*, and *Ioannes Thalius*, in the deſcription of *Hercynia Saxono-thuringica*, *Sambucus montana*, *ſeu racemoſa*. *Raubinus* calleth it *Sambucus racemoſa umbra*, putting a doubt whether it be *Sambucus montana* of *Pliny*, which he ſaith groweth on *Mountaines*, and thinking it alſo to be *Acte* of *Theophraſtus*, whereof he maketh mention in his 3 booke and 4 chapter, among thoſe trees that onely delight to grow on hills, and will not grow in champions, and which *Gaza* in the Latine tranſlation hath omitted and left out: but the Greeke *Theophraſtus* hath put *ἀκτὴ ὄρεια* as *Ruellius* ſetteth it downe, but *ἄκτη Φηγὸς*, as *Gaza* hath it in other places, he and *Pena* before him, being the cauſe of many mens errours, in miſtaking the Latine *Fagus* a Beech tree, for this *Φηγὸς* of *Theophraſtus*, which is a kinde of Oake as you ſhall underſtand in his proper place, when I ſhall treate of all the ſorts of Oakes. The fourth *Lobel* in his Dutch herball, firſt made knowne to all, having found it planted in the gardens of the low countrie Apothecaries, and others that were lovers of rare and ſtrange plants, called it *Sambucus laciniato folio*, whom all others have followed. The fift is called *Sambucus aquatica* of *Matthiolus*, *Tragus*, *Lobel*, *Caſtor Durantes*, *Lugdunenſis* and others. *Sambucus paluſtris* of *Dodonæus*, *Caſalpinus*, *Camerarius*, *Cordus in hiſtoria* calleth it *Lycoſtaphylos famina*. *Vualgrina*; *Ruellius* tooke it to be *Opulus*; but that is a kinde or name of Maple, as *Lugdunenſis* hath it. *Anguillara* calleth is *Planatus aquaticus* (and ſo do the *Italians* the moſt part) which is the third kinde of Maple as he ſaith. *Geſner* calleth it *Sambucus paluſtris vel aquatica ocellaris*, and ſaith ſome alſo called it *Chamæplatanus*. *Lugdunenſis* firſt and *Raubinus* after him, doe take it to be *Ἀκτὴ ὀρεία* *Theophraſti* or *Theophraſtus* in his third booke and ſeventh chap. and in his fourth booke and 13 chap. *Raubinus* calleth it himſelfe *Sambucus aquatica flore ſimplici*, as doe calleth the *Gelder* Roſe *Sambucus aquatica flore globoſo pleno*. The Wallworte or Daneworte or dwarfe Elder, is called in Greeke *χαμαίακτη*, id eſt, humi *Sambucus*, in Latine *Ebulus*, by which names all other Greeke and Latine writers have called it: and that from the Noble *Contarenus* his garden, receiveth the name of *Ebulus laciniato folio* as it is in the title. Truely ſuppoſed it tooke the name Daneworte, from the ſtrong purging quality it hath, many times bringing them that eate it unto a fluxe, which then we ſay they are troubled with the Danes. The *Arabians* call it *Iuſtach*, the *Italians Sambuco*, the *Spaniards Sabuco*, *Saüco* & *Canivero*; the *French Sufeun Sufier* & *Suin*, the *Germanes Holder* & *Holler*, the *Dutche Vlier*, and we in *Engliſh* Elder.

The Vertues.

Both *Dioſcorides* and *Galen* doe attribute to the Wallworte, as well as to the common Elder, (for they account their properties both one) an heating and drying qualtey, purging watery humors abundantly, but not without trouble to the ſtomacke: the firſt ſhoutes of the common Elder boyled like unto *Aſparagus*, and the young leaves and ſtalkes boyled in fat broth, draweth forth mightily choller and tough flegme; the tender leaves alſo eaten with oyle and ſalt doe the ſame: the middle or inner barke boyled in water, and given to drinke, worketh much more violently; and the berries alſo either greene or dry, expell the ſame humours, and is often given with good ſucceſſe to helpe the dropſie, by evacuating great plenty of watery humours: the barke of the roote boyled in wine, or the juyce thereof drunke, worketh the ſame effects but more effectually, then either leafe or fruite doe; the juyce of the roote taken provoketh vomit mightily, and purgeth the watery humors of the dropſie; the ſame decoction of the roote cureth the biting of the viper or adder, as alſo of a mad dogge, it ſoftneth the hardneſſe of the mother, if women ſit therein, and openeth the veines and bringeth downe their courſes: the berries boyled in wine performe the ſame effects; the haire of the head or of other parts waſhed therewith, is made blacke; the juyce of the greene leaves applyed to the hot inflammations of the eyes aſſwageth them: the leaves boyled until they be tender, then beaten and mixed with barly meale, and applyed, aſſwageth hot inflammations of them, and helpeth places that are burnt either by fire or water, cureth ulcers being layde thereupon, and eaſeth the paines of the goute, being beaten and boyled with the tallow of bull or goate, and layd warme thereon: the juyce of the leaves ſnuffed up into the noſtrills, purgeth the vaines of the braine; the juyce of the berries boyled with a little honey, and dropped into the eares, eaſeth the paines of them; the decoction of the berries in wine being drunke, prouoketh urine: the powder of the leaves prepared in vinegar, and then taken in wine, halfe a dramme at a time, for certaine dayes together, is a meanes to abate and conſume the fat fleſh of a corpulent body, and keepe it leane: the berries ſo prepared, and a little white tartar and a few aniſeede put to them, a dramme of this powder given in wine, cureth the dropſie hereby purging very gently: the dry flowers are often uſed in the decoctions of glifters to expell winde and cauſe chollicke, for they loſe their purging quality which they have being greene, and retaine an aſtringing and ſcalding propertie being dryed: the diſtilled water of the flowers, is of much uſe to cleare the ſkinne from ſunne burning, freckles, ſanphew, or the like: and as *Matthiolus* ſaith both the forepart and hinderpart of the head being bathed therewith, it taketh away all manner of the headach that commeth of a cold cauſe. The Vinegar made of flowers of the Elder by maceration and infolation, is much more uſed in *France*, than any where elſe, and is gratefull to the ſtomacke, and of great power and effect to quicken the appetite, and helpeth to groſſe or tough flegme in the cheſt. A *Syrupus acetoſus* made hereof, would worke much better than the ordinary, for theſe purpoſes. The leaves boyled and layd hot upon any hot and painefull apoſtumes, eſpecially in more tender and fineive parts, doth both coole the heate and inflammation of them, and eaſe the paines. The diſtilled water of the inner barke of the tree or of the roote, is very powerfull to purge the watery humours in the dropſie or timpanie, taking it faſting, and two houres before ſupper: *Matthiolus* giveth the receipt of a medicine to helpe any burning by fire or water, which is made in this manner; take, ſaith he, one pound of the inner barke of the Elder, bruiſe it or cut it ſmall and put it into two pound of fine ſallet oyle, or oyle Olive, that hath beene firſt waſhed oftentimes with the diſtilled water of Elder flowers, ſet them boyle gently a good while together, and afterwards ſtraine forth the oyle, preſſing it very hard; ſet this oyle on the fire againe, and to thereto, foure ounces of the juyce of the young branches and leaves of the Elder tree, and ſo much new wax as them boyle to the conſumption of the juyce, after which being taken from the fire, put preſently thereunto

Original from UNIVERSITY OF MICHIGAN

ounces of liquid Vermilio (such as Joyners use to vermilio their bedsteeds, cupboords, tables, &c.) and afterwards of *Albanum* in fine powder foure ounces, and the whites of two egges being firſt well beaten by themſelves, all theſe being well ſtirred and mixed together, put it up into a cleane pot, and keepe it for to uſe when occaſion ſerveth. The young buddes, and leaves of the Elder, and as much of the roote of Plantaine beaten together, and boyled in old Hogs greaſe, this being laid warme upon the place, pained with the gout doth give preſent eaſe thereto. The leaves alſo burned and the powder of them put up into the noſtrills, ſtaieth the bleeding being once or twiſe uſed. If you ſhall put ſome of the freſh flowers of Elders into a bagge, letting it hang in a veſſell of wine, when it is new made, and beginneth to boyle (I thinke the like may be tried with a veſſell of ale or beere new tunned up, and ſet to worke together) the bagge being a little preſſed every evening, for a ſeaven night together, giveth to the wine a very good reliſh, and a ſmell like Muſcadine, (and will doe little leſſe to ale or beere.) The leaves of Elder boyled tender and applied warme to the fundament, eaſeth the paines of the piles, if they be once or twice renued growing cold. The foule inflamed or old ulcers and ſores of the legges, being often waſhed with the water, of the leaves or of the flowers diſtilled in the middle of the moneth of May, doth heale them in a ſhort ſpace. The diſtilled water of the flowers, taketh away the heate and inflammation of the eyes, and helpeth them when they are bloud ſhotten. The hands being waſhed morning and evening with the ſame water of the flowers, doth much helpe and eaſe them that have the Palſie in them, and cannot keepe them from ſhaking. The pith in the middle of the Elder ſtalkes, being dried and put into the cavernous holes of Fiſtulous ulcers, that are ready to cloſe, openeth and dilateth the orifices, whereby medicins may be uſed, and other remedies applied for the cure of them. It is ſaid that if you gently ſtrike a horſe that cannot ſtale, with a ſticke of the Elder, and binde ſome of the leaves to his belly, it ſhall make him ſtale quickly. The Muſhrumes of the Elder called Iewes eares, are of much uſe being dried to be boyled with Ale or Milke with Columbine leaves for ſore throates, and with a little Pepper and Pellitory of *Spaine* in powder, to put up the *uvula* or pallet of the mouth when it is fallen downe. *Matthiolus* ſaith that the dried Iewes eares ſteeped in Roſe water, and applied to the temples and forehead, doe eaſe the paines of the head or headach. The Mountaine or red berried Elder, hath the properties, that the common Elder hath, but weaker to all purpoſes: the berries hereof are taken to be cold, and to procure ſleepe, but the frequent uſe of it is hurtfull. It is ſaid that if a branch of this Elder be put into the trens that a moale hath made, it will either drive them forth, or kill them in their trends. The Marſh Elder is of the like purging qualitie with the common, eſpecially the berries or the joyce of them. Hens and birds doe feede upon them willingly in the Winter. The Wallwort or Danewort, is more forceable or powerfull than the Elder, in all the diſeaſes and for all the purpoſes whereunto it is applied, but more eſpecially wherein the Elder is little or nothing prevalent; the Wallwort ſerveth to theſe uſes. The young and tender branches and leaves thereof taken with wine, helpeth thoſe that are troubled with the ſtone and gravell, and laid upon the teſticles that are ſwollen and hard, helpeth them quickly: the juice of the roote of Wallwort applied to the throate, healeth the Quinſie or Kings evill: the fundament likewiſe is ſtayed from falling downe, if the joyce thereof be put thereinto: the ſame alſo put up with a little woolle into the mother, bringeth downe Womens courſes: the ſame juyce of the roote is a mighty purger of watery humours, and held moſt effectuall for the dropſie of all others herbs whatſoever: the dried herbe, or the ſeeds beaten to powder, and taken in white baking, worketh the like effect, the powder of the ſeeds taken in the decoction of *Chamæpitys* or ground Pine, and a little Cinamon, to the quantitie of a dramme at a time, is an approved remedy, both for the gout, joynt aches, and ſciatica, as alſo for the French diſeaſe, for it eaſeth the paines by withdrawing the humors from the places affected, and by drawing forth thoſe humors that are tenuit, peccant and offenſive: the powder of the roote worketh in the like manner, and to the ſame effect. The roote hereof ſteeped in wine all night, and a draught thereof given before the acceſſe and comming of the fit of an Ague, prevaileth ſo effectually there againſt, that it will either put off the fit, or make it more eaſie, and at the ſecond taking ſeldome faileth to rid it quite away. An ointment made of the greene leaves, and May butter made in the moneth of May, is accounted with many a ſoveraigne remedy, for all outward paines, aches and crampes in the joyntes, nerves, or ſinewes, for ſtarkneſſe and lamenеſſe by cold and other caſualties, and generally to warme comfort and ſtrengthen all the outward parts ill affected: as alſo to mollifie the hardneſſe, and to ſweeten the obſtructions of the ſpleene, the grieved parts anointed therewith. The leaves laid to ſteepe in water, and ſprinkled in any chamber of the houſe, as it is ſaid, killeth Fleas, Waſpes and Flies alſo, if you will credit the report. Trago ſaith, that the tender branches boyled in wine, whereunto ſome honey is put, and drunke for ſome dayes together, is profitable for a cold and drie cough, cureth the diſeaſes of the breaſt, by cutting and digeſting the groſſe and tough flegme therein. Briefly whatſoever I have ſhewed you before in relating the properties of Elder, doth Wallwort more ſtrongly effect in opening and purging choller, flegme and water, in helping the gout, the piles, and womens diſeaſes, colloureth the haire blacke, helpeth the inflammations of the eyes and paines in the eares, the ſtinging and biting of Serpents or a mad Dogge the burnings or ſcaldings by fire and water the wind collicke, the collicke and ſtone, the ſtrangurie or urine, the cure of old ſores and fiſtulous ulcers, and other the griefes before ſpecified, which for breviti I doe not ſet downe here, avoiding tautologie as much as I can.

CHAP. XXV.

Helleborus niger. Blacke Hellebor or Bearefoote.

OF the Gatherers there are two primary ſorts, white and blacke: Of the white ſort we will ſpeake in the next Chapter, and of the blacke in this whereof there are ſundry ſorts as you ſhall heare.

1 *Helleborus niger verus.* The true blacke Hellebor, or Chriſtmas flower.

The firſt or blacke Hellebor (or Bearefoote as ſome would call it, but that name doth more fitly agree unto the other two Peſtilent kinds) hath ſundry faire greene leaves riſing from the roote, each of them ſtanding on a thicke round ſtiffe greene ſtalke, about an handbreadth high from the ground, divided into ſeven, eight, or nine parts or leaves, and each of them nicked or denied from the middle of the leafe to the point ward on both ſides;

1. *Helleborus niger verus.*
Blacke Hellebor or Chaffinch flower.

2, 3. *Helleborastor minor, & trifolius spinosus.*
Baſtard blacke Hellebore or Beares foote, and with trifoile prickle leaues.

3. *Helleborastor maximus flore coeruleo.*
The greateſt baſtard blacke Hellebor or Beares foote called Setterwort.

ſides, abiding greene all the Winter, at which time the flowers riſe on the like ſhort ſtalkes, as the leaues grow on, without any leafe thereon for the moſt part, yet ſometimes hauing a ſmall ſhort pale greene leafe, reſembling rather a skin than a leafe a, little vnder the flower, and grow but little higher than the leaues: each ſtalke alſo beareth vſually but one flower, yet ſometimes two, conſiſting of five large round white leaues a peece like vnto a greate ſingle white Roſe, changing ſometimes to be either daſhit with a purple about the edges or to be wholly purple without any white in them, as the weather or time of continuance doth effect, with many pale yellow thrums in the middle, ſtanding about a greene head, which after groweth to be the ſeede veſſell, diuided into ſeuerall cellor pods like vnto a Columbine head or *Aconitum hyemale*, but greater and thicker, wherein is contained ſome what long and round blackiſh ſeede, like the ſeedes of the baſtard kindes: the roote are a number of browniſh blacke ſtrings, which runne downe deepe into the ground, and are faſtened to a thicke head, of the bignes of one finger. Of this kinde there is an other whoſe flower is red from the firſt opening, which *Fuchſius* remembreth in his obſeruations to haue ſeene in the Woods of Greece.

2. *Helleboraſter minor flore viridante.* Baſtard blacke Hellebor or Beareſoote.

The ſmaller baſtard Hellebor or Beareſoote is in moſt things like vnto the former true blacke Hellebor, for it beareth alſo many leaues vpon ſhort ſtalkes diuided into many parts, but each of them are longer and narrower, of a darker greene colour ſtained on both ſides, and ſeele ſomewhat hard, periſhing every yeare, but riſe againe the next ſpring: the flowers hereof ſtand on higher ſtalkes, with ſome leaues on them alſo, yet very few, and are of a pale greene colour like the former, but ſmaller by the halfe at leaſt, having likewiſe many greeniſh yellow threads or thrummes, in the middle, and ſuch like heads, or ſeede veſſells and blackiſh

God

seede in them, the rootes are more stringie blacke and hard than the former.

3. *Helleborus niger foliis trifidis stinkes.* Trefoile Prickly leafed Bearesfoote.

This sort differeth little in the manner of growing from the tall deformed, having long stalkes with leaves thereon, and flowers at the toppes of the same fashion and to rise the seede like that followeth, but the leaves are harder, and only divided into three parts, & are dented about the edges and hard that are also prickly: the flowers being of a pale or white greene colour.

4. *Helleborus niger maximus sive Catalogi.* The great tall ballard blacke Hellebor, or Bearesfoote, called also Setterwort.

This great Bearesfoote hath diverse tall greene leaves, rising from the roote, each upon long stalkes, which are divided into 7 or 9 divisions or leaves, each of them narrower than the taller ballard blacke Hellebore or Bearesfoote, nicked or dented about the edges, but not so deeply, and abiding above ground greene all the winter; whereas the other perisheth as I said every yeare, and dieth againe in the spring: this shooteth up a reasonable great and tall stalke, higher by the halfe than the other, with such like leaves thereon as grow beneath, untill it come to the toppe: where it spreadeth into divers branches bearing many hollow cup-like flowers, divided at the brimme into 5 parts, but doe seldome spread themselves open, of a white with yellow greene colour somewhat like the other ballard kind, & sometimes purplish about the brimmes or edges, with a greene head in the middle, & a few white threads about it: Whereby it may seeme likely to be that fourth kind of *Veratrum nigrum* of *Dioscor.* which he calleth *μελάνθιον*, and which is like unto the third of *Pedanius*, whose figure as hee saith, he there with there, to be known which he mea-

neth, but it is not the third of *Dodonæus* as he saith, but the second, and this that I here describe unto you is *Dodonæus* his third *Veratrum nigrum*.) which greene head growing to be the veneli, wherein the blacke seede is contained, shooteth forth into foure, five, or sixe hornes, fashioned like the other bastard kind, but smaller, as is also for the most part, the roote is but single with nothing so many strings growing with it, and sometimes perisheth after it hath given seede, yet not alwayes, nor in all places: the whole plant, and every part thereof, is of a worse smell than the other: the roote of this with the lower part of the stalke next thereto is that setterwort, that the country people doe use to rowell their eared withall. Of this kinde also *Clusius* doth make mention of another, differing onely in the darker greene colour of the leaves, and in the flowers, whose edges of the three inner most are of a darke purple colour.

After cast.

5. *Helleborus niger foetidus vernus.* Vernall fœtid bastard blacke Hellebor.

This kind of bastard Hellebor shooteth forth many greene stalkes, sometimes lying or leaning to the ground, or else standing somewhat upright, but set very thicke with small leaves, finer and shorter than fennell, some of them ending in a tuft of such like fine meane leaves, and some having at the toppes of them one large flower, greene, somewhat reddish or brownish on the outside, while they are in bud and a while after, which being open consist of 12. or 14. long and narrow leaves, of a faire shining yellow colour, set in order round about a greene head with yellow thrummes in the middle, laying themselves open to the Sunne on a faire day, but else remaining close: after the flower is past, the head growing greater sheweth it selfe compact of many roundish seede, very like unto the head of *Adonis* flower, but much greater: the rootes are many long and blacke strings set together at the head, very like unto those of the lesser blacke Hellebor or Bearefoote, but harder, tough or more brittle, and seeming to be without any moisture in them, but abide and increase every yeare, whereas the stalkes with greene leaves doe utterly perish every yeare.

6. *Helleborus niger Sanicula folio major.* The greater purging Sanicle like Hellebor.

This Hellebor hath divers broad darke greene leaves, each of them standing upon a long foote stalke, wholly cut in on the edges into five divisions for the most part, & dented about beside, somewhat resembling the leaves of the common Sanicle, but more truely the leaves of the field *Ranunculus* or Crowfoote, or *Geranium Batrachioides* Crowfoot, Cranes bill: from among which leaves rise up divers slender smooth greene stalkes having some leaves set on them, and at the tops of them, two or three or more flowers together, each of them consisting of many small whitish leaves, as a pale or border, compassing many threads in the middle; which being fallen, there rise many flat whitish and long seede, somewhat like unto seede Fennell seede, but not altogether so bigge, or yellow; *Gerard* following *Dodonæus* description, and not his owne knowledge, saith the seede are like unto *Castinaus*, and his Corrector mendeth not the fault: the rootes are small blacke strings, shooting from a top head, like unto the roote of the Bearefoote.

7. *Helleborus niger Sanicula folio minor.* Small purging Sanicle like Hellebor.

This small Hellebor or Sanicle, (which you please to call it) hath divers small and somewhat round leaves, every one upon a long foote stalke, being not much broader than the nayle of a mans thumbe, yet divided even to the middle ribbe into seven parts, every one of them being shorte, narrow, and dented about the edges: the stalkes are many and small, not above an hand breadth high, with one or two leaves on them, more cut and divided than the lower are; at the toppes of them stand divers small flowers very thicke, set together in little umbles, like unto the last, but smaller, after which come small flat seede, somewhat like the other, but lesse much, as it is also in all the other parts thereof.

8. *Ieopardo? Matthioli. Matthiolus* his bastard blacke Hellebor.

This small herbe riseth up with sundry slender weake smooth stalkes, bearing each of them a broad greene leafe, divided for the most part into five divisions or parts, somewhat like those of the last, yet sometimes but into three, especially the first or lower most, and dented also about the edges: the flowers grow from small leaves upon the like slender stalkes, being flatte like, and compoted of sixe pale coloured leaves, with many threads in the middle; the roote is a tuft of blackish fibres like the former blacke Hellebors, rising from a blacke head.

The Place.

The first groweth in *Germany*, *France*, and *Italy*, and *Greece* in sundry places: the second I have seene in the woods in Northamptonshire, and in other places of this Land; the third groweth at *Rome* with *Corvinus*, at *Padua* as *Melanus* saith in his *Pomarium* garden: the fourth groweth as *Fuchsius* saith in the borders of the fields and grounds, and on rockie hills by the *Moselle* and the *Rhine*, as also in *Hercynia Sylva*, and a kinde like unto it in *Aquitaine*, as also by the river *Lunel* at *Montpelier*: the fifth groweth in *Austria*, and both the *Bauarres*, as *Clusius* saith, the sixth groweth naturally on the hills of *Germany*, and other untilled and craggy places: the seventh groweth on *Mons Ida* in *Candia* neare the *Cretan* sea, as also on the *Pyrenæan* hills: the last as *Penæ* saith in the low ground or valleyes of the forrest of *Essone*, not farre from *Lutetia* hill.

The Time.

The first doth flower in December and January, if the weather be any thing temperate: the second, third, and fourth in February or March, and their seede is ripe in May: the fifth in April: the other in May and June.

The Names.

It is called in Greeke ἐλλέβορος and sometimes without the aspiration ἔλλεβορος, *for Latines vsitat quoddam corporis vitium*, in Latine also *Elleborus* or *Helleborum*, and also *Helleborus*, & *Helleborum*, & *vicissim*, *quidlibet item versa*: But there is much controversie and contrariety, both in the ancient and moderne Writers concerning them: for the *Hellebores* of *Theophrastus* and *Dioscorides* doe much differ the one from the other, and diverse of our moderne Writers, thinke that ours doe differ from them both. Some likewise appropriate one kinde unto one and another unto theirs as you shall presently heare. *Theophrastus* saith in the ninth Booke, and eleventh Chapter of his History of Plants, that the rootes of the blacke and white Ellebor, are like the one unto the other, except in colour, that is, the one blacke the other white (which may be reconciled if you will take it spoken only of the fibres, the one being blacke the other white) but that the leafe of the blacke as he saith is like unto a Bay leafe, and that of the white unto those of Leekes, can no way be reconciled, for they are so differing from *Dioscorides* or ours, that we may well say, we neither have nor know any of both. *Theophrastus* his Ellebors, whether the

be some errour in the text as many thinke, *Dioscorides* describeth his blacke Ellebor, to have leaves like *Platanus*, the Plane tree, but lesse, neere unto those of *Spondilium* or cow Parsnippe, but more rough and blacker, cut into many divisions; the stalke is rough, the flowers, saith he, are whitish, inclining to purple standing in a cluster: the seede is like *Cicera* or ballard Saffron, which is called *Sefamoides* or *Sefamoeris*, wherewithall they make suffumigations: the rootes are small blacke strings, comming from a certaine head like an Onion, which are in use; thus farre *Dioscorides*, unto this description our true blacke Hellebor doth not agree in all things: for the leaves of ours, do very lothly resemble those of the Plane tree (which is a whole broad leafe cut otherwise in the edges into parts or divisions) nor of the *Spondilio* cow Parsnip, (which is a broad whole leafe, cutting of many much broader devisions in it) neither are the leaves rough, (but rented or trotled at the ends) nor the stalke rough, but smooth, nor do the flowers stand in cluslers but one by one each upon their own stalke, or two at the most on a stalke: whereupon *Dodonæus* would make our first sort here recited, which is somewhat like the *Sesamoide* or Sesile heele, to be the *Veratrum nigrum*, or *Ellebor. niger Dioscoridis*, because it hath seeds in cuttes, which *Gesner*, *Fuchs*, and *Lobell*, call *Sesamoides nigra* of *Dioscorides*, and *Cluslius Semiculæ semina*; but *Dodonæus* himselfe is much puzled, to make it agree thereunto, finding it to differ in many things, sometimes in making the seed to be like *Cicera*; whereunto it hath but little resemblance, as I shewed you in the description, and sometimes blaming the text, (where it is said to be called *Sesamoides* in *Asiagra*, to be corrupt, and that *Dioscorides* borrowed it from *Theophrastus*; who saith that in *Asiagra*, they did give *Helleborus Sesamoides* the *Sesamoide* like *Helleborus*, that is to say whose fruit is like unto *Sesamum*, to purge withall: And it is most probable, that the seede of the blacke Hellebors, both the true and the ballard kindes, may somewhat agree thereunto, and not very unfitly be compared unto the fruit or seed of *Sesamum*, & the seed of *Cicera*, but whether the seed of those blacke Hellebors, have more force in purging than the rootes have, I am not certaine, that any hath made a true experience of, for most of our moderne writers do agree, that both our white and black Hellebors are the true sorts set forth by *Dioscorides*, (& notwithstanding the variation, as it is before set downe) *Theophrastus* also. The first is called *Helleborus niger* by all that have written of it, some adding thereunto *Flos magno purpureo*, as *Gesner*, or *Flore rosæ* as *Bauhinus*, or *leguminis* or *veris*, as others doe. *Dodonæus* onely in his French Herball calleth it *Ellebor. niger domesticus*, but why I know no reason: the second is called *Helleborus niger* & *Helleborus niger vulgaris* by *Gesner*, by *Cordus sufrus*, by *Cæsalpinus Helleborus hortensis*, and *Cruciatus* by *Lugdunenses* and *Turner*: the third is remembred by *Matthias* in his *Icons Farnesianæ*; the fourth is called by *Dodonæus* in his French Herball *Ellebor. niger domesticus*; from *Lobel* he doth in his *Adversaria* so follow, saying it commeth neere to the *Aconites*: *Gesner* in *Cordus* booke it to be *Pulmonaria Vegetis*, *Cordus* calleth it *Sefamoides mas*, and *Tragus Pulmonaria fœdo odore*, *Dioscorides* and *Cluslius Veratrum nigrum verum*, and *Cæsalpinus Encephalon Plinii*: but generally it is called either *Helleborastrum nigrum* as *Tabernæmontanus*, or *Helleborastrum nigrum*, or *Helleborus niger sylvestris vulgaris*, or else *Cruciata Bauhi*, as *Lobel*, *Lugdunenses*, *Lugdunenses* and others: yet all the Hellebors both black and white are also taken by some for the *Cruciata*, for in regard there is no description of *Cruciata* extant in any author, but the vertues and properties onely wherunto it is applyed, divers have written thereof divers, *Trages*, *Lonicerus*, *Gesnerus* and others, both Phytitians and Apothecaries almost through all *Germany*, and the parts adjoyning in former times, make this 5th sort, called *Buphthalmum nigrum*, by *Anguillara*, *Clusius*, and others; and *Helleborus niger fœtidus* by *Lobel*, but *Pseudo Helleborum* by *Matthiolus* to be the true *Helleborus niger* of *Dioscorides*, or at least a kind thereof, and which *Clusius* saith was used of all in *Vienna* and those parts before he came thither, and shewed them their error and the right kind, which they ever after used: *Dodonæus* also calleth it *Buphthalmum*, joyning it next to *Eranthemum* or *Flos Adonis*, whereunto it is very like in leaves and seede, but not in rootes: others would make it *Sesamoides minus* of *Dioscorides*, whereunto it hath no correspondency: the first is called by *Fuchsius Semicula fœmina*, and so doth *Gesner*, who also calleth it *Aconitum nigrum*, as *Lobel* doth, following as it should seeme *Tragus*, who calleth it *Osteocollum montanum*: *Tabernæmontanus* calleth it *Imperatoria minor*, *Hedenius* as I layd before, taketh it to be *Ellebor. niger*, or *Veratrum nigrum* of *Dioscorides* and *Bauhinus* in his *Pinax* calleth it *Ellebor. niger*, *Semiculæ folio major*, and I from him do so like of it, as thinking it a name as proper if not more then any other is given it: the seventh *Bauhinus* onely hath described in his *Prodromus* by the same title that I have given it: the last is the *Epipactis* of *Matthiolus*, which *Lobel* and *Pena* call *Ellebor. Alpinus Semiculæ & Helleborinis affinis & communis*, as counterfeited by him, yet others doe not thinke so: but whether the *Epipactis* of *Dioscorides*, which he saith some called *Ellebor.* in mild lice referred to the white Ellebor, as *Camerarius* and others would have it, or to the blacke, relieth doubtfull, because *Dioscorides* is so briefe in his description thereof, that it cannot certainly be determined, he onely saying it is a tuell Herbe with small leaves, good for the diseases of the Liver and against poyson. The *Arabians* call it *Cheebaleon* and *Cherbech* also, the *Italians Elleboro negro*, the *Spaniards Verago ellebro negro*, the *French Hierre ou Verate noir*, the *Germans Lenten Nieswurtz* and *Christwurtz*, the *Dutch Swart Nieswrt*, and we in English, as it is in their titles.

The Vertues.

The true blacke Hellebore is used for most of the griefes and diseases, whereunto the white is available, but is nothing so violent or dangerous: the leaves dried small, or the juice of the leaves made up with flower into small cakes, and baked, hath been used to good purpose to helpe the Dropsie, Jaundies, and other evill dispositions of the Liver and Gall. The leaves sometimes also are used to purge and open the body in foule cases, as well as the rootes which are of greatest use, and greatest effect, against all melancholike diseases, long lasting Agues as the Quartan and the like, the Megrime and the old paines in the head, the blacke as well as the yellow Jaundies, the Lepry, Palsie, Convulsion, Contraction either of the Lunges or whole body, or paines in the belly; Sciatica, Cramps, Convulsions, or distillings of Sinewes, and all other griefes, paines and aches of the joynts or sinewes, it is taken in powder, or infusion or decoction, or in broth, being first prepared in vinegar as is before mentioned to the white, that is steeped in vinegar for a day and a night, and after dryed up againe, which manner of preparation is according to the ancient custome then used: but wee have not found that the roots of the blacke Hellebore growing in our owne Country, to be deadly to cattle if they eate it, or any of the other parts, or that it hath any such fearefull or dreadfull operation in working, as the ancients doe attribute to that of the forren Countries, that thereby such preparations should needs to qualifie the malignitie thereof: for we have found by long use, (I thinke the moisture and temperature of our climate, abating and correcting the

the violence thereof) to worke any troublesome fit or passion in any that hath taken it, without any of that preparation aforesaid, (the remedy if any danger be thereby is to drinke Goates milke) yet *Matthiolus* doth much commend his *Elleborismus* (the receipt whereof is in the third booke of his Epistles namely in that to *Hannibaldus*) whose preparation is to steepe the roores and take out their pith and dry the barke againe, and preferreth the roores of that true blacke Ellebor that beareth red flowers, before those that beare white, but in want of the one as he saith himselfe, the other may be to as good effect taken; for that kind (if it be a kind of it selfe, that will not degenerate, and not the quality of the climate onely causing the colour) were have not seene growing in our land, although such an one hath beene sent me from beyond sea, but perished quickly after: he commendeth it for all the griefes aforesaid: yet if an extract be made of the roores, it will serve upon all occasions, being ready at hand to be used: the roores applyed in a pessarie mightily prevaile to bring downe womens courses: the powder of the roore strowed upon foule Vlcers, although they be fistulous doth quickly heale them: and if there be any callous or hard flesh growne in the Fistula, the roore left in it for two or three dayes will consume it quite. *Galen* remembreth this in 6. *de simpl. med. facult.* and *Iulius Alexandrinus* saith, he often tryed it to be true: the roores boyled in vinegar, and any place washed therewith troubled with scabbes, wheales or pustles, the lepry or any other such like breaking out, yea although they be gangrenous or eating sores, by staying the eating or spreading, preserveth the flesh from putrefaction: the same decoction also helpeth the Toothach, if the mouth be gargled therewith; as also dropped into the eares easeth the noyse and helpeth the deafenesse. The Second kind which is the lesser bastard Hellebor or Beares foot, for any thing that ever I could finde, but in severall tryalls made thereof, is more forcible and churlish in working and purging then the former; a dram of the roores steeped in wine all night and drunke in the morning, assuredly prevaileth powerfully against all the diseases appropriate unto the former kind: therefore I shall not neede to repeate the same things againe: besides the things before remembred, the powder of the dryed leaves thereof doth helpe to kill the worms in children more effectually then a little thereof given in drinke or broth, or in a Fig or Raysins, or strowed upon bread spread with Honey: it is sayd also to resist any poyson that is taken to expell it, or cause that it shall not hurt: the use hereof like wise in outward causes, as the like with the former, as for foule sores and Fistulaes, Scabs, &c. An idle conceit possessed many in ancient times, that he that would digge up the roores hereof, had needs to eate Garlicke before hand, least the evill vapours that should arise from it in the digging up, might offend the head and braine: The greater Bastard Hellebor or Setterwort, was held by *Dodonæus* as I sayd before to be a venemous Aconite, not to be dealt with, and that it would kill Woolves, Foxes, Dogs, &c. Hee knoweth little use thereof unlesse in great necessity, where the other sorts are not to be had, and onely among country people, whose strong robustious bodies are able to abide the working thereof, but is onely or chiefly used to rowell cattell withall, as *Plinie lib. 25. c. 5.* saith that a peece of the roore of blacke Hellebor being drawne through a hole made in the eare of a beast troubled with the cough, or having taken any poisonous thing with it, if it be taken out the next day at the same howre. *Absyrtus* and *Hierocles* declare the same thing and *Columella* also: this manner of curing is used with us: but the place is changed from the eare to the dewlap of Oxen, and the foreleg or hinderleg of an horse above the pasterne. It is thought also by divers of good judgement that not onely all the Hellebors both white and blacke will doe the like if any cure be performed thereby, but many other sorts of herbes: yet as the name Lowsewort importeth the herbe made into an ointment, or the decoction of the leaves killeth Lice, if the places be either washed or annointed that are chiefly troubled with them. Those here set forth, which I call purging Sanicle, hath beene often found by good experience to open and purge the body of melancholy humours, & that safely without such perturbation thereto as is sayd to be in the other sorts of blacke Hellebor: *Dodonæus* likewise supposing this to be *Dioscorides* his black Hellebor, appropriateth all the vertues thereto, that *Dioscorides* saith they of *Anticyra* used their *Elleborus Sesamoides*, the other sorts are not all or very seldome in Physick now adayes.

CHAP. XXVI.

Helleborus Albus. White Hellebor or Neesewort.

OF the white Hellebores there are two principall varieties, as greater and lesser, the greater being discovered with us manured or of the garden, and the other wilde.

1. *Helleborus albus vulgaris.* Ordinary white Hellebor or Neesing roote.

The first great white Hellebor riseth at the first out of the ground with a great round white greene head, which growing up openeth it selfe into many goodly faire large greene leaves plaited as it were with emi nent ribbes all along the leaves, compelling one another at the bottome, from the middle whereof riseth up a strong round stalke with divers such like leaves but smaller to the middle thereof, from whence to the top it is divided into many branches, having many small yellowish or whitish green flat like flowers, all along upon them, which after turne into small long three square whitish seede, standing naked without any huske to containe them, although some have written otherwise: the roote is reasonable thicke and great at the head, having a number of great white strings running downe deepe into the ground, whereby it is strongly fastened. Some doe make a varietie in the flowers hereof to be whiter, and so would make a differing sort thereof by that cause onely, but I doe not thinke it worth the name of a differing sort. *Does flore albo.*

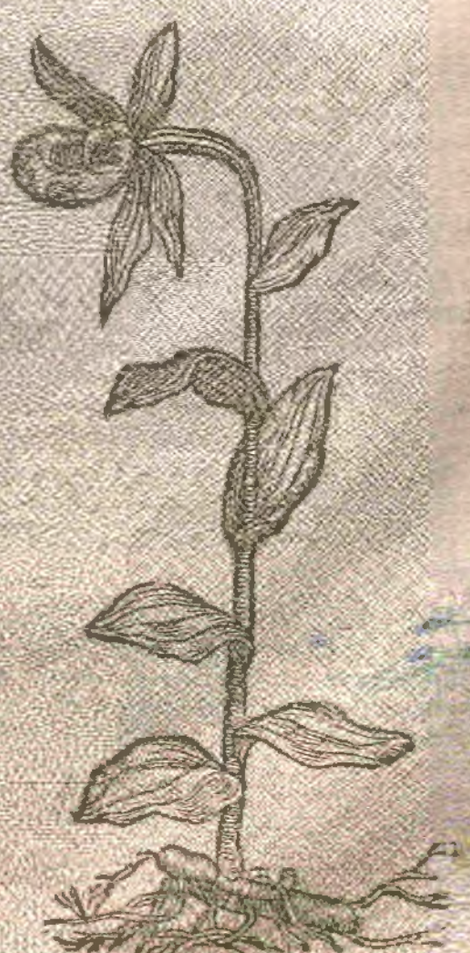
2. *Helleborus albus præcox flore atro-rubente flore.* The early white Ellebor with darke red flowers.

This other Hellebor is very like the former, but that it springeth up a moneth at the least before it, and that the leaves are longer thinner & no lesse plaited, foulding themselves backwards oftentimes and sooner perish falling away from the plant: the stalke hereof is higher then the former, with fewer leaves thereon, bearing such like flowers, but of so darke or blackish a red colour, that they are scarce discernable but at a neere distance: the seede is very like the former: the roote hath on such ruberous head as the other, but as it were a long bulbous head, from whence shoote as many long white strings as the other: both these lose their leaves wholly and grow fresh every spring.

3. *Ellebore*

1. Ellebor. alba vulgaris.
Ordinary white Ellebor or Neotandes.

2. Helleborus albus perennis, sive alterum Parthei
The only white Ellebor with Parkinson now in.



3. *Helleborine major sive Calceolus Mariæ.* The great wilde Hellebor, or our Ladyes Slipper.

The greater of these sorts of wilde white Hellebors, riseth up with one two or more stalkes, a foote and halfe high at the most, bearing broad greene leaves on each side, one by one, somewhat like those of the former white Hellebor, but smaller and not so ribbed, and each compassing the stalke at the lower end; at the top of the stalkes standeth sometimes but one flower, yet sometimes two or three at the most, one above another upon small short footestalkes, with a small leafe at the foote of every one; each of these flowers are of a long ovall forme and hollow withall, especially at the upper part, the lower being round and swelling like a belly; at the hollow part there are small peeces like eares or fingers, that at the first doe cover that hollow place, and after stand apart one from another, all which are of a fine pale yellow colour in all that I have seene; yet it is reported that some are found of a brauner colour or tending to purple; there are likewise fowre long narrow and darke coloured leaves at the setting on of the flower unto the stalke, wherein as it were the flower at the first was enclosed; the whole flower is of a pretty sweet sent; the seede is very small, and like unto that of the Orchis or Satyrion, and contained in like pods; the roote is composed of a number of strings entrelacing themselves one within another lying within the upper crust of the earth, and not pearcing deepe, of a darke brownish colour. It groweth with us in the North parts of *America* differing onely in being greater both in stalkes, leaves and flowers, which are not yellow but white, with a reddish streake through the chiefe of them.

4. *Helleborus albus parvus alter.* The small white Hellebor with a white flower.

This smaller Hellebor groweth up in the like manner and not much lower, bearing like leaves but smaller, and of a white greene colour like those of *Lady Cawsey*; the top of the stalke hath many more flowers, but lesse growing together spike

4. *Calceolus Mariæ.* Our Ladyes slipper.

America

Salbion

4. *Elleborine minor flore albo.*
Small wilde white Ellebor.

5. *Elleborus angustifolius.*
Narrow leafe white Ellebor.

fashion with small short leaves at the stalke of every flower, which consisteth of five small white leaves with a small close hood in the middle without any rent at all: the seede is alike and so are the roots smaller.

5. *Elleborine minor flore purpurante.* The small wilde white Hellebor with blushflowers.

The leaves hereof are narrower than the last, the stalke and flowers are alike but smaller and of a pale purple or bluish colour.

6. *Elleborine flore viridante.* Wild white Hellebor with whitish greene flowers.

This differeth not much from the last, but in the colour of the flower which is greenish on the outside somewhat white within.

7. *Elleborine flore atro-rubente.* Wilde white Hellebor with darke red flowers.

This wilde kinde groweth somewhat bigger and higher, and with larger leaves than any other of these wild sorts, the flowers likewise are more in number and of a deepe purple colour.

8. *Elleborine angustifolia spicata versicolor.* Variable wilde white Hellebor.

This also riseth somewhat high, having narrower leaves on the stalke, yet ribbed somewhat like unto the broad Plantaine: the stalke endeth in a long spike of fine purple coloured flowers, in fashion like the rest, but the opening hoodes with their labels are white spotted on the inside with purplish spots: the leaves and roots alike.

The Place.

Both the first sorts grow in sundry places of *Germany* and *Austria* as *Clusius* saith, as also in some of the Isles about *Russia* where a good ship might be fraighted with the roots of the ordinary sort as Master *Tradescant* the elder affirmed; the other sorts grow many of them in our owne land as well as beyond sea, namely the third, fourth and sixth, especially the third in a wood called the *Helkes* in *Lancashire* neere the border of *Yorkshire*.

The Time.

The first floweth before the second, although it spring earlier out of the ground, being not in flower till the end of July, the rest flower about May, some earlyer or later than others.

The Names.

I have shewed you in the chapter before that it is called *Elleborus* or *Helleborum*, &c. The first is commonly called *Helleborus albus*, and by *Dodonæus*, *Cordus* upon *Dioscorides* and others *Veratrum album*, *Guilandinus* taketh to be the *Helleborus candidus* of the Grecians, but is assuredly the *Consiligo* of *Vegetius*, *Absyrtus*, *Columella*, &c.

Plinie, Gerarde recite this for the next to call it *pterax*. *Bauhinus* to distinguish them calleth this *flore subcæruleo*, and the second *flore cæruleo obscuro*, other writers *ex purpureo nigricante*, and *Lobel* addeth *purpureo violaceo*: the third is called by *Clusius Helleborus secundus*, and of others *Caliculus Maior* or *Maximus*, and *Lugdunensis*, *Helleborus ferrugineus*. *Dalechampius* (before he knew *Germania*) taketh it to be *Alter genus foetidum*: and both *Tabernæmontanus*, where he *Pseudodamasonium*, the fourth is taken by some to be *Epipactis*, by others *Aconitum* or *Dorycnium*, but generally is now adayes called *Helleborine flore albo*: the rest have their names in their titles, as they are usually entitled by others: the controversies hereabout I have touched in the foregoing chapter, and therefore will not here against recite it: the *Arabians* call it *Chanbarbum*, the *Italians Elleboro bianco*, the *Spaniards Verdegambre blanco* or *yerua de ballestieros*, the *French Verane* and *Hellebore blanc*, the *Germanes Weyss Nisswurtz*, the *Dutch witte Nieswort*, and we in *English* white Ellebor or Sneezewort.

The Vertues.

The roote of white Hellebor or Neesewort is of most use (neither the leaves flowers nor seede being used at any time with us that I know) and worketh very strongly and churlishly with any that shall take it procuring strong vomitings: yet being taken with convenient preparation of the body aforehand, and ordered by advise as *Dioscorides* warneth it, may doe much good to strong constitutions that can endure the working of it by casting much tough vitious slimmy and corrupt humours that offend the stomacke to be avoyded, to be taken not falling but for some time after one hath eaten, for which purposes the *Oxymel Helleboratum* is a medecine prepared to your hand and fit to be used: it provoketh womens courses and will kill the birth if it be taken inwardly: shalle a dramme of the roote prepared with *Oxymel* and given in wine, to those that are so deeply possessed with melancholy that it causeth them of fury or madnesse, do much ease the perturbed humours giving much ease to the party: being likewise steeped and afterwards boyled in broth and given, helpeth those that are troubled with the falling sickenesse, the leprosie, and all other breakings out in the skinne, as scabbes, &c. quartane agues, the stranguary consumption, an old cough, the dropsie, ruptures, sciatica, gowte, crampes, paines in the joynts and sinewes, and paines and swimming in the head: the best preparation of it is to be infused in the juyce of a Quince, or to be put into a Quince, and either baked in an oven, or roasted under the embers, and halfe a dramme thereof given at a time: and this was as *Matthiolus* saith, the ancient manner of curing these diseases: but being in dangerous a medecine though sometime taken with caution, that it forceth more into fear and of strangling, and is onely remedied by eating Quinces, or taking the juyce or the Syroppe made thereof, saith moreover the use thereof is wholly almost to be given over and left: the roote saith *Dioscorides* is put with other things to helpe the dimnesse of the sight: the juyce of the roote dropped into the eares taketh away the noyse and singing in them: being boyled in lye and the head washed therewith it killeth lice and helpeth the running scabbes and sores thereof, being mingled with flower and a little honye or butter, or else boyled in milke and set where flies gather, &c. doe much resort, doe kill as many as much as if hens, ducks, or geese doe chance to drinke thereof it will kill them likewise: being moulded up with meale and honye, and put into moale holes in the furrowes of field or dormise, or any other such small Vermine will quickly destroy them: the powder or scraping of the roote by it selfe, as with a few leaves of Marjerome put up into the nole, purgeth the head and brain: by nesting being boyled in vinegar and the decoction gargled in the mouth, easeth the paines of the tooth ach: the same decoction likewise helpeth the itch and scabbes in the hands, and cleanseth foule sores and ulcers in the legges and other parts. The *Spaniards* and *Navarrois* doe make a certaine poyson of the juyce of the roottes of white Hellebor which after it hath fermented in a horne or earthen headed vessell (the time when it is readie to be used they know by this tryall: having thred a needle with thred, and wetted it therein, they draw it through a frogge which if it presently dye, then it is good, and ready) they dippe their arrow heads therein, and then what beast shall be wounded therewith shall suddenly dye: which thing *Matthiolus* saith, hee also tryed on hogges and chickens which dyed speedily after they were wounded with a weapon dipped therein: in that the venome had pierced the blood, against which poyson no other antidote can be found more fit and speedy, than the eating of Quinces, for even the smell of them being in a house where that poyson is, taketh away the whole force thereof: but is restored again (as it is said) if ripe grapes be mixed there with or some pepper cast into it: this poyson is only used while it is fresh, for it loseth the strength of the juyce dry upon the arrow heads, and therefore to keepe them the better they use to keepe them in a case. The iron heads being wrapped in wooll and clothes wet therein: but this is the most wonderfull as it is related, that this poyson being drunke, procureth almost no harme to them that drinke it, unlesse they take too much: and as it is said the hunters often take it themselves to purge them: it is said also that the flesh of those beasts killed by this poyson, is more tender and pleasant in eating than of other not killed therewith, and especially that part about the wound. *Frontinus* in *Phrasis* recordeth a notable stratagem that *Selymus* used at the seidging the Citty of *Cyzicum*, viz. That having cut off the River *Phlius* from running into the Citty, he caused a great many of these rootes to be put into a quantity thereof, which after they had sufficiently infected the water, he let passe into the Citty againe, whereof when they had greedily drunke they grew so weake and feeble by the too much purgation thereof, that they were forced to leave their walls and ward whereby the *Assyrians* their enemies became masters of their Citty: the like stratagems are for diverse by diverse other authors performed by the helpe of other herbes. The lesser white sorts are not knowne with us to be used in Physicke: but of the vertues of these *Ellebors* he saith *Epipactis* he saith it is good in the defects of the liver and against poysons and to procure vomiting; *Theophrastus* saith the same.

CHAP. XXVII.

Gratiola, Hedge Hyssope.

OF the true *Gratiola* or Hedge Hyssope, I doe know but one kinde as all the best authors doe agree: but yet unto it there are added two or three other hearbes, as weeres thereunto, either in form or qualitie: some reckoning the one and some the other; and I in this place bringing them all to be ranked under this title.

1. *Gratiola vulgaris.* True hedge Hyssope.

This hearbe is but a small low plant, seldome growing with his slender bending foure square branches, above a foote high; having diverse small leaves set thereon, very like unto those of the ordinary garden Hyssope, but little shorter and broader, and of a pale greene colour, of a very bitter unpleasant taste: from about the middle of these branches, at the joynts of the leaves up to the toppes of them, come forth the flowers, every one at a long stalke, standing upon very short foote-stalkes, which are somewhat long and hollow, ending in foure leaves, the lowest standing out as it were lippes, and the other two above, shorter by the halfe, of a whitish yellow colour, tending to a blacke blew, and sometimes more blew with or purple: after which come small round heads wherein is contained small seede: the roote shooteth forth too and fro under ground very much, with joynts and fastall fibres at them, thereby increasing and quickly spreading largely, especially if it stand in any moyst place, because it will hardly hold long in any dry ground.

Flore luteo. *Camerarius* saith he found by a brooke side, not farre from *Geneva* one of this kind with a yellow flower, differing in any thing else.

2. *Gratiola minor sive Hyssopoides.* Small hedge Hyssope.

This small hedge Hyssope shooteth forth sometimes many, and sometimes but one or two round reddish stalkes halfe a yard high, branched toward the toppes; whereon are set one above another, and sometimes one against another, diverse small and somewhat long leaves, somewhat smaller than the former, and neere resembling Hyssope leaves, of a pale greene colour, joyning close unto the stalkes and branches, and without any foote-stalke at all: at the joyntes with the leaves come forth flowers, every one by it selfe, standing in a long husk consisting of foure leaves of an excellent blew colour: after which succeede small browne seede, contained in long round pods: the roote is white and shooteth forth many fibres, whereby it comprehendeth well in the ground: the hearbe and every part thereof is utterly without any smell, and almost without any taste, some hold it to have a nitrous or little salt, and some a little sweetish taste: sometimes and in the same grounds, this is found with larger leaves, and growing higher; sometimes with smaller and longer leaves, which scarce riseth an handbreadth high, and that in the dry grounds.

1. *Gratiola Vulgaris.* The true hedge Hyssope.

2. a. *Gratiola angustifolia minor.* 2. *Latifolia major.* Small hedge Hyssope. The lesser broad leaved hedge Hyssope.

3. *Gratiola cærulea, sive latifolia major.* The greater broade leafed or blew flowered hedge Hyssope.

This herbe also is referred unto *Gratiola*, for some resemblance it hath, both for place and manner of growing, and especially for the bitternesse thereof, so like it, which by *Lobel* and *Pena* their judgements was thought at the first likelihood to be a kinde of *Lysimachia*, and so intituled it *galericulata* for distinction sake, but others of good judgement our time, have otherwise thought, as you shall heare anon: I have placed it, with the *Gratiola*, partly led by the authority of others, and partly by the common vote of these times, who as frequently call it *Gratiola latifolia*, as *Lysimachia galericulata*: take the description thereof, therefore in this manner. It is a smooth low plant not rising above a foote high, with many square stalkes diverslie branched from the bottome to the toppe, set with diverse joynts and two small leaves at every one, which stand upon short loose stalkes, being broad at the bottome and smaller to the end, a little dented about the edges, (which is not remembred in *Lobel* and *Pena* their description) and full of veines, of a sadder greene colour than the former, longer also and broader: the flowers are gaping, somewhat like unto those of Dead Nettles, of a faire blewish purple colour, with some white spots the rim, every one standing at the joynts with the leaves up to the toppes: after which come forth small seede vessels, formed somewhat like unto the toppe of the thigh bone of a man or beast, wherein the small nut or huckle bone is set; the upper part whereof doth fall open, when the seede is ripe, and falleth away when it is touched, the wing within it full of yellow seede: the roote spreadeth much, and with many branches under ground, quickely thereby possessing a large circuite or compasse.

There is a lesser sort hereof found in the like places as the former, differing onely in the smallnesse of the plant.

4. *Gratiola latifolia sive major minor.* The lesser broad leafed hedge Hyssope.

There is also another small herbe growing in our Land onely, for ought I can either heare or learne which *Gerard* first found and called *Gratiola latifolia*, as referring it thereunto, and so doe I also, yet more for the resemblance of the lesser unto the last (which was not knowne to him, or at least not mentioned by him) and bitternesse, than any thing else: Out of the wet boggie ground from among the grasse &c. that groweth about it, springeth up one or more small stalkes, fearse halfe a foote high, round but crested as it were all the length, which spread forth other smaller branches, whereon doe grow many small leaves, set by couples one against another, being somewhat broade, but very short withall, seeming almost round, and ending in a point, a little dented about the edges: at the joynts with the leaves come forth the flowers, every one by it selfe, on a small foote stalke, being in forme somewhat like the last, a gaping flower but shorter, of a pale reddish colour, spotted in the middle of the lower leafe, with many small white spots: after the flowers are fallen come in their places small seede vessels, in shape somewhat like unto the nut of a crossebow, wherein is contained small yellowish seede: the roote is small long and white, spreading it selfe under ground diverse wayes, which perisheth not in the winter, neither runneth like the last, but spreadeth new branches every yeare: the taste hereof is as extreame bitter as the last.

3. *Gratiola cærulea sive latifolia major.*
The greater broade leafed or blew flowered hedge Hyssope.

The Place.

They doe all naturally grow in moyst and marrish grounds, wherein they will joy well, if you will have them to live. The first naturally groweth in many places in *Italy* and without Saint *Iustines* gate at *Padua* plentifully, and is onely cherished in gardens with us. The second hath beene found naturally growing in some places of our owne Land; but the third in many and sundry places of the Country, in wet low grounds and by waters sides: and the last upon *Hampsted* heath in the wet boggie places, and in sundry other parres of the heath.

The Time.

They all flower in June and July, the first seldome giveth good seede in our land; all the other doe ripen their seede quickely after their flowers are past.

The Names.

None of these herbes are mentioned by any of the ancient Greeke or Latine writers, not of *Plinie*. The first is generally now adayes, as it was formerly called *Gratiola* by *Matthiolus*, *Gesner*, *Dodonæus*, *Lobel*, *Lugdunensis*, and others: it is also called by some *Gratia Dei*, after the high *Dutch* name *Gottes gnad*, which signifieth so much; yet some call it *Gratia Dei altera*, because there is another herbe among the Greeks so called: *Matthiolus* thought it might be the *Digynos Ipecacuana* of *Dioscorides*: the seede hereof is called in Shops *Grana Gratiæ*. *Cordus* calleth it *Lysimachia frutescens altera*, because diverse for the bitternesse take it to be a kinde of *Lysimachia*: *Lobel* thinks it a species of *Centaurium minus*: he also calleth it *Eupatorium Mesuæ*, for so it was generally thought here in all the upper and lower *Germanie* for along time, and among some of our Apothecaries also in times past, which opinion I thinke is worne out, time bringing the truth to light. *Gesner* calleth it *Gratiola sive Centaurium aquaticum*, and thinketh it may be the *Polemonium palustre* sive *vis* of *Hippocrates* (the horse-

leech, not the famous Phyſition and *Fabius Columna* that ſaith it is vſually called *Gratiola*, yet ſaith it is thought of ſome more truly to be taken, for a common Hyſope; *Geſner* vſed to call it *Seſamoides*: *Bauhinus* in his Pinax calleth it *Gratiola Centaurioides*: we call it in Engliſh Hedge Hyſope for diſtinction ſake, and not for that it groweth by any hedge ſide; for it might more properly bee called Marſhe Hyſope, from the naturall place of the growing. The ſecond is called by *Cæſalpinus Hyſopoides*, (as if you ſhould ſay a ſmall Hyſope) and ſome is called in Italy. *Geſner* in *Collectione ſtirpium* calleth it *Gratiola minor*, *Cordus* in his woode of obſervations, nameth the herbe to be called with them in *Germany* Groſſe poley, with the leaves of knot graſſe, growing in moiſt places which doth fitly anſwer unto this plant; and therefore *Bauhinus* in his *Pinax* doth ſo referre it; but *Cæſalpinus* calleth it there himſelfe *Hyſopoides*, becauſe his brother *John Bauhinus*, had ſo called it formerly; when as *Matthiolus* he calleth it *Gratiola ſecunda*, it is called alſo as he ſaith by ſome at *Montpelier*, where it groweth in the brookes there *Anagallis aquatica*, and in *Huſſia* as hee ſaith alſo, ſome called it *Halimus aquaticus*. The third is called as I ſayd before by *Lobell* and *Pena Lyſimachia galericulata*, from ſome reſemblance of the leaves and naturall place of growing, but becauſe none of the reſt of the *Lyſimachias* have hooded flowers, but conſiſting of five leaves laid open, I think it fitter to joyne it with theſe then with thoſe. *Camerarius* calleth it *Lyſimachia cærulea galericulata Lobelii*: *Ioannes Thalius* in his *Hercynia ſylva*, calleth it *Sideritis cærulea*, and ſaith it was called alſo by divers, *Gratiola contra Calaſpinos* calleth it *Gratia Dei*, *Tabernamontanus Terebinaria*, and *Dodonæus* in his French Edition *Herba Iudaica altera*. With us it is generally called, as well *Lyſimachia galericulata*, as *Viola lanſolia*, but more properly as I ſayd in my judgment *Gratiola*, both for that this is extreame bitter as hee are, and hath hooded flowers as all the others have, yet I have added thereunto *major* becauſe of the neat, in Engliſh the greater broad leafed, or blew flowred Hedge Hyſope. The laſt is called by *Gerarde* as I ſayd *Gratiola folia*, whereunto I have added *noſtra minor* becauſe if the laſt or this be to be referred unto the *Gratiola*, this is leſſer, which may ſtand untill a fitter be found out. The *Arabians* as is before ſayd, call the ſeeds *Gelbemech*, the *Iuns* the herbe *gratia Dei* and *Stancia valle*, the *French* Grace de Dieu, the *Germans* Gottes gnad, the *Dutch* *gratie*, and we in Engliſh, Hedge Hyſope.

The Vertues.

The firſt hedge Hyſop worketh very ſtrongly and churliſhly, both upward and downeward, avoiding ſtrongly and groſſe flegme choller and watery humors, thereby giving eaſe to thoſe that are troubled with ſuch humors, paines in the joynts and the hips, the dropſie, the gout and ſciatica; if either the decoction of the greene herbe be given, or a ſmall quantitie of the pouder of the dried herbe it helpeth alſo both tertian & quartane taken in the ſame manner, but becauſe it is ſo churliſh, it is needefull to put thereto ſome correctors, as Annyſe, Cinamon or the like: Some alſo give the powder in broth the leſſe to offend. *Camerarius* commendeth a diſtract hereof, made into pilles with the powder of Cinamon, not onely to be availeable againſt the dropſie, but againſt all ſorts of tertian and day agues, if ſome of the juyce of Calamint be added unto it: it is profitably given for the obſtructions of the liver and ſpleene, by opening and purging the peccant humors: it killeth the worms in the belly, and prevaileth much againſt all putrefactions, either inward or outward, for the pouder, infuſion or decoction, cleanſeth and healeth wonderfully all old and foule ulcers, and conſolidateth freſh wounds. The ſecond is not applied to any diſeaſe by any Author or other, that ever I could learne. The other two likewiſe not remembred by any, whereunto they might be availeable; yet their bitternes comming ſo neare unto the *Gratiola*, induceth me to thinke, that they cannot but be effectuall, if not to purge by the bitternes, yet to ſolidate and heale by the temperate heate is joyned with them: the *Italian* name declareth the true experience they have found in it, that horſes will become lancke and leane that feede thereon.

CHAP. XXVIII.

Staphis agria. Staveſacre or Louſewort.

STaveſacre ariſeth up with a ſtorre, but ſtrong blackiſh greene ſtalke, branching forth divers waies whereon doe grow great large leaves, cut at the edges into five or ſeven diviſions, ſomewhat like unto the leave of the great yellow Aconite or Wolfesbane, but deeper edged, and of a ſad or darke greene colour, every one ſtanding upon a long ſoore ſtalke, the flowers grow at the toppes of the branches one above another, upon ſhort ſtalkes, being ſomewhat like a Larkes ſpurre flower, but hath a ſpurre or heele behind it, of a very deepe or darke blew colour, but much larger: after which come in the places three or foure horned ſeede veſſells, like unto the Aconites but greater, wherein are contained many rough great ſeede: the roote is long and wooddy, periſhing every yeare, after it hath borne ſeede.

The Place.

It is onely nourſed up in our gardens, and that very hardly, for if it be not well defended, it will not abide Winter with us; for it never riſeth to flower or ſeede the firſt yeare it is ſowen, but in the hotter countries *Italy*, as *Naples*, and in *Iſtria* and *Sclavonia*, and other places it groweth in the open champion grounds.

The Time.

It flowreth not with us untill it be late in the yeare, notwithſtanding it hath abidden a Winter, and then giveth perfect ſeede.

The Names.

It is called in Greeke *ſtafis agria*, *Galen haſtir i aut i agria*, but at this day the naturall Greekes call it *Aſtrea*, but more properly *Aſtrea coccos*, that is *granum pedicularium*, in Latine *Staphis agria*, in the Apothecaries ſhoppes beyond ſea *Staphiſagria*, and *Pediculoria*, and *Pediculorum*, and *Pituitaria ſic dicta a viribus quas habet ad pituitas evacuandas, & ſervare pituitam educendi*, and thereupon *Cordus* or *Dioſcorides* calleth it *Pituitaria*. *Lobelius* ſeemeth to call it *Pes Paninus* in his 26. Booke and 13. Chapter, but in his 23. Booke and firſt Chapter, he ſaith that *Aſtaphis agria* or *Staphis*, is corruptedly called *Pes Paninus*. The ſeede thereof is ſo called alſo being onely in uſe, and to be had in ſhoppes. The *Arabians* call it *Alhaſa Hamſa*, *Mathocaga*, *Alhaſa*, the *Italians* *Staphiſaria*, the *Spaniards* *Fabaras Papareras yerua piuma is peyſpera*, the *French* *Eſtaphiſaigre Pouillouſe* and herbe *aux pouilleux* or *pouilleux*, the *Germans* *Biſſmuth*, the *Dutch* *Luyſenkruit*, and we in Engliſh Staveſacre and Louſewort.

The Vertues.

A few of the feed bruised and strained into posset drinke, and drunke, worketh very strongly upon the stomacke, bringing forth abundance of grosse flegme, but there had needs great caution to be used, of whosoever shall take it, for in that it breaketh extremely, and bringeth danger of strangling by the violence thereof; it is not adventured by ignorant or desperate Surgions, or countrie leeches, without such correction and things as may mitigate the force thereof, that thereby it may do no harme: which being so ordered, it is then used to be given to those that are troubled with itch, leaches, the lepsie, or foule scurfe, as well inwardly, as to wash the places outwardly with the decoction of the seeds, which helpeth much, as also to kill lice and vermine, growing in the heads or bodies of any, or the seeds mixed with oyle and *axungia* and anointed on the places. Some use to make an Electuary of them, by boyling them in water, with some few correctors, unto which liquor being strained, so much Sugar is put, as may be sufficient to make it up with the powder of Aniseede and Cinamon into an Electuarie, whereof a dragme is a sufficient proportion at a time, and is probable for the diseases aforesaid, as also to procure womens monethly courses: it is also good to wash foule ulcers in the mouth or throate; but if the decoction be too strong, you may slay it with some vinegar, and a little honey mixed therewith and so use it: the seeds bruised and boyled in vinegar is good to help the toothach, if the teeth and gummes be washed therewith, for it draweth downe abundance of rheume, which peradventure was the cause thereof, being bruised also with a little pellitory of *Spaine*, or without it, and put into a fine linnen cloth and chewed where the teeth paine you most, doth the like, and often easeth and sometimes taketh away the paine. Some say that if the flowers be chewed in the mouth, and some of them laid upon the hurt place, of any stung or bitten by any serpent, they will heale them: the seede beaten and mingled with meale, and eaten, or made up into a paste with some hony, will kill Mise and Ratts, and such like vermine that doe eate it.

Staphisagria.
Stauesacre or Lousewort.

CHAP. XXIX.

Euphorbium; The burning thornie plant called *Euforbium & Antiephorbium*.
The remedy for the *Euforbium*, or the burning thorny plant.

AS the most extreme of all violent purging plants, I bring this to your consideration, not having any to exceede it in the qualitie of heate or violence; and thereunto as many other Authors before me have done, I joyne that other cooling herbe, which is accounted the onely helpe and remedy against the fierie heate thereof.

1. *Euphorbium.* The burning thornie plant called *Euforbium.*

This strange thornie plant, from a leafe thrust into the ground, will shoote forth rootes, and growe to have divers thicke and long leaves, round also and not flat, halfe a yard in length, set with divers great ribbes, which are armed all the length of them, with a double rowe of small sharpe thornes or prickes, two for the most part set together, like unto the middle bone of a fish, &c. what fruit or flower it beareth we have not learned of any, that hath seene it growing in *Barbary*, from whence it hath beene brought both into our countrie and into others: the rootes are great thicke and long, spreading very much, but impatient to endure any cold, as the leaves are also: there issueth out of the leaves, as some say, or out of the rootes as others say, a pale yellow with gumme, in small droppes or peeces, most violent fierce even to smell unto, but being tasted doth burne the mouth and throate not to be endured, the dust also and fuming vapours that arise from it when it is stirred, but much more when it is beaten to powder, doe so fiercely penetrate into the head and mouth, but especially the nostrills, that it procureth frequent and strong neesing, often times even unto delacrymation; and if any shall touch their face, or any other part of the skinne also it is needer, with their hands after they have handled it, it will burne and enflame it so terribly that sometimes it will raise blisters and wheales, the furie whereof will not be allaid scarse in halfe a day after, although cold water or any other cold thing be applied to mitigate the strength thereof, and therefore in the same naturall places groweth with it as the chiefe and onely remedy thereof, the

2. *Antiephorbium.* The remedy for *Euforbium.*

The *Antiephorbium* hath divers fat thicke greene stalkes, with many thicke and long leaves thereon somewhat like unto the leaves of *Sanders*, but much bigger, both stalkes and leaves being full of a cold and fluxive moisture, moist to the end and apt to conceive the heate of the former; we have likewise no further understanding of either flower or seede that it beareth, the rootes are great and thicke, from whence shoote forth many long and great branches and small leaves, but as quickly subject to the cold as the former, and perisheth upon the first cold blast that commeth upon it.

The

1. *Euphorbium.*
The burning thorny plant called *Euphorbium.*

2. *Euphorbium.*
The true tree like *Euphorbium.*

The Place.

Both these plants have beene brought out of *Barbery* as I said from many places there, as also other Ilands about, and here they have thrived well all the heate of the yeare, but as I said will endure no manner of cold, and therefore without extraordinary care and keeping not to be kept in our land.

The Time.

The time of the well thriving is formerly expressed, for it never bore flower with us, or with any that I had it, as farre as we can learne.

The Names.

The Greeke name is ευφορβιον, and the Latines have no other name than *Euphorbium* for it, although *Pliny* calls the plant *Euphorbia*, and the gumme *Euphorbium. Iuba* that was father to *Ptolomy*, and inst ruled both the countries of *Mauritania*, is said by *Pliny* to have first found this plant, and gave it the name *Euphorbium*, after the name of his chiefest Phisition, whose brother *Calus* healed *Augustus*, who also wrote much in commendation of it. I have called it in English rather a thorne or thorny plant than a thistle, for that it hath no resemblance with a thistle or thistle like plant, neither is it venemous or poysonous, though violent in heate: the *Antiquarians* have no other name in any Author that hath written of it; onely *Dodonæus* who last gave us the figures of both these plants, thinketh this may be some species of *Telephium* or *Orpine*.

The Vertues.

Although neither *Dioscorides* nor *Galen*, have made mention of any purging qualitie in the *Euphorbium*, as *Pliny* for got it not, making mention thereof in his 26. Booke and 8. Chapter, and *Actuarius* hath found and declared it, and so hath *Ætius*, *Paulus* and *Actuarius*, who have exactly delivered their knowledge thereof; that it doth mightily purge the waterish humors of the dropsie, and tough viscous flegme from the joynts, and all more remote parts of the body, and therefore helpeth the gout and Sciatica, by cleansing consuming and drying those grosse humors, that lie deepely hid in the hollownesse of the joynts and sinewes: but because it bites the body and fretteth the bowels extremely, corroding them and the stomacke, and inflaming the liver, it is necessary that it be corrected before it be given, and that it be grossely not finely beaten to powder; as also that such things be mixed with it, as may allay the violent heate and sharpenesse, and such are cold and mucilaginous seedes, and such things also as may make it slippery, the more easily and speedily to passe away, and thereof made into pils with hony, may be effectuall, and that the quantities of these correctors be so plentifull that they may cover the superficies thereof. It being so dangerous, therefore the advise to be taken, is that it be not used inwardly, but in cold windie and temperate bodies, and not in hot and dry constitutions; but outwardly applied it is of exceeding good use; as mixed with the oyle of Wallflowers, or any other digesting oyle, it wonderfully helpeth all cold diseases of the sinewes, as palsies and shakings, or trembling of the joynts and sinewes, also cramps and convulsions or shrinkings, aches & lamenes that come from colds, a plaister made up with it and waxe, is available for all these recited griefes, as *Galen* saith. The powder of *Euphorbium* mixed with *Aqua vitæ* and anointed, cureth all scurfes and fraidnesse of the head, and with Beares grease, causeth haire to grow on the head, or any parts of the body, where haire doth usually grow, it being shed or not appearing upon some cause

applied

applied also with oyle to the temples of such as are drouzie dull and heavie to sleepe, which we call the Lethargie, doth quicken their senses, and causeth them to be more lively: the nape of the necke being anointed with the oyle of *Euforbium*, recovereth them speech againe that have lost it, by reason of the Apoplexie, or any other casualtie: it being mixed with vinegar and applied, taketh away the markes and scarres of wounds, and all other foule spots or blemishes in the outward skin: The *Antiquorum* is the chiefest, if not the onely remedy against the violent heate, and piercing qualitie of the *Euphorbium*, for the juyce thereof being very cooling and humid, tempereth it so well and speedily, that it never faileth to give ease.

CHAP. XXX.

Sena. Sene or purging Sene.

There are two sorts of this purging Sene tree, differing very little betweene themselves, as also three or foure sorts of base or bastard sorts, more churlish then the other in working, as you shall heare by and by.

1. *Sena Alexandrina.* Sene of Alexandria.

This Sene by the judgement of those that have written thereof groweth not above a cubite high, with slender branches, set with many leaves together on a ribbe, somewhat like unto Licorice, being narrow and pointed, which being dryed and brought over unto us, if they bee fresh will smell very like unto fresh new made hay: the flowers stand at the tops of the branches, one above another being as *Matthiolus* saith (for we have never seene them beare flower in England) of a yellow colour, like unto the flowers of Cole worts, that is consisting of five leaves laid open, (but some rather thinke, the flowers are formed like unto those of the Spanish Broome, or of the bastard *Sena* called *Colutea*, as most plants that beare cods do) with purvenes running thorough every leafe: after which come crooked thinne huskes, fashioned somewhat like a bille Moone: in the middle pith whereof (the skinnes of the huskes growing so clean together, that they can hardly be parted) growe flatseed very like unto grape kernels, but of a blackish greene colour, and somewhat flat: the whole plant perisheth (as it is said) every yeare, and must be new sowne of them that will have it.

2. *Sena Italica.* The Sene of Italy.

This Sene differeth in no other thing from the former, but in the forme of the leaves, which are not so narrow and pointed, but broader and rounder, which difference is plainly to be discerned, by comparing the leaves of that Sene, that commeth over from Alexandria, with that which groweth in Italy, and therefore there needeth no more to be said thereof.

The Place.

The first groweth (as is generally thought) in *Arabia Felix*, and in *Syria* also, as some say, and brought to Alexandria in Egypt, as many other things are, which from thence is transported unto all other Countries. The other *Matthiolus* saith, was in his time frequently sowen, in the Duke of *Florence* his dominions in Italy; many Acres in a field being sowne therewith: they will hardly spring up with any leaves in our Country, for experience hath beene made thereof many times.

The Time.

They flower in the Summer moneths, but in Italy as *Matthiolus* saith, it will not sowne until *May*, and will not indure but unto Autumne.

The Names.

Mesues and some *Arabians* call it *Senna*, but *Persicum Senne*, it is generally held by all good Authors, that it was not known to the ancient Greeke and Latine writers, *Dioscorides*, *Theophrastus*, *Galen*, *Pliny*, &c. or others that did translate their copies, although some would referre it to *Dioscorides* his *Helleborum*, others to *Petiveria*, some to *Tephrion*, others to *Emerocon*, some to *Anagyris*, and others to the *Cercis* or third *Colutea* of *Theophrastus*, or to *Scorpius* or *Coronilla*, all which in part quite contrary thereunto, and can by no meanes agree unto them. The *Arabians* being the first finders out thereof, and of the purging quality therein; who did much use the leaves or cods, as hereafter shall be said: but later experience hath found the leaves to bee of more effect with us.

The Vertue.

The leaves of *Sene*, howsoever used are a very safe and gentle purger, as well made into poudes, as the weight of a French Crowne or drammes thereof taken in Wine or Ale, or broth falling; as the infusion of halfe an ounce in Wine or Ale for a night, or the decoction of halfe an ounce, or if need be of six drammes with some other herbes or rootes (that because they are a little windie, a few Aniseed or Fennell seeds, and a little Ginger is to be added unto them to helpe to correct that evill quality) and then they purge melancholy, choler,

Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

ker, and ſcoure from the head and braine, the lungs and the heart, the liver and the ſpleene, cleanſing all thoſe parts of ſuch evill humours as by poſſeſſing them, are the cauſes of thoſe diſeaſes incident unto them, and comforting the ſtomacke, eſpecially if ſome cordiall or ſtomachicall helper be put with it; for *Matthiolus* ſaith that it hurteth the ſtomacke, but *Alexander* and *Matthiolus* denye that it can doe ſo, in regard that Sene hath ſome what a bitter taſte, partaking of heat and dryneſſe, all which qualities are knowne rather to ſtrengthen the ſtomach, then to trouble or weaken it; it ſtrengthened the ſenſes both of ſight and hearing, and procureth mirth by expelling away that inward humour, which was the inward cauſe of ſadneſſe in the minde, opening the obſtructions of the bowells, and cauſing a freſh and lively habit in the body, prolonging youth, and keeping backe old age; Divers things are added hereunto to quicken the working thereof, and to make it the more eſfectuall as Rubarb, Agaricke, Caſſia Fiſtula drawne, Syrupe of Roſes &c. according as the nature of the diſeaſe, the age, ſtrength and neceſſitie of the patient doe require; *Serapio* ſaith it wonderfully helpeth ſuch as are diſtracted of their ſenſes by the extremitie of the fits in agues, or in other diſeaſes, which were raſt raving or talking idle, or ſuch as are growne lunatik, their braines being overdidled, or growing into a frenſye or madneſſe by inflammation of the braine, the epilepſie alſo or the Falling ſickneſſe, and the headach, all ſorts of paſſies, which are the relutions of the ſinewes, the lowſie evill alſo, and all ſorts of itches ſcabs and wheales or peſhes, &c. whatſoever Sena likewiſe is an eſpeciall ingredient among other things put into a bag, to make purging Pierre or Ale, to be taken in the ſpring of the yeare, not onely for all thoſe diſeaſes afore mentioned, but alſo to cleanſe the body from all ſharpe humours, mixed or running therewith: Purging Prunes alſo and purging Currance are made herewith, by boyling Sene and ſome other opening herbes and roots, or if yee will without them, with ſome Annifeede, Fennelſeede, Cinamon, Ginger and Cloves, ſome of theſe or all of them a little quantity, and according to the proportion of your Prunes or Currans, being ſet to ſtew with the decoction of your Sene, and other things above ſpecified: theſe may be given to the daintieſt ſtomack that is without offence and without danger, open the body and purge ſuch humours above ſpecified, as trouble the body: And becauſe the decoction of Sene, too unpleaſant, ſo many weak and tender ſtomacks & even the ſoyle thereof doth cauſe them to refuſe any one made therewith, the infuſion thereof for a night in warme ale, and ſtrained forth in the morning is more eaſily receyved, & yet no leſſe purging: In that infuſion whilſt is warme you may diſſolve ſome *Manna*, or put thereto ſome Syrupe of Roſes and ſo take it. Caſſia fiſtula alſo may be drawne with the decoction of Sene, corrected & ſtrengthened & ſo given of it ſelfe, or made into a bole with Rubarbe powdered, or with the powder of Sene leaves a little Annifeed and Liquoris together; ſome alſo I have knowne that after they have infuſed Sene, Rubarbe, Agaricke, Tamarinds & Tartar, with a few Annifeeds or Fennelſeeds, Cinamon and Cloves in White wine, whereto ſome have put thereto juice of Pomitery for a whole day and night, then diſtilling the water from them, doe keepe it to drinke with ſome ſugar put thereto as a moſt dainty and pleaſant purge: After this manner water may be diſtilled from other things, as Mecoacan, Turbith, Scamony, and all the ſorts of purgers, infuſed in wine or the juice of Pomiterry, or other herbs as may be thought meete; whereunto being diſtilled, ſugar, Manna, Syrupe of Roſes, or Rubarbe may be added, and ſo drunke for the purpoſes aforeſaid: For the manner of diſtilling theſe things, if they be done in glaſſe they will be more neate and dainty, and the glaſſe body to ſet in Balneo with water onely may they be uſed in an ordinary ſtill, ſo as is before. If theſe might be made to grow wilde as here in England in any quantity, or in any of our plantations abroad, whereof we make no doubt, a water might be diſtilled from the whole plante while it is greene and freſh, according to the manner of other waters diſtilled from herbes, which would be a daintie aſwage as could be ſo. The lye wherein Sene and Camomell flowers are boyled, is marvelous good for weake braines, to comfort and ſtrengthen them, as alſo for the eyes and hearing, if the head bee waſhed therewith; the ſame lye alſo is very profitable for the nerves that are ſtiffe with cold, or ſhrunke with cramps, to helpe to warme, comfort & extend them: it helpeth alſo to take away the itch in the body and the hands, if they bee waſhed therewith. *Dioſcorides* ſaith, that the leafe is good to ripen and cure ſtale Vlcers and ſores: The *Turbith* Sene worketh the ſame effects before ſpecified, but more weakely in every part.

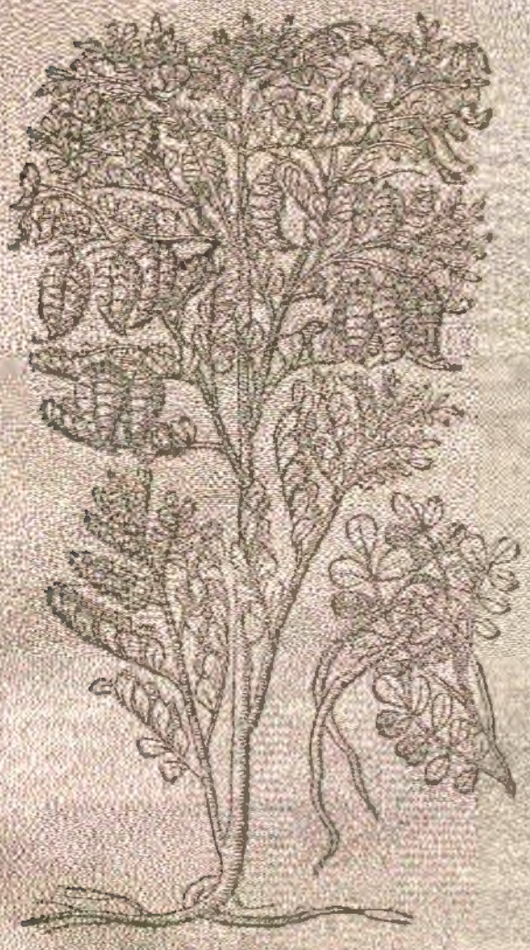
CHAP. XXXI.

Colutea. Baſtard Sene.

OF the Baſtard ſorts of Sene there are many, differing much one from another, as ſhall be ſhewed you in this Chapter.

1. *Colutea ſylueſtris vulgaris.* Ordinary Baſtard Sene with bladders.

The greater Baſtard Sene groweth in time to be a tree of reaſonable greatneſſe, the ſtem or trunke being of the bigneſſe of a mans arme or greater, covered with a blackiſh greene ragged barke, the wood whereof is harder then of an Elder, but white in the middle of the branches which are divided many wayes, having divers winged leaves compoſed of many ſmall round pointed or rather flat pointed leaves, ſet at ſundry diſtances and ſomewhat like unto Licorice, or the Hatchet fitch, among which come forth yellow flowers like unto Broome flowers and as large; after which come thinne ſwelling cods, like unto thinne tranſparant bladders, wherein are ſet ſtained blacke ſeede ſet upon a middle ribbe within the bladders, which being ſlightly crufhed betweene the fingers, will give a cracke like a bladder full of winde: the roote groweth great and woody, branching forth divers wayes.



2. *Colutea ſcorpioides maior.* The great Scorpion podded Baſtard Sene.

This baſtard Sene groweth nothing ſo great or tall, but ſhooteth out ſundry ſtalkes from the roote; the elder whereof have a whitiſh barke, and the younger a greene, with winged leaves ſet thereon as in the former but ſmaller, greener and more pointed; the flowers are yellow like the other, but ſmaller alſo, and with a reddiſh veine or ſtripe downe the backe of the upper moſt leafe, the pods are ſlender and long, with ſmall ſwelling knobs thereon like unto a Scorpions taile.

3. *Colutea*

Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

2. *Colutea Scorpioides vulgaris & sumplonis.*
Common and Scorpion podded bastard Sene.

3. *Colutea humilior.*
The lower bastard Sene.

3. *Colutea Scorpioides humilior sive minor.* The lesse Scorpion Bastard Sene.

This lesser bastard Sene is in all things like the former, but lower and smaller both in leafe flower and cods of seede which have not such eminent bunches on them as the last. *Lugdun* hath set forth another of this sort, having more leaves set together then the last and the end leafe bigger then all the rest, being all hoarse or of a silver like colour, sweete as the flowers are also.

4. *Colutea maritima glaucofolio.* Small Sea bastard Sene.

The Sea bastard Sene hath small slender branches, seldome longer then halfe a yard, whereon grow such like winged leaves, as the former hath, but that they are a little dented at the ends of every one, making every leafe seeme somewhat like unto the forme of a hart as it is painted, and being also of a more blewish colour then any of the rest: the flowers are yellow very like unto the former, but not growing so many together in a rank, and after them come small jointed or bunched pods, wherein lye such like seede.

5. *Polygala Valentina cluſii.* Evergreene Bastard Sene of Valentia.

The neare resemblance of this plant unto the former, hath caused me to place it with them, whose description is this: It hath many small weake, but tuffy and rough slender greene stalkes, rising from a foote high, whereon are placed without order, such like rowes of leaves as are in the former, but much smaller, thicker and of a blackish blew greene colour; like as the leaves of Rue are, of an unpleasant and binding taste, abiding on the branches all the winter, as well as sometime with out shedding: on the tops of the stalkes and branches, which are bare without leaves for a good space, come forth many small yellow flowers, very like unto the

Original from UNIVERSITY OF MICHIGAN

flowers of Melilot hanging downe round about them in manner of a crowne, after which succeed small long and round podds, with three or foure divisions or bunches on them, wherein lie the seede, being somewhat long and black; the roote is long and somewhat thicke, hard and tough withall. Of this kinde *Clusius* maketh mention of an other larger in every part, which he found also in the wooddie hills of *Valentia* in *Spaine*, and a third with slender greene branches full of pith, with fewer softer and thicker leaves thereon, growing on the low ground by *Valentia*.

Major montana & tenuifolia.

The place.

The two first sorts grow about *Trent* plentifully, and are kept in many gardens with us especially; the third groweth at the foote of certaine hills that are neere the Alpes, among the hedges and the borders of the vineyards about the *Duomo* or *Dauphine*. The fourth groweth neare the Sea shore by *Venetium*, and for the rarenesse of it brought into *Cardinall Bembus* his garden at *Padua*. The last *Clusius* saith he found in the fields of *Salamanca*, & also in the kingdome of *Granada* and *Valentia*, in the sundry borroughes of the hills.

The Time.

They doe all flower with us in June and July, or thereabouts, and give their ripe seede the next moneth after, except the fift which being more tender seldome abideth a yeare with us.

The Names.

It is called in Greeke κολουτέα, and in Latine *Colutea*. The ordinary *Colutea Vesicaria* is taken of most Writers since *Matthiolus*, to be the *Cornicabra Lobelij* that *Theophrastus* mentioneth, lib. 3. cap. but I doe rather thinke the *Colutea Scorpioides* should be it, because it properly beareth *simplices* podded, when as the other hath rather *vesicas tumidas*, tender bladders, and not properly podds or cods, and that *Theophrastus* would have given some proper note of difference from other sorts of *siliqua* cods, if he had meant there thinne transparent skinnes or bladders, and not the other which are the more formable, even as his *Cornicabra* and *Cerris*, which are *arbores siliquis* or *legumine*, and by some thought to be *Arbor Iudæ* and *Laburnum*, I like mistaken herein let others better judgement interpretes in this case. The other sorts received the name *Scorpioides*, from the forme of the podds, which are distinguished into bunches or joynts, as a Scorpions taile, and may also be called *Siliquosa*, in distinction from the first or greatest; they are called in English Bastard Sene, because the leaves are alike unto the leaves of the true Sene tree; *Ruellius* as I take it being the first that called it Sene. The first is by most Authors called *Colutea vera*; *Cordus in Historia* calleth it *Sena*, *Ruellius*, *Sena Mauritanorum*, and *Gesner in horto*, saith it was called *Sena by others quibusdam simplex mas*, but others *Colutea vesicaria*, *Tabernæmontanus* calleth it *Sperni vesicam grex*, the second *Sperni vesica*, but by all others *Colutea Scorpioides major*, and by *Bauhinus Colutea siliquosa major*, the third being called *Scorpion or worme* by all; the fourth is so called as it is in the title by *Bauhinus*; the last is called by *Clusius Polygala Valentina*, of the people in *Valentia Carendadel Rey* that is *Serrilargia*, where it is that the Apothecaries use the flowers for *Melilot*, and because he found it plentifully in divers territories of *Spaine* also in *Valentia*, and that the learned there (as he saith) did referre it to the *Polygala* of *Dioscorides* and *Plinie*. *Lobell* calleth it *Colutea minima*, and therefore I have you see referred it to the *Colutea's*, as being in face of leafe most like unto them, and as I thinke not much differing in vertue or properties, as by the unpleasant taste, of of leaves and seede may be gathered, I have therefore given it an English title as I thinke not unfitting it.

The Vertues.

The leaves of the greater bastard Sene with bladders, as also of the other with Scorpion podds doe both provoke strong vomitings and purgings downe wards, but very churlishly and with some trouble to the stomach and bowells; avoiding rough flegme and choller; the seede is more forcible in each of those qualities, and worketh more violently in the body, and from the joynts; it is therefore seldome given to any but to strong bodies and where any better or other purgers are not at hand. Let not therefore any take this to be good Sene, or use it instead thereof, *Theophrastus* saith it doth fatten sheepe wonderfully, and therefore much used in those countries but seldome proved in any of the qualities of the other sorts of bastard Sene, are not set downe by any, but onely by their taste being unpleasant like the other, declare them to be not much differing.

Chap. XXXII.

Genista & Spartium. Broome.

There are many sorts of our ordinary Broome as well as *Spartium*, *Spanish* Broome, reckoned among those plants that doe purge, as also divers others smaller sorts called *Genistella*, of all which I meane to entreate in this Chapter.

1. Genista vulgaris sive Scoparia. Our common Broome.

Our common Broome shooteth forth many woody stemmes or stalkes, of the bignesse of mans finger sometimes (especially if it be suffered to grow long) at the bottome, rising to the height of a reasonable tall man spreading into divers the like woody branches, covered with an hard and thicke darke grayish greene barke, which shoote forth a number of slender pliant square, or cornered small rushie branches, like rushes; whereon appeare small darke greene leaves, three or foure sometimes set together in a place, abiding but a small time, so that it is seldome seene with leaves on it; the flowers are long, and of a yellow shining colour, growing one above another for a good space at the tippes of the branches, turne into hard and flat small cods, almost blacke when they are ripe, wherein is contained the small brownish seede; the roote is long and woody, yet tough withall, spreading many wayes under the ground, perishing but sending forth new shoores every yeare, and more especially when the old stalkes are cut and taken away. From the rootes hereof in many places (but more often where no Broome groweth, namely in the hedge sides and upon heathes) groweth another plant, whose stalke is of the bignesse of a finger or thumbe sometimes above two foote high, having a shew of leaves on them, and many flowers at the tippe, somewhat like unto the flowers of Orchis, but larger and of a deadish yellow colour, as the stalkes and leaves are also, which perisheth without seede, or encreasing the roote, being somewhat round and scaly.

Major sylvestris.

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

2. *Genista minor folijs Hyperici.* Small or low Broome.

This differeth from the former chiefely in not growing so great or high, and that the slender branches are thicke stored with leaves like unto Saint *Johns* wort: the flowers, seede, &c. are like the former.

3. *Genista Hispanica.* Iland Broome.

This Iland Broome shooteth forth many stalkes, divided into many branches full of great joynts or knees, with divers small and narrow leaves set round about the joynts, of a pale yellowish greene colour as the stalkes are also; this hath yellow flowers and seede like the common.

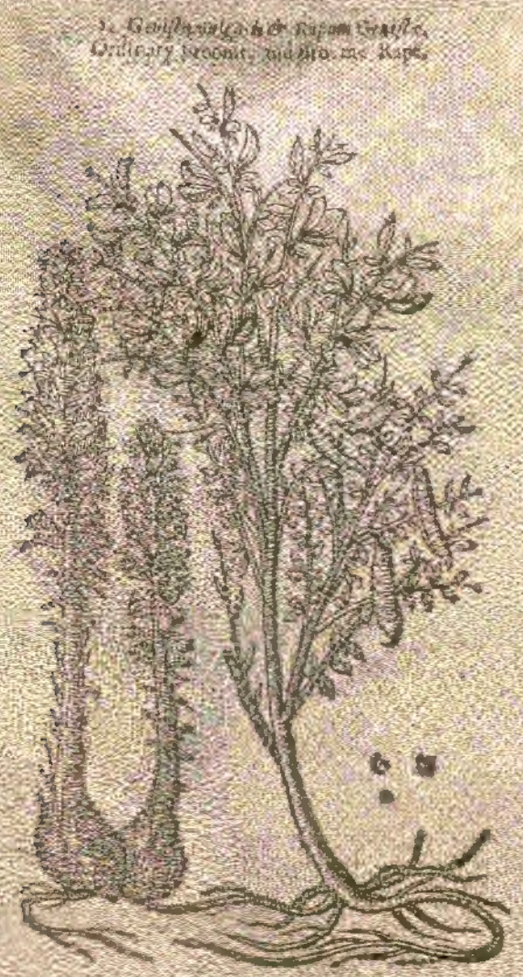
4. *Genista alba tenuifolia.* White Broome.

This Broome is very like the former, but that it groweth not so great, having many twiggie branches; which in time grow to woodily stalkes, whereon are set many smaller leaves then the former, somewhat greene on the upperside, and of a gray and shining colour underneath: the flowers, are in forme like the others but somewhat smaller, and of a whitish colour: the seedes and pods are also like the former.

5. *Chamægenista.* Dwarfe Broome.

This low or Dwarfe Broome never groweth very great or high, neither come his slender greene pliant branches to be hard or woodily, but alwayes abideth low, rising little more than a foote in height: on whole greene pliant twigges are set small and somewhat long leaves, of a darke greene colour on the upperside and gray underneath, abiding on them all the summer long, and at the toppes grow small yellow flowers, not so yellow nor so large as the first, but like unto them for the forme, and so are the pods and seede but smaller: the roote is long, rough, and much spreading in the ground, and long lasting.

6. *Chamægenista Cretica.* Dwarfe Broome of Candy.



The Candy dwarfe Broome hath low small hoary branches lying upon the ground, not exceeding one hand in length, yet divided into branches of two or three inches long, having very small and very narrow leaves set thereon, two or three growing together, one being longer than the rest, all hoary as the stalkes are: from the joynts with the leaves come forth three or foure yellow flowers like the other.

7. *Genista tinctoria vulgaris.* Common Greene weede or Dyers weede.

Our common Dyers weede hath a number of small tough greene stalkes, two foote long or thereabouts, rising from a roote very much dispersed under ground, and woodily; whereon grow without order many small long leaves of a sad greene colour, and many yellow flowers at the toppes, very like unto Broome flowers, but lesser and somewhat paler, after which come small pods lesser than Broome, and seede therein not much unlike.

8. *Genista tinctoria Hispanica, Spanish* Greene weede.

The *Spanish* Greene weede hath more woddy stalkes, rising much higher than the former, and bare without either leafe or branch for a good space above the ground, and then spreadeth forth may small shore and brittle branches, stored with many long and narrow leaves, somewhat like unto the leaves of Flaxe or Spurge flaxe, greene on the upperside, and of a glistering white or silver colour underneath, somewhat harsh and bitter withall in taste: the flowers are many and yellow, that stand at the toppes of the branches, like unto the former: the whole plant is very beautifull to behold, either in flower or out of flower. Under this Tribe when it was in

3. *Genista vulgaris siue rapum Gratiæ,*
Ordinary Broome, and Gratia. mes Rape.

7. *Genista tinctoria vulgaris.*
Common greene weede, or Dyers weede.

flower, *Clusius* saith he found growing in his naturall place, such another Broome rape, as is before specified, about a foote high, stored with many large and long gaping flowers, from the middle of the stalke upward, both stalke and flowers being of a yellow colour, and full of an unctuous or oylie moisture. *Alterum Rapum Genistæ.*

2. *Genistella montana Germanica*, Base Broome of *Germany*.

From a small and much spreading roote under ground, shooteth forth divers greene weake ruthy stalkes of leaves, or leafed stalkes: for the whole stalke being about a foote long, consisteth onely of small and somewhat long leaves, one springing forth from the end of another, and some likewise comming forth from the joynts of them: branched also here and there; which abide greene all the Winter, new comming up in the Spring: at the toppes of these stalkes, come forth many yellow flowers like unto Broome flowers, but smaller when they are blowen, standing at the first close together in a soft woolly head: the cups or huskes that containe the flowers, abiding woolly afterwards: the seede is small, enclosed in small pods that follow.

10. *Genistella altera pinnata, Hispanica, Spanish* base Broome.

This *Spanish* base Broome hath likewise many leafed stalkes, rising from the roote to the height of a foot or lesse, branching forth in diverse places, the whole plant as the former before, consisting onely of leaves, but somewhat greater and broader than the other, waved as it were a little on the edges, and each leafe rising from the middle rib of the other, being somewhat hard and rough in handling, thicker also than the former, and each leafe pointed at the ends of them, and sometimes ending in two points: the flowers are small and of a gold yellow colour like the former, foure or five standing together at the toppes of the stalkes enclosed in soft or woolly huskes, some also of the lower leaves of the flowers, seeming downie, the pods and seede are not unlike the other, neither the roote, but not so much spreading.

11. *Pseudo Spartium Hispanicum*, Bastard Spanish Broome.

Because this plant doth participate both with the former base Broomes in some things, and with the Spanish Broomes that follow, I have thought good to place it betweene them both, whose description is as followeth. The stemme riseth up to be two foote high or thereabouts, covered with a whitish barke, spreading into many small branches, some of them the length of ones hand, and some shorter, whereon doe grow very sparingly a few leaves, somewhat long but very narrow, which doe not abide but fall away within a very short space after they are spring, so that the plant for the most part is seene without leaves: on the toppe of every branch standeth one soft woolly round head, like unto the former Base Broomes, which after openeth it selfe into many small pale yellow flowers, every one standing in a woolly huske, after which come small pods wherein lyeth small seede like the others.

12. *Spartium Hispanicum fructu vulgare*, Ordinary Spanish Broome.

The ordinary Spanish Broome groweth to be five or six foote high or more, with a woodily stemme below covered with a darke gray or ash coloured barke, shooting forth many pliant long and slender greene twigs, whereon in the beginning of the yeare are set many small and somewhat long greene leaves, which fall away quickely

12. *Spartium Hispanicum fructu vulgare.*
Ordinarie Spanish Broome.

13. *Spartium Hispanicum minus monospermon flore luteo.*
The smaller Spanish Broome with yellow flowers.

Original from UNIVERSITY OF MICHIGAN

not abiding long thereon: towards the toppes of theſe branches grow many flowers, faſhioned like unto Broome flowers, but larger and more ſpread open, of a more ſhining gold yellow colour, and ſmelling very ſweete, after which come ſmall long cods, creſted at the backe, wherein is contained blackiſh flat ſeede faſhioned like unto the kidney beanes: the roote is woodily diſperſing it ſelfe diverſe wayes under ground.

13. *Spartium Hiſpanicum minus monoſpermon flore luteo.* The ſmall Spaniſh Broome with yellow flowers.

This ſmaller Spaniſh Broome, growth with a ſtemme or ſtalke of the bigneſſe of ones thumbe at the bottome, to bee about two foote high, whoſe barke is rough and ſtraked all along, ſending forth many greene ſlender pliant branches, which divide themſelves againe into many other ſmall ſwigges, wherein for a while after they are ſhot forth, abide a few ſmall leaves, untill they begin to ſhoote out flowers, and then fall away, leaving the branches naked and without leaves, all the reſt of the yeare after: from the ſides and joynts of the ſmaller ſwigges, ſhoote forth ſmall long ſtalks, bearing many ſmaller yellow flowers, than the former Spaniſh Broome, without any ſent for the moſt part: After which come ſmall round skinnie cods, containing for the moſt part, but one ſeede in every one of them, being blackiſh and faſhioned ſomewhat like unto the Kidney Beane, which when they are ripe, will by the ſhaking of the winde, make a noyſe in their pods: the roote is hard and woody.

14. *Spartium Hiſpanicum majus flore albo.* The greater White flowred Spaniſh Broome.

14. *Spartium hiſpanicum flore albo.* White flowred Spaniſh Broome.

The other Spaniſh Broome (in his naturall place) groweth much higher than the former, even to any mans height, whoſe branches are more lithy and pliant than the other, having ſmall leaves on them like the other, and as ſoone fading: the flowers alſo ſtand upon long ſtalkes, and are like them for the forme, but larger and of a white colour, of as ſmall ſent as they, which afterwards turne into ſmall round pods, like the former, but ſmaller, each one containing but one ſeede for the moſt part, and ſmaller alſo.

15. *Chamæſpartum montanum triphyllum.* Dwarfe Broome of Naples.

This ſmall Broome hath wooddy ſtalkes from whence ſhoote forth ruſhlike branches ſet at diſtances with three ſmall whitiſh hairy leaves as ſmall as thoſe of Sothernwood, at the toppes whereof ſtand yellow flowers and hoary hairy huskes ſucceeding.

The Place.

The firſt groweth plentifully in many places of our owne Country, as well as in *Spaine*, *Italy*, *France*, and *Germany*: The ſecond is found in ſome places about *Montpelier* in *France*, and *Friburg* in *Germany*: The third growes in the Iland of the *Twinhoms* Sea called *Hoa*: the fourth in ſome places of *Spaine* only: the fifth is found in many places of our own Land: the ſixt groweth in *Candy*, as *Alpinus* ſaith, and *Bauhinus* ſaith he had it out of the garden of the Noble *Contarenus* at *Padua*: the ſeaventh groweth in many untilled or unmanured grounds of our land, as alſo by the hedges, and way ſides, and in ſome meddowes alſo plentifully, where they keepe it for the profit is made thereof, even as of Broome: the eight *Cluſius* ſaith he found in no other place, than onely in the kingdome of *Murcia* in *Spaine*, and there alſo he ſaw the Broome rape, growing from the roote thereof. The ninth growes in many dry unmanured ſheepe paſtures, in *Narbone* of *France*, as *Pena* and *Lobel* ſay: the tenth *Cluſius* ſaith, he onely found in ſome rough dry grounds in the Kingdome of *Valentia*: the eleventh was found in *Spaine*, neere unto a place called *Aquæ blanæ*, as *Bauhinus* from Doctor *Alborne* ſaith: the ſwelfth in many places of *France*, *Spaine*, and *Italy*: the thirteenth is common as *Cluſius* ſaith, in the dry ſandy grounds, of both the Provinces of *Caſtile*: the fourteenth he ſaith he onely found in the Iland of *Gades* or *Cales*: the laſt *Columna* ſaith he found on the hils in *Naples*.

The Time.

All theſe flower ſome earlyer or later in the ſommer moneths, and give their ſeede ripe before winter, but the *Spaniſh* kindes are for the moſt part the latеſt that perfect their ſeede.

The Names.

Geniſta as ſome write it *Geneſta, agenum flexile aut & ulnæ ut vitis haud dubie nomina ſunt, vel quod ejus vitibus medeatur & lenimen*, and therefore diverſe in former times did take *Spartium Dioſcoridis*, to be the *Geniſta* or *Genuenſium*, and even *Plinye* alſo in his time was doubtfull whether it were not ſo, for *Spartum* as Dioſcorides calleth *cinerekinum* is *alligandis vitibus præcare*, and therefore the controverſie among diverſe writers, endured in *Ruellius* his time, who refuted the opinions of *Hermolaus* and *Marcellus*, that tooke them to bee both one, as alſo *Pena* and *Lobel* ſince them in their *Adverſaria*, call the *Geniſta Scoparia* (which is our common broome) *Spartium*, as if there were no difference, when as yet they appoint the *Spartium*, or *Spartum Hiſpanicum* of *Bauhinus*, to be the true *Spartium* of *Dioſcorides*, which many call alſo *Geniſta Hiſpanica*, *Italica* and *Alexandrina*: likewiſe miſtooke the *Spartum Junceum*, which is a kinde of Ruſh, wherewith in *Spaine* they make baskets, to put Rayſins, Figges, and other things in, to be the *Spartum frutex*, deceived by the name onely.

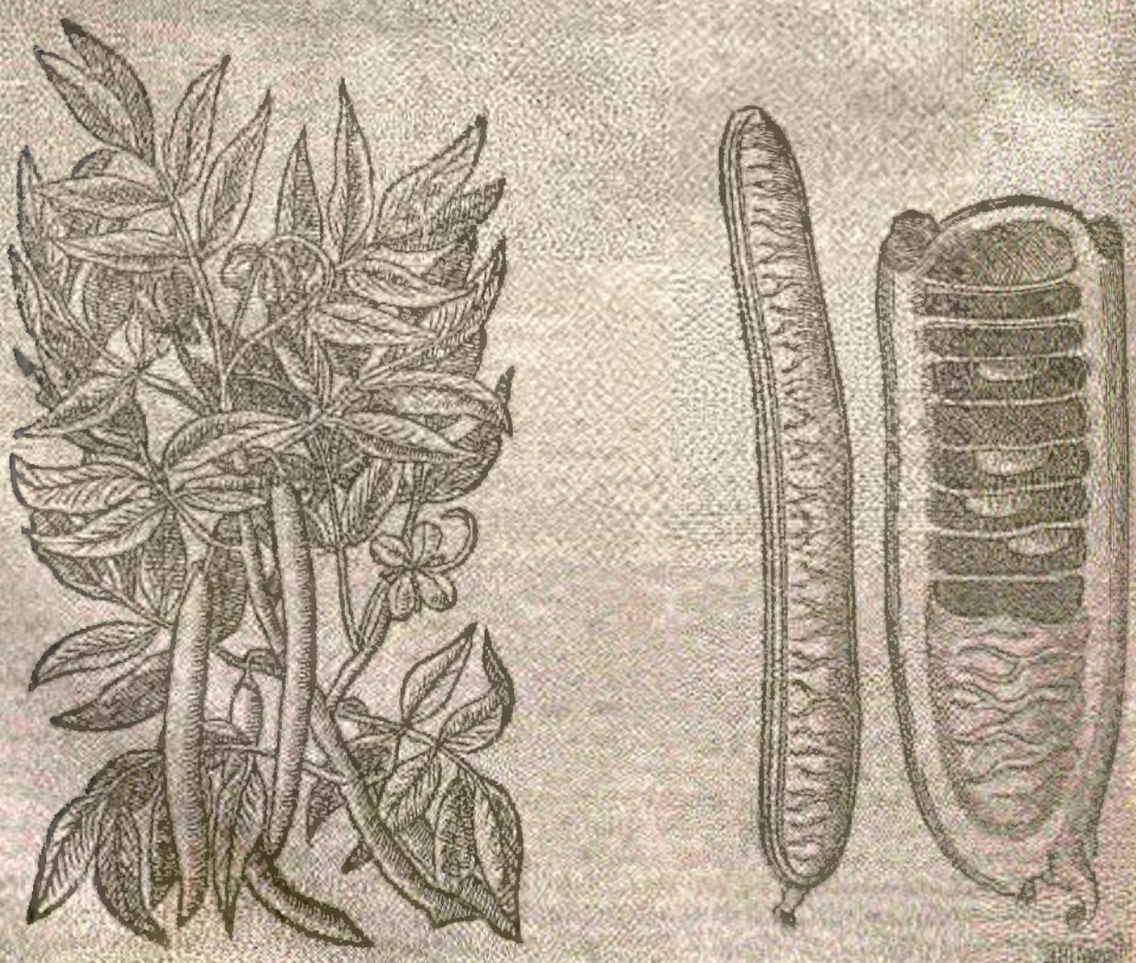
Broome, have the like qualities, and may be conducible for the same disease, but every one in his owne proper existence, some being weaker or stronger than other. The *Spanish* Broome over and above the same properties, as also to purge downewards and to provoke vomits, especially the seede taken to the quantitie of a dramme in mead or honied water, purgeth by vomit as Hellebor doth, without trouble or danger: the flowers thereof boyled in meade and drunke, or the powder of them taken in a veare egge, or the juyce of the young branches drunke fasting, doe cure the Kings evill and the hippe gowte, and an ointment made of them and the seed, often used, breaketh and healeth all impostumes of the Spleene, by causing the corrupt matter to void it selfe upwards often, and draweth also flegme and raw humors from the joynts.

CHAP. XXXIII.

Cassia solutiua. Purging *Cassia.*



IN former times there was onely one sort of purging *Cassia* knowne, but there hath beene lately Brought to our knowledge another, whereof I meane to give you the relation in this place.

1. *Cassia solutiua vulgaris.* The ordinary purging *Cassia.*

The purging *Cassia* tree groweth in *Assiria* about *Babylon*, and in the *Indies* to be a wonderfull great tree, spreading both in height and breadth very much, but in *Arabia*, *Egypt* and *Italy* much lesse, yet growing to be a tree of a large size or bignesse, whose wood is solid and firme, yellowish towards the huppe or outside, and blackish like *Lignum vitæ* at the heart, covered with a smooth soft and ash coloured barke, very like unto the Walnut tree: the branches are not very great, and but thinly stored with winged leaves, consisting of eight or some leaves, for the most part five standing on each side of the stalke, without any odde one at the end, each whereof is larger and longer pointed than the leaves of the *Carob* or Sweete Beane tree, the followeth in the next Chapter to be described: the flowers are yellow and large, many growing together on a long stalke, and hanging downe somewhat like as the *Laburnum* or Beane *Trefoile* doth, consisting of some leaves for the most part, or sometimes of five leaves, with many greenish threads in the middle, standing about a small horne crooked umbone or horne, of a very sweete sent, especially in the morning, before the Sunne shine upon them, but grow weaker in smell, as the Sunne groweth hotter upon them: the small horne in the middle of the flower, groweth to be the pod, which while it is young is greene, but in time commeth to be of a darke purple colour, and being suffered to grow longer, or taken at the time and kept turne blacke, being of divers sizes both for length and greatnesse, some being smaller and some greater, some a foote, or a foote and a halfe, or two foote long, with a hard round wooddy wrinkled shell, not very thicke or very hard to breake, with a seame as it were, or slit all the length thereof at the backe, eminent to be seene and with another small one against it upon the other side, which causeth it to be easily broken into two parts by the middle long wayes, and

1. *Cassia fistula vulgaris.*
The ordinary purging *Cassia.*

2. *Cassia Fistularis.*
The great *Cassia* of Bastil.

Original from UNIVERSITY OF MICHIGAN

diſtinguiſhed inwardly into many skinny wood-like partitions: on both ſides of which partitions grow a ſoft blacke ſubſtance like unto honie and very ſweete, which is that part onely that is to be uſed, and no part thereof elſe beſide: betweene theſe celles or partitions lie round and flat grilly ſeed, of a darke browniſh colour, very like unto the ſeede of the Carob tree: the rootes are great, and grow deepe in the ground: the choiſe of the beſt cods or canes, is that they be moiſt within, and that the ſeeds doe not rattle when they are ſhaken.

2. *Caſſia ſalutiva Braſiliana.* Purging *Caſſia* of *Braſill.*

There is another ſort of *Caſſia*, that hath beene brought from *Braſill*, which differeth not much from the former, either in the forme of the tree or fruite; for the tree it ſelfe groweth (as by relation it is affirmed) great, and hath ſuch like winged leaves as the former hath: the fruit onely or chiefely differeth from the other in this, that it is about two foote long, (eſpecially ſuch as we have ſeene) and more than two inches broad, and about an inch and a halfe thicke, whoſe barke or outward rinde is much harder, thicker, browner and flatter than the other but with great wrinkles or furrowes croſſing it as the other hath; the ſeames likewiſe at the barke, and againſt it are greater and more eminent, and the ſeede lying in the celle, larger and flatter alſo, the pulpe or blacke ſubſtance lying upon the wooddy skinnes, is as ſweete as the other, but of more force in working by the one halfe at the leaſt.

The Place.

This fruit groweth plentifully in *Egypt*, but yet not naturally, for it is onely in their orchards where it hath beene planted: for it is generally held to be firſt brought thither, and to *Arabia* alſo, from *Syria* and *Cappadocia*, and they from the Eaſt *Indies*. It groweth alſo in the Weſt *Indies*, firſt planted by the *Spaniards* in *Hiſpaniola* in ſo great abundance, that from thence the moſt ſtore that is ſpent in Europe is brought: The other groweth in *Braſill*, from whence it was brought into theſe parts.

The Time.

The firſt flouriſheth chiefely in *June*, and the fruite hanging upon the tree all the yeare, are gathered much about the time of the flowring: for the tree holding his greene leafe all the Winter, hath uſually both bloſſomes and greene fruite, and ripe all as it were at one time. The other hath not beene hitherto further deſcribed or knowne.

The Names.

Caſia or *Caſſia* is a word of divers ſignifications, for it is either the *Aroma* of the ancients, *Theophraſtus*, *Dioſcorides*, *Galen*, &c. like unto *Cinamon* called *Caſſia lignea* in the Apothecaries ſhoppes, or this *Caſſia fiſtula*, or elſe a ſhrubbe called *Caſſia poetica* or *Mezereon*, but it is very likely that this tree, nor his fruite was knowne to any of the ancient Greeke Writers, unleſſe as *Cordus* ſaith it might be the *Faba Indica* of *Ariſtobulus* and ſome others, but the later Greeke Authors, as *Aëtius*, and others ſince his time, called it *κασσια μελαινα*, *Caſſia nigra*, from the *Arabians*, who firſt brought in the uſe thereof, and called it *Caſſia fiſtula*; and becauſe it was not knowen where elſe it did grow then in *Egypt*, it was called by many *Siliqua Egyptia*, and is thought be divers that it may be the *Xylina* called *Piper Egyptium* by *Theophraſtus* in his firſt booke and 18. Chapter: and of others *Caſſia ſiliquoſa*, the uſuall name is *Caſſia fiſtula* in all Apothecaries ſhoppes: but why the name of *Caſſia* ſhould be given to this tree or his fruite, is not eaſie to know or learne: *Pena* and *Lobell* in their *Adverſaria* thinke it might come from the Greeke word *απο του καθαιρειν τα κοιλα εκκενουν*, becauſe the cods or canes are like feather; but I verily believe the *Arabians* (and it may be thoſe from whom the *Arabians* had it) called it *Caſſia* in regard of the ſweetenelſe of the flowers, like unto the *Caſia aromatica* or *odorata*, and *Columna* in the 4. Chapter and 14. verſe of the *Canticles*, maketh mention of this *Caſſia* tree, as I take it, for in the Latine Tranſlation of Saint *Jerome*, I find it is *fiſtula*, which the Tranſlators make to be *Calamus* in Engliſh: And it is not improbable that the tree *Caſſia aromatica*, or *odorata*, was called *Fiſtula*, becauſe the peeces of the barke were rowled together, and hollow like a pipe, even as Cinamon (which is *congener* if not *idem*) is, which in ſome countries is called *Canella*; and I finde that the people both in *Italy* and in *Spaine* doe call the *Caſſia aromatica* by the name of *Canella*, yet to this day, either from the forme of Cinamon, which is like unto a pipe, or from *Canna*, a reede or Cane, as I thinke rather, and the diminitive thereof is *Canella* a ſmall Cane reede. They are much deceived that thinke the barke of the pipes or fruite of this *Caſſia fiſtula*, is of any more force than a dry chippe, to procure womens courſes, &c. as ſome in former times did, for the error is groſſe. The other is called by *Lobel Caſſia ſiliqua Braſiliana purgatrix compreſſa*, who firſt gave us the knowledge thereof in his *Pharmacopœa Rondeletiana*.

The Vertues.

The inner blacke ſubſtance or pulpe, cleanſed from the ſhells, ſeeds, and skins that grow together with them, is the onely medicinall part that is uſed, taken by it ſelfe in bulls, or bits, or in potions or drinkes, and is very effectuall to purge the reines, kidneyes and bladder, for it tempereth the heate of them, cleanſeth the humors that be therein, both by ſtoole and the ſtoole, and thereby giveth much eaſe to thoſe that are troubled with the ſtone, if they uſe it often: taken with Rubarbe and a few Anniſeed and Liveris to correct the windineſſe thereof, it is an eſpeciall good medecine in *ſanguine* to cleanſe the reines, that other helpes may be the more availeable afterwards, it alſo cleanſeth the liver, the ſtomach and melentery veines, from choller and fleame, cleareth the blood and ſpirits of the heate thereof, and is therefore profitable in all hot agues: it is very effectuall againſt all fluxures and ſharpe diſtillations, and againſt choller and melancholike diſeaſes: it is often uſed in all the bodies of cold all diſeaſes, as old coughes, ſhortneſſe of breath, wheezings, and the like. If it be taken with Agaricke as ſome adviſe, it is not ſo convenient for thoſe that have moiſt, weake and ſlippery bowells, unleſſe it be given with *Anacardium*, Rubarbe, Spikenard, or Mallicke: elſe it may be ſafely given to all ſorts of people, ages and conditions, and to prevent the danger of ſuch lubricitie, divers doe uſe to give it with *Hieraphœnix*: The young cods taken while they are ſmall and greene, boyled a little and then laid in the ſhadow a while to drie, and after boyled in ſugar or Hony, doth purge the body, as the pulpe or blacke ſubſtance, and is a delicate medecine for tender and weake ſtomackes, that abhorre all manner of Phiſicke; and hereof the uſuall quantitie is three or foure ounces to be taken at a time for elder perſons, and one ounce for the younger: the uſe of *Caſſia* outwardly either in ointments or plaiſters, is much commended of many for all hot pimples, and other eruptions in the skinne, and alſo to eaſe the paines of the gout and hot inflammations, and paines in the joynes. The

other

other sort of *Cassia* is more effectuall to purging, for it hath beene proved by experience, that one ounce hereof, is as forcible as two ounces of the other, and is effectuall to all the diseases aforesayd.

CHAP. XXXIIII.

Siliqua dulcis sive Ceratonia. The sweete Beane or Carob tree.

OF this kind of sweete Beane or Carob tree, there hath beene one other also lately found out, and made knowne to the world by *Fonsi* for the ordinary sort, being well knowne to most, especially to *Spaine* and *Italy*, and other the hotter Countries of the East, is remembred by the ancients.

1. *Siliqua dulcis sive vulgaris.* The ordinary sweete Beane or Carob tree.

The *Carobe* or sweete Beane tree that hath beene of longest knowledge to all, groweth in the hot Countries, as *Spaine* and *Italy*, to be a very great tree covered with an ash coloured barke, spreading very much in breadth with very faire great branches, the youngest being reddish at the first, whereon doe grow sparsedly winged leaves, very like unto the leaves of the purging *Cassia* tree, but that they are rounder at the ends or points, and somewhat harder in handling, of a darke greene colour on the upperside, and of a paler greene underneath: it beareth a long catkin in the winter, like unto that of the Walnut, which in the spring time openeth into many darke purplish flowers, and afterwards bringeth crooked cods, of the bignesse of a large Beane cod, in some larger in others smaller, greene at the first, and of a brownish colour, when they are ripe, wherein are flat and round seedes, very like unto those of *Cassia*, and are of an unpleasant taste, while they are fresh, but of ther more sweetenesse being kept to be dry: the shell thereof although hard is eaten, as well as the inner substance; which that I may use the words of *Pliny*, is neither of a fleshie wooddy or skimie substance, but of them all as it were mixed together. In the hotter countries of *India* &c. as *Strabo* in his Geographie writing of the trees of *India* doth report, there is a certaine thicke substance lying within these cods, which being taken out serveth the *Indians*, and those other people where they grow in stead of Sugar or Honey, to preserve the young cods of *Cassia*, *Ginger*, *Myrobalans*, and other fruites withall.

2. *Carobe sive Siliqua seu Ceratia purgatrix.* The Carob or purging Beane of *Guinye*.

The *Carob* or purging Beane of *Guiny*, groweth no doubt in his naturall place, to be a great tree, but in the lesse warme Countries, as *Italy* whereunto it was first brought, it cannot doe so: but sheweth by the growing that it much differeth not from the former, bearing his leaves after the same manner, the fruite (for we have no knowledge of the flower as yet) is crooked thicke and short (and as *Pona* saith, somewhat like an *Anacardo* or *Cajou*) about three inches long, of a browne colour on the outside, very like unto the other, having a bowing or roundnesse all the length of the backe, and an eminence or hill as it were in the hollownesse: within which is foure or five somewhat rounder and not so flat seedes, more pointed below and round at the head: the taste more sharpe and quicke, even almost burning the throat, which peradventure is but from the nature of the hot Country, where it grew and may grow more milde, after hath beene inured unto a more temperate climate.

Siliqua dulcis vulgaris.
The ordinary sweete Beane or Carob tree.

The Place.

The first as is before sayd groweth in all the Southest East Countries, as *India*, *Armenia*, *Syria*, *Arabia*, *Egypt* &c. and in *Greece*, *Spaine*, *Italy*, &c. frequently in most places, as both *Acosta Christus* and *Clusius* make mention: the other is originally from *Guiny*, and is set forth onely by *Pona* of *Verona*, in his *Italian* booke, who had it from *Sig. Contarini* of *Venice*.

The Time.

The first flowreth in the very beginning of the spring, &c.

1. *Flores & fructus Siliquæ dulcis vulgaris.*
2. *Alia Guinea.*

Original from UNIVERSITY OF MICHIGAN

the fruite is ripe in the hot time of the Sommer onely: of the other there is no further knowledge as yet, than of the fruite.

The Names.

It is called in Greeke *κερατία*, *Ceratia* of *Dioscorides*, *id est*, *siliquæ*, *& κερατωνία & κερωνία Ceratonia & Ceronia*, *quasi cornuta Siliqua* of *Galen*, *Aegineta* and others, because the cods are crooked, or bowing inwards like a sithe or horne. But that *siliqua* whereof *Theophrastus* maketh mention in his fourth booke and second chapter, and which the *Ionians* called *Ceronia*, and some as he saith *ficos Aegyptias*, but falsely, with a white flower and fruite growing from the body of the tree, more plentifully than from the branches, cannot be this *siliqua*, but some other; even as *Lugdunensis* and others affirme also: *Plinye* calleth it *Siliqua dulcis* and so doth *Apuleius* and others: in some Apothecaries shops beyond Sea *Xylocastia* or rather *Xylocarubia*, the *Arabians* call it *Charubbium*, in *Italy* they call it *Carobe* and *Carobole*, and in *Naples Saliqua*, corruptly, from *siliqua* as *Matthiolus* saith, the *Spaniards* call it *Algarrovas*, the *Germanes* and *Dutch* call it Saint *Ioans brot*, that is, Saint *Iohns* bread, supposing that Saint *Iohn* fed upon these fruites, and wilde honey, while he did abide in the wildernesse of *Iudea*, as in *Matth.* 3. 4. but they are much deceived, for the word in the Hebrew text (as *Pomius* and *Tremellius* doe note upon the 22 *vers.* of the 11. *chap.* of *Leviticus*) is *Arbe*, (whereof there were foure kindes, of each whereof it was lawfull for the *Israelites* to eate) translated into Greeke *ακρίδες*, in Latine *Locustæ*, which are kindes of grashoppers, peculiar to those Easterne Countries, much differing from ours: but this *siliqua* or sweete beane tree, is the same mentioned in the 15 *chap.* and 16 *vers.* of the Gospell according to Saint *Luke*, whereof the swine fed themselves, and the prodigall child would fain have eaten of them to stay his hunger, but could not have them: for in all these Countries where they grow, the poorest sort of people doe often eate them, and the hogges for the most part consume the rest: the seede of this Beane, was that kinde of weight in ancient times called *Carat*, and among the goldsmithes a Carret, weighing five graines formerly, although in these dayes they account it to be but foure.

The Vertues.

The fruite while it is fresh and new gathered, helpeth to purge the belly, but being dryed doth rather binde it, and is then more beneficiall to the stomacke, than while it is fresh, because it somewhat troubleth it with the evill taste, and hard digesting thereof: the sweete substance within them, boiled also and used as honey, doth loosen the belly, almost as much as the extracted pulpe of *Cassia*, and is also good for the inflammations of the reines and backe to temper the heate, and is effectuall in the diseases of the chest, as coughes and shortnesse of breathes as *Cassia* is, which things also the decoction of the cods, performeth very well: *Galen* in his second booke of *Aliments*, condemneth the use of them for meate, saying they are hard of digestion, and are not easily avoyded forth of the body; and in his seventh booke of simple medicines, hee saith they are of a drying and binding quality, although they conteine in them some sweetenesse, and that they are somewhat like unto Cherries, that being fresh they loosen the belly, and being dry binde it, because the moyst substance being consumed, the thicker essence remaineth.

Chap. XXXV.

Tamarindus. The Tamarind or sower Beane tree.

The Tamarind or sower Beane tree groweth to be as great as a Plum tree with many branches thicke set with pale greene winged leaves, that is many set together on both sides of the middle rib but smaller, like unto those either those of the *Cassia* or Carob tree, having alwayes an oddeone at the end, which usually close themselves together, both at the setting of the sunne, and upon raine, and open againe at the rising thereof, and faire weather, of a sower or acide taste: the flowers are somewhat large and white, like unto flowers of the Orenge tree, consisting of eight leaves, smelling very sweete, having foure small white threds standing in the middle about the umbone, which after groweth to be the fruite, and when it is ripe, is much larger, than any kidney beane cod, some greater and lesse than others, as in all sorts of fruite, some what bending or crooked, wherein is contained a blacke substance, not distinguished into cels, as the *Cassia solutiva* is, but the seede lying dispersed among the pulpe, hath diverse bigge and long strings running through it, of a very acide sowre or sharpe sweete taste, very pleasing to the palate and stomacke: the seede or kernels are greater than those of Cassia, and as it were square and somewhat flat also: the tree never looseth his leafe, but will endure no cold, as hath beene often tryed in those colder Countries.

The Place.

This tree naturally groweth in many places in the East Indies as *Garcias* saith; it is onely nourished as a stranger both in *Arabia* and *Egypt* in their Orchards.

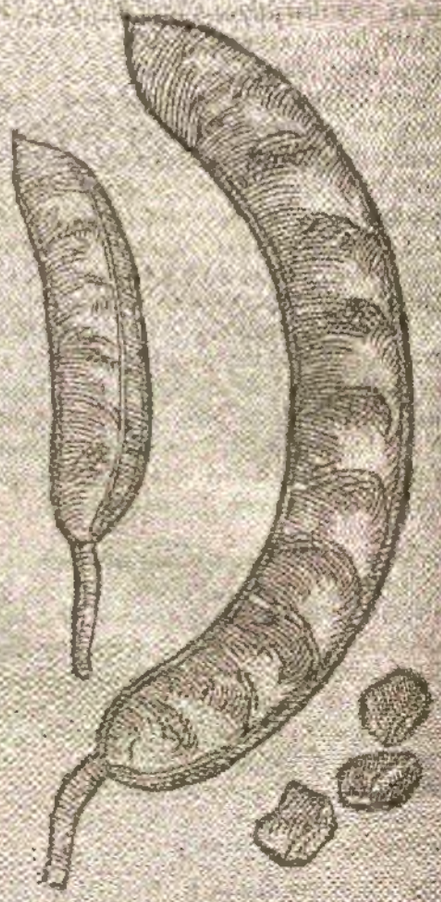
The Time.

We have no certaine knowledge of the time of flowring or the bearing of ripe fruite.

The Names.

It is called by the *Arabians* (for none of the ancient Greeke writers hath made any mention of it) *Tamarindus* that is the Date tree of India, for *Tamar* signifieth a Date with them, and of the later Greeke writers *Oxyphœnix*, that is the sower Date tree; but both of these very unaptly, for it may very well be perceived that it is nothing like unto any kinde of Date tree, *Lacuna* following *Matthiolus*, calleth it *Dactylus Indicus*, of the Greeke word *δάκτυλος* that signifieth a finger, which the fruite doth very well resemble, being bowed or crooked like unto a bowed or bended finger: some take it to be *Pala* of *Pliny*, whereof he maketh mention in his 12 booke and 6. chap. some againe thinke that it differeth nothing from the *Palmula Turbinata* of *Dioscorides*, the Dates of *Thebes*; and because it should not want an *English* name, according to the property thereof, I have called it the sowre Beane tree, for that the fruite or cod is so like a great kidney beane cod.

The Vertues.



The inward pulpe of the *Tamarind* is very effectuall to purge choller, and therefore is of great good use in all hot or pestilentiall agues, it openeth the obstructions both of the liver and splene, and therefore is profitable as

Tamarindus.
The Tamarinde or Sower Beare tree.

Tamarindi pomum sive capsula.
The cod and fcoales of the Tamarinde tree.

gainſt all breakings out of the skinne, which come of the heate of bloud, or of a ſharpe or ſalt water, running be-tweene the fleſh and the skinne, as itches, ſcabbes, lepry, and the like, and helpeth thoſe that are troubled with the Jaundies, and the ſtopping of the Spleene: it doth exceedingly helpe to aſſwage the thirſt, if an ounce there-of be diſſolved in faire water, and a little Sugar mixed thereswith, or taken of it ſelfe; for the people of the hot countries, doe uſually eate thereof in their long travells to quench their thirſt, which they were never able to indure without it, to refreſh themſelves in the great heate, both of the Summer, and of thoſe due places, where no water is to be had. It cooleth all inflammations, both of the liver and of the ſtomacke, as alſo of the reines and backe, and helpeth the *Gonorrhœa*, or running of the reines: taken with Burrage water, it quieteth the duiled ſpirits by melancholy, and ſomewhat mittigateth the fits of frenſie and madneſſe: it doth ſtay all fluxes and diſtillations, being taken with ſome Suger and the water of Maiden haire: if a ſmall quantity of the pulp of *Tamarinds* and *Caſſia*, and the ponder of Rubarbe be mixed togeether, it maketh a delicate medicine to purge the ſtomacke and liver, and is very effectuall to helpe to expell all hot or burning agues, and procure an appetite: it ſtaieth alſo vomitings, and taketh away the loathing of meate: the leaves as well as the pulpe ſerve inſtead of vinegar, with many of the *Indians*, *Ethiopians*, *Arabians* and others, they give the leaves alſo to children for the wormes, and both leaves and pulpe ſerve outwardly to coole all hot inflammations, and wheales, pimples and ſuch like. The young cods of the Tamarinds are preſerved in *Arabia* with the hony of the Carobs, or with Sugar, which ſerve for all the purpoſes before recited.

Chap. XXXVI.

Nux Ben ſive Glans unguentaria, The oyly Nut Ben.

THis oyly Nut Ben hath undergone much controverſie, and contrarietie among thoſe Authors that have anciently written thereof, as namely *Dioſcorides*, *Theophraſtus*, *Pliny* and *Galen*: for *Dioſcorides* ſaith that the tree is like unto *Tamariske*, *Theophraſtus* ſaith it hath leaves like unto Myrtle leaves, *Pliny* ſaith like unto the leaves of *Helixtrapum*, or Tamariske: but for I purpoſe this controverſie and end this contrarietie betweene them, I will ſhow you here the true deſcription and figure thereof, ſuch as Doctor *Tobias Aldinus*, the Cardinall *Farnſius* his Phyſitian at *Rome* hath ſet it forth being well growen, for that which *Honorius Belli*, a famous Phiſition, living long at *Candie* had growing with him from the Nuts, which he planted, (and ſent the figure thereof to his friends in diuers places, & eſpecially to *Iohannes Pona*, an Apothecary in *Verona*, who in the deſcription and catalogue of the names of thoſe plants that grow upon Mount *Baldus*, which he ſet forth himſelf, hath inſerted the figure hereof)

Nux Ben ſive Oleifera vulgatiſſima fructus integri, nucis cum Exemplaribus
The ayle nut bearing the whole cod, and the nuttes drawne and let by themſelves.

he received it from the ſaid *Arabia* Iwas but a young plant, of not above a yeare or two growth. *Theophraſtus* in deſcribing the tree growen great, ſaith it groweth crooked, and not ſtraight upright ſpreading rather in breadth than in height, whoſe leafe is like thoſe of Myrtles, but longer: by the figure that you here ſee you may well perceive and nothing like unto thoſe of *Tamarindus*, and that the compariſon of *Theo* in the leaves like Turnſole, is not much amiſſe, for if they be both compared they will not be found much to differ in the forme, I meane Turnſole leaves, from the larger Myrtle leaves, but the difference betwixt *Dioſcorides*, and *Theophraſtus* eſteth as it is thought from the errour in the Writers out of the copie of *Dioſcorides*, the Greeke word in *Dioſcorides* and *Theophraſtus*, being ſo neare and like the one unto the other, that it might eaſily be miſtaken, which are vſed in *Dioſcorides Aegyptia ſpina Tamarindi*, or ſalem *Aegyptiam* in *Theophraſtus*, yet it is more probable that there is no errour in the Text of *Dioſcorides*, in that his compariſon of this tree here *Tamarindus* is not unto the forme of the leaves, as *Theophraſtus* ſaith, but unto the forme of the whole body, and growing thereof: the true deſcription therefore hereof as *Alpinus* hath moſt accurately ſet it downe is thus. The ſtalk two or three yeares ſuch he ſaw ſpring up and withered or periſhed downe every Winter to the roote, and roſe againe a freſh every Spring, but after it became three or foure yeare old, it grew more woody and more likely to abide without decayings it roſe up greatly after the firſt, with one ſtemme ſhooting forth branches of winged leaves, or rather winged bracher of leaves, the barke being whitiſh as the leaves alſo, but they are conioyned after ſuch an order, as no other tree doth the like; for the branches riſe up with the ſtemme or body, divided into many other ſmaller ſtriggles no bigger than quilles, set with two leaves at ſeverall ſpaces diſtant farre in manner, ending in ſmall long points like hares, but have no eyes or buddes at the feete of the leaves, as the ſmall branches of all other trees have, which cauſeth that the whole branches ſtalke or diuided branch, is but as one winged leafe: the leaves fall falling away, leaving the branches bare, which then ſhew like unto ordinary or *Spaniſh* broome when it hath loſt the leaves; and after the leaves the ſtalkes likewiſe periſh that held the leaves wholly unto the very ſtemme, and therefore ſheweth to be but as one winged leafe of a tree, as in the Aſh, Wallnut, &c. the loweſt of theſe leaves are ſomewhat round pointed like the herbe *Helioſcopium Sempervivum*, thoſe on the middle of the branch more ſharpe pointed like unto Myrtle leaves and the uppermoſt ſmalleſt ſome what like unto Knotgraſſe: it hath not borne either flowers or fruit in our Chriſtian countries as yet ſo far as I can heare: the roote is thicke, large, white and ruberous as it were, yet ending in ſome ſprayes being not much woodily but rather fleſhie and tender. But the nuts or fruits, ſuch as have been brought ouer to us enclоſed in their huſkes, as alſo out of their huſkes are expreſſed here by themſelves: that is, that many of them grow ſingle in the huſks & ſome two together, and ouer the nuts are lyned in every huſke each by it ſelfe have their place branched forth where each of them lie, and ſo inclined beneath them both, the lower and upper end of the huſke being ſmall and ſharpe pointed, and about an handbreadth long, round and of a darke aſhe colour on the outſide, and ſomewhat reddiſh on the inſide, of the ſubſtance of leather, like as of caſſe to bow, rugged on the outſide with many long ſtreakes in it, but ſmooth on the inſide: the nuts themſelves are three ſquare, for the moſt part, covered with a whitiſh *loſt* and ſomewhat rough woodily huſk wherein the white kernell lieth, which is not altogether inſipid, but ſomewhat ſharpe in taſte and ſyrie withall, cauſing a kind of loathing upon the taſting almoſt ready to provoke vomiting; out of which is preſſed an oyle, as *Dioſcorides* and *Galen* affirme, like as is preſſed out of Almonds: and not from the huſks or huſke as ſome formerly ſuppoſed, for it is commonly known vnto many here in our owne land, and to my ſelfe alſo, who have preſſed as good oyle out of the kernelles of the nuts, as any hath beene brought from beyond Seas: and therefore *Theophraſtus* was herein much miſtaken, or at leaſt miſinformed, that ſaid the oyle that ſerved for ſweete oyles and ointments, was drawne from the huſkes and ſhells and not from the Nutts themſelves, and ſo all the reſt ſaith the ſame doth erre in that, although he ſaith that an oyle is drawen out of the nuts, yet ſaith *Dioſcorides* for the oyle to both uſes is one and the ſame.

The Place.

Theſe trees grow in *Perſia*, *Arabia*, *Aethiopia*, and *India*, and although ſome lay in *Egypt* alſo, yet I thinke *Proſper Alpinus*, who was curious to ſet downe all the rare trees, and plants vnknowne in *Italy* that grew there, would have given ſome knowledge thereof, among other *Egyptian* plants, if they had beene there in his time.

The Time.

We have ſaid before, no knowledge of the time of flowring hereof.

The Names.

It is called in Greeke by *Dioſcorides*, *Galen* and others [illegible] *Dulcis Aegyptia*, that is *Glans Vnguentaria*,

gustatia, and by *Lobel Glans unguentaria cathartica siliquosa*, by *Theophrastus* Βαλανος only, and by *Plin. Myrobalanus Trychidia*, in his 12 booke and 17. chap. but why the Grecians should call it *Balanos* an Acorne being like unto none of the kindes of Acornes, nor the fruite it selfe, nor shell or huske I know not, for if they that doe so call it, had ever seene the huskes, wherein the Nuts are enclosed, they would surely have given it a more proper name. *Monardus* tooke them to be the *Avellanæ purgatrices* of the West Indies, because the fruite is more like an Hasell nut than an Acorne, and called them *Ben Magnum*, but he was much mistaken therein, and therefore the *Arabians* called it *Ben* and *Hobben*, which signifieth a Nut with them, yet *Pena* seemeth to make the name and forme to agree together. *Ioannes Costæus* called it *Myrobalan album* saying it is three square, and like a Beech mast or fruite of the Beech tree, for what cause onely as it is likely, *Bellonius* compared the tree to a Beech, it is called either *Balanus myrepsica* or *Glans Unguentaria*, after the Greeke signification of moist matters, but we in these dayes more usually call it *Nux Ben*, and the oyle *Oleum de Ben*, or as the ancients called it *Oleum Balaninum*. I have given the *English* name to it, according to the most proper signification as I thinke, calling it rather a Nut, than an Acorne as *Gerard* doth after the Greeke name.

The Vertues.

The kernells of the nuts bruised and drunke with *Posca* posset (that is water and vineger mingled together) doth purge the body from grosse and ranke flegme also, and thereby is helpefull to those are troubled with the wind collicke, if a few Aniseede and Fennelseede be put unto it: the oyle that is drawne out of the nuts doth the same also, and provoketh vomiting, clensing the stomacke of much foule matter gathered thereon, yet it doth much trouble the stomacke in the meane time, but the nut being toasted at the fire taketh much of that evill quality, oftentimes causing them to purge downewards only: it is with very good effect also put into glisters for the same purposes, the oyle dropped into the eares, helpeth the noise in them, and the deafenesse also: a draught of the kernell taken in posset, doth soften and dissolve the hardnesse of the spleene and liver. *Mesues* commendeth the drie pressing after the oyle is taken from it, being of a clensing as well as of a cutting qualitie, & by reason that the moisture is taken from it, of a drying effect also, for to helpe the itch, the lepry and running sores, and to take away the ruggednesse of the skin, morphew, drie scabbes, scarres, freckles, wheales and pimples, from the face or body, especially if it be used with vineger and nitre, with which it well agreeth, and performeth the cures much better. It is also used with the meale of *Cicers* the bitter Vetch, or the meale of Darnell in manner of a plaister, to be laid to the side to consume the spleene; It helpeth the gout also used in the same manner, used with barly meale, it comforteth the sinewes, that are pained with cold, and all spasmes or crampes, and used with honey dissolveth all knots and hard swellings, the shells or huskes are of an exceeding binding properrie, so to be used when occasion serveth for such purposes: The oyle that is pressed forth out of the nuts is much used of Perfumers, although it have no sweete smell of it selfe to commend it, yet it is of so excellent a qualitie, that being kept never so long, it will not grow ranke, and therefore it doth both preserve the sweete scents of Musk, Civet, Ambergrise and the like mixed with it, and keepeth that the gloves, leather, or other things, shall not gather spots or staines in them, nor ever grow mouldy, as those things that are perfumed with oyle of Almonds will doe. This oyle likewise is much better than oyle of Almonds, to receive any sweete thing to be steeped in it and to keepe the scent thereof in it, for being utterly without scent of it selfe, neither growing ranke by any time, the scent of any thing will be the sooner infused, and the longer also retained and kept therein.

CHAP. XXXVII.

Frangula sive Alnus nigra baccifera. The black Alder &c.

Alnus nigra baccifera sive Frangula
The blacke Alder tree.

THe black Aller or Alder tree, riseth seldome to be of any great bignesse, but for the most part abideth like a hedge, bush or tree, spreading into branches, the wood of the body being white, and of a darke red at the core or heart, the outward barke being of a blackish colour, whereon many white spots are noted to be seene; but the inner barke next unto the wood is yellow, which being chewed will turne the spittle yellow, as much or more than Rubarbe, neare unto a Saffron colour, the leaves are somewhat like unto those of the ordinary Alder tree, or those of the female Cornell or Dogge berry tree, but blacker, and not so long but rather rounder, the flowers are white comming forth at the joynts with the leaves which turne into small round berries, greene at the first, and red afterwards, but blackish when they are thorough ripe, divided as it were into two parts, wherein is contained two small round and flat seedes: the roote runneth not deepe into the ground, but spreadeth rather under the upper crust of the earth.

The Place.

This tree or shrubbe groweth in woods in many places of our land, as in Saint *Johns* wood by Hornsey, in the Woods upon Hampsteed heath, &c.

The Time.

It flowreth in May, and the berries are ripe in September.

The Names.

It is called *Frangula quia citò frangitur*, that is, the branches be brittle and eatie to breake, and *Alnus nigra baccifera*, that is might

be knowne from the *Alder tree*, whose barke is whitish and the wood more red, and beareth not berries as the *Alder*. *Tragus* calleth it *Lentiscus* that is Faule tree, of the evill sent and sauor, the *Dutch* men call it *Vulgaris*, the *Germans*, and some other land *Traen Faulbaum*, the *Dutch Spruckenast* and *Hondsboom*, and we in *English* the Hacke Alder or Alder tree.

The Vertues.

The inner yellow barke hereof as *Matthiolus* saith, purgeth downewards both cholers and fegmes, and the watery humors of hydropicke persons, and strengthneth the inward parts againe afterwards, even as Turbith doth: if the barke hereof be boyled with *Agrimonie*, Wormewood, Dodder, Hoppes, and some Fennell and Smallage, Bedine and Cichory rootes, and a reasonable draught taken every morning for some time together, it easeth the hall against the *Iaundise*, the dropsie, and the euill disposition of the body, to whome especiall purging medicine, have beene taken before to avoyd the grosser excrements, and then it will the better soften the belly, and keepe it soluable without trouble or danger to the stomacke, purging and strengthning the liuer and spleene, in so good manner that diuerse have beene cured by this onely medicine, who have had their liuers and spleenes (with their humors and hardnesse, by opening all obstructions in the inward parts, and cleansing them from such euill humors as they were full of before. the dried barke is onely fit for those purposes, for the fresh or greene barke being taken inwardly, prouoketh strong vomitings, paines in the stomacke, and gripings in the belly, yet if the decoction thereof stay stand and settle for two or three dayes, vntill the yellow colour be changed into blacke, it will not worke so violently by much as before, and is not prouoking vomiting or purging, it will strengthen the stomacke, and procure an appetite or desire to meate the outer barke operateth both and the body, and exercise is helpefull for all lasks and fluxes thereof, but this should be given after it hath beene dried also, to worke the better. the inner barke hereof boyled in vinegar, is an approued remedy to kill lice, to cure the itch, and take away scabbes, and doe them no in a very short space. the same also is singular good to wash the teeth, both to take away the paines, & fasten those that are loose, to cleanse them from corruption, and to keepe them sound. the leaves are also good vnder for same, to cause them grow the more abundance of milke.

Chap. XXXVIII.

Euonymus. The Spindletree or Prickewood.

Although the former ages, were content to know but one sort of this *Euonymus*, or Spindle tree, yet *Cæsalpinus* in his *Remedy* of *Candia*, hath set forth two other sorts, not knowne before to any, which I will here ioyne together.

1. *Euonymus vulgaris.* The common Spindle tree.

Our ordinary Spindle tree, is vsually but a thicke bushe or hedge bush, rising vp with many stemmes, or sometimes

1. *Euonymus vulgaris.*
The common Spindle tree.

2. *Euonymus Pannonicus latifolius.*
The broad leaued Spindle tree of *Hungary*.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

but with a few, the elder boughes having a whitish barke, and the younger greene, with foure crowning like lists, running all the length of them, which make them seeme foure square, the wood is somewhat white, hard, and yellow, it hath diverse branches, whereon doe grow faire and darke greene long leaves, rounded at the middle, from among which come forth long stalkes, whereon stand foure or five white flowers, shutting together, consisting of foure leaves a peece, with some threds in the middle, after which come round hard fruits or red berries, divided into foure parts, in each whereof lieth a white hard seede, covered with a yellow skinne which will give a yellow colour, if it be put into water: the roots are many, not running deepe into the ground, but spreading rather under the upper face thereof.

2. *Evonymus Pannonicus.* The Spindle tree of *Hungarie.*

The Spindle tree of *Hungary* hath diverse gentle and plant braunches, rising from the roote, which grow to the height of foure foote high, and of the thicknesse of ones thumbe, covered with a thicke greene barke, with many branches spred thereon, divided into many other lesser branches, set in a formely or comely order one above another, about which grow many leaves, set opposite one unto another, somewhat like unto the greater Myrtle leafe, but more gentle in handling, lightly dented about the edges, of a drying taste at the first, but afterwards somewhat bitter and hot, from among the leaves at the joynts of them come forth small long stalkes, with two or three flowers on each of them, consisting of foure leaves a peece, of a thinne purplish colour hanging downe their heads, and with a square cuttbone in the middle, which grow into a foure square head or berrie, like unto the former, somewhat spongie or light, of a faire yellow colour on the outside, wherein lie blackish round seede, blacke on the outside, two or three lying in one cell or partition, which are very like unto the seede of ballard Dittany.

3. *Evonymus latifolius.* Broad leafed Spindle tree of *Hungary.*

This broad leafed Spindle tree, riseth up (if it be manured) to be higher than any man, spreading into many plant branches, unable to breake, whereon doe grow many faire broad greene leaves, set by couples, as large as the leaves of *Laurocerasus*, or Cherry bay tree, lightly dented about the edges, and of an unpleasant bitter taste: at the joynts betweene the leaves and stalkes spring forth long stalkes, with diverse flowers at the end of them, hanging downe their heads, consisting of foure white broad leaves, standing in a fielh reddish colour, very like unto the common Spindle tree, which turne into foure square heads of berries, and sometimes to five square berries, but much larger, having certaine like to winges on every of them, wherein are contained white graines or kernells, covered with a yellow skinne as in the first.

The Place.

The first groweth in many places of this Kingdome, in woods and untilled places, and serveth among other shrubbes for hedges; the second *Clusius* found both in the upper and the lower *Hungary*, upon those hilles which runne to the Alpes, as also in *Moravia* in the woods there. The last was found by *Clusius* also, in a wood in that part of *Hungary* that is called *Interamnis*, and which the *Germanes* call *Waldschlande* beyond the river *Drave*.

The Time.

They doe all flower about May, and their berries are ripe in September.

The Names.

This is generally by most Writers called *Evonymus*, and taken to be the tree *Euonymos* of *Theophrastus*, of whom mention is made in his 5. cap. 4. libri, and which tree he calleth *Petraeola* translated *Spondaetia* by *Theodorus Gaza* in that Booke and first Chapter; but there are diverse, and *Lugdunenses* with them, that have rather judged it to be the shrubbe to be *Evonymus*, which *Tragus* in his Epistles, and *Clusius* in his Historie of Plants, thinke to be a kinde of *Ledum*, and is by *Clusius* called *Ledum Alpinum*, (which I have remembred before in the former Chapter) *Tiffus Absinthoides*, or *Nerium Alpinum*, as *Tragus* in *descriptione montis Fracti* doth record, and is probably the *Chamaerhododendros Alpina* flore of *Penn* and *Lobel* in their *Adversaria*, and which *Lobell* in his Observations calleth *Balsamum Alpinum*: but *Clusius* sheweth plainely, that it cannot agree therewith, not having a foure square head or huske. It hath beene corruptly called *Aconitum* of diverse, instead of *Evonymus*, as *Cordus Hist. stirp.* *Tragus* mistaking it called it *Cupressus*. It is called also *Fusanum* and *Fusaria*, because the Italians called it *Fusare*, as being used by Turners and others, to make spindles for spinning wheeles and other things. It is by *Bauhinus Evonymus vulgaris granis rubentibus*. The second is called by *Clusius Evonymus alter*, vel *secundus*, by *Camerarius* and *Tabernamontanus Evonymus Pannonicus*, and by *Bauhinus Evonymus grossis oliveis*. The third called *Evonymus foetidus* by *Clusius* and all others. It is called in English Spindle tree, Prickwood and Prick wood, and in some countries of this land Dogge wood, and might from the forme of the berrie well be called Square berried tree. The *Italians* call it *Fusano*, the *French Fusin*, and *bonnet de prestre*, the *Germanes Spindelbaum*, the *Dutch Papenhaut*.

The Vertues.

This is seldome used in Physicke with us for to helpe any disease, yet it is found by experience that three foure kernells will purge both by vomiting & by the stoole, purging much cholles and flegme: so writeth *Dioscorides*, and from him diverse others, have said that the leaves hereof are pernicious and deadly, especially to Sheepe and Goates, unlesse they be purged by *Anethum* (which word is not well knowne what it meaneth) *Matthiolus* interpreting it, that they should be purged upward and downeward, and others understanding it, that they should be purged by want or abstinence from meate. *Dalechampius* as *Lugdunenses* terme it, somewhat doubteth that saying of *Theophrastus*, to be hurtfull to Goates by his owne experience, who saith he hath fed many dozens of Goates upon the shrubbes that grew with this, but none of them to touch it, and that they refused to eat a twig of them, but *Clusius* saith the cleane contrary, that here in Lowerhood the Goates in *Hungary* did greatly delight in the leaves thereof, and tooke no harme thereby, and that the *Hungarians* in their language call this tree *Kechke rogo fa*, id est *caprae rosa arbor*, the Goates Rose tree, so diverse be the writings and opinions whereof in many other things we have hitherto experience.

CHAP. XXXIX.

Rhamnus foliis cum spina deciduis. The purging Thorne.

There are diverse sorts of *Rhamnus*, some for this *Classis*, others for another, as shall be shewed in their places. Of this Thorne formerly we had the knowledge but of one sort onely, untill *Clusius* in his *Pannonicke* observations set forth two other, the one whereof shall be here expressed, for I must referre the other to another place, that is to the kindes of *Lycium*, where you shall finde it.

1. *Rhamnus foliis cum spina deciduis vulgaris.* The common purging thorne.

The purging thorne, that is frequent in our owne Land, is for the most part but a low shrubbe or hedge bush, seldome growing any thing bigge or like a tree, having many stemmes or branches rising from the roote, covered with a smooth blackish-red barke on the outside, and greene on the inside, the innermost being yellow, the wood whereof is of a whitish yellow, toward the outside, and of a reddish yellow inward, and at the heart

1. *Rhamnus foliis cum spina deciduis vulgaris.* The common purging Thorne.

2. *Rhamnus foliis cum spina deciduis Pannonica.* The lesser purging thorne of Hungary.

3. *Rhamnus foliis non cum spina deciduis.* A more rare figure hereof.

Original from UNIVERSITY OF MICHIGAN

strong, and not easie to bend or to breake, whereof strong bowes may be made, and hath beene in times past; the smaller branches are furnished with many leaves like unto those of the crab tree, but smaller, with small long straight thornes in many places set with the leaves, the ends of the branches ending in a thorne also; among the leaves come forth many flowers, every one upon a severall foote stalke, consisting of foure leaves a peece, of a whitish greene colour; after which come small round berries, greene at the first, and blacke when they are ripe, full of pulpe or joyce that is greene, with one or two small graines within them of an unpleasant taste.

2. *Rhamnus solutivus minor Pannonicus*, The lesser Purging thorne of *Hungary*.

This lesser *Rhamnus* groweth much lower than the former, with smaller branches, not above a yard and a halfe high, having many leaves thereon, smaller and narrower than the former, almost as small as those of the blacke thorne or flowe tree, with a few thornes set here and there upon the branches, but ending alwayes in a thorne; the flowers are like unto the other but smaller, and of an herby, or whitish greene colour, with small berries also succeeding them.

The place.

The first groweth in many places of this land, but especially in *Kent*, as at the hither end of *Dartford* next unto *London*, *Farningham* upon the Connie burrowes, and in a narrow Lane neere *South Fleete*, and in many other places. The other *Clusius* found in *Pannonia*, and in *Germany* neere the bathes at *Baden*.

The Time.

They flower in Aprill and May, their fruite is ripe in September and October.

The Names.

It is called *Rhamnus*, although it can be referred to none either of *Dioscorides* or *Theophrastus*, yet all agree it is a *species* or kind of *Rhamnus*, and so even the thornes declare, and therefore the word *solutivus* is added thereunto, to denominate the difference. *Matthiolus* I thinke first called it *Spina infectoria*, and is by many followed therein. *Tragus* calleth it *Rhamnus alia species*, yet knew not of any purging quality in it. *Dodonæus* called it *Rhamnus solutivus* and *Lusitanicus*: *Rhamnus Carthaginensis*, & so doth *Lobelius*; *Gerard* calleth it *Cervi spina*, *Gesner Spina Cervina* and *Cæsalpinus*: *Spina Cervalis vulgo*, and some also *Burgi spina*, from the French word *Bourg epine* which they call it as also *Nerprun*. The other is called of *Clusius Spina infectoria pumila germanica* although *Gerard* hath called it in *English Laxative Rum* and *Buckthorne*, yet I have rather entituled it a purging thorne, as most fitting it.

The Vertues.

The berries hereof dryed and a dramme of the powder, given in wine or the broth of flesh, doth purge fleagme and grosse thicke humors also, yet *Pena* saith it rather draweth forth thinne fleagme, and that from the joints and Arteries, and therefore is singular good for dropsies, some doe make an Electuary and some a Syrupe of the juyce of the berries clarified, and Sugar or Honey put thereto, but because it worketh a little troublesomely, some spices are to be added thereto to aromatize it, as Cinamon, Ginger and Cloves, and some adde Mallicke and roses also, which doth correct the evill quality therein, and cause it worke without paine; an ounce or more of either Electuary or Syrupe may be given at a time, dissolved either in wine or in the broth of flesh which will draw forth raw whayish humors, and choller aboundantly, as also thicke clammie fleagme, for it worketh not with any trouble some hearing of the parts, but doth strengthen them after purging, not suffering a flux to follow: Of these berries are made three severall sorts of colours, as they shall be gathered; that which gathered while they are greene and kept dry, are called Sappe berries, which being steeped in some Allome water, or fresh bruised into Allome water, they give a reasonable faire yellow colour, which painters use for their workes, and Bookebinders to colour the edges of bookes, and leather dressers to colour leather, as they also do to make a greene colour called Sappe greene, taken from the berries when they are blacke, being bruised and put into a brasse or copper kettle, or pan, and there suffered to abide three or foure dayes, or a little heated upon the fire, and some beaten Allome put unto them, and after pressed forth, the juyce or liquor is usually put up in great bladders, tyed with strong thred at the head, and hung up untill it be drye, which is dissolved in water wine, but sacke is the best to preserve the colour from starving as they call it, that is from decaying and to make it hold fresh the longer: the third colour (whereof none that I can finde hath made mention, but onely *Tragus*) is a purplish colour which is made of the berries suffered to grow upon the bushes, untill the middle or end of November, that they are ready to droppe from the trees.

Chap. XL.

Anagyris & Laburnum. Beane Trefoiles.

THe *Anagyris* and *Laburnum* are such *congeneres*, so like the one unto the other, that divers writers doe call that *Anagyris*, which others call *Laburnum*, and indeed I know no other difference betweene them, than of *fœtens & non fœtens*, *major & minor*.

1. *Anagyris fœtida*. Stinking Beane Trefoile.

The stinking beane Trefoile in his naturall places, which are the hot Countries of *Spaine* and *Italy* in *France*, seldome groweth to be higher than a tree, but transplanted into more cold and temperate climates, riseth twise so high; having the barke of the body, and elder boughes of a darke grayish greene colour, the younger of a fresher greene, from whence shoote forth at divers places three somewhat large leaves upon a thin, standing upon a pretty long foote stalke, of a greene colour on the upperside, and of an hoary or three leaved colour underneath; of a strong unpleasant sent, like unto stinking *Gladwin* especially in the hot countries, but in the colder countries it is nothing so much, and very little in ours, as I have tryed, who have had it many yeares growing with me: at the joynts with the leaves come forth many flowers standing upon a long foote stalke, one above another, which are larger than in any *Cytisus*, almost as great as the *Columnes*, the flower leaves being of a pale yellow colour, and the uppermost which cover them, of a deeper gold yellow, which after turne into long flattish cods; wherein five foure or five seedes, twise as big as in the other, almost as big as Kidney beanes and more discoloured than the other, that is of a darke purple spotted, which were of a fairer purple, when

yeas

1. *Anagyris fœtida*
Stinking Beane Trefoile.

2. *Laburnum majus.*
The greater lesse stinking Beane Trefoile.

were thorough ripe: the roote thrusteth not deepe into the ground, but is well faltened with branches and fibres within the ground. Of this kind there is one growing in *Candy*, whereof *Honorius Belus* gave knowledge to *Lobius*, that hath rounder leaves, which as yet I never saw.

2. *Anagyris fœtida sive Laburnum majus.* The greater lesse stinking Beane Trefoile.

This Beane Trefoile groweth larger in body and branches, than the former, and sometimes shooteth forth diverse stemmes from the roote, the wood whereof is very tirme and hard, yellow toward the barke, and blackish at the heart, (whereof the strongest bowes are made, and stakes that will abide hard in the ground longer than others) with leaves larger than either the former or the smaller sort, of a darkish greene above, and silver colour underneath like them; the flowers are more in number, and smaller than in the former, the stalkes of flowers hanging downe and not standing up, being sometimes almost a foote long, and not so long as in the former, and are for the most part all of one pale yellow colour: the cods likewise are blacker, shorter and smaller, and so are the seedes within them also, yet greater than in the lesser sort, else much alike, being blackish and very hard, scarce yeelding to be mollified in water, the leaves and flowers have but little sent at all to discommend them, in any that I have seene and smelt.

3. *Laburnum minus.* The lesser Beane Trefoile.

This lesser Beane Trefoile is in most things like unto the last described but that it groweth not so great, nor are the leaves so large by the halfe, nor yet either flowers or seede.

The Place.

The first as is before said groweth in hot Countries: the second, and so doth the least also, in many of the woods of *Italy*, and the higher parts of *France*, and other places, and upon the Alpes.

The Time.

The first seldome abideth within us to shew his flower: but in his naturall places, it flowreth early even in *January* and *February*, in *Spaine* as *Calsius* saith, but in *Aprill* and *May*, in other places; and the seedes are ripe in the Summer time, after in *Spaine*, but not untill *September* in other places: the other flowreth in *May* and *June*, and the seede sometimes ripeneth well, but not untill *September*, but the least ripeneth well.

The Names.

The first is called of *Dioscorides* ἀνάγυρος or ἀναγυρὶς & ἀνάγυρις or *Anagyris* or *Anagyros*, which *Pliny* saith some called *Acopon*: *Acopon fœtida*, is usually added to it to distinguish it from the other, which is also called *Anagyris* of some, but *Acopon non fœtida*, which second or *non fœtida*, *Matthiolus* calleth *Anagyris prima & major*, as he calleth the least *Anagyris altera*, but he contendeth against *Gesner* who did in following other mens opinio, make the great *Laburnum* or *Anagyris altera* to be *Laburnum* of *Pliny*, which is the least and called *Cytisus* of those that dwell about *Trent*, *Camerarius* in horto calleth it *Laburnum*, when as he calleth the least, *Anagyris altera* of *Matthiolus*, *Aegnidara* North, & is called by the inhabitants *Frane*, & thinketh it may be *Ebeni secunda species Theophrasti*; *Lugdunensis* also calleth it *Laburnum primum*, and the least *Laburnum alterum*, and saith it might be called *Anagyris Alpina*; *Cordus*

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

calleth it *Arbor trifolia*, diverse doe call the leafe *Laburnum*, *Faba arborea*, *Gerard* his figure of *Anagyris foetida* and *Anagyris*, are the same diuersely in *Matthiolus*, but the titles are contrary; for *Gerard* has *Anagyris fœtida*, & the *Eglecto* or *Anagyris altera* in *Matthiolus*. It is probable in my opinion, that the smaller *Laburnum* should be that *Cytisus* of *Theophrastus*, which is set down in the 14. c. of his third book, with a willow leafe; for if you take any of the leafe by it self, it may well resemble a Willow leafe; both for forme and colour, and beareth small seeds in cods, like unto pulse as that doth: *Gesner* did referre this kinde unto the mountaine *Cytisus*, but *Matthiolus* reproveth him for it: the great booke of *Tabernæmontanus* calleth it *Anagyris latifolia*, but I call it *Laburnum maius*, as I doe the lesse *Laburnum minus*.

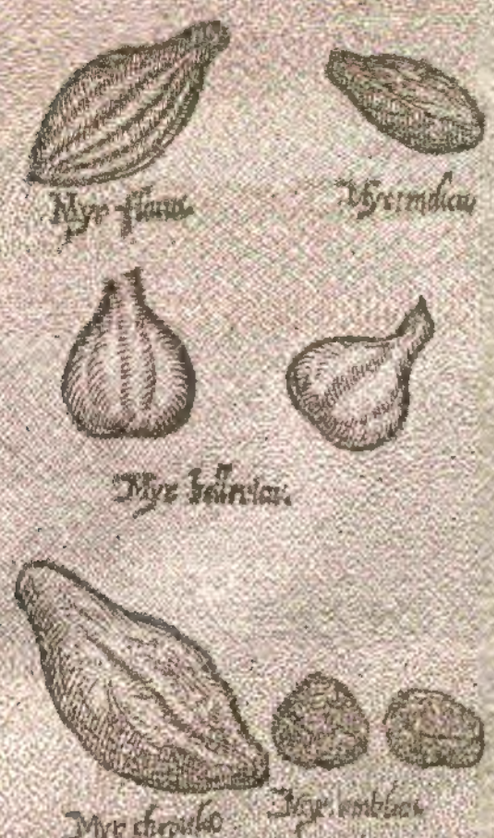
The Vertues.

The leaves as well as the seede of the first Beane trefoile, are a strong vomit, especially in the hot Countries where it groweth and *Honorius Bellus* writing thereof to *Clusius*, saith that in *Candy*, where that kind groweth with rounder leaves, if the Goates or sheepe do chance to feed thereon, the milke which they give will cause him that shall take it, to fall as well into extreame scouring downewards as strong casting upwards, and that many thereby have beene brought in danger of their lives: the young leaves saith *Dioscorides* applyed unto tumors or swellings, discusseth and repelleth them; and if a dram of the powder of them, be drunke in wine, as he saith also, it expelleth both the dead birth, and the secondine, and likewise bringeth downe the monethly course of women, if some of the leaves, be bound to those that have hard and uneasie travell in child bearing, it causeth a speedy delivery of the birth, but they must bee taken away presently afterwards; they are likewise given in wine to those that are short winded, and to such as are often troubled with the head-ach: the barke of the root hath a digesting ripening and discussing quality: both the other sorts here set downe, have the same properties, for they are also of the same temperature, but *Matthiolus* saith, that he hath knowne, that some that have eaten ignorantly of the seede of the lesser Beane trefoile, have had strong vomitings even unto blood: *Solerius in silua in Erinæ* saith, that by certaine and undoubted experience it hath beene found, that a dramme either more or lesse, of the dryed bark thereof made into powder, and taken in any kind of drink, purgeth very strongly both upwards and downewards, but in a divers manner; for if as he saith, (which I take rather to be but a conceite) the barke be pulled off from the tree upwards, it will cause vomitings; if downewards great purging of the belly downewards: the bees saith *Pliny*, refuse to touch the flowers of this *Laburnum*, which is the lesser sort of Trefoile, but it hath beene truely observed, that both in the naturall places where it groweth, as also with us that the Bees doe not refuse to feede upon them: the *Greekes* have an usuall proverbe with them, *Anagyrim commouere* when they would signifie one, that worketh as wee say his owne woe, or is the cause of his owne harme.

CHAP. XLI.

Myrobalani. Myrobalans or purging Indian Plummes.

Although there be none of these Myrobalan trees (whereof are 5 sorts of fruites well known & diligently used in the Apothecaries shops) growing in any of these Christian Countries of *Europe*, whatsoever I could learne, yet I could doe no lesse than make mention of them here both because the fruits are often used in Physicke among other purgers, and to make it knowne to all that might be mistaken by the name, and thinke that the Myrobalane Plummes, the red and the white (that I have remembred to my former booke) be some of these kindes, but so they are not, neither for forme nor quality: it were well that some ingenious mind among our Merchants, that trade to *Aleppo* & *Cairo*, & into *Persia* and the East Indies, to give order to their factors if they doe it not themselves, to enquire and seeke out such of the sorts that are to be found in the places of their abode, and either to plant the stones of these severall kinds in those warme countries, if they abide any time in them, that when they are a little growne they might then send them hither, or send the fresh stones over hither to us (for those are too dry that are brought for physicke use) that we might plant them here to try if they will not growe and abide with us, that at least, having but a sight of the fruit or the leaves of any sort, we might compare them with the descriptions that writers have made of them, whether they are answerable thereunto: I must in the meane time therefore but shew you them as *Garzias* and others before me have done, with such descriptions as they gave of them, and are extant, not knowing whether they be true or no.



1. *Myrobalanus Citrina.* The yellow Myrobalane or purging Indian Plum.

The tree that beareth these yellow Myrobalanes is said to grow as great as a Plum tree, having many branches and winged leaves on them like unto the true Service tree: the fruit is for the most part as bigge as reasonable Plums, somewhat long and not fully round, but having many faire ridges on the outside, especially when it is dryed, shewing it to be five square though round, of a yellower colour on the outside then any of the rest: the flesh or substance being of a reasonable thicknesse, yet not so thicke as the Chebuli, or Emblici, nor so thin as the Bellerici; the stone is white thicke and very hard to breake, with eminences and ridges also therein, and a small long kernell lying in the middle, of an astringent taste as the dryed fruit is also, but much more than hath no such kernell that thereout may be pressed an oyle, as *Bellonius* noteth of the kernells of that fruit the rooke to bee the yellow Myrobalane tree, in the plaines of *Hircha* as he noteth it, *in lib. Observationum cap. 86.*

2. *Myrobalanus Chebula.* The purple Myrobalane, or purging Indian Plum.

This kind of Myrobalane tree growing in stature and branches like a Plum (as *Garzias* saith of the tree bearing leaves on the branches like unto the Peach tree: the fruit hereof is the greatest and longest of all the five sorts, of a blackish purple colour on the outside while it is fresh, which it loseth in the dry fruit (which *Matthiolus* commended for the best) being five square as the former, of the thickest substance, and more than any other, and with the smallest stone in the middle, not fully so hard to breake as the former, but the smallest kernell therein.

3. *Myrobalanus*

3. *Myrobalanus Bellerica.* The round Myrobalane, or purging Indian Plum.

The round Myrobalane is like the reſt for growth, but bearing leaves like the Bay tree, yet of a paler greene colour, and ſomewhat aſh-coloured (underneath peradventure) withall: the fruit is of a meane bignes, round and ſmooth, yet being as it were three ſquare in many, and of a pale ruſſetiſh colour when they are freſh, but of a darke or duſky whitiſh colour on the outſide, being dry, of the thinneſt ſubſtance or leaſt fleſhy of any of them: the ſtone whereof is thicke greater then any other, proportionable to the fruit, very hard to break, with a kernell within of a reaſonable bigneſſe.

4. *Myrobalanus Emblica.* The bearded or ſix ſquare Myrobalane or purging Indian Plum.

The tree that beareth this Myrobalane or delicate Plum, being like a Plum tree for height and manner of growing (as you have heard before that *Garzias* ſaith ſo of them all) hath leaves of a palme or handbreadth long, very finely cut in or divided on the edges: the fruit is round in ſhew, but doth ſeparate or will be broken into ſix parts, as both we have obſerved in the dry fruit, alwayes brought unto us, broken into ſmall peeces, without any ſtones; and more plainely in the fruit preſerved, whereof good ſtore hath beene brought over many times unto us, which will be divided into many parts: the ſtone whereof within it is ſix ſquare, with three greater ridges, and three leſſer lying betweene them, and bearded at the head of the three greater ridges, the kernell within it being ſeparated into the three ſeverall diviſions, having each of them two cells, wherein the parts of the kernell lye almoſt three ſquare.

5. *Myrobalanus Indica.* The blacke Myrobalane or purging Indian Plum.

The blacke Myrobalane tree is like the reſt; whoſe leafe (as *Garzias* ſaith) is like unto a Willow leafe: the fruit (with *Garzias*) is eight ſquare, which may be when they are freſh, but they cannot be ſo plainely diſcerned in thoſe that are brought over unto us dry, the ſmalleſt of all the reſt, ſomewhat long, altogether fleſhy, without any ſtone in the middle, and the blackeſt of any.

The Place.

All theſe fruits grow in the Eaſt Indies wild and not manured, but in divers provinces, as ſome in *Goa* and *Batecala*, others in *Malavar* and *Dabul*. Yet *Garzias* ſaith foure ſorts grow in the kingdome of *Cambaya*, and the *Chebuli* in *Bisnagar*, *Decan*, *Guzarate* (which we call at this time *Surrate*) and *Bengala*: *Ballonius* ſaith in his booke of obſervations that the yellow Myrobalanes grow in *Arabia* and *Syria*, and alſo in the plaines of *Hierico*, but I doe much doubt of the certainty thereof and thinke rather that he was miſtaken.

The Time.

We know ſo little of the trees, that we know leſſe of their time of flowring or bearing fruit.

The Names.

Theſe kind of fruits were not any of them knowne unto any of the antient Greeke writers, as *Diſcorides*, *Theophraſtus* or *Galen*, neither unto *Pliny*, for although hee maketh mention of a Myrobalanus, yet hee addeth *Tragoduyre*, which is the *Nux Ben*, *Balanus Myrepſica*, or *Glans Unguentaria*, as I ſhewed you a little before, yet

yet both *Balanus Myrepfica* and *Myrobalanus* have but one fignification in the Greeke tongue. The *Arabians* were the firſt that made them knowne to the world, and called them all in generall by the name of *Delegi*, as by the writings of *Mefue* and *Serapio* doe appeare; but the Greekes that tranſlated theſe *Arabians*, gave the names of Myrobalanes unto theſe fruits, becauſe (as it is likely) they thought the fruit was like unto an Acorne, and therefore gave the name *Balanus*; but why they ſhould give the other word *Myrei*, which ſignifieth an ointment, cannot be underſtood by any, for none of theſe were ever uſed in any pretious or ſweet ointment, and *Myrobalanus* ſignifieth as much as *Balanus Myrepfica Glans unguentaria*, the Acorne for ointments. *Avicenna* among the latter Greeke writers maketh mention of them, but that none of theſe did grow among the *Arabians* their ignorance of their growing declareth plainely: for *Aſſigius* writeth that the *Citrini Chebuli* and *Nigri* doe all grow upon one tree, and for that they beare twice in a yeare, the *Citrini* are the firſtripe, and the *Nigri* are the ripe of the firſt bearing, and the *Chebuli* the fruit of the later bearing; which how contrary unto truth it is, *Garcias* doth declare, in his booke of the Drugges of the Eaſt Indies, where hee plainely ſheweth that all the five ſorts, grow ſeverally each upon a ſeverall tree, as I have ſhewed you before: the *Indians* call the *Citrini* or *Flavi*, *Arees*, but the Phyſitions *Arabians*, and the *Indici* or *Nigri* they call *Reczenale*, the *Bellerici* or *Gentili* or *Gentuly*, *Chepali* or *Chebuli Arecca*, and the *Emblici* or *Amalati* as *Garcias* ſaith, or *Amalati* as *Acoſta*. I have you ſee inumbled them all purging Plums, as moſt proper for them in my judgement, and given them their ſundry Epithites according to their quality as I thinke.

The Vertues.

All theſe ſorts of Myrobalanes have a gentle purging quality, ſome more and ſome leſſe then others, for alſo purging choller, ſome flegme, and ſome melancholy; but they have in them alſo an ſtrange ſtrong quality, and more then is in *Rubarbe*: the *Citrini* and *Bellerici*, that is the yellow and the round Myrobalanes doe purge choller gently: the *Chebuli* and *Emblici* that is the purple and the ſquare Myrobalanes doe purge flegme: and the Indies or black ones melancholy: the decoction or infuſion of them all doth purge better then any waye elſe, yet ſo gently that in evacuating the humors, they ſtrengthen the ſtomacke, the liver and the heart, but given in powder they bynde the body more then purge it, and indeed the binding quality in them all, eſpecially in the dryed fruites, is more predominant, and as *Garcias* ſaith, the Indians wholly uſe them for that purpoſe; for therefore they are the beſt medicines to be mingled with *Acamony* and all other violent purgers, to reſtraine the violence and to correct their fierceneſſe, and yet as *Meſue* ſaith they are often times uſed with *Caſſia, Manna*, & *Tamarind*, to helpe the working of them, as a moſt ſafe medecine: the *Bellerickes* and *Emblickes* for purging the ſtomack from rotten flegme lying therein, and ſtrengthning the braine and ſinewes, the heart and liver, and binding all other looſe or fluent humors in the parts of the body, are very profitable, as alſo for the trembling of the heart, and to ſtirre up the appetite, ſtay vomiting and reſtraine the fury and beldings of choller, to incraſſate the juyce and ſubſtance of the ſpirits, to quallifie the exceſſive heat of the inward parts, and the thirſt raiſed thereof, and doe helpe and give eaſe to thoſe that are troubled with the hemorrhoides or piles, by reſtraining the fierceneſſe of choller flowing unto them, and for this laſt effect the *Citrini* are moſt uſed: alſo for all hot conſtitutions, as in all hot agues where there are no obſtructions, for (they as all the other ſorts alſo) doe rather cauſe obſtructions, and therefore in all ſuch when they are to be uſed they are to bee corrected with Wormewood, or the juice of Fumitory, or with Rubarbe, Agaricke, Spikenard and the like, as alſo with other opening and diſcuſſing things: the *Chebules* in eſpecially doe purge flegme, ſharpen the memory, cleare the eye ſight, ſtrengthen the ſtomacke and are very effectuall againſt the dropſie, and all old agues: the Indian or black Myrobalanes in ſpecially, doe purge melancholy, and blacke or burnt choller, and thereby are neadeable for quartaine Agues, the Leſſy or falſe evill, and all paralaticke diſeaſes: the Emblicks and Bellericks in ſpecial purge flegme and comfort the braine very much, as alſo the heart and ſtomacke, ſtay vomiting and ſtirre up appetite. They all of them in generall are of eſpecial uſe in all Fluxes both of the ſtomach and belly, by gently purging the malignant diſpoſition of the humors, and ſtrengthning and binding the parts adjacent; but in eſpecially in ſuch rebellious or ſtay an old continued laske, I have knowne this medicine doe much good. Take and burne a pint of Claret wine, with a little Roſemary and Sugar, wherein put to ſteepe all night one dozen Rubarbe, firſt ſliced and rolled at the fire, and halfe a dram of Chebule Myrobalanes, which ſtanding by the fire all night, and ſtrained forth in the morning, is to be taken at two ſeverall times, a draught in the morning falling, which if it helpe not ſufficiently the firſt time, being renewed and taken two dayes more, will certainly ſtay the laske wholly, if the malignity and ſharpeneſſe of the humors bee not to ſtrong that fearfe any time will cure it. The Chebule Myrobalanes broken and ſteeped in roſe water, or in the clarified juice of the pell for two or three dayes, and after ſtrained forth; this water dropped into the eyes doth cleare the ſight, and a fine cloth wet therein and often applyed, taketh away the heat and inflammation in them, and ſtayeth rheumes and diſtillations into them: the pouder of any of the Myrobalanes and Mallicke, put into running ulcers and ſores, dryeth up the moiſture and conſolidateth them: The Chebules and the Emblicks are often brought unto us preſerved, whereof the Chebules are more uſed Phyſically for ſuch purpoſes as are before ſet down then the Emblicks are, which being nothing harſh in taſte as the Chebuls, but being very pleaſant, are more often uſed as a delicate preſerved Plum, among other junckets, then for any Phyſicall reſpect.

CHAP. XLII.

Agaricus & Terebinthina ex Larice. *Agaricke* growing on the Larch tree, and the fine cleare Turpentine taken from it alſo.

BEcauſe the Roſin or Turpentine of the Larch tree doth gently open and purge the belly, therefore eſpecially the Agaricke that groweth thereon, I muſt to ſhew you the manner of growing of the Agaricke, give you alſo the view of the body of the tree, from whence it is taken, and leaſt branches and leaves thereon to be knowne by: but the deſcription of the tree it ſelfe, ſhall be ſhewed you among the other *Conifera & Reſiniferæ arbores*, trees that beare Cones or Pine apple like fruit, and out of which

is extracted a cleare liquid Rosin or Turpentine, called in shoppes *Venice* Turpentine, by boring the tree to the heart, and receiving it into vessells, and from the body of the tree when it is growne great and old in many places, and from the greater armes and boughes also, groweth certaine excrescences like Mushromes but greater, called Agaricke of divers and severall sizes, that is from the bignesse of ones hand lesse or more, to be as bigge as any mans head, and sometimes greater, covered with a hard blackish barke, which being cut and pared away, the substance under it appeareth very white, and if it be of the best sort, very light also, easie to breake, loose or spungie and without strings through it, somewhat sweete in taste at the first, but very bitter afterwards, and not having any hard barke on the outside: the blacke, heavy, and hard, is utterly unfit to be used in Physicke.

The Place.

The Larch tree groweth in many woods about *Trent* and *Roviso* in *Italy*, and neere the rivers *Benacus* and *Padus*, and in *Galatia* a Province of *Asia*, as *Dioscorides* and *Galen* doe record, and in *Rætia* a country of *Sarmatia*, from whence the Agaricke tooke the name, in *Silesia* also *Moravia*, *Lusatia*; And the Agaricke is gathered in most of these places, so is the Turpentine likewise, but especially from the woods about *Trent*, &c.

The Time.

The Rosin or Turpentine is gathered in the hottest time of the yeare, and the Agaricke at the latter end thereof, that is November and December especially.

The Names.

This tree is called ἄρκευθος in Greek and *Larix* or *Laricio* in Latin. *Pliny* hath in no one thing in all his History, shewed his inconstancie and repugnancie more than in this one tree, not onely in not knowing that whereof he writeth, but denying that which is found true by good experience, and saying that in one place, which hee contrarieth in an other, as in his 16. Booke and 21. Chapter, hee reckoneth the Larch tree among those wild trees, that doe not shed their leaves, and are sharpe pointed, where it seemeth he tooke the Larch tree for the Pine tree, as hee doth in the 20. of the same 16. Booke: and whereas *Theophrastus* in his third Booke, and tenth Chapter, speaking of the difference betweene the Pine and Pitch tree, saith, that the Pine tree being burnt downe to the roots sprung not from them againe, but as some say the Pitch tree doth as it hapned in *Ladon*, when the wood *Pyrrhene* was fired, which was lined with Pitch trees. This very narration *Pliny lib.* 16. *cap.* 139. in citing, applieth to the Larch tree, which *Theophrastus* doth to the Pine tree. And in another place *Theophrastus* saith, that a kinde of female Vine is called *Eyes* or *Egida*; and *Pliny* saith the female Laria is called *Egida*, by all which places it may be plainely seene, that *Pliny* mistooke the Larch tree for the Pine tree. For *Theophrastus* hath not made mention of the Laria in all his History, whereby many did judge that it did not grow in Greece, for else he would have knowne it, and spoken of it. In one place againe *Pliny* maketh the leaves of the Larch tree soft, woolly, thicke and fat, and in another place hard & drie: againe he saith that the Larch tree hath not flowers nor any cones to commend it, when as they have cones, and the blossomes on them are very beautifull: and lastly *Pliny* saith (or should seeme following *Varronius*, who before him said the same) that the wood of the Larch tree, will not burne, nor make a cole, nor will consume in the fire, any otherwise than a stone, when as himselfe saith and acknowledged, as *Vitruvius* also doth, that it yeelds forth a Rosen; and how could any man thinke, that a tree yeelding Rosen should not burne, when as the very earth and stones that have any bituminous or resinous matter in them, will burne exceedingly, as is plainely seene in our turfe, in pit and sea coales which maintaine our fires, in many places of our Land, and elsewhere also. This I thought good to set downe, not to much to declaime against *Pliny*, as to forewarne others that translate or write others opinions, to be judicious and examine by reasons, wherefore that which others have written agree with the truth of the matter, and not hand over head either beleeve or set downe, whatsoever others have written, be it true or false. Concerning the cleare Turpentine, of this tree called *Venice Turpentine*, there is some controversie among Writers, some alledging it to be taken from the Pine tree, as *Fuchsius* and others, and *Matthiolus* contending there against, that of his owne knowledge and experience, it is onely taken from the Larch tree and no other, for no other Turpentine was to be had in the former times for many ages, because the Merchants neglected to bring the true Turpentine of the *Terebinthus* Turpentine tree, and therefore this onely was used: and no other sort of Turpentine was fit to be taken inwardly in stead of the true from the Turpentine tree, which we doe usually call *Cyprus* Turpentine, because as it is thought, the best is gathered in the Iland *Cyprus*, those about *Trent* as *Matthiolus* saith use to call it *Larix*, derived as is likely from the Greeke, yea *Pliny*, *Galen*, and others of the ancients have set downe, that the Larch yeeldeth whitish yellow Rosen, like unto the tony of *Athens* or *Spaine*, but in little quantitie and soone waxing drie, which is true Turpentine or Rosen that sweateth out of the tree in Summer of its owne accord without boring: There is also some controversie and contrariete both in the ancient and moderne Writers, concerning Agaricke, *Dioscorides* and *Galen* making it to be a roote, like unto that of *Silphium*, yet doubting some what thereof. *Dioscorides* saith that some hold it to be a Mushrome, or Excrescence engendred from the rottennesse of the trees, as Mushrooms are from the earth. *Pliny* writeth, *lib.* 16. *cap.* 8. that it was said that those trees, that have Agaricke in the countrie

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

tries of *France*, did beare Agaricke; and in his 25. Booke and 9. Chapter, he saith that Agaricke was but a Mushrome of a white colour, growing upon a tree about the *Bellpheras*, and in another place that it groweth upon the Cone-bearing trees, among the which the Larch tree is the chiefest: whereby it is plaine, that he also not did not well know it. *Brasavolus* saith, that in riding neare *Conadin*, he found Agaricke upon diverse Oakes, and especially upon Ilex or evergreene Oake, which saying *Matthiolus* contradicteth, saying, that in all *Tuscany*, and other places of *Italy*, as also in diverse countryes of *Germany*, *Carniola* and *Dalmatia* which abound with all the kindes of Oake, he could never see, nor so much as heare that any Agaricke grew on them; but that he saw diverse other hard dry Mushromes, both white and blacke called touchwood growing upon diverse, wherewith the people use to take fire, that the steele and flint doe give, and use it in stead of Match to discharge their fowling pieces with all. As also that he never saw Agaricke growing upon any tree, but the Larch tree only, in all the mountaines of *Trent* and *Austria*, where there be many Oakes growing, as well as Pines, Firres, and Pirch trees, and Larch trees abundantly: yet many doe affirme there is growing in many places upon the bodies of many trees a kinde of white Mushrome, so like unto Agaricke, that many mistake it for Agaricke.

The Vertues.

There is in the leaves, barke, and fruit of the Larch tree, the same temperature that is in the Pine tree, the Turpentine thereof taken to the quantitie of an ounce will gently open the belly, and move to the stoole, provoke urine, cleanse the reines kidnies and bladder, and helpeth to breake and avoid the gravell and stone, and so give ease to those that have the gout: if it be first washed with Plantaine and Rose water, then made into pills, with the pouder of white Amber, red Coralll, Mastick, and a little Camphire, it doth wonderfully helpe to stay the *Gonorrhœa* or running of the reines, if they be taken for certaine dayes together, and taken simply rowled in sugar it helpeth it well: it is profitable also for the Phthicke or Consumption of the lungs, being taken with honey in Electuary, it helpeth to expectorate rotten flegme, from those are troubled with a continuall cough: the Turpentine as it is the clearest for inward uses, and serveth in stead of the true Turpentine, so is it the best also for outward salves, and doth both draw, cleanse and heale all sores or ulcers, either new or old, and greene wounds also, and therefore there is scarce any salve made for ulcers and greene wounds, wherein Turpentine is not put, there is likewise an oyle drawne chimically from Turpentine, which is singular good to be used in wounds, being more drying and consolidating than the Turpentine it selfe, as also to warme and ease the paines of the joynts and sinewes caused of cold: the water that is distilled with the oyle, is used for freckles and spots in the face, a cruple in waight of that water, taken in white wine procureth a vomite, thereby giving much ease to such as have their stomacks overcharged with flegme, the oyle is profitably used in hollow ulcers, being dropped into them, or a tent dipped in it and put into the ulcer: it is good also for the wormes and heatednesse of the eares used with a little Oxe gall: some use to mingle bay salt and Turpentine together, and therewith spread a girdle of leather, and tie it about their waste that have an itch, which by wearing some small time, will cure the itch that is spread over the bodie, as well as the hands. Agaricke is a medicine of frequent and familiar use, often by it selfe, but most commonly with other purgers, to open obstructions of the liver, spleene and intralls, purging flegme especiall, but in generall all other vitious humors, offending any member of the body, and because it doth trouble what trouble the stomacke, and procure calling, it is usually corrected with Ginger, and given with Syrupe: that is, Syrupe made with vinegar and honey: for it purgeth both thinne and rotten tough flegme, both yellow, hard, blacke, and burnt choller from the head and braine, from the breast and lungs, from the stomacke, liver, spleene, from the reines and blacke, and from the wombe, as also from the joynts, sinewes and cruddes, and so helpeth to cure the diseases that proceede from them, that is such as are troubled with the gout, dropsie and falling sicknesse, jaundise, the cholicke and hardnesse to make water, the feavers or paine of the tipe, the paines in women called by the slaying of their courses, the shortnesse of breath, the cough and consumption of the lungs, the spitting of blood, the paines of the mother, the sharpenesse of urine and the wormes: it is helpeth also to cure all sorts of agues, either tertiane or quotidian, to ease the griping paines of the stomacke and belly, or such as have had falles or bruises, or are burten bellied, all which actions it chiefely performeth by purging those grosse and vitious humors that trouble the parts and members of the body, and are the cause of these diseases: it is an antidote against all poisons, and cureth the bitings of Serpents very quickly, halfe a dramme, or two scruples being taken in wine, either by the infusion or the pouder: for the other diseases afore specified, a dramme sliced, and put into a gentle purging decoction but not violent, or into an infusion, is the most generall manner of preparing it to be given: if it be boyled in lye with other Cephalicall helpes, it much comforteth the braine and memorie, and giddinesse of the head to be washed therewith, as also helpeth to stay the rheumes or catarrhes thereof, and cleanseth it much from scurfe and dandraffe.

Chap. XLIII.

Zizyphus sive Iujuba. The Iujube tree.

Although in former times, there was but one sort of *Iujube* knowne, yet now we have two or three which shall be shewed in this chapter.

1. *Zizyphus sive Iujuba major.* The greater Iujube tree.

The Iujube tree groweth sometimes to be very high, but more often to a reasonable height, having his stemme or body, bowed or crooked, and spreading rather in breadth, the wood whereof is whitish and hard, covered with a rugged barke, from whence spread great branches, and from them slender whitish twigges, about a foote long, full of leaves set on both sides, not directly one against another, but one alitle above another, with an odde one at the end, each whereof is small, some what long, pointed at the end, dented or finely nicked about the edges, with long veines in them, smooth and somewhat hard in handling, each standing on a short foote stalke, and very like unto the leaves of *Palma* or Christs thorne,

Original from UNIVERSITY OF MICHIGAN

as the loose of every leafe towards the toppes of the twiggie roome foorth small yellowish flowers, of five leaves apeece, where afterwards stand the fruite, which is somewhat like unto a small Plumme or Olive, but a little long, greene at the first, and sweet is somewhat harsh, and yellowish also, but red and of a reasonable sweetenesse, yet cleaving whilst, and somewhat clammy when they are ripe, that as it were at the lower end, next the stalke, whose skin is tender and harder than a plumme, and the stone within it is small firme and solid, long, round and pointed like unto an Olive or *Cornelian* Cherry stone, both for forme and hardnesse: all the branches both greate and smaller are armed with thornes, two always at a joynt, whereof the one is long, strong, sharpe pointed and straight, and the other crooked, both of them of a blackish red colour, like unto the elder branches: the roote is long and firme in the ground.

a. Zizyphus fructu subdulci minor.
The greene Jujube tree.

2. *Zizyphus fructu Jujubæ minor.* The lesser Jujube tree.

This lesser Jujube tree is very like unto the former, both for the forme of branches, leaves and flowers, but lower and smaller in all parts: the fruite also is alike, red when it is ripe, with such an hard firme Olive like stone, as the former, but the fruite hereof is smaller and rounder, and not long like as the other for it is as thickely and strongly armed with thornes though somewhat shorter than the other.

3. *Zizyphus sive Jujuba sylvestris.* The Wilde Jujube tree.

This low Wilde Jujube tree groweth much lower and more like a shrubbe than the last, and more cruelly armed also with small sharpe thornes: the leaves are like the last, growing in the same manner, but lesser and narrower: the flowers are like the other, the fruite is round and red like the last, and somewhat lesser, but dryer of substance, not having such a pulpie substance as either of the former have, and more austere even when it is ripe.

The Place.

The first groweth naturally in *Africa, Egypt, Arabia & Syria*, & those more Easterly Countries, fro whence as *Pliny* saith it was brought into *Italy*, and planted there in his time by *Sextus Papinius*, in the latter end of *Tiberius Cæsars* his reigne, which now a dayes is very frequent, not only in many gardens, and Orchards of *Italy*, but in *Provence* of *France* also: it is to tender that it seldome endureth long in our Country, because it cannot endure the cold: The other like wise was brought into *Italy* in these latter times from *Syria*, where it is only to be seene, but with a few that are lovers of rarities. The last groweth wilde in the fields by the hedges, not farre from *Perone*, abundantly as *Pona* saith.

The Time.

They all shoote forth in *April* (for none of them doe hold their leaves all the winter) and flower in *May*: their fruite is ripe in *September*.

The Names.

It is called in Greeke Ζίζυφα ἡ ἡ ἡ Ζιζύφα & Ζιζυφία, of *Columella Ziziphus*, of *Plinius Ziziphum vocitat*, of others *Rubea* and *Jujuba*, and of the *Arabians* from whom the Apothecaries tooke it *Jujube*, and so doe *Leonicenus* and *Petrus Angellius* thinketh it to be the *Lotos* of *Athenæus*, as also the *Lotus* of *Theophrastus*, that grew in the Iland *Pharos*, mentioned in *lib. 4. c. 3.* which is most likely, for it hath a dented leafe as he saith like unto *Hedg*, whereunto this is more like, than the leafe of the *Lotus arbor*, whereof I have made mention in my former booke. Some doe thinke that this fruite is that which *Galen* in 2. *Alimentorum* calleth *Serica*, and unto this opinion many doe adhere, especially because *Avicen* entreating of Jujubes calleth them *Serica*, for his title is thus, *Ziziphus id est Serica*, yet it is no other likely, but that he was mistaken, for many worthy and learned men, doe doubt of it: but *Pliny* maketh mention of *Sericum*, before *Galens* time, in his 15. booke and 14. chap. to be one of the kinds of Tuberes (which we take to be *Nuces persicæ Nectarinæ*, for in his 16. booke 25. chap he reckoneth the tuberes, with the Almonds, Peaches, and Apricocks, as if they were all of one kindred, and in his 17 booke and 10. chap. he saith that the Tuberes, are best grafted on the Wilde Plumme &c. and therefore it is likely he thought them of that kinde of Plummes) of the colour of raw silke (and we have a yellow *Nectarine* neere unto that colour) whereof came the name, which maketh me thinke that *Galen* his *Sericum* should not differ from *Ziziphus*, seeing they lived not any long time, one before the other in *Rome*, and therefore the name could not be there altered: for *Galen* rather allowing of those things that were conducible to medicine, (and we know that Jujubes are) then of such as did please the palate onely, as *Nectarine* are, and were fit and desired of wanton women and children onely as he saith, did not greatly commend the fruite for any good to the bodies healths, but I verily thinke, and of this opinion is *Cruserius* also, that his and *Plinies Sericum* are all one. And although *Leonicenus* seemeth to finde fault with *Pliny* his booke to be false in naming but one sort of *Ziziphus*, and two of the Tuberes, where as *Columella*, *Varro*, and *Cato*, make two sorts of *Ziziphus*, yet assuredly then other whose *Ziziphus* is good onely to kill all foule footed beasts, in the same manner that *Oleander* doth. The other *Cornus* of the Gallory or plants maketh mention of, and calleth it *Jujuba minor*, and which maketh me to thinke it not to be a Tuber, it is very probable to be the *Rubea Africana* of *Theophrastus*, and the *Ziziphus sylvestris* of *Leonicenus*.

For

for I thinke he knew not the true Iujube which I call *Prunella*, and is called *Zizyphus* [illegible] of *Lobel* & *Pena*, *Matthiolus* who thinke it to be *Pinaster* shire or *Pinaster Theophrasti* mentioned by *Dioscorides* lib. 4. cap. 36. of *Lobel* & *Pena* in the description of *Arbor Balanos Chalcis* ægyptia and *Zizyphus* [illegible] *fera*. The *Arabians* call it *Hanna* and *Hannah*, and *Zizyfa*, of the *Italians Agiuole*, the *Spaniards Azofaifa*, the *French Jujubes* and in some *Brandenburg*, the *Germans Rothpflaumen*, and *Knopfflein*, the *Dutch Jujuben* and in *English Jujubes*.

The Names.

The Jujubes (especially while they are fresh) much more than being dry) doe open the belly and gently purge choller, and clense the blood this saith *Mesuæus* and *Simeon Sethi*, yea *Matthiolus* following the opinion of *Avicen* denyeth that they have any purging quality in them at all: all authors doe agree, that they coole the reines and bladder of the blood, and therefore good in hot agues, and doe helpe them that have a dry cough, and are cachectique, and is good for the other diseases of the chest and lungs as shortnesse of breathing, distillations, &c. [illegible] from the Lungs: it is also a good purpose vsed to clense the raines and the bladder from gravell, which it performeth by the vitious quality in them, in making the passages slippery, so that gravell and stones passe out the more easily: they allay the vomitings procured by sharpe humours: but they are hard of digestion, and doe not easily passe out of the stomack, being eaten either fresh or dryed, they are then most vsed in deadly sicknesses, when other things, fit and convenient for those griefes are forbidden.

CHAP. XLIIII.

1. *Myrobalanus Sebestes.* The Sebestien or Assyrian Plum.

The Sebestien tree groweth some what lower then the Plum tree, covered with a whitish barke, the branches are greene, wherein grow smooth thicker and harder leaves then they of the blossome tree, consisting of five leaves a peece, growing many together on a long stalke, which afterwards turne into small berries rather then Plums, of a blackish greene colour when they are ripe, and are standing in a little cupp of a sweet taste, and glutinous or clammy substance, and a very thicke skinne: within which layeth a three square hard stone, with a thicke shell and a small kernell: these are gathered and laid to the Sunne, whereby they grow wrinkled, and so they are kept, and brought over unto us in boxes.

Fig. 1. The Sebestien tree.

2. *Myrobalanus sylvestris.* The wilde Sebestien.

The wilde Sebestien is in all things like the other, but that it groweth lower, more like unto a hedge bush, and with lesser and thinner leaves; the flowers and fruit are alike but lesse.

The Place.

The first groweth in *Syria*, and about *Damasco* in *Egypt*, as *Mesuæus* saith, and from thence were brought into *Italy* in *Dioscorides* time, which were planted on the Sea coast, and do now grow in many places there in their Orchards: it is tender, not endoring the cold with us, that we can scarcely keepe it, so cause it to spring, the shell of the stone being so thicke and the kernell so small. The wilder as *Alpinus* seemeth to averre, is naturall of *Egypt*.

The Time.

They flower in *May*, and the fruit is gathered in *September*.

The Names.

The tree is called in Greeke [illegible] and the fruit [illegible] and [illegible] in *Latine* [illegible] in the tree, and *Myxa* and *Myxarium* for the fruit as thought as *Dioscorides* saith that the *Syrians* in steed of [illegible] called them *Sebestes*, from whence the *Arabians* called them *Sebestes*, and the Apothecaries in their shops use that name onely.

The Vertues.

The Sebestens by the judgement of both Arabians and Greekes doe open the body in the same manner, or rather more by reason of the mucilagines in them, then Damaske prunes, yea more while they are greene, and lesse when they are dry, yet the decoction of them, or the infusion of them in broth, although dryed and taken whole worketh effectually, which *Fuchsius* denyeth, affirming that they binde rather [illegible] they serve to coole the intemperate heate of the stomack or liver, and therefore are good in hot agues, and to purge choller when it doth come: *Matthiolus* saith that he had often found by experience, that ten drammes weeded of the pulpe of sebestens, taken from the skins and stones, worketh as well and to as good purpose as the pulpe of *Cassia Fistula*: they ease very effectually also to lenifie the sharpe scurffe and roughnesse of the throate, they take the cough and wheesling of the lungs, and distillations upon them, by lenifying the passages and causing spettle to be avoyded: they also give ease to them that are troubled with paines in their sides, and miraculously helpeth them that are troubled with the sharpenesse of their urine, proceeding from choler or hot [illegible]

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

they also drive forth the long wormes of the belly. There is a kinde of Birdlime made of these fruites, by boyling them a little in water to take away their skinnes and stones, and after soyling them more to a consistence, the which as *Matthiolus* saith was used at Rome for catching birds, but *Alpinus* saith they use it in Egypt, as a plaister to dissolve hard tumors or swellings.

CHAP. XLV.

Ruscus. Butchers Broome.

THe first shoots that sprout from the roote of Butchers Broome are thicke whitish and short, somewhat like unto those of Asparagus, but greater, which in some places are eaten in the same manner that Asparagus shoots are; these rising up to be a foote and and a halfe high are spread into diverse branches, greene and somewhat crested with the roundnes, tough, pliant, and flexible, whereon are set some what broad and almost round, hard leaves, sharpe and prickely pointed at the ends, of a darke greene colour, and somewhat like unto Murtle leaves, two for the most part set at a place very close or neare together, about the middle of the leafe on the backe or lower side from the middle ribbe breaketh forth a small whitish greene flower consisting of foure small round pointed leaves, standing upon a very short or no foote stalke, and in the place whereof commeth a small round berry greene at the first, and red like an Asparagusberry when it is ripe, but greater wherein are two or three white hard round seedes contained: the roote is thicke, white, and great at the head, and from thence sendeth forth diverse thicke, long rough white strings.

Ruscus. Butchers Broome.

The Place.

This groweth generally throughout this land, in copples, and upon heathes and waste grounds, and oftentimes under or neare the Holly bushes.

The time.

It shooteth forth his young buds in the Spring, and the berries are ripe about September, the branches and leaves abiding greene all the winter.

The Names.

It is called in Greeke Ὀξύμυρσινος, *i. acuta Myrtus* Ὀξύμυρσος, *Myrtus spinosa*, (but there is another *Myrtus spinosa* accounted of among the ancients, which is like unto the tame or manured kinde;) and *Plinie* in his 15. Booke and 7. Chapter, confoundeth both these together, in giving to the one the faculties of the other,) Μυρσίνη ἡ ἄγριος, *Myrtus agrestis*, *Myrtus spinosa*, and of *Theophrastus* κεντρομυρσίνη, *Centromyrtus*, *Pliny* saith they called it *Chamemyrsine*, and *Acatos* or rather *Acoron* which is one of their bastard names, of the Latines *Ruscus* and *Ruscum*, in the Apothecaries shoppes *Bruscus*, and of some as *Marcellus* saith *Scoparegia*. The *Arabians Serapio*, and others farre wide erred in calling the berries here of *Cubebe*, which are certaine aromaticall graines or berries like unto Pepper, but with a small point in end. *Rellius* translation of *Dioscorides* Greeke copie is faulty herein, that he saith the berries hang downe from the leaves, when as the Greeke words are, it hath round berries in the middle of the leafe, which *Theophrastus* confirmeth in his 3. Booke and 17. Chapter, saying it is proper as well to *Laurus Alexandrina*, as *Ruscus* to beare the fruite on the leafe. The *Italians* call it *Rusco* and *Pongitopo*, as if you would say Prickemouse, even as the *Germans* doe *Mausdorn*, and both from the Greeke μυοσκόρδον, *Muscum spina quod secundi auctores alii Alaterno appellant*: the *Spaniards* call it *Iur barta & Gilbarbeyras*: the *French Fois pignart*, the *Dutch Steeckebolmen*: and we in English Knee holme and Butchers Broome.

The Vertues.

The roots and leaves of Butchers Broome are hot in the second degree, and dry in the first with some temperie of parts: the young shoots are eaten like unto Asparagus, but because they are more bitter they are seldome used Physically, and are very profitable to open obstructions, to provoke urine, and to amend the strong smell thereof, and some of the two opening diuretick all rootes in the Apothecaries shoppes, helping to expell gravell and the stone, strangury and womens monethly courses by drinking the decoction of the rootes made with wine; the same also helpeth the yellow jaundies, and the head ach, and with some sugar or honey put thereunto helpeth to expell and evacuate the grose and clammy humours gathered therein. *Dioscorides* attributeth to the leaves & berries the same effect: yet some doubting of the operation hereof to such purposes as afore is said, do hold it more available in knitting and consolidating of broken bones and parts out of joynt, as *Solomon* teaches *Cyrurgie*, or the like, to drinke the decoction of the rootes, and apply them poultis wise unto the affected place. The pliant twiggines or stalkes with leaves set on in former times for many uses, to binde their vines or other things, as *Virgil* in his Verses doe testifie in the second of his *Georgicks* in these words,

Z —Nec

——— fœce non etiam aspernor Rusci,
Vbique per insulam, & copia facilis arundo. Cyllenius.

and to preserve hanged meate from Mice eating, from whence come the *Italian* name of *Fongitopi*, and for to make Broomes to sweepe the house, from whence came the name of *Scopa regia*, but the Kings chamber is by revolution of time turned to the Butchers stall, for that a bundle of the stalkes tied together, serveth them to dash their stalles, and from thence have we our English name of Butchers Broome.

CHAP. XLVI.

Sesamum. The oyly purging Pulse *Sesamum.*

THis plant upon the full springing thereof from the seede, riseth up with foure small long and somewhat broad leaves, between which come forth other, that when they are full growne, are as large and long as the great Night shade leaves, but some deeper jagged than others, and even almost torne; especially at the lower end of the leafe next the stalke, each standing on a long foote stalke: the stalke rising from among the lower leaves being straight, thicke, fat, strong and round, two or three foote high; from whence shoote forth on all sides (if it obtaine a strong fat ground, and a warme place) diverse stalkes of leaves like unto the other. (Or else abideth bare or without branches) two for the most part set at a joint, and at each joynt of the stalke up to the toppe, commeth forth one flower, of a whitish colour, which is somewhat long like unto a Bell flower, made of one leafe without division at the edges, having a few long threds as the bottome, not rising so high, that they may be seene without opening the flowers: after the flowers are past, there come up in their steede, small long hard cods, having three or foure or five ribbes or cruelles, which doe open themselves into so many parts, having in each part small whitish yellow flat seedes lying therein: the roote is somewhat great and long, with many strings and fibres at it, taking as full hold in the ground, as a Sowthistle doth: both leaves, stalkes, and seedes are very bitter while they are greene, that cattle will not touch them, but being dried they become more pleasant for them to eate: and the seede becommeth more oyly than Line seede, from whence is pressed forth a whitish oyle, very sweete while it is fresh, and will not in a long time decay or grow stronger.

Sesamum. The oyly purging pulse *Sesamum.*

The Place.

It groweth naturally in the *Indies* and other Easterly countries, but is only sowen in the fields, of *Syria*, *Egypt*, *Italy*, *Candy*, *Greece*, and other places there abouts, it is to be had but in the gardens of lovers of rare plants in all *Italy*, neither in the transalpine countries: the Apothecaries in our land doe seldome use either seed or oyle, few or none of them ever saw the seede, much lesse the plant.

The Time.

It floweth accounted July, and ripeneth not the seede untill September.

The Names.

It is called σήσαμον and σήσαμος in Greeke, and *Sesamum* and *Sesama* in Latine of all Writers thereof. *Alpinus* saith it is called in *Egypt Semsem*, the oyle thereof *Syri*, and the foote and grounds of the oyle *Thone*. All Authours almost doe number it among the graines and cornes, as a kinde thereof, and not of the pulse, which doe all for the most part keepe cods, yet of diverse fashions: but why they should doe so, I cannot conceive any other reason, than that it was put into bread as Poppy seede was, the seede being somewhat like unto Millet, and that it was sowen in the fields, as other graine and pulse were; for *Theophrastus* in distinguishing the kinds of graine, &c. 8. cap. 4. keeth 2. sorts, the first wheate, barly, &c. the second beanes, peale &c. the 3. Millet, Panicke and *Sesamum* which of corne beareth spike or eares, pulse beare cods, and those that are like Millet, Panicke, &c. doe beare *Sesamum* or *Sesama*, for so he calleth that reede-like ruffe or bushy feather like toppe which the Millet and Panicke beares, and setteth downe *Sesamum* among them: now *Sesamum* hath no such bushy feather toppe as Panicke Millet, or the like have, but rather severall cods as the pulse, although in differing manner: *Athenæus* doth number it among the pulses, and saith it was in his time eaten of many as pulse: *Dioscorides* the 83. Chapter of his third booke of Observations, setteth downe the manner of making thereof, which if any be desirous to know, I referre him to the Author.

The Vertues.

The seede and oyle of *Sesamum* are all of one qualitie and temperature, being neere the first degree of heate and moisture, both mollifying and dissolving: but the leaves especially while they are greene, are more cold for to represse the inflammations and griefes of the eyes, by way of fomenting them, the seede is taken inward in decoctions or other wayes, or used in glisters to loosen the belly, when it is bound or pained by the mollifie

which it worketh by his vnctuous or oylie quality, and therefore the oyle is often vsed for the same purposes: both *Dioscorides* and *Galen* say that it troubleth and overturneth the stomach, by reason of his vnctuosity, and doth hardly digest with them that eate it, yeelderh a grosse nourishment vnto the body, and filleth it vp with fat flesh, quickly: it causeth a stinking breath because it often sticketh in the teeth when it is eaten, whereby it is offensive: *Mesues* saith that the Egyptians vse the decoction of the seede, to those that are troubled with the cough, the shortnesse of breath, the vlcerous or hard scirrhous swellings of the liver, and *Auicen* saith, it lenifieth the roughnesse or hoarsenesse of the throat, and cleyes, making it cleare and free of paine: it mendeth the bitings of the horned serpent *Cerastes*, and easeth the paines of the head, proceeding of the heate of the same: the decoction of both herbe and seede with some honye, is very profitable for women to vse, when wombes are hard or swollen, and to bring downe their courses when they are stayed, as also to wash their heads, that are much troubled with dandraffe, or scurfe, or dry scabbes: the herbe or seede stayeth vomiting, take in meate: *Mesues* saith also that the seede or oyle doth lengthen the body, and increaseth sperme. The oyle is of great vse and effect to anoint the face or hands, or any other part of the body, to cleanse the skinne, and to take away tumbuoning, morphew, freckles, spots or scarres or any other deformities of the skinne, proceeding of melancholy: it is good also to anoint any part scalded or burnt with fire: it helpeth those sinewes that are hard or shrunke, or those veines that are too great. The seede was in ancient times much vsed in bread for to refine and make it sweeter, as also in cakes with honey as Poppie seed was.

CHAP. XLVII.

Iris maior latifolia. The Flowerdeluce.

THere are so many sorts of Flowerdelices, that to shew you them all here againe (having described them all exactly in my former booke) would make this booke too voluminous, I must therefore referre you thereunto, and give you here some descriptions and figures with the vertues.

1. *Iris maior latifolia.* The greater broade leafed Flowerdelice.

This Flowerdelice hath many heads of very broad and flat greene leaves enclosing or folding one another at the bottome, and after divided as swordes with thinne edges on both sides like a sword and thicke in the middle: from the middle of some of their heads of leaves riseth up a round stiffe stalke two or three foote high bearing at the toppe one two or three large flowers out of severall huskes or skinnes consisting of nine leaves, three whereof fall downe, having a freeze where the bottomes, three other smaller than they bowed or arched over the bottomes of the falling leaves, each of them divided at the ends and turning up a little, and three other the largest of them all stand upright but bow themselves a little that they may all for the most part meete together at their toppes or ends: in some white,

1. *Iris maior latifolia.*
The greater broad leafed Flowerdelice.

2. *Iris maior angustifolia.*
The greater narrower leafed Flowerdelice.

3. Iris sylvestris Lusitanica.
The Portingall Flower-de-luce.

4. Cyclamen Latinum.
Dwarfe Flore-de-luce with a broad leaves.

Chamæ Iris angustifolia.
The narrow leaved dwarfe Flower-de-luce.

5. Iris sive Spatula fœtida.
Stinking Gladwin.

in others blew or purple, or blackish purple spotted, and in others of such varietie of mixture in colour that it is admirable, as you may see in my former booke, where I am too copious to bee here expressed, and therefore must referre you thereunto: the seede is encloled in thicke short pods, being flat, and lying in rowes close one upon another: the roote is tuberous shooting forth on all sides the like knobs.

2. *Iris Magor angustifolia.* Narrow leafed Flowerdeluce.

This other sort of the greater Flowerdeluces, differeth not in roote, leafe, flower or seede from the former, but in having the leaves narrower than it, and the flowers to be various as the former yet not so much.

3. *Iris bifloria Lusitanica.* Portingall Flowerdeluce.

This also hath no greater difference to distinguish it than that it will sometimes flower twice a yeare, and the flowers sometimes have 12 leaves, 4 falling downe, 4 standing up, and 4 arched to cover the falls.

4. *Chamæiris latifolia.* Broad leafed dwarfe Flowerdeluce.

The dwarfe kinds likewise grow both in roote leafe, flower and seede like unto the greater kindes in all respects except the lowneese, for some will scarse rise above a foote high, others not halfe a foote, and some scarse so high, as their leaves, which in this sort is broader, in others narrower: the flowers also varying in colour one from another, but not mixed with that varietie that is in the former.

5. *Xyris sive Spatula fœtida.* Stinking Gladwin.

The stinking Gladwin is one of the kindes of wilde Flowerdeluces, both in forme and propertie, as I said before, and therefore must be numbred among them. It hath diverse leaves rising from the rowes, very like unto a Flowerdeluce, but that the leaves are sharpe edged on both sides, and thicker in the middle, of a deeper greene colour, narrower alby and sharper pointed than the leaves of most of the Flowerdeluces, and of a strong or evill sent, if they be rubbed or bruised betwixt the fingers: in the middle riseth up a reasonable strong stalke three foote high at the least, bearing three or foure flowers at the toppe, made somewhat like the flower of a Flowerdeluce, having three upright leaves, of a dead or sullen purplish all colour, with some veines discoloured in them, the other three doe not fall downe, nor the three other small ones are not so arched, nor cover the lower leaves, as those doe in the Flowerdeluce, but stand loose or asunder from them: after they are past, there come up three square hard huskes, opening wide into three parts when they are ripe, wherein lye reddish seede, and turning blacke, when it hath shaden long: the roote while it is young is but small, and full of strings, but being growne elder they are greater, and fashioned like unto a Flowerdeluce roote, but reddish on the outside and whitish within, very sharpe and hot in taste, and of as evill a sent as the leaves.

6. *Iris bulbosa latifolia primus Clusii.* The first broad leafed bulbed Flowerdeluce of *Clusius*.

This kinde of Flowerdeluce hath diverse long somewhat broad and hollowish leaves not stiffe like the other sorts but soft, greenish on the upperside, and whitish underneath: among which riseth up one stalke and some-

6. Iris bulbosa latifolia Clusii.
Clusius his first bulbed Flowerdeluce with broad leaves.

7. Iris bulbosa minor flore argentifolia.
The lesser bulbed Flowerdeluce.

2 3 times

Original from UNIVERSITY OF MICHIGAN

times more, nor above halfe a foote high, bearing at their toppes one flower a peece, and seldome more, somewhat like unto a Flowerdeluce, consisting of nine leaves, whereof those three that stand upright are shorter, and more closed together than in others, the three that fall downe turne up their ends a little, and those three that others doe cover the fall at their bottomes, stand like the upright leaves in other Flowerdeluces, and are parted into two ends like unto two eares: the colour of the flowers is blew, either paler or deeper, or white, which is very rare, smelling very sweete, the roote is round and white under the blackish coates that cover it, having sundry long white roots in steede of fibres like unto an *Hyacinth*.

7. *Iris bulbosa major Anglica*, The greater bulbed Flowerdeluce.

This hath five or six long hollowish or gutterd whitish greene leaves, broader than in any of the lesser sorts among which riseth up a little round stalke two foote high sometimes, at the toppe whereof, out of a skinny huske breaketh forth one or two flowers consisting of nine leaves like unto, standing in the same manner that the former sorts doe, but each of the falling leaves have a yellow spot more neere their bottomes, and the three upright leaves are small, and narrow at their bottomes but broad upwards: the colour whereof is all blew, purple, white, or mixed very variably, as is in my booke expressed: the heads for seede are smaller than the former, and so is the seede, and not so flat: the roote of this is usually greater than in the other smaller bulbous sorts with long haires or threds, in the outer browne coates which are not in the others.

8. *Iris bulbosa minor sive angustifolia Hispanica*, The lesser bulbed Flowerdeluce.

This lesser sort groweth in the same manner that the greater doth, but hath narrower long pointed leaves, the flowers likewise are smaller, shorter and rounder than in the other, but of the same fashion, and vary more in the diversitie of their colours than it: the seedes are smaller, and the pods longer and slenderer, and the roote also smaller, but more encreasing in bulbes.

The Place.

The Flagges or Flowerdeluces here mentioned as well as the bulbous kindes grow in diverse Countries, *Africa*, *Greece*, *Italy*, and *France*, and some in *Germanie*, and in our owne Countrie, but are chiefely nursed up in their gardens that are lovers of both delights; the *Gladiolus* groweth as well upon the upland grounds, yea in mayst places, as in woods and shadowie places by the sea sides in many places of this land, and is continually nursed up in gardens; yet in particular you may finde it growing, by a foote path, not far from the further end of *Dedford* towne in *Kent* as also neere to *Kentish* towne, which is hard by *London*, if it be not digged up and carried away. for I doe easily thinke, it is not naturall in that place, but some seede by chance, hath beene brought among the soyle, whereby it grew there.

The Time.

The fayrest kinds of Flagge Flowerdeluces flower in *Aprill*, the greater in *May*, and the bulbous sort not so till *June*, the *Gladiole* is somewhat later than any Flowerdeluce doth, that is to say not untill *July*, and the seedes ripe in the end of *August*, or in *September*, yet the huskes after they are ripe opening of themselves, will hold their seedes within them for 2 or 3 moneths, and not shed them.

The Names.

The greekes call it ἶρις, as also ἴρις, *Iris* and *Hiris quasi sacra*, which made *Gaza* finding it so written in the coppies of *Theophrastus*, to vanilate it *Conscerare*; but it was called *Iris, a celitis arcus similitudine, quem in cœlo repræsentat*, from the Rainebow whose various colours the flower thereof doth imbrace, the old ignorants made a difference betweene *Iris* and *Iresine*, according to the Latine verse extant thereof, which is this, *Iris purpureum florem gerit Iresine album*. The *Iris tuberosa*, which is a peculiar kinde, as you shall finde it in my former booke, is called of *Matthiolus Hermodactylus verus*, because the roots are like unto fingers, and from him divers did so call it, but most erroniously: for a while *Dodonæus* tooke it to be a kind of wild Flowerdeluce, and lastly: yet some did take it to be *Leucoium luteum* of *Theophrastus*: the *Arabians* call it *Afsonsal jenzi* or *Afonfa*, the Italian *Iride Coltivata*, *Giaggiuolo*, the *Spaniards Lirio*, the *French Flambe*, the *Germane Gilgen* and *Hundsblumen*, but only *Lobelius* would call the *Iris bulbosa Anglica* by the name of *Hyacinthus poeticus*: I see no reason for it hath none of those mourning markes as in the *Iris*, nor is it of the forme of a Lilly. *Gladiolus* is called in Greeke ξίφιον, *Xyris* of ξύλη *similitudinem quasi xeriam telorum, aut novaculæ dicitur*, and in Latine *Spatula*, *Spathula fœtida*, for *Spathe* is taken for a sword as *Gladium* is, and for that the leaves being frosted smell strong, his denomination in *Latine* and *English*, hath risen suitable thereunto: *Theophrastus* calleth it *Iris Agrestis*, *Tragus* in mistaking it did take it to be *Gladiolus*, the *Arabians* call it *Caforus*, the *Italians Spatola fœtida*, the *French Glayeul puant*, the *Germanes Wendelenfkraut*.

The Vertues.

All the Flowerdeluces especially the Flagge kindes are very neere of one qualitie, but of the bulbous kinde I finde no Author to write, or experience to teach whether they be of the same or differing properties. The juice or the decoction of the greene roots of the Flag Flowerdeluce, with a little honey drunk, doth purge and loose the stomach of grosse & tough flegme and choller that lyeth therein, which might be the cause of vomit: it helpeth the laundise also, and the dropsie, by evacuating those humors both downwards and upwards: and because it doth some what hurt the stomach, it is not to be given but with honey & Spikenard: the same being drunk doth ease the paines and torments, or wringing of the belly, and sides, the shakings of agues, the diseases of the liver and spleene, the wormes of the belly, the stone in the raines, convulsions or crampes that come of cold humors, by warming them and comforting the parts: as also helpeth those whose feede passeth from them unawares of it unwillingly, yet as one saith, it dorke confume and waste it very much also, and is a remedy against bruises and stingings of venemous creatures, being boyled in water and Vineger and drunke: the juice being boyled in wine and drunke prouoketh vrine, helpeth the collicke, bringeth downe women's monthly sickenesse, and made up into a pessary with honey, and put up into the body, draweth forth the dead childe: it is also commended against the cough, to cause tough flegme to rise the more easily excrementes, and to be expectorated forth: and therefore the *Druggers* in the Apothecaries shoppes, either in the powder, or made into a Lohoch or licking Electuary, is well found for the same purpose: it conduceth much to ease the paines in the head, and procure sleepe and rest: being applyed with rose water rose cake and vineger, to helpe watering eyes, by drying the moyst sharpe humors, and drying them up: being put up into the Nostrils, it procureth neesings, and there-

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

also purgeth the head very much of flegme: the juice of the root applyed to the Piles or the Hemarhoides, giveth much ease: and for the Dropsie, an Electuary made of the juice thereof, with other things in this manner, is held very effectuall: Take of *Galanga*, and of *Zedoaria*, of each two drams, of Cinamon and Cloves of each one dram and a halfe, of the leaves of Sea Bindweede called *Soldanella* in the Apothecaries shoppes, halfe an ounce, make these into pouder, and with so much hony, wherein three drams of the juice of the rootes of Flowerdeluces hath beene boyled, and is inspissated, make them up into an Electuary; whereof halfe an ounce taken in the morning fasting, for diverse dayes will doe much good: it doth also wonderfully helpe the paines and swellings of the cods in this manner. Take foure drams of the pouder of the rootes thereof, of Cinamon and of Dill, of each two drams, of Saffron one scruple, mix these well together and apply them to the cods being first laid upon a scarlet cloth, moistned in whitewine, and warmed in a dish, over a burning dish with quick coales therein: the decoction of the rootes gargled in the mouth taketh the toothach, and a strong or stinking breath: the oyle called *Oleum Iridinum*, if it be rightly and truly made of the flowers of the great broad Flagge Flowerdeluce, of what colour I thinke it greatly mattereth not (but not of the flowers of the greater blew English bulbous Flowerdeluce, as I know some Apothecaries have and doe use) and rootes of the tame sorts of Flowerdeluces, is very effectuall to warme and comfort all cold joynts and sinewes, as also the Gout and sciatica, and mollifieth, dissolveth and consumeth tumours or swellings, although they be scrophulous in any part of the body, as also of the matrix: it helpeth the Crampe and Convulsion of the sinewes, warming them, and helping to extend them; the head and temples annointed therewith, helpeth the Catarrhe or thin Rheume distilling from thence; and used upon the breast or stomack, helpeth to extenuate the rough cold flegme, making it easie to be spit out; it helpeth also the paines and noyse in the eares, and the stench or evill savour of the nosthrills; it giveth also much ease unto the painefull Piles: The roote is fitte either greene or in pouder, helpeth to cleanse, heale and incarnate wounds, and to cover with flesh the naked bones, that ulcers have made bare, and is also very good to cleanse and heale up Fistulaes and Cankers, that are hard to be cured: divers doe use to beate the greene rootes, and so apply them to the face or other parts, but it is better tyed in a faire linnen cloth, and laid for a day and a night in faire or Role water, with which water you may wet or moysten the skin of the face, hands or neck, that are sunburned or deformed with the Morphew, black or blew markes of scarres, or any other discolouring of the skinne, but they that use it had needs take heede that they use it not too strong, nor let it lie on too long, but rather wash it off anone with faire water, within two or three houres after it hath beene used: The dryed roote called Orris, being beaten either alone of themselves into pouder, or with other sweete things, are used to be laid in presses, chests and wardrops, to sweeten and perfume garments of linnen, and like especially, and all things that you will put it to, and thus much of the Flowerdeluce. But there are but few that have written of the Gladwin, or that have remembred the purging qualitie therein, yet many of our country people in many places use with the decoction of the rootes purge themselves, and thereby avoyd much corrupt tough flegme and choller: yea some that will not have it worke so strongly, doe but infuse the dryed rootes in ale, and some take the leaves which serveth well for the weaker and tender stomacks: the juice hereof procureth sneezing, being put up or snuffed up into the nose, and draweth downe from the head much corruption, and the pouder thereof doth the same: the pouder also drunke in wine helpeth those that are troubled with Crampes and Convulsions, or with the Sciatica or Goute, and giveth ease to those that have any griping paines in their body or belly: and helpeth those that have the Strangurie, that is, that cannot make their water, but by drops: it is with much profit also given to those that have had long fluxes by the sharpe and evill qualities of humors, which it hath having first clensed and purged them, by the drying and binding propertie therein, even as Rubarbe and some other such like things doe, the roote procureth womens monethly courses very effectually, if it bee drunk after it hath beene boyled in wine, and some of them dryed and boyled in wine and vinegar, in equall parts, that flies may sit over the hot fumes, being close covered until it grow neare cold: the roote used as a pessarie, worketh the same effect, but in women with child it causeth Abortion, that is, the delivery afore the due time: the leaves beaten to pouder and taken to the quantity of halfe a dram in wine, helpeth those that cannot make water very effectually: the same taken with vinegar dissolveth both the hardnesse & the tumors of the spleene: the roote is very effectuall in all wounds, and specially of the head, as also to draw forth any splinters, thornes, broken bones, or any other thing sticking in the flesh without causing any paine, used with a little Verdigrease and hony, and the great country rootes: the same also boyled in vinegar and layd upon any hard tumors, doth very effectually dissolve and consume them, yea even those swellings of the throate, called the Kings Evill: the juice of the leaves and rootes is profitably used to heale the itch, and all running or spreading scabs or sores, and blemishes or scarres in the skinne: some doe suppose by the sharpenesse of the taste in the roote (especially more then in the seede, which is more drying) that it hath as well a corrosive as opening quality therein: some also doe appropriate it to the effects of the cheste and lungs, for which the Iris or Flowerdeluce is more proper and effectuall: some also to stay the involuntary passage of the sperme, following *Pliny* therein: and some also to heale the hemorrhoides, and others the diseases of the fundament: it is thought also to bee effectuall against the poyson of Serpents: and thus much for the stinking Gladwin.

Chap. XLVIII.

Carthamus sive Cartharnus. Baftard or Spanish Saffron.

Although these kinds of *Carthamus* might well be placed among the Thistles, as other Authors doe, and with these that other wilde kinde, called *Atractylis*, but because these onely have purging qualitie, I thought it best thus to separate them, and intreate of these in this place.

1. *Carthamus sive Cartharnus sativus.* The manured baftard Saffron.

The manured baftard Saffron hath sundry large leaves lying next the ground, without any pricks, or with very few, white ones at the corners of the leaves and divisions, among which riseth a strong hard round stalke three or foure foote high, branching it selfe up to the top, bearing thicke leaves, sharpe pointed,

Original from UNIVERSITY OF MICHIGAN

1. *Crocus sine Corbacio sativus.*
The ordinary Spanish Saffron.

2. *Crocus alter Cretensis.*
Wilde or bastard Saffron of Candye.

ted, and prickly at the edges, and at their ends a great open scaly head, out of which breaketh forth many gold yellow threds, of a well orient and shining colour, which being gathered in a dry warme time and kept dry, will abide in the same delicate colour that it bare when it was fresh for a very long time: the seed when it commeth to maturity, is white and hard, somewhat long and round, and a little cornered: the roote is long white and wooddy, perishing yearly after seede time. This hath beene found with a white flower but very bare.

2. *Crocus alter Cretensis.* Wild or bastard Saffron of Candy.

This other bastard Saffron of Candye, from a thicke and long blacke roote sendeth one straight round stalke, halfe a cubit high, set here and there with long sharpe pointed leaves, thicke set with prickles at the denies of the edges, at the toppe whereof standeth a scaly head compassed with prickly leaves, of the bignesse of the *Alexandrian* or Tuftafe Thistle, out of which breake forth divers thicke yellow Saffron like threads thicke thrust together, after which the seede groweth therein being white, and as great as the greater Centory seede.

3. *Crocus alter parvus Cluſij.* The lesse blue everliving bastard Saffron.

This bastard Saffron riseth up with divers hard strong and round stalkes, without any branches at all from them, to the height of three or foure foote, bearing thereon at severall places somewhat large and long leaves, dented about the edges, of a sad or duskie greene colour: at the top of every stalke, standeth one great close hard scaly head, but not prickly at all, not so great as the other *Crocus* or bastard Saffron, never opening the scales of the head as it doth; from the middle whereof commeth divers threds, yet nothing so many as in the other, of a sad blewish yellow colour, and whitish at the bottome of them, the seede which lyeth among the downe in those heads is greater, (although *Clusius* saith smaller, for I set

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

you forth the plant as it groweth with us) then of the other thick and short, but not white, and in lesser quantity then is the former roote runne downe deepe into the ground, and being there encreased doe runne and spread themselves, taking up a great deale of roume.

The Place.

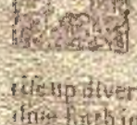
The first is generally sowen in *Spaine*, *Italy* and other places, for the especiall use thereof: The second *Alpinus* saith was brought out of *Candy*: The last groweth wilde in *Spaine*, as well about *Sevill* as *Cordula*, and in other places as *Clusius* saith, *Love* removeth it to grow upon Mount *Baldus*.

The Time.

They flower in the end of *July*, or about the beginning of *August*, and the seede is ripe about the end thereof.

The Names.

It is called in Greeke *κρόκος* and *κρόκος*, *Crocus* and *Crocus*, either *ἀπὸ τοῦ κόρου quod sit purgans vel medens*, or *ἀπὸ τοῦ κρούειν quod pungendo prurigines excitet*, but is more properly to be understood of the wilde kind: or rather *a flore colore, consistentia & expansione crocea vel rutilo*: it is called *Crocus* and *Crocus*, also in Latine, and *Carthamus* in the Apothecaries shops, *à tinctura* as it is thought, *quod sit purgans*, but more truly from the *Arabians Kartom*. The first is called *Crocus sativus urbanus* and *vulgaris* by most Authors, and *Carthamus* as I said in the Apothecaries shoppes, of some also *Crocus Sarracenicus*. The second is remembred onely by *Alpinus* in his booke *de plantis exoticis* by the name of *Crocus sylvestris*: the last *Clusius* calleth *Crocus alter viridiflorus*, and so doe all other after him without any great variation. The *Arabians* call it *Kartom*, the *Italians Safferano* and *Sarasenico*: the *Spaniards Alcor* and *Azafran salvaje*: The *Germaines* call it *Wilder Saffran*, the *French Safran bastard* and *graine de Perroquets*, because they use to feede Parrats with the seede: in English, Wilde Saffron, Bastard Saffron, Spanish Saffron, and Catalonia Saffron.



The Vertue.

The first Spanish Saffron flowers are much used in *Spaine* and other places, to tinct put into their brothes and meates, to give them a yellow colour, which doth much please them: for as for any relish of spice, or hot quick taste they have none, nor any comfortable qualities, that they should be desired or used, neither have they any great use in Physicke that I know: but many pounds of them are spent in dying silke into a kind of Carnation colour: the seede is chiefly used in Physick, or rather the kernells within the seede, which beaten and the emulsion thereof with honyed water, or with the broth of a pullet, taken fasting, doth open the body, and purgeth waterie and flegmatick humours, both upwards and downewards: which humors also it voydeth if the emulsion of the seede be given in a glister, and thereby helpeth the colicke and dropsie, and those other diseases that proceede from those humors: being made into a loloch or licking electuary, with Sugar and hony, and a few almonds and pine kernells, it clenseth the brest and lungs of flegme sticking therein wonderfully, causing it to be easily spit forth, it also clenseth the voyce, and encreaseth sperme, by the often use of it: but it doth somewhat trouble the stomacke, and therefore some stomachicall helpers are fit to be given with it, as Aniseede, Galanga, Mastick, or if need be of more forcible, *Cardamomus*, Ginger, *cal gemma*, &c. a dram of the flowers in pouder taken in *hydromel* or honyed water, or in barly water helpeth the laundise: a dram of the pulpe of the seede taken with an ounce of the Syrupe of Wormewood, doth the like also: the confection made of the seede hereof, called in shoppes *Diacarthamum*, is an especiall good medecine both to purge choller and flegme, as also to cleare and clense the body of the watery humors of the Dropsie. Parrots doe moste willingly feede upon this seede, yet doth it not move their bodies a whit. The second sort *Alpinus* saith is used by the naturalists in the same manner, and to the same purposes to purge that the first is used. Of the last there is little written, but wee may onely suppose that being so like in forme, it should so be also in quality.

Chap. XLIX.

Papaver corniculatum, Horned Poppie.

There are at this day two or three sorts of horned Poppies knowne to us, whereas there was but one sort knowne to *Dioscorides*, and other the ancient Greeke and Latin writers.

1. *Papaver cornuculatum luteum*. Yellow horned Poppie.

This horned Poppie hath divers long and somewhat large whitish or hoary leaves, lying upon the ground, very much cut in or torne on the edges, and somewhat rough or hayrie, from among which rise up divers weake round stalkes, leaning downe rather then standing upright, somewhat hayrie also, spreading forth into some branches, and bearing a large flower, at the top of every one of them, consisting of foure leaves of a fine pale yellow colour, with a few threds in the middle, standing about a small crooked pointell which in time groweth to be a long naked round pod, halfe a foote long or better; with a small head or button, as it were at the end thereof, wherein is conteyned small blackish round seede: the roote is white long and rough, spreading divers wayes, enduring many yeares, and keeping his leaves all the winter; every part hereof yeelds forth a yellow juice being broken, of bitter taste.

2. *Papaver Cornuculatum rubrum*. Red horned Poppie.

The red horned Poppie hath fewer, lesser and more jagged leaves then the former, nothing so whitish, but of a fullen greene colour, somewhat hairy also: the stalkes are slenderer and lower, bearing flowers at the tops of them, like the other, and consisting of foure leaves a peece, but much smaller and of a pale reddish colour, for the most part, yet sometimes ladder; after which come such like crooked or horned pods, but smaller then the other; having such like small blackish seede within them: the roote is long and slender, perishing every yeare, and raiseth it selfe oftentimes from strowne sowing, or else must bee sowen every yeare in the spring: this yeeldeth no yellow juice, when it is broken like the other.

3. *Papaver Cornuculatum flore violaceo*. Blew horned Poppie.

The blew horned Poppie groweth much lower, and with smaller leaves, very much or finely cut and divided into many parts, of a sad greene colour: the stalkes are low and slender, yet somewhat hairy, rising not much above

1. 2. Papaver cornutum luteum & rubrum.
Horned Poppie yellow and red.

3. Papaver cornutum coeruleum.
Blew Horned Poppie.

above a foote or halfe a yard high at the most, with small flowers at the toppes of them, like unto the last in forme, that is consisting of foure leaves, but of a fare deepe purple colour, almost like unto a violet: after whose come small slender and shorter pods, not above a fingers length, wherein lyeth such like blackish seede, as smaller: the roote is small and perisheth every yeare.

The Place.

The first groweth naturally by the sea sides, as well beyond sea, as on the coastes of our owne country in many places, both of the Kentish and Essex shore, as at *Rie* and *Lid*, at *Harwich* and *Whitstable*, in the Ile of *Thanet*, *Sandwich*, and is much desired and planted in Gardens, for the beautifull aspect thereof, as well as the vertues of other two *Cheiri* saith, hee first found in Spaine, growing by the way sides, and in the corne fields, as he in *Austria* and *Bohemia*, that with the red flower, *Matthiolus* long before his time remembreth to have found there.

The Time.

The first flowreth from *May* all the Summer long, untill the end of *August* oftentimes, and his seede ripened in the meane time. The second flowreth seldome before *July*, and giveth ripe seede every yeare, if the time prove not too unkindly: but the last as it is late before it spring, so it commeth late in the yeare to flowring, and seldome giveth good and perfect seed with us.

The Names.

It is called in Greek κέρας ἁλιτικὸν, and in Latin thereafter *Papaver cornutum*, or *Cornutum*, *a siliquarum figura in cornuculorum modo tortarum*, because the pods are crooked like a Cornet of Horne. *Pliny* and others say it was called also *Paralion*, that is *maritimum*, and of some *papaver sylvestre*. Divers doe thinke that *Glaucium* were the same herbe, as *Dioscorides* saith hardelie: *Pliny* saith in his time it was so called, deceived as *Dioscorides* saith of the likenesse of the leaves: but *Dioscorides* in describing *Glaucium*, saith it is the juice of an herbe, that hath leaves somewhat like unto Horned Poppie, but fatter, yeelding a yellow juice, in that it is not like, it cannot be the same thing: *Clusius* saith that the Spaniards called the last *Rosetta*, and some *Amapolas marinas*, because the flowers give a juice like Mulberries. It is called in English of some Sea Poppie: they of *Narbonne* in *Pena* saith, were wont to call it *Autmans cornichelata*: The *Arabians* call it *Almacharen*, the *Italians Papaver cornuto*, the *Spaniards Dormidera Aguarina*, the *French Pavot corne*, the *Germans Gelb Dotnagen* and *Gelb Mangen samen*, the *Dutch Geel Hoel* oft *Horne hoel*, and we in English Horned Poppie.

The Vertues.

The seede of the Sea or Horned Poppie, doth purge the belly gently; if it be taken in meate or boyled with the roote thereof broiled in water unto the halfe, and drunke, helpeth the obstructions and other diseases of the liver, and the paines of the sciatica or huckebone: it provoketh urine also, and is very good for those that have foule matter, like cagges in their urine; the leaves and flowers as *Dioscorides* and *Galen* say, cleanse cankers and virulent Vlcers, and that so powerfully, that *Galen* adviseth that they should not be applyed unto those parts

ulcers that are already cleansed, till they consume the quicke flesh also, it taketh away also by the strength and force of the lenitive quality, even those crusts that ulcers many times doe get by sufferance or ill looking unto: the leaves and flowers saith *Dioscorides*, being used with oyle, cleanse the eyes of cattle, that have spots or filmes in them.

CHAP. L.

Papaver Spumeum sive Rhœas album vulgo. Spadling Poppie.

THis small low herbe hath diverse weake tender stalkes, full of joynts, about halfe a yeard or two foote long, usually lying on the ground, whereon grow many pale whitish greene leaves, two always set together at the joynts, one against another, having many times upon the leaves, but more often about the joynts of the stalkes, a certaine white frothy substance, like unto that is called Cuckow spittle: at the toppes of the stalkes stand many flowers together, every one on a pretty long foot stalke, hanging down their heads, which are white, compoted of five small white leaves a peece, with a deepe notch in the middle of every one of them, making it seeme to consist of more than five, standing in a large loose husk striped, the flower scarse appearing above it, wherein afterwards is contained blacke seede: the roote is white and spreadeth in the ground abiding sundry yeares.

Papaver Spumeum
Spadling Poppie.

The Place.

It is found generally through *England*, in many places and pastures, and by the hedges sides, yea it is much desired to be planted in gardens.

The Time.

It flowreth from Iune untill the end of July or later, and the seede ripeneth in the meane time: the roote abideth all the Winter, and so doe some greene leaves with it.

The Names.

It is generally called *Papaver Spumeum*, and of some *Rhœas album*, as a difference both from the *Valeriana rubra Dioscoridis*, red *Valerian*, and *Muscipula Lobelij*, each of them called *Rhœa rubra*, yet neither of them is the true *Rhœadium* or *rubrum* of the *Arabians*. *Dodonæus* taketh it, as others doe also, to be the *Salmonium* of *Dioscorides*, but he is therein more mistaken in my judgement, than those he thinketh are, that take it to be the *Papaver Spumeum* or *Heraclæum* of *Theophrastus*, *Dioscorides*, and *Galen*: but *Pliny* throweth his mistaking the Greeke words ῥοιὰς in the description thereof wonderfully, comparing the leaves to the wings of Sparrowes or birds, when as *Dioscorides* intendeth the herbe *Struthium*, called *Radicula* or *Lunaria herba*, which some with us take to be *Saponaria*, because in ancient times, they used to whiten linnen clothes with the roote thereof, and *Theophrastus*, if *Pliny* had regarded the place, *lib. 9. cap. 13.* (speaking of *Papaver Heraclæum*, saith it hath leaves like *Struthium*, called *Radicula*, wherewith they use to whiten linnen) might have eschewed that errour. It is accounted a kinde of *Lychnis* by most of the best Herbarists, and therefore *Bauhinus* nameth it *Lychnis sylvestris quæ Rhœas album vulgo*: some with us call it Knapweede, and others Spadling or Frothy Poppy.

The Vertues.

The seede of spadling Poppie purgeth flegme saith *Galen*, and causeth vomitings saith *Dioscorides*, being taken in meade or honied water, and is especially good for those that are troubled with the falling sicknesse.

CHAP. LI.

Thalictrum sive Ruta pratensis. Medow Rue.

THere are sundry sorts of Medow Rue, some growing in our owne Land, others in severall countries abroad as shall be described in this Chapter.

1. *Thalictrum majus vulgare.* The greatest common Medow Rue.

This Medow Rue riseth up from a yellow stringie roote, much spreading in the ground, and shooting forth new sprouts round about, with many herby greene stalkes, two foote high, crested or cornered all the length of them, set with joynts here and there: and many large leaves on them, as well as below, being divided into smaller leaves, nicked or dented in the forepart of them, of a dead greene colour on the upperside, and pale greene underneath: toward the toppe of the stalke there shooteth forth

forth diverse thorny branches, on every one whereof stand two or three or foure small reeded heads or tufts, which breaking the skinne that enclosed them, flow forth a curle of pale greenish yellow hairs in order, which falling away, there come in their places small three cornered cods, wherein is contained small long whitish seede, the whole plant as well leaves, as flowers, have a more strong unpleasant sent than the next former kinde.

1. *Thalictrum latifolium montanum.* 1. *Thalictrum latifolium.* 1. *Thalictrum aquaticum.*
Spanish Meadow Rue. Broad Meadow Rue. The lesser Meadow Rue.

There is another of this kinde whose leaves standing one against another are not divided at all but are whole and longer as branch whereof I give you here to see.

2. *Thalictrum majus album Hispanicum.*
Great Spanish white Medow Rue.

The leaves hereof are much larger than the former, and more divided at the edges, and so like unto Columbine leaves that they easily deceive one not well acquainted therewith, yet are they lesser and of a sadder colour standing on long stalkes, among which riseth up a strong round stalke three foote high at the least, branching forth into two or three parts, with leaves at the severall joints of them, at the toppes whereof stand many small round yellowish buttons in a cuft together enclosed in a white skinne which breaking each button sheweth to be a small tuft of threads like the former but greater, and of a white colour tipt with yellow and somewhat purplish at the bottoms, of a strong sent abiding long in flower if it grow not too open and then fall away like short threads: the seede is like the former but greater, and so are the roots in white and yellow like it, which roots neither perish nor leave all the Winter, but shooteth new in the Spring.

3. *Thalictrum montanum latifolium.*
The greater mountaine Medow Rue.

This Mountaine kinde hath as large stalkes as the former great kinde, and riseth as high, but are not tufted or cornered at all, the leaves are divided like unto them, and of a sad greene colour also, the flowers are as ture, which smelleth strong as they, and the leaves are rather thinner than the first, the roots likewise are yellow, and spreadeth not so much.

4. *Thalictrum montanum minus album.* The lesser mountaine Medow Rue.

This is like unto the last in all things, but in the smallnesse of the plant, and in the smell, which is nothing so strong or unpleasant, for the leaves are greene as they, and the flowers white as the last greater, and the roots yellow.

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

yellow and some what creeping. There is also another sort hereof differing little from it, but in the colour of the flowers which is of a pale Violet colour with yellow tops.

2. *Thalictrum minus.* The smaller Medow Rue.

This small kind is almost in all things like unto the former, but smaller both in leaves, being of a little fresher greene colour, somewhat more thinne; and in the stalkes being round and not cornered, and in the flowers being somewhat whiter: the roots likewise are yellow, but doe not spread or creepe, so much as the former.

3. *Thalictrum minimum.* The least Medow Rue.

The smallest kind of Medow Rew, hath such like small or rather smaller, divided and notched leaves than the fourth kind hath, but they are of a wan like greene colour; the stalkes rise not above a foote high or a little more, the flowers are more yellow, and the roots stone in the ground, rather more than any of the former.

4. *Thalictrum angustifolium folio.* The narrow-leaf Medow Rue.

This kinde of Medow Rue hath yellow thinne roots, like unto all the former sorts, from whence springeth up a stalke, very much cornered or squared, three foote high, bearing many sad greene leaves at the joynts, which are smaller and longer than any of the former, and ending most commonly in three points longer than any of the rest: the toppes of the stalke is branched bearing many small pale yellow tufts of flowers like unto the other. Of this kinde there is another whole leaves being smaller than of that former sorts, with more leaves or without any division in the middle, like wise, doe not otherwise differ either in height or colour of flowers from the fourth sorts, both these sorts with uncut leaves, I saw in a bundle of dried herbes, belonging to Doctor *Foxe*, President of the Physitians Colledge of *London*. *Mistaken for the 4th sort.*

5. *Thalictrum minimum fœtidissimum.* Stinking Medow Rue.

The stinking Medow Rue hath his stalke round and greene, which sometimes purplish, not above a foote high with diverse leaves thereon, divided for the most part into three parts, each whereof hath two dents or notches, of a sad greene colour on the upper side, and of a pale greene underneath, as the full kinde here is described, the toppe of the stalke is branched, and on them stand small round mossie or thrumme flowers, like the rest, of a pale yellow colour: the small seeds that follow are cornered with a crooked end, five or seven standing together, wherein is included small seede: this smelleth most strong and unsavory as all the rest in the naturall place, but by transplanting and manuring, it loseth part of the virulencie and accordingly lesse offensive.

6. *Thalictrum Americanum.* The *American* Medow Rew.

This stranger is in face and outward habit so like a wilde Spanish kinde, that they can hardly be knowne asunder, but that it is fuller of stalkes and leaves: the flowers of the toppes of the branches are at the first of a pale blush colour, but being blowne open consist of five white leaves, and a number of white threds in the middle, ripe with yellow. There is another kinde of it wherein the whole flowers are purple tipt with yellow. *Mistaken for the 3d sort.* *Mistaken for the 4th sort.*

The Place.

The first as I said groweth in many places of our owne Land, in the borders of moist Medowes, and by ditch sides. The second was sent us out of *Spaine*, is found like wise in our moist Medowes and by ditch sides, but nearer the sea, and at *Margate* on the chalkie cliffe on the left hand, as you goe from the towne to the sea side: and in other countries farther from the sea side. The third and fourth were found by *Clusius* on the hills in the lower *Austria* and *Hungaria*. The fift and last was found by *Clusius* also in the lower grounds, by the rivers sides. The seventh is said to grow in the fields by *Mychfield* in *Switzerland*. The eighth grew in the countrie of *Valesia*; and the two last came from *Virginia*.

The Time.

They doe all flower about July, or in the beginning of August.

The Names.

It is generally held by our best moderne Writers, to be the *Thalictrum* of *Dioscorides*, called in Greeke θαλικτρον and θαλικτρος, as some thinke *a thalloo* growing to small sprigs or twigs. Some also have called it *Pityocampe spathe*, that is *Ruta*, for the forme of liknesse of the leaves, and so have entituled it *Ruta palustris* or *paludosa*; others from the yellow colour of the roote, have called it *Pinella rhabarbarum* Ballard Rubard: but I thinke more truely of the purging and binding qualitie, both joyned together like unto Rubarbe. Most Writers now doe call all these kinds of herbes by the name of *Thalictrum* or *Thalictrum*, with their several distinctions. For the first here set downe is called by most *Thalictrum majus*, and of some *Ruta pratensis*, as *Lobel* doth: of *Cæsalpinus Ruta sylvestris*, of *Lugdunensis*, it is set forth for *Pityocampe spathe* above, *Ruta*, and of some as *Cæsar Taygetus*, *Serpyllago hirta*, *Camedrios*, it is called it *Thalictrum Germanicum Lobelianum*, and the *Pityocampe* which is here the second he calleth *Italicum*. The fift is *Lugdunensis*, his *Hypecoum*, in his Booke *de stirpibus*, and is the *Ruta* of *Dodonæus*, or *Ruta pratensis tenuifolia* of *Lobel* and others. The third is the first great *Mountaine* of *Clusius*, and the first of *Camerarius flore albo*. The fourth is *Clusius* his small Mountaine kinde, with a white flower, as the purple floured kinde is his third Mountaine sort. The first is *Camerarius* his *Thalictrum tertium angustifolium* and *Clusius* his seventh or last. The seventh *Bauhinus* calleth *Angustifolium*, and he doth the eight *minimum Ruta similis* as their titles declare. The two last are called by those that first set it out, as it is under their titles.

The Vertues.

Dioscorides saith that being bruised and applied to old sores, it bringeth them to cleansing, that is doth perfectly cure them: and the distilled waters of the herbe and flowers doth the like, for as *Galen* saith it drieth without any heate or sharpenesse. The herbe is of some used to be put among other pot herbes, to helpe to move or open the body, and make it loosible: but the rootes washed cleane and boyled in ale and drunke, doth provoke to the stoole more than the leaves, but yet very gently. It is said (according to many other superstitious conceits in other things) that if the whole plant both herbe and roote, be hung up in a chamber, or tied to the necke of any person doth free them from any danger of harme. The rootes hereof boiled in water, and the places of the body anointed with vermine or lice, washed therewith while it is warme, destroyeth them utterly. *Tragus* saith it is good against the Plague, and in Saxonie against the Jaundice as *Camerarius* saith: *Lugdunensis* in Dauphine the name *Pityocampe* hereunto doth there with set downe a vertue proper to Rue, as if it did belong to that, that is, that it raiseth up him from his bed that hath the falling sickenesse, if some of the juice be put up into his nostrills, and there kept a while.

CHAP. LII.

Asarum, Asarabacca.

I Have in my former Booke given you the knowledge of this Asarabacca, but because I have not there expressed it so sufficiently, as it ought to be, I have here amplified myselfe in some particulars. Now although there was but one sort of *Asarum*, with all Writers now adayes, yet were of late observed another sort out of *Virginia* somewhat differing from the other; and although the name hath beene formerly misapplied to many other herbes, as is in part shewed in the 3^d. Chapter of the former tribe, and shall be further declared in this; yet now I hope that it is so sufficiently knowne, there is no cause of errour, but *Matthiolus* doth adde another herbe somewhat like unto it in leaves, whereof I meane to speake also here.

1. *Asarum vulgare*. Common Asarabacca.

Asarabacca hath many heads rising from the roote, from whence come many smooth leaves, every one upon his owne footestalke, which are rounder and bigger than Violet leaves, thicker also, and of a darker greene shining colour on the upper side, and of a paler yellow greene underneathe, little or nothing dented about the

1. *Asarum vulgare*. Common Asarabacca.

2. *Asarum Americanum*. Virginia Asarabacca.

edges: from among which rise small round hollow browne greene stalkes upon short stalkes about an inch long, divided at the toppes into five divisions, very like unto the cuppes or heads of the Heobane seede, but that they are smaller, and the like all the flowers it carrieth; which are somewhat sweete being smelled unto, and wherein when they are ripe is contained small cornered rough seede, very like unto the kernells or stones of Grapes or Raisins: the rootes are small and whitish, spreading diverse wayes in the ground, and increasing into diverse heads, but not running, or creeping under ground, as diverse other creeping herbes doe, which are somewhat sweete in smell, resembling *Nardus*, but more being drie, than when they are greene, and of a sharpe but not unpleasant taste. *Camerarius* saith that *Gesner* found a greater kinde hereof, and more sweete, upon the Alpes in *Switzerland*, which *Bauhinus* as it should seeme never saw, and therefore doubted of the truth.

3. *Aloides Asarinum*.
Bellus *Aloides* of *Matthiolus*.

2. *Asarum Americanum*, *Virginia* Asarabacca.

The *Asarum* of *Virginia* groweth very like the former, but the leaves are a good deale larger, little also and thicke, somewhat crumpled about the edges, of a darke greene colour, but not so much shining as it, and not so

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

round but a little pointed at the end, some also will be spotted or streaked: the flowers have usually but three divisions or points of a paler greene colour; the roote are somewhat greater and fuller of substance spreading in the same manner and smelling somewhat more fragrant and a little hot in taste biting a little the tongue.

3. *Asarina Matthioli.* Bastard Asarum of *Matthiolus*.

Bastard *Asarum* is a low herbe also, creeping upon the ground, somewhat like unto *Asarum*, having such like leaves upon long hairy footestalkes, but rounder and rougher than they, and somewhat dented about the edges: the flowers are like unto Camomill flowers, but that they are smaller by much, and wholly yellow, as well the border of leaves at middle thereof, and are not unpleasant in smell; the roote are slender small and long, creeping under the upper crust of the earth, and not shooting downe deepe somewhat of a sharpe taste, and a little bitter withall.

The Place.

The first groweth under trees and upon shadie hills, in *Pontus* and *Phrygia*, as *Dioscorides* saith, and in *Italy* also, and in sundry other places, and is frequent in gardens. The second came from the parts in or about *Virginia*. The third as *Matthiolus* saith is found upon some mountaines of *Bohemia* and likewise in *Somersetshire* in our owne Land, found by Dr. *Lobel*.

The Time.

The first and second keepe their greene leaves all the winter, but shoote forth new in the spring: and with them come forth those heads or flowers, which give ripe seede about Midsommer, or somewhat after: the other doth follow much the same course.

The Names.

It is called in Greeke Ἄσαρον ἀπὸ τοῦ μὴ στεφανοῦσθαι τοὺς πότους, as *Pliny* saith because *in potum non addacet*; but the text of *Dioscorides* is flat against him, for he saith it is καὶ ἐπὶ τῶν στεφάνων, a sweete herbe used in garlandes: it is also called νάρδος ἀγρία, in Latine *Asarum* or *Nardus Rustica*, and as *Mesue* saith *Valeare*, as by his verse appeareth: *Est Asaron Graece Valeas dicebile Latinis*: The former times as Lloyd before thought *Asarum* and *Baccharis* to be one herbe, and therefore not knowing what *Baccharis* was, they called this *Asarum Asarabacca*, which name is continued both in *Spaine* and other places, and with us also to this day: but the descriptions of them being so diverse (if they had beene regarded of learned sort, which was utterly neglected, and those times led onely by tradition, without searching out the verity of things) would make one marvaile how they could be so much mistaken, as from the ignorance of some that called *Asarum Baccharis*, to make one name of both: but the errour being so old even before *Pliny* his time, may seeme to make it the more excusable, but we should not continue in the same course, they formerly did: seeing *Pliny* sheweth the errour, and findeth fault with them that were so led, as is shewed in the chapter of *Baccharis*. The first is called *Asarum* by all our later writers, except *Lobel* that calleth it *Asarum Baccharis sive Baccharis*. The second we have imposed the name according to the forme it carrieth as it is in the title. The third *Matthiolus* first called *Asarina*, and so doe others that set it forth after him, onely *Clusius* doth much suspect it to be no second *Tussilago Alpina*, and that his figure was taken from a dry plant, and before it had brought forth the flowers to perfection: but by the sharpe taste and creeping roote, it may more probably be taken to be the *Cotyledon palustris verior* or *minor*. The *Arabians* call it *Asaron*, the *Italians Asaro* and *Baccharo*, the *Spaniards Asarabacara*, and we in *English Asarabacca* or *Asarabacca*.

The Vertues.

Dioscorides saith it hath an heating quality, where or howsoever applyed, and that it provoketh urine & easeth the paines of the stone; is profitable for dropsies, and for the old paines of the Sciatica: and that five drammes of the rootes being drunke in honeyed water procureth womens courses, and purgeth like unto blacke Hellebor: *Mesue* placeth it among other purging hearbes and so doe I, for being drunke it not onely provoketh vomiting, but worketh downewards, and by urine also, purging both choller and flegme: it is made the more strong if some Spikenard be added, with the whey of goates milke or honyed water, but it purgeth flegme more manifestly than choller, and therefore doth much helpe those that are troubled with the paines in the hippes, and the parts thereabout, especially if it be either steeped or boyled in whey: it doth wonderfully helpe the obstructions of the liver and spleene, and therefore profitable for those that are troubled with the dropsie, and the overflowing of the gall, which is the Iaundise, being steeped in wine and drunke: it helpeth those continuall agues, that come by the plenty of flubbornie humors: An oyle made thereof by letting it in the sunne, and whereunto some *Ladanum* is added, provoketh sweating, if the ridge of the backe be annointed therewith, and thereby driveth away the shaking fits of agues. It will not abide any long boyling, the chiefest strength thereof vanishing thereby: not much hearing, for the finer powder doth provoke vomits and urine, and the coarser purging downewards, thus saith *Matthiolus*, hereby as *Matthiolus* saith, the *Germaine* Country people were taught to cure both *vernes* and *quotidiane* agues, by drinking a draught of the decoction thereof made with wine, wherein a little Mace or Cinamon or honey is put, either every day or every other day, which purgeth the body and often procureth vomitings: also they annoint the ridge of the backe, and the soles of their feete with this warme oyle made thereof by long simming, upon the accesse or comming of the fit, being in their warme bed, whereby they prevent the shaking fits, and provoke much sweate, and are thereby cured, that have long lingred under the disease: It is profitable for those that have convulsion of the sinewes, and an old cough. The confection hereof is to take the juyce of 3 or 4 leaves in a little drinke to cause vomitings: the roote also worke in the same sort, but not so forcibly: but an extract made thereof according to art with wine, might be more safe and effectuall, and may be kept all the yeare, to be at hand ready to be given, when there is occasion, the quantity onely is to be proportioned according to the constitution of the patient, as the learned Phisition can best appoint. It is also effectuall against the venime of serpents, (the roote especially) and therefore is put among other simples, both into *Mithridatium* and *Antidotus Hiera* Trankle, which is usually called Venice Treakle: *Fuchsius* saith that the roote of *Asarum* hath the same property that *Aristolochia* hath but more strong, and *Paulus Agineta* agreeth with him; but *Leonicenus* findeth fault with them both, because they have a purging quality, whereof they make no mention, a dramme of the roote in powder given in white wine, a little before the fit of an ague, taketh away the shaking fit, and thereby causeth the hot fit to be the more remisse, and in twise taking expelleth it quite: It is said that the

the leaves being a little bruised, and applyed to the forehead and temples, doe ease the paines of the head, and procureth sleepe; and applied to the eyes, taketh away the inflammation of them: the juice with a little Frankincense prepared and put into and dropped into the corner of the eyes, sharpeneth the eyesight, and taketh away the dimnesse and mistinesse that is often in them. The leaves and rootes being boyled in lye, and the head washed therewith often while it is warme, comforteth the head and braine, that is ill affected by taking cold, and helpeth the memory also. The *Virginia Alisma* hath beene but little experienced by any that I know, and therefore can say nothing thereof, but it is probable to be of the like effects, being to much more aromaticall and fweet. The *Water Alisma* or *Marthiolus* saith, hath a little clensing quality, but a greater properties to accumulate or make thicke that which is thicke, to curre like that which is rough, and to open that which is obstruct: a dram of the powder hereof taken in fweete wine, or honyed water doth loosen the belly and purgeth from thence tough and clammy flegme, and blacke or burnt humors: It is to very good purpose and profit given to those that have the yellow laundife, to those that have the falling sicknesse, and to those that have the Palsie, the herbe eyther taken in fallet, and eaten as in fallets, or the decoction thereof made and drunke: It killeth also the wormes of the belly. I confesse I might have placed these herbes among the other forts of fweete herbes, but the purging qualities being so prevalent, both in procuring vomit and working downewards by the stoole, hath rather moved me to set them here.

Chap. LIII.

Brassica, Colewort.

AMong the edible forts of Colewords and Cabbiges with some others of delight, I have mentioned in my former worke so amply, that who so will may finde them there at large declared, I will only in this place give you some figures of them and their vertues more amply, because I was then so briefe, & with them shew you some wilde kinds: as also the Sea Colewort, which for the purging quality is fit for this place.

1. *Brassica sativa*, Garden Cabbiges and Coleworts.

The Cabbige (as I have shewed) is of many sorts, some greater others small, some white others redder tween white and red, and all these close their innermost leaves so inwards that they grow into a round head, the outmost leaves only abiding loose and open. The Colewort is well knowne never to close the leaves together, but grow alwayes spreading: the second yeare after the sowing they shoote forth stalkes, bearing pale yellow flowers, and afterwards small long pods with small round seed in them.

Besides these forts there are others also as the Coleflowers and the Colerape delicate meates. There are likewise some garden forts of Coleworts not so much used to be eaten, as pleasant to the sight in regard both of the

Brassica sativa, Garden Colewort. *Brassica capitata*, Cabbage.

fine crumpling forme of the leaves, and of the variable mixture of colours in them, as greene, white, red and yellow, which maketh them to be beheld with the more admiration: of all which I have spoken in my former booke, unto these I must ioyne the wilde sorts.

2. *Brassica Cyclostyla.* Wilde Coleworts.

The wilde Coleworts groweth with many long grayish round leaves, much gashed or torne on the edges, among which rise the stalkes bearing such like but smaller leaves on them, and yellowish flowers at the toppes, succeeded by small rough pods which hold round seede in them; the roote is white, long and somewhat woody.

3. *Brassica spinosa,* Thorny Coleworts.

The whitish woody stalke of this thorny Coleworte riseth to be more then two foote high, branching forth into sundry striped or creased branches, and they againe into other fewer slender twigges, each of them ending in small sharp white thornes, and on each of them under the thornes groweth one flower, in forme like unto an Hiacinthe of a pale redde or bluish colour, from which rise small round peaselike heads pointed, wherein lyeth the seede: the leaves that grow without order on the branches are somewhat long and narrow, a little dented or waved about the edges, and with other smaller sometimes ioyned together, of a grayish greene colour.

4. *Brassica marina monospermos.* Sea Coleworte.

The Sea Coleworte hath divers somewhat broad and large thicke wrinckled leaves, or as it were curled about the edges, growing each upon a severall thicke foote stalke and very easy to be broken, of a grayish greene colour, from among which ariseth up a strong thicke stalke two foote high and better, with some leaves thereon at the toppe, where it brancheth forth much, and on every branch standeth a large bush of pale whitish flowers, consisting of foure leaves a peece, after which come small thicke and short pods, containing but one round grayish seede a peece, much greater then *Soldanella* or Sea Bindweede seede; the roote is somewhat great and creepeth forth many branches underground, keeping the greene leaves all the winter.

The Place.

The manured edible sorts are onely nourished up in Gardens: the second groweth wilde on many ditch bankes as well in the ilands as neare the sea sides: the third is nourished in the curious Gardens of *Italy*: the last groweth in many places upon our owne coasts, as well the *Kentish* as *Essex* there, as at *Tilbie* in *Kent* and *Colchester* in *Essex*, and in other places also, and in other countries likewise.

The Time.

The flowring time is towards the middle or end of *July*, and the seede is ripe in the end of *August*.

The Names.

The Greeks call it *Selinon* and *Aristexiraphe*, or *Leipsydrion*: so called as it is supposed by some, *quod oculo papillas pelluciditate deterat*, because it dulleth and dimmeth the eyesight, which *Columella* signifieth by the *Thicken, Dimme* or *Darke* unto *Crocodile*: but he doth contrary himselfe for both he and other good authors lay that it is good for dim eyes, as also to take away the canker in the eyes; others lay *quod oculorum aciem reficiat & purget*, with *facultatem detersoriam*. *Theophrastus* and other Greeke Authors before him, doe call it *Selinon*, *ab umbrosis*, as some thinke *quoniam umbrosis & paludosis nascitur locis*, *vel quia*, as others, *ex umbrosis*, *in solem transfertur*, because of the likenesse of the seed, they supposing that if it were old, the one would degenerate into the other, which error in this as in many other things, is fatall to the old world, and I would to God it were not so also to ours; for the opinion is almost hereditary, at the least growne to old by custome, that there is small hope to roote it out of the minds of a great many, that the seeds doe often change into other herbes, then as they were taken from, which is quite contrary to the Text of the Scripture, *Genesis* 1. 29. that saith God did appoint every herbe and tree to have the seede of his owne kind within it selfe, and not of another kind; and would faine have any man of judgement, to tell me if hee thinke it possible that the seede of Cabbages should bring forth Raddish, or Raddish seede Cabbages; but *Pliny* and others also before him, mistaking the Greeke word of *Theophrastus* and others, which is understood by all of good judgement to be *Brassica*, translateth also properties of *Brassica* to *Raphanos*, that is, to Raddish: It is called also in Latin *Brassica*, *quasi gratissima*, as *Varro* saith *quod hujus generis nullum sit ingratum*; or as others thinke of *Pascua*, *quod ex eadem materia pascua fiant*, or as some *quod hujus generis alia*, *alia carnosa*, because poore people did in ill of all call for them to eate them: it is called also in Latin of many *Caulis quasi cauteris fecundis, gradatoque turgescat caule*. And from thence is thinke came our English word Cole, whereby anciently the Coleworts was called: the second is usually called *Brassica Pratensis* of all, as *Dodonæus* as *Raphanos* hath it, but that it should be that of the auncients I make great doubt: the third is also called *Brassica spinosa* both by *Alpinus* and *Raubolfus*, who onely that I know have written thereof. It is also thought by some, as *Turner*, *Lugdunensis* and *Caldesius* to bee the *Crambe Sylvestris* of *Dioscorides*, and that not onely for good reason, the face thereof so well resembling a Colewort, and the bitternesse and wholesome likewise, but also for that it is called *Raphanus marinus*, *Cluserij*, *maritimus monospermos*, but *Raphanus Brassica marinus*, *Dodonæi*, *Lugdunensis* & *Anglica*, as if it were onely proper to our coasts. The *Arabians* call Cabbages *Carnabi* and *Karnabi*, the *Italians Cavolo* and *Verza*, the *Spanish Colbes* and *Coures*, the *French Choulx*, the *Germans Kol*, and *Dutch Caboysschoolen*, and wee in English Cabbige and Colewort.

The Vertues.

The Cabbages or Coleworts (for they are in a manner of one operation) themselves being boyled gently in

broth, and eaten doe open the bodie, but being twice boyled or the second decoction of them doth binde: the nitrous quality therein being thrice consumed and spent by the twice boyling: the juice thereof drunken in wine, helpeth those that are bitten by Adders or Vipers, and the decoction of the flowers bringeth downe womens courses, and hindreth conception as it is said, if it be tried as a pessary: being taken with honey it recovereth the hoarsenesse or losse of the voyce: it helpeth those that are entring into a Consumption, if they use to eate them well boyled and often: the pulpe of the middle ribbes of Coleworts boyled in Almond milke, and made up into an Electuary with honey, is very profitably used by those that are thorowinded and are purse, if they often take thereof, being also boyled twice and an old Cocke boyled in the broth, this being drunke helpeth those that are troubled with griping paines in their stomacke, or belly: the same broth or decoction is very good, for those that are troubled with the paines and obstructions of the liver and spleene, and the stone in the backe and kidnies. the juyce thereof boyled with honey, and dropped into the corner of the eye cleareth the sight by consuming any filme or cleare beginning to dimme it, as also consuming the kanker growen therein: the juyce is safely given to those that have eaten Mushroomes, if they prove offensive unto them: they are much commended being eaten before meate, to keepe one from surfetting, as also from being drunke with much wine, by restraining the vapours that else would intoxicate the braine, or being drunke, will disperse the vapours and make them quickly rise sober againe: and even *Galen* himselfe applied the juyce thereof, to the temples of them that had paines in their heads caused by drunkennesse; for as they say there is such an antipathy or enmity betweene the Vine and the Colewoort, that the one will die where the other groweth: swollen and gouty legges and knees, where into many grosse or watery humors are fallen being bathed warme with the decoction of Colewort, have found ease thereby, for it taketh away the paine and ach, allayeth the swelling and watereth and dispersteth the humors: it helpeth old and filthy sores, being washed therewith, it healeth all small running sores and scabbes, pustules or wheales that breake out in the skinne: yea it cleanseth so strongly saith *Galen*, that it will cure the lepry: the ashes of Colewort (taken) are of such a drying quality, that they become almost caustick, or burning, and being mixed with old grease, are very effectuall to anoint the sides of those, that have had long paines therein, or any other place paine'd by the access of melancholike and windie humours, helping mightily to digest them: it is thought to be effectuall for all the diseases of the body, either inward or outward, and therefore *Chrysippus* wrote a volume of the vertues, applying it to every part of the body: and the old *Romanes* having excelled Physitions out of their territories, did for five hundred yeares maintaine their health, and helped their infirmities, by using and applying it, for their onely medicine in every disease. The broth or first decoction of the sea Colewort likewise doth by the sharpe nitrous and bitter qualities thereof, open the belly and purgeth the body, (but the second decoction is said to bind the body,) yet as *Galen* thinketh not without some hurt thereto, because it much worketh seeing (saith he) from the temperature of our bodies, being hotter and drier than the golden kindes, and therefore as all other wilde herbes, are stronger in operation, and so this cleanseth and digesteth more powerfully than they: the leaves while they are young, although bitter, being boyled (in lye saith *Dioscorides*, but in fayre water, for so it is all with us in these dayes) are eaten as other Coleworts are, by diverse poore people neare the sea, for boyling, taking away much of the bitternesse thereof: the seede hereof bruised and drunke killeth wormes: the leaves or the juyce of them applied to sores or ulcers cleanseth and healeth them, and dissolveth tumors or swellings, and taketh away the inflammations.

Chap. LIV.

Centaurium minus. The lesser Centory.

There was formerly but one kinde of small Centory knowne, but there hath of late since found out diverse other sorts, referred thereunto, both for forme and qualities.

1. *Centaurium minus vulgare flore rubente.* The red ordinary small Centory.

The common small Centory groweth up most usually but with one round and somewhat crested stalke about a foote high or better, branching forth at the toppe into many sprigges, and some also from the joynts of the stalkes below, the flowers that stand at the tops as it were in an umbell or tuft, are of a pale red, tending to a Carnation colour, consisting of five, or five sometimes small leaves very like unto those of Saint *Johns* wort, opening themselves in the day time and closing at night: after which come seede in little short huskes in forme like unto wheate cornes: the leaves are small and somewhat round, very like unto *Hyperium*, but without any holes therein as it hath: the roote is small and hard, perishing every yeare: the whole plant is of an exceeding bitter taste.

2. *Centaurium minus flore albo.* White flowred Centory.

The small Centory differeth not from the former, neither in stalke or leafe, neither in forme or height, but onely in the colour of the flower, which is white, as the other is red.

3. *Centaurium minus spicatum aliorum.* Small spiked Centory.

The spiked Centory hath his crested stalke divided at the bottome, into two or three branches, and they againe into others, having the lowest leaves next the ground, somewhat broad and round, yet pointed at the ends: but those which are upon the stalke, and are for the most part two at a joynt, are smaller, long and narrow: at the joynts with the leaves all along the stalkes up to the toppe, doe grow forth the flowers, one only at a place, which stand in small huskes, made as it were of small leaves divided, which consist of five white leaves, and after they are past, come such like small seedes as is in the former.

4. *Centaurium minus luteum.* Small yellow Centory.

The small yellow Centory, is somewhat like unto the former, but somewhat greater, the leaves being larger and broader, and broad at the bottome, yet not compassing it as the next: the flowers likewise are somewhat greater and yellow, wherein it differeth from the other, and is not so bitter.

5. *Centaurium minus luteum, perfoliatum ramosum.* Small yellow thorough leafed, branched Centory.

This yellow Centory hath some small leaves next the ground like unto the former Centories, but somewhat greater;

1. Centaurium minus vulgare.
The ordinary small Centory.

2. Centaurium minus spicatum flavum.
Small spiked Centory.

4. Centaurium minus luteum vulgare.
Small yellow Centory.

5. 7. Centaurium minus luteum perfoliatum & ramosum.
The small yellow thorough leafed and branched Centory and the small yellow.

greater: the ſtalke ſtandeth forth, ſometimes diverſe long branches from the joynts, and ſometimes but onely at the toppe, at the joynts whereof ſtand two ſomewhat broad and long pointed leaves, ſo compaſſing the ſtalke about the bottome, and making it ſeeme as if it ranne thorough them, that they will hold the dew or raine that falleth upon them, the flowers that ſtand at the toppes of the ſmall branches, are ſomewhat larger than thoſe of the ordinary kind, compoſed of foure or eight leaves, of a fine pale yellow colour, and ſometimes deeper, after which come bigger heads, and ſomewhat greater ſeede than the other; the roote is ſmall and white like the former: the whole is as bitter as the former.

6. *Centaurium minus luteum non ramoſum.* Small yellow unbranched Centory.

There is another of this kind of yellow Centory found, that differeth not in leafe or flower from the former, but the ſtalke bearing ſerpolated leaves, brancheth not forth, but beareth onely one flower at the toppe, which hath made it noted to be a different kinde from the other.

7. *Centaurium minimum luteum.* The leaſt yellow Centory.

The leaſt yellow Centory differeth not much from the laſt deſcribed, being that it is leafe in every part, and beareth two or three or more ſmall flowers, at the toppe of each ſtalke.

The Place.

Moſt of theſe Centories are found in our owne country in many places, the ordinary ſort almoſt every where in fields, paſtures, and woods, yet that with the white flower more ſparingly by much than the reſt, the ſpiked kinde groweth about *Hampſtead*, and upon the *Engliſh* hilles neere *Padua*. The firſt yellow Centory groweth in many places of *Kent*, as in a field next unto Sir *Francis Carew* his houſe, at *Beddington* neare *Croydon*, and in a field next beyond South-ſtreet Church towards *Greenſtead*, and in many other places where the other ſorts are ſometimes found.

The Time.

They doe all flower in *July* or there abouts, and ſeede within a moneth after.

The Names.

It is called in Greeke Κενταύριον τὸ μικρὸν, *Centaurium parvum & minus*, *Plin.* maketh three ſorts, his *Centaurea Chironia* is *Dioſcorides* his *Centaurium maius*, his *Centaurium* is this little Centory, and the third he maketh *Centaurium* by the miſtaking *Theophraſtus* his meaning, *lib. 9. cap. 9.* where he ſpeaketh of that kinde of Hawke called in Latine *Buteo* a *Buſſard*, and in Greeke βωτὴς of whom they that did gather this Centory ſhould take heed to be hurt. *Geſner* and *Dalechampius* doe both note *Plin.* of this his error herein: of ſome *Centaurea*, and for the exceſſive bitterneſſe *Fel terræ*, and for the qualitie *febrifuga*, of ſome alſo *Mollis radix*, but for what cauſe I know not: *Dioſcorides* ſaith it was called *Limoſium*, and *Plin Libadion*, becauſe it loveth to grow in moiſt places: It is thought to be that herbe that *Theophraſtus*, counted among the *Famaræ*, and called *Lepthophyllum*: *Plin* ſaith it was called of the *Gaules* in his time *Exacon* becauſe it did purge by the belly, all other evill medicines out of the body: It is called in *Italian Biondella*, becauſe women did with the lye thereof cleare and whiten their haire as *Marcellus* ſaith, but *Dodonæus* ſaith, it doth make the haire yellow: *Dioſcorides* calleth the third *Centaurium minus flore albo*: *Lugdunenſis* calleth the laſt *Centaurium luteum minus*, or *Centaurium luteum minus*. The yellow Centory is called by *Meſues*, *Centaurium floribus luteis ſive citrei gallici*, and is thought by ſome to be the *Achilleos nema*, that *Plin* mentioneth in his 25. Booke and 4. Chapter: and therefore *Geſner in horto* calleth it *Perſolata Achillea*. The *Arabians* call it *Kantarion ſagyr & Cantaryon ſegir* or *Sevir*, the *Italians* as is before ſaid *Biondella & Centaurea minore*, the *Spaniards Chamaria & Jelacrisa*; the *French* Petite Centoire, the *Germans Tauſent goldekraut* and *Fieber kraut*; the *Dutch Kleine Santory ende Eerdegall*; and we in *Engliſh* ſmall Centory.

The Vertues.

Dioſcorides, Plin, Galen, Meſues, and the other *Arabian* Phyſitions with diverſe others doe all agree, that the leſſer Centory being boyled and drunke, purgeth choller, cruditie and groſſe humours, and helpeth the Sciatica, and yet *Dodonæus* ſeemeth to averre that it hath no purging qualitie in it, that he could finde by any experience thereof: which words and ſaying *Gerard* ſcareth downe, as if himſelfe had made the experience, which as they are the very words of *Dodonæus*, it is much uſed with very good effect to be given in agues, for it openeth the obſtructions of the liver, gall and ſpleene, helping the jaundice and eaſing the paines in the ſides, and hardneſſe of the ſpleene: and ſtrengthening it: making thinne both the blood and humours, by the cleanſing and bitter qualities therein: it helpeth alſo thoſe that have the dropſie, or the greene ſickneſſe as the *Italians* doe at home, who much uſe it for that purpoſe in powder; it is of much uſe to be boyled in water and drunke againſt agues as all know: it killeth the wormes in the belly found true by daily experience; it helpeth alſo to ſtir up the ſhrunke ſinewes as *Gerard* ſaith, being put with other things for that purpoſe: the decoction thereof alſo (the toppes of the ſtalkes with the leaves and flowers are moſt uſed) is good againſt the chollicke, and coſtiveneſſe of women: it eaſeth and helpeth to avoid the dead birth, and eaſeth the paines of the mother, and is very effectuall in all old paines of the joynts, as the gout, crampes, or convulſions: a dramme of the powder thereof taken in wine, it is wonderfull good, being againſt the biting and poiſon of the Adder or Viper: the juice of the herbe taken while it is greene, as is uſed in other herbes, and dried in the Sunne, or by decoction and evaporation by the fire, as was uſed in ancient times, worketh the ſame effects: but the diſtilled water of the herbe, as it is more pleaſant to be taken, ſo it is leſſe powerfull, to any the purpoſes before ſpoken of, becauſe it wanteth that ſubſtance and fatneſſe that is in the herbe: the juice thereof with a little hony put to it, is good to cleare the eyes from dimneſſe, miſts, or clouds, that offend and hinder the ſight, it is ſingular good both for greene or freſh wounds, and alſo for old ulcers and ſores, to cloſe up the one, and cleanſe the other, and perfectly to cure them both, although they be hollow or ſinuous: the greene herbe eſpecially being bruiſed or laid on: the decoction thereof dropped into the eares, cleanſeth them from wormes, cleanſeth the foule ulcers, and ſpreading ſcabbes of the head, and taketh away all freckles, ſpots, and markes in the skinne being waſhed therewith. The yellow Centory (ſaith *Meſues*) worketh the ſame effects, that the other with the red flowers doth.

CHAP. LV.

Rubia major, Madder.

BEsides the manured and wild Madder, which were both knowne to the ancients, there are at this day many other sorts found out, not knowne to them, as well of the greater as lesser kinde, some growing on mountaines, some in Medowes and pastures, and some by the sea side: but because I would not cumber her one Chapter with too many of them, let me onely in this shew you the greater sorts, and in the next following the lesser.

1. *Rubia major sativa sive hortensis.* Garden Madder.

The Garden Madder shooteth forth many very long, weake, foure square reddish stalkes trayling on the ground a great way, very rough or hairy (which therefore *Pliny* calleth *spinosas* prickly) and full of joynts: at every of these joynts come forth, diverse long and somewhat narrow leaves, standing like a starre at the rowell of a spurre, about the stalkes, rough also and hairy: towards the toppes whereof, come forth many small pale yellow flowers; after which come small round heads, greene at the first and reddish afterwards, but blacke when they are thorough ripe, wherein are contained the seede: the roote is not very great, but exceeding long, running downe halfe a mans depth into the ground, red, and very cleare while it is fresh, spreading diverse ways.

2. *Rubia sylvestris.* Wild Madder.

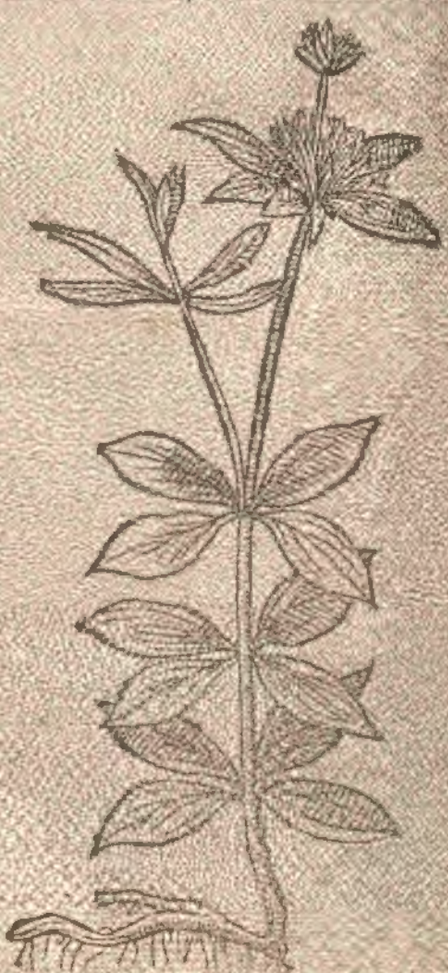
The wild Madder is in all things like unto the manured, but that the stalkes are smaller, not spreading so far, not yet so rough or hairy; the leaves are lesse, the flowers are white, and the roote groweth greater; but not so red, not cleare as the Garden kinde.

3. *Rubia sylvestris longioribus foliis.* Wild Madder with long leaves.

This wild Madder hath diverse round joyned stalkes, two or three foote long or there abouts, smooth, or at least nothing so rough, as the other wild sorts: the leaves that stand at the joynts, are somewhat rough, narrower and longer than the other, seven or eight at a distance: at the toppes of the stalkes, stand many white flowers, made of foure small leaves a peece, which turne into small round seede like the other: the roote is smaller, but red like the former.

4. *Rubia laevis Tauricensium.* Smooth leafed Madder.

This smooth Madder hath diverse round smooth stalkes, two or three foote long, pointed in like manner as other, but not so frequent, whereat stands foure leaves usually, not rough at all but smooth, larger and broader than the Garden Madder, towards the toppes of the branches, and at the joynts with the leaves, come forth divers flowers, standing round about the stalkes, which consist of five or six small pure white leaves: the roote is smaller than the other, and runne not farre in the ground.



5. *Rubia laevis arborescens Cretica.* The great smooth Candy Madder.

This Madder hath a thicke short stalke about a fingers thicknesse, from whence issue sundry straight smooth

1. *Rubia major sativa.* Garden Madder.

4. *Rubia laevis Tauricensium.* Smooth leafed Madder.

branches

branches with small short leaves, set at distances like the former sorts, at the toppes of the branches come forth two or three slender sprigges, bearing whitish flowers not unlike to the ordinary Madder: the roote is long and somewhat reddish: there is no roughnesse in any parte of this plant: but the roote is somewhat bitter with a verrie small austere taste also.

6. *Rubia Marina*, Sea Madder.

The Sea Madder spreadeth many square hard, somewhat rough stalkes, round about the roote upon the ground and full of joynts, from whence grow many small long leaves, somewhat rough, broadest at the bottome and pointed at the end, more white in the naturall places, then being transplanted, from among which growing lesser towards the toppes, come forth small whitish flowers, fashioned like the other, but longer: the roote is more red on the outside than within, harder and more woodily than the other.

The Place.

The first is onely manured either in gardens or larger fields in many Countries of *Europe*, for the profit that is made thereof. The second groweth in heldes and by hedge sides neere *Nyse* and many other places in *Germanie*, and so doth the third likewise, it groweth also in many places, in our owne land as at a place called *Hadnall* in *Shropshire*, on that side is next to the river, in the parish of *Stoupaine*, 2 miles from *Shrewsbury* at *Wemsam* likewise in the same shire, on a mud wall in the same towne, and at a place called *Somerpill*, neere to a Chappell, which is by the landing place, as ye come from *Atterry* to *Chefell* in great abundance. The fourth as *Lobel* and *Penny* say, groweth by *Turin*, on the hils of *Piemont*. The fift in *Candy*, and the last by the sea side in *Provence*, and neere *Montpelier*, and in *Spaine* also as *Clusius* saith.

The Time.

They flower toward the end of Summer, and the seede of some of them ripeneth quickly after, but the sea Madder, doth seldome give ripe seede in our Country.

The Names.

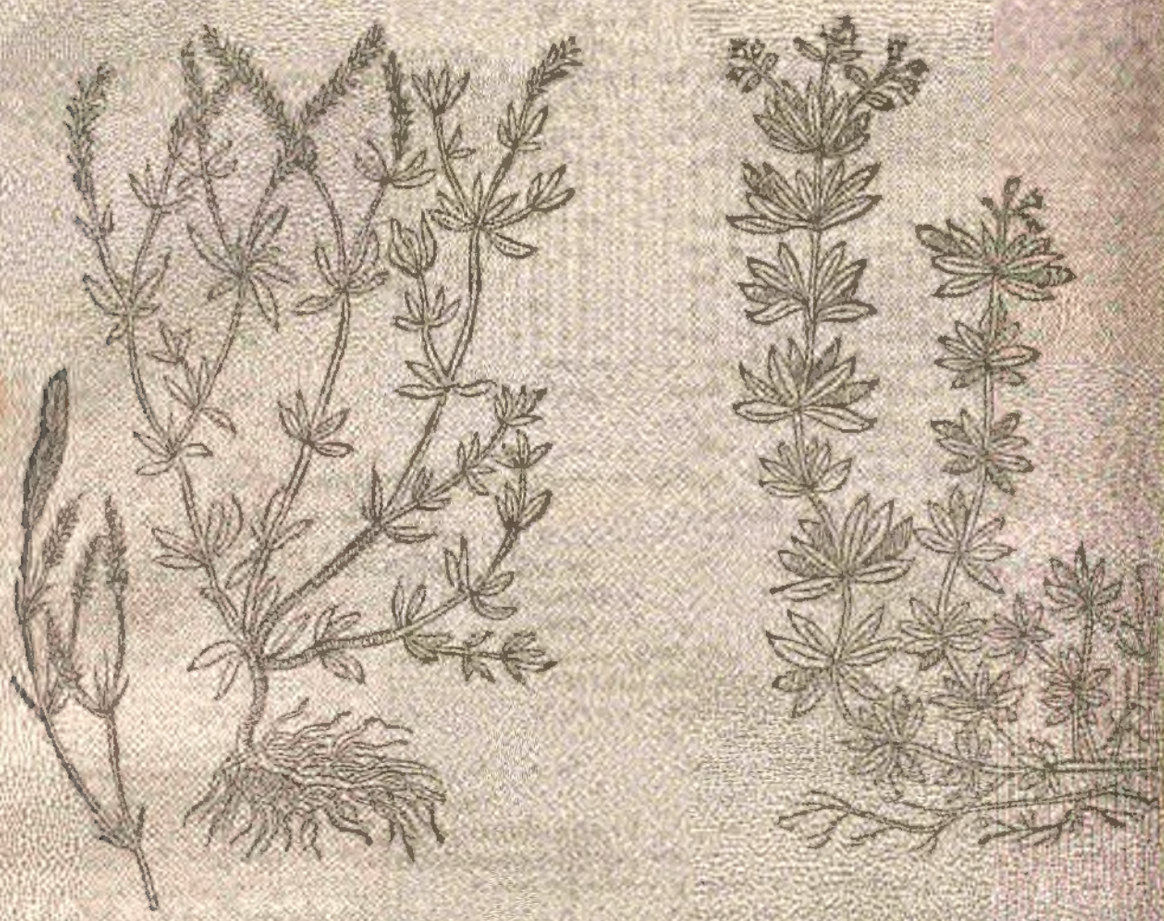
It is called Greeke ἐρυθρόδανον or ἐρυθρόδανος *Erythrodanum* and *Erythrodanus*, *Nicander* in *Theriacis* calleth it φοινὶξ βότρυον, in *Latine Rubea* and *Rubia*, and both Greeke and Latine from the colour of the roote, and of the dying cloth, or leather into a red colour. The first is generally called *Rubia Tinctorum*, and *Rubia sativa* in Shoppes: The other have their names in their titles, as most writers doe call them by: The *Arabians* doe call it *Rasis* and *Serve alfa hagine*: the *Italians Robbia* and *Robbie*, the *Spaniards Rubia* and *Granza*; the *French Garance*; the *Germanes Terberwurtz*: the *Dutch Crapp Roote* or *Meer*, and we in *English Madder*.

The Vertues.

There is some controversie betweene our moderne and the ancient writers concerning the vertues of Madder, whether it open or bind the body: the ancient writers *Dioscorides* and *Galen* affirming, that the roote hereof doth open and clense the body, of much tough and grosse flegme, that it provoketh urine plentifully, and hath so strong and powerfull an opening quality, that it bringeth downe womens courses, driveth forth the dead childe and afterbirth: but others, and *Dodonæus* among the rest, denyeth it to have any such strong opening quality, and saith that both *Dioscorides* and *Galen* were much mistaken therein, because that *Dioscorides* saith, it expelleth urine even unto blood, it being but the tincture of the roote in urine, and no blood that is voyded at all, saying that it hath onely a binding or astringent quality, insomuch that it helpeth ruptures, stayeth the flixe of womens courses, the flixe of the hemorrhoides or piles, the laske, and the abortment, or untimely delivery of women: whose very words and sayings, *Gerard* translateth and setteth downe in his booke, as if he had made the experience, and this contesting with *Dioscorides* and *Galen*, had beene out of his owne judgement and tryall: but we must needes say according to the truth, that it hath an opening quality, and an astringent property also: the opening quality is well perceived, by colouring the urine red, even as Rubarb will dye it yellow: the poperty in them both being a like, to open and then to binde and strengthen: it is an assured remedye for the yellow laundise, by opening the obstructions of the liver and gall, and clensing those parts; it openeth likewise the obstructions of the spleene, and diminisheth the melancholike humour; it is available also for those that have the palsie, and feele the paines of the hippes, called Sciatica: it is usually given with good effect, to those that have bad bruises, by falls or blowes, and inwardly felt as much as outwardly: and therefore it is mingled in vulnerarie drinkes: the roote for all these purposes aforesayd, is to be boyled in wine or in water, as the cause doth require, and some honey or sugar put thereto afterwards: the seede hereof taken with vinegar and honey, helpeth the swellings and hardnesse of the spleene: the decoction of the leaves and branches, is a good fomentation for women to sit over, that have not their courses: the leaves and roote, beaten and applyed to any part that is discoloured, with freckles, morphew, the white scurfe, or any other such deformitie of the skinne, clenseth them throughly, and taketh them away.

Chap. LVI.

Rubia minor. Small or little Madder.



The smaller madders are many that have beene lately found out, by the diligence of painfull Herbalists or lovers of herbes, some in one Country, some in another; all which I meane to comprehend together in this Chapter, that so you may have them all recorded together; but although there be diverse other things, that are called as *Alsine*, *Aparine*, *Gallium*, *Mollugo*, and *Cruciata*, that may be reckoned as kinde of Madder, and ought and should be joyned together, if I follow the course of other Herbalists that doe or should follow the congeners: yet because I have vowed my selfe to another course, let me referre them to another place, but not expell them from your sight and knowledge.

1. *Rubia spicata Cretica latifolia.* Candy Madder, with a spiked head and larger leaves.

This small Madder shooteth forth diverse square rough slender stalkes, full of joynts, from whence grow many branches, and where also stand 4 or 5 small leaves compassing them, and somewhat rough: the top branches end in small long spiked heads foure square, composed of many short rough huskes, set close together one above another;

1. 2. *Rubia fylvestris Cretica latifolia & angustifolia.*
Candy Madder with spiked heads, and with larger and smaller leaves.

3. *Rubia pratensis minor cærulea.*
Small Madder with purplish blew flower.

ther; from whence come forth small whitish greene flowers, scarce to be seene: after which come forth greenish seede: the roote is compoſed of many ſmall fibres, ſet unto a reddiſh bigger ſprigge, ſomewhat woody and periſhing every yeare.

2. *Rubia ſpicata angustifolia.* Spiked Madder with ſmaller leaves.

This ſpiked Madder is a kinde of the former, differing in this onely, that it is leſſe both in ſtalkes, braunches, leaves, not growing above an hand breadth high, and with as ſmall leaves as Knawell, periſhing every yeare.

3. *Rubia pratenſis lævis acutis folia.* Small ſmooth Madder with ſharpe pointed leaves.

This ſmooth Madder ſhooteth forth, one ſmooth square joynted ſtalke, for the moſt part, halfe a foote length; from the joynts whereof grow other ſmaller braunches, whereat are ſet foure ſmall long leaves and no more, ending in a ſmall point: the flowers that come forth at the toppes are ſmall and yellow at firſt, and of a pale white colour afterwards, made of foure leaves.

4. *Rubia quadrifolia rotunda lævis.* Small ſmooth Madder with round pointed leaves.

This other ſmall ſmooth Madder, hath many ſquare ſtalkes, halfe a foote long, ſending forth other ſmall braunches, and at every joynt, foure ſmall round pointed leaves, that are not altogether ſo ſmooth as the laſt, but rather a little rough: at the toppes whereof ſtand ſmall white flowers, upon ſmall threddie foote ſtalkes, made of foure leaves a peece; the roote is ſmall, threddie and reddiſh.

5. *Rubia minor pratenſis cærulea.* Small creeping Madder with purpliſh blew flowers.

This ſmall Madder creepeth upon the ground, with many ſmall ſquare ſmooth braunches, much divided & parted into other ſmall ones, full of joynts and at every of them, five or ſixe ſmall round and very freſh greene leaves, ſmooth alſo, or but very little rough: from theſe joynts and roundels of leaves, as well as from the toppes of the braunches come ſeverall ſmall flowers, made of five blewiſh purple round pointed leaves, with ſome few threds in the middle; the ſeede is ſmall and long pointed, two for the moſt part ſtanding together: the roote ſmall and of a reddiſh yellow colour, abiding all the winter with greene leaves thereon, and will increaſe plentifully from the ſeede it ſheddeth every yeare.

6. *Rubia minima ſaxatilis.* The ſmall rocke Madder.

This ſmalleſt Madder, groweth not much above an hand breadth high, with a ſquare ſtalke, ſpreading forth braunches from the joynts, at which grow 7 or 8 ſmall long pointed leaves, even the ſmalleſt and narrowe of all before mentioned, being ſomewhat rough alſo: the flowers are very ſmall, and of a pale red or blush colour, ſtanding in tufts or umbels, at the toppes of the braunches: the roote is ſmall and reddiſh as all the reſt are.

7. *Rubia Echinata ſpecialis.* Small Rocke Madder with prickely heads.

This ſmall Madder ſhooteth forth from a ſmall whitiſh threddie roote, many tender ſquare braunches ſmall & ſlender below, next unto the roote, and thicker an higher, diſtinguiſhed by many chinke and knottie joynts, whereat grow foure ſmall leaves leſſer than thoſe of Rue: betweene the leaves and the braunches come forth

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

small greenish flowers for the moſt part ſtanding together upon a ſoote ſtalke, each of them conſiſting of foure leaves, with certaine ſmall threds in the middle, after which rife ſmall heads ſomewhat rough, which when they are thorough ripe and dry are more then prickly, divided into foure parts as armes or wings on each ſide of the head, the middle part alſo being prickly, wherein is contained ſmall yellow ſeede: it flowreth by degrees, the loweſt joynt firſt, and the higher afterwards.

8. *Rubia argentea Cretica.* Candy ſilver-leafed Madder.

This ſmall Madder is like the former ſmall Madder, but that the leaves are longer and whiter, and the flowers yellow.

The Place.

The firſt groweth in *Candye*, and abideth well with us: the ſecond groweth upon the hils not farre from *Mompelier*: the third in *Germany* in the fields neere the bathes of Luke, and by *Lipſwick* alſo: the fourth on the hils in *Switzerland*, & about *Straſbourg* likewiſe: the fift groweth plentifully in many places of our owne land: the laſt groweth alſo in diverſe places with us, and upon the chalkie hils neere *Dreyton*, over againſt the Iſle of *Wight*: the ſeaventh was found by *Fabius Columnus*, on the ruinous moyſt walls of *Diocleſians* bathes in *Rome*: the laſt in *Candye* as *Alpinus* ſaith.

The Time.

They all flower in the Sommer Moneths, and give their ſeede ſhortly after.

The Names.

All theſe ſmall Madders have their denominations in their titles, as they are called by *Cluſius*, *Bauhinus* and others that have mentioned them: onely the laſt I take to be the *Mugrane alterum genus Dalechampii* of *Lugdunenſis*; and the ſeaventh is called by *Fabius Columna*, *Cruciata ſerpit ſummis minimis ramulis*, and peradventure is the ſame that *Ceſalpinus* calleth *Cruciata minima in nortensi*, which *Lobelius* hath altered, and called *Rubia cretica faxatilis*.

The Vertues.

Theſe ſmall Madders, as by their taſte and temperature may be gathered, are of the ſame property with the greater kindes, but are leſſe effectuall in every reſpect.

A ſmall wood Madder.

CHAP. LVII.

Piſſilium. Fleawort.

THe ancient writers have delivered us but one ſort of Fleawort, but there hath beene in later times, ſome others knowne, which ſhall be here ſet forth together.

1. *Piſſilium vulgare.* The ordinary Fleawort.

The ordinary Fleawort riſeth up with a ſtalke two foote high or more full of joynts and branches on every ſide up to the toppe, and at every joynt two ſmall long and narrow whitiſh greene leaves, ſomewhat hayrie: at the toppes of every branch ſtand diverſe ſmall ſhort, ſtalke, or clay-like heads, out of which come forth ſmall whitiſh yellow threds, ſuch as the Plantaine heads doe give, which are the bloſſomes or flowers: the ſeede enclоſed in thoſe heads is ſmall, and ſhining while it is freſh, very like unto fleas, both for colour and bignеſſe, but turning blacke when it groweth old: the roote is not long, but white hard and woody, periſhing every yeare, and raiſing it ſelfe againe of it owne ſeede, for diverſe yeares if it be ſuffered to ſeede: the whole plant is ſomewhat whitiſh, and hayrie: ſmelling ſomewhat reſinous or like Roſen.

2. *Piſſilium magni ſemper virens.* The greater ever greene Fleawort.

This Fleawort differeth not from the former in the manner of growing, but onely that his ſtalke and branches, being likewiſe greater doe a little more bow downe to the ground; the leaves are ſomewhat larger, the heads ſomewhat leſſer, the ſeede alike, and the roote and leaves abide all the winter, and periſh not as the former.

3. *Piſſilium Indicum folijs crenatis.* Indian Fleawort with dented leaves.

Indian Fleawort hath a woodly reddiſh rough ſtalke, next to the ground, about a foote high, ſpreading forth into diverſe branches; the leaves that ſtand at the joynts thereof are ſomewhat long, narrow pointed at the end, and notched, or rather ſomewhat corne on the edges, and hayrie alſo like the former: the toppes of the branches are more ſtored with heads than the former, but of the ſame bignеſſe and faſhion, with flowers and ſeede ſhining like the other.

4. *Piſſilium minus.* Small Fleawort.

The ſmall Fleawort hath ſmall round reddiſh branches, leaning downe to the ground, not above a handfull high, ſpreading into more branches, as having three or foure at a joynt, and two leaves ſtanding at every of them, one againſt another as in the former, but very ſhort and narrow: the ſmall heads that ſtand at the tops of the ſtalkes, have two ſmall long leaves, and ſometimes more, ſet under every of them, one longer than ano-

Pityos vulgaris.
The ordinary Fleawort.

ther, and in time bowing downewards and somewhat hard: the bloomings or flowers are white, and the seede that flowreth is shining, and like the other, but smaller: the roote is small and white with divers Fibres thereat.

The Place.

The first groweth in the fields and untilled places of *Spaine* and *Italy*, but with us no where but in gardens: The second groweth more plentifully in the fields that are neere the sea. The third is thought to come out of the *East*, as the name importeth, but we are not sure thereof. The last is naturally of *Egypt* or *Arabia*, and grew in the most noble Signior *Bembo*, his garden at *Padua*.

The Time.

All these Fleaworts flower in *July* or thereabout with us, but in their naturall places, all the Summer long, yet the last is the latest with us.

The Names.

It is called in Greeke ψύλλιον, in Latine *Psyllium*, *Pulicaris herba*, or *Pulicaria*, because the seede is like unto fleas, and not because it driveth away Fleas, being brought greene into the house, for that is false: there is also another *Pulicaria* called *Conyza*, which we have shewed before: The *Arabians* call it *Hasara Chatama*, and *Benzecolhame*. The *Italians Pigliol*, the *Spaniards Zargatona*, the *French Herbe aux Poulx*. The *Germans Pfloemen kraut*; and wee in English Fleawort, and not Fleabane, for that is *Conyza*, as is shewed before: The first is generally called *Psyllium* of all writers. *Gesner in horto Germaniæ* calleth it *Crespi* of *Theophrastus*. The second is called by *Matthiolus Psyllium alterum*, *Gesner* and *Camerarius* call it *Psyllium perenne*; *Lobel* in his *Adversaria* calleth it *Psyllium Plinianum forte maius radice perenne*; the third is *Aegyptiacum* his first *Psyllium*, and thought by *Bauhinus* to be the true *Psyllium* of *Dioscorides* and by him called *Indicum*, because the seede came to him under that name. The last as *Bauhinus* saith he had from the most noble *Arabick* Garden at *Padua*, under the name of *Conyza rubra*, as he had another called *album*, which is a kind of *Helenium*. *Bauhinus* mentioneth *Prosper Alpinus* to call it *Conyza rubra*, but I can finde no other then *Conyza mascula Psyllium arborum* in his *Egyptian* plants: he saith also that it was sent him from *Heidelberg* by *Sprengerus*, and the name *Botrys rubra*.

The Vertues.

All Authors doe confirme that the seede of *Psyllium* is cold which *Aetius* attributeth to the barke or rather saying that the inward pulpe thereof, is hot sharpe and drying: but divers doe utterly mislike and refute that opinion: the mucilage of the seed made (but indeed the seede is seldome boiled by any Artist, but always used whole) with barly water, and some syrupe of Roses or Violets put thereto and drunke, doth purge downewards grosse flegme and burnt choller; but the seede being tryed and so taken, stayeth the flux or laske of the belly, the corrosions that come by reason of hot choller, sharpe and malignant humors, or by the superpurging of any violent medicine, such as Scammony or the like worketh: the mucilage of the seede made with rose water and a little Sugar Candy put thereto, is very good in all hot agues, and burning feavers, and other like distillations, both to coole the thirst, and to lenifie the drinesse and roughnesse of the tongue and throate: it helpeth also the hoarsenesse of the voyce, and diseases of the brest and lungs caused by heat, as sharpe salt humors, as the Pleurisie also: the mucilage of the seede made in Plantaine water, wherunto the yolke of an egge or two, and a little Populeon is put, is a most safe and sure remedy to ease the sharpenesse, prickings, and paines of the hæmorrhoides or piles, if it be laid on a cloth and bound thereto: it helpeth also all inflammations in any part of the body, and the paines that come thereby, as the headach and megrime, and all hot impostumes, swellings, or breakings out in the skin, as blaines, wheales, pushes, purples and the like, as also the paines of the joynts, and of those places that are out of joynt, the paines of the Gowte and Sciatica, the tumbling of young children, and the swelling out of the navell, applyed with oyle of Roses and Vineger; the same also is very good to ease and wish good successe applyed to heale the Nipples, and the sore breasts of women lying in childbed: the juice of the herbe with a little honey put into the eares, helpeth the running of them, and the wormes breeding in them: the same also mixed with Axungia, and applyed to foule corrupt and filthy Vlcers and sores, cleanseth and healeth them, by cooling the heate and repelling the sharpenesse of the humors flowing unto them. Whereas divers have written that the frequent use of the seede inwardly taken is very dangerous, it is not otherwise true, then as it falleth out in all other great cooling herbes, as Nightshade, Houseleeke, Henbane, and the like, which are all safe herbes, being wisely and conveniently applyed: but ignorance, rashnesse and inadvertency in the applying of remedies, hath alwayes done more harme and brought more diseases unto the body, then all the danger in them can threaten it: and therefore it is not sufficient to know that a medicine is good but to

foote, if there were judgment and discretion, how, to whom, and when to apply it; and this I thinke is a good reason for women leeches, and impudent bold practisers of Phisicke and Surgery.

Chap. LVIII.

Kali. Glasswort or Saltwort.

There are diverse sorts of *Kali*, with the ashes whereof they use to make glasse, and other things, which were none of them knowne to the ancient authors, but remembred onely by the later *Arabian* Philosophers and Chymicks, of which I meane to entreate in this Chapter. and because diverse doe thinke that some of these is the *Anthyllis altera Apuleji* of *Dioscorides*, for the likenesse they have with them, I will in the next chapter, shew you all those herbes called Anthyllides, that are most worthy of that name; for unto some herbes the name ἀνθυλλὶς is falsely imposed, whereof I meane not here to speake.

1. *Kali majus crassifolium.* Great Glasswort with Snaile like seede.

The great *Kali* riseth up with a bigge round reddish fleshy stalke, very like unto Purslaine, two foote high or thereabouts divided into many branches, whereon doe grow many thicke, long, round fleshy leaves, pointed at the ends, growing without order, sometimes but one or two, and more often, more standing at a place; here and there also dispersed upon the branches, come forth small yellow with flowers, and after them small brownish heads, turned round like snailes, wherein lye small round seede; the roote is somewhat long, with many fibres thereat, and perisheth every yeare, after it hath given seede for the most part: this hath an evill taste but salt-ish.

2. *Kali album minus.* Small white Glasswort.

This lesser white *Kali*, hath diverse whitish greene branches rising from the roote, nothing so high as the former, and bending or leaning downe to the ground, spreading it selfe into other smaller branches, full of joynts; whereon grow more fibre of smaller and shorter, round and pointed leaves, nothing so fleshie as the former, and of the same pale greene colour with the stalkes: the flowers are white, and stand finely on the toppes of the branches; after which come small huskes, wherein lyeth the seede, which is small blacke and shining, like unto Sorrell seede; the roote hereof likewise is small white and woody, and perisheth after it hath given seede.

3. *Kali Ægyptiacum.* Glasswort of Egypt.

The *Egyptian Kali* groweth up with one slender stalke, bending it selfe downewards, and branching forth at the joynts into other small ones, which for the most part stand more upright, and at every of the joynes, two very long and somewhat hayrie leaves, bowing themselves downewards, because of the length of them: the small branches are bare without leaves unto the toppes or ends of them, where there grow many small and long leaves, hayrie like the former, but nothing so long: from among which grow small whitish purple flowers, with many small threds in the middle of them: Of this sort there is some other with shorter leaves differing in little else.

Kali foliis Rosmarini.

1. *Kali crassifolium majus.* Great Glasswort.

2. *Kali minus album.* Small white Glasswort.

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

4 *Kali geniculatum sive Salicornia*, Joynted Glasswort.

This joynted *Kali* riseth up usually, but with one upright round thicke, almost transparent stalke, a foote high or better, thicke set and full of joynts or knots, without any leaves at all on them, but shooting forth joynts, one out of another, with short eares at the heads of them, and also such like smaller branches on all sides, and they also divided into other smaller ones: this is thought to beare neither flower nor seede, the roote is small long and threddie.

Kali geniculatum tenuifolium.

There are some other kindes hereof found, differing a little in the forme of the joynts one from another, and one that is wholly reddish, not differing in any thing else from the forme of the other joynted ones.

The Place.

The first groweth by the sea sides, in diverse places both in *Syria*, *Africa*, *Italy*, and *Spaine*, as also in *Provence* and *Aquitaine* or *Gascoine*, where also they sow large fields therof, for the profit is made thereof. The second groweth not onely in those places, but in other colder climates also, and not onely by the Sea, but by the Salt pits in *Saxonie* as *Camerarius* saith, and upon our owne coasts likewise in many parts, especially of the West Countries; the third is more particular to *Egypt* as *Alpinus* saith, yet *Columna* saith it is frequent on the *Neapolitan* Welt shore. The last is generally growing among other Sea plants in all Countries almost, and on our coasts in many places, as also in *Saxony* and other places of *Germanie*, where there are lakes of salt water, whereof they make salt.

The Time.

They all flourish in the Sommer, and those that perish give their seede in *August* and sometimes later: the last abideth the Winter.

The Names.

The name *Kali* came first from the later *Arabians*, as it is commonly thought (for *Pena* thinketh that none the ancient writers either Greekes or *Arabians*, have made any mention of them or of their properties to make glasse, which was not made but of the ashes of this hearb; of the same ashes also made into a lye being boyled we doe vse to be made our ordinary sope; out of the said ashes also they extracted a salt called *Sal Kali*, *Sal Alkali*, to much desired and vsed by *Chimists*: for the herbe being dryed and burnt in great quantitie together, doth melt, and runne into a lumpe of a blackish ash colour, and is called by diverse *Soda*, and of some *Alumen Catinum*, or per adventure *Calinum*, onely by the alteration of one letter: and of the ashes of any other herbes, but especially of the 3 former sorts beaten to powder and mixed with a certaine kind of sand, the glassemen by the heate of fire, in their fornace being molten, doe make those fine Christall glasses wherein we drinke (but those other glasse bottles, &c. which serve to keepe Rosewater, and other distilled waters, are made of other things, as also that glasse which serveth for the Windowes of houses) and from this glasse, when it is in the furnace a boyling and running, riseth a kinde of scumme, which they that tend the furnaces, doe diligently take off, and this is called *Asungia vitri*, in *French Suye de verre*, the salt of glasse, and wee in English much therefter *Sandiver*, and is indeed but the salt part of the ashes separated by the fire from the rest of the molten substance, for it taketh like salt, and will relent, grow moyst, and consume like salt if it be not continually kept dry as it is: Of the ashes of the *Kali* like-wise relented into a lye, and boyled with oyle of Olives as in *Spaine*, &c. vse to make a kind of hard sope to wash with, the one sort coming from *Spaine*, &c. we call Castile sope, another from *Venice*, &c. white or *Venice* sope, but now it being for the most part spent in making of glasse there are found out other things sufficient, to make our ordinary sope at a farre easier and cheaper rate. The first is called of *Colet* and *Pena* in their *Adversaria*, *Kali magnum Sedi medii folio semine cochleato*; *Matthiolus* in *Coptic Dioscorides* following him in all things) in describing this kind confoundeth it with the last, making them seeme but one. *Camerarius* nameth it *Kali cochleatum majus*, and saith it is that *Anthyllis salsa*, that *Lobelius* also doth mention in these Epiphalicall verses.

Et cineres misse, salsaque Anthyllidis herba
Fuvenes flammis linde dare assa solent,
Sic simul ater eram, cineres nunc salvor in ignes;
Sed nitidum fumus corpus habebo die.

Bauhinus calleth it *Kali majus cochleato semine*, *Cesalpinus*, *Salsola semine in cornu*, and is generally called so in *Italy* where it groweth *Vsnea*: the second is usually called *Kali album*, & in *French* & *Scotish* *Blanc cendre* in distinction from the former: it is also called *minus* for the same cause, & is usually called *Kali Spanicum* where it groweth *Barba*: it is very likely to be *Anthyllis Chamæpitys foemina* of *Cordus*, in his Annotations upon *Dioscorides*, and likely also to be the *Anthylloides* of *Thalius* in his *Hercynia sylva*. *Bauhinus* calleth it *Kali minus cochleatum*: this is the third sort of *Kalis Ægyptium* with *Prosper Alpinus*, because it is more proper to *Egypt* than to other places as he thinketh: *Bauhinus* calleth it *Kali Ægyptiacum folio valde longo hirsuto*. The last is called of most *Kali*

Kali vermiculatum, and of some *Salsola*, or *Cinis* in *Officinarum shopis*, *Anthyllis vulgaris* verius *species quarta*, and of *Tragoselinum Salsola genus alterum*, as it is called in *English* Glasswort and saltwort of some the people that dwell neare it by the Sea side, call it Frogge grasse and Crab grasse.

The vertues.

All these sorts of *Kali* have a cleansing qualitie in them, without any manifest heate or thicknesse of any of them, or the juyce which is much better, taken to drinke doth purge downewards flegmatick waterish and adust or melancholike humors, and therefore are often used for the dropsie, to provoke urine, and to expell the dead birth, as also to open the obstructions of the liver and of the spleene, and to consume the hardnesse thereof, they are sometime mixed with those things, that are used as corrosives to consume proud or spongie superfluous flesh, that groweth in fistule and virulent ulcers, but the ashes themselves are very sharpe and biting like a caustike, and the lye that is made thereof is so strong, that it will fetch off the skinne from the hands or any other part of the body; and therefore if any will use to elende the skinne from freckles, breckles, morphew, or the like, they had needs to be carefull in the using of it, and apply it very sparingly, or delay it little inely, and so it may be good. If the ashes that is made of the lye of the ashes of these *Kalies* or saltworts be spread upon a peece of thicke course browne paper, and the lye of their whole bulbs that are cutwardly taken specifically, and bound to the soles of their feete it will bring againe the speech and that within a little time after the applying thereof, if there be any hope of being restored, while they live; this hath beene tried to be effectuall upon diverse persons: *Kali* over worketh much to the same effect with *Kali*: it boiled often being made into powder either to be blowne into bodies eyes, or being dissolved squirted into them, to take away any skinne that beginneth to grow there, and dimme the sight: both of them likewise serve to drie up running sores and scabbes, tetters, ringwormes and the like, and to helpe the itch.

Chap. LIX.

Anthyllis marina, Sea Chickweede and sea ground Pine.

Dioscorides maketh mention of 2. sorts of *Anthyllis* only the one with leaves like Lentiles, the other with leaves like unto Pines or ground Pine, unto each of these some have appropriated certaine herbes, and called them after those names, because they nearest resemble them; but it is judged an hard matter certainely to affirme any of them for the right: of the most likelihood of them, as I said before I shall speake in this Chapter, and referre these other sorts that are not properly called *Anthyllis*, unto their proper places.

1. *Anthyllis marina incana*, Hoary sea Chickweede.

This small *Anthyllis* also hath diverse hoary branches set with many small whitish or hoary leaves by dilligences

1. *Anthyllis marina incana.* Hoary Sea Chickweede.

2. *Anthyllis marina vera folijs.* Sea Chickweede with Lentile like leaves.

3. *Anthyllis altera herbariorum.* Sea Ground Pine.

about

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

about them, as small as any Chickweed almost, the flowers are white, and stand at the toppes of the stalkes, after which come small seede.

2. *Anthyllis maritima tenuifolia.* Sea Chickweed with Lentill like leaves.

This Lentill leafed *Anthyllis*, hath diverse short erected branches lying upon the ground, of a pale greene colour, and not much above an hand breadth long, spreading forth diverse small branches, whereon are set very small winged whitish greene leaves, many together upon a stalke, somewhat like unto those of the tuffed Lentils, somewhat narrow: the flowers stand at the toppes of the stalkes and branches, like pointed flames, of a yellow greene colour, after which come three square heads, like unto a *Tithymall* or Spurge, wherein is contained long round seede: this also is fat in the salte, but somewhat bitter and hot withall.

3. *Anthyllis alpina herba arenaria.* Sea ground Pine.

This *Anthyllis* (which is referred unto the second *Anthyllis* of *Dioscorides*, and that not without good judgement) hath divers hard hairy stalkes, without branches upon them, whereon doe grow many somewhat long and narrow leaves without order one above another, thicke bushing at the toppe, somewhat like unto those of *Chamæpitys* or *Ajuga*, but dented about the edges and hairy also, somewhat of a warming hot taste, and of unpleasant savour: the flowers stand among the leaves upon the branches, like unto the flowers of *Chamæpitys* or ground Pine, but of a purple reddish colour, after which come small grayish rough seede, somewhat long, four for the most part in every husk: the roote is somewhat thicke and white.

The Place.

The first groweth neare the sea in *Narbone* of *France* as *Pena* saith, as also in the kingdome of *Valence* in *Spaine*, as *Clusius* saith. The second hath beene found in the Iland of *Portland* in the West parts of this land by *Lobel*, and set forth in his *Adversaria*: the last groweth about *Montpelier*, and was also found by *Clusius* in *Portugall* and *Valentia*.

The Time.

They flower in July and August, and their seede is ripe in September.

The Names.

It is called in Greeke ἀνθυλλὶς, in Latine also *Anthyllis*, *quasi florida dicta videtur*. There is much controversie among Writers, concerning these *Anthyllides*, imputing them to be some of *Dioscorides*, every one alledging forth some herbe or other, under the name of the one or other *Anthyllis*, supposing them to be the same or at least wayes, to be referred for its likenesse unto them: *Lobel* and *Pena* set forth three sorts, whereof the first two here mentioned are two of them. The first is called by *Lobel* and *Pena*, *Anthyllis maritima altera Alpini Narbonensium*, of *Matthiolus* and *Anguillara*, it is set forth under the name of *Perpenchia altera* of *Dioscorides*, and by *Clusius* called *Gallica prima*: it is thought also by *Anguillara* to be the *Gramen secundum* *Plinij*, where he maketh mention in his 24. Booke, and 19. Chapter. The second is called by *Lobel*, *Anthyllis quæ herba maritima Ephori effigie* by *Dalechampius*, *Anthyllis minima*, & is the *Anthyllis Portulacæ folio* of *Pena* of *England*. The last is called by those of *Montpelier* *Pena Matthiola*, and is with them also accounted to be the *Anthyllis altera* *Dioscorides*, *Pena* calleth it *Anthyllis Chamæpitydis*, *Clusius* *Anthyllis altera*, and saith it is very like unto *Chamæpitys*. *Lugdunensis* saith it is called *Anthyllis herba arenaria*: *Bauhinus* in his *Pinax* refuseth to name this among *Anthyllides*, but putteth it among the *Chamæpitydes*, and namely that the *Anthyllis Chamæpitydis* first set forth by *Pena* called *Sedum marinum tenuifolium*, disliking to call it *Chamæpitys* saith that he doubteth whether *Dioscorides* meant to call it *Chamæpitys altera vermiculata*, *Sedi facie*, for he thinketh it rather meant to call it *Anthyllis*, having it both for likenesse of the leafe unto, in comparison of the other he calleth *Anthyllis Chamæpitydes*, and called *Lob. Matthiolus* by those of *Montpelier*, but allmeerly the *Anthyllis altera Chamæpitydis* of *Lugdun.* expressed in his annotations upon *Dioscorides*, and the *Anthyllis dicta minor* of *Thalius* are none of them *frutescentes plantæ*, which *Lugdunensis* maketh all one with his *Anthyllis Chamæpitydes frutescens*, whereunto he referreth his *Anthyllis*, as I have shewed.

The Vertues.

The likenesse of these Sea Chickweedes unto the *Anthyllis prima* of *Dioscorides*, as also the like taste perceived of them, that they are not inferiour in qualitie unto that of *Dioscorides*, who saith that both his *Anthyllides* are very helpefull to the raines and bladder and to provoke urine, as also to mollifie the hardnesse of the mouth, being used with oyle of Roses and milke to heale up wounds in the body or flesh, and besides these properties he saith that his second *Anthyllis*, doth helpe the falling sicknesse being taken with Oxymell or honied vinegar, but *Clusius* saith he learned both of the *Portugalls* and *Spaniards* in *Valentia*, where he found it growing, that they used it much and to every good purpose, to purge and cleanse the blood, when it waxed sowre, whereby it appeareth that most of the sea plants, whether salted or not, have a cleansing quality in them, and might be to good purpose applied, if wisely considered, and experience made of them.

CHAP. LX.

Chamæpitys sive Ivæ Arthriticæ. Ground Pine or herbe Ivie.

Dioscorides setteth downe three sorts of *Chamæpitys*, whose descriptions I will here expresse, which comparing them with those here set downe, you may see how aptly they do agree unto them: the first of *Dioscorides* saith is a small crooked herbe, creeping by the ground, with leaves like the Fenugreeke, but much thinner or smaller, tarter also and hairy, many growing about the roote like unto the Pine tree leaves, (to both *Matthiolus* but *Lugdunensis* hath the Pitch tree, for it is generally held that Greeke signifieth the Pitch tree, and Latine the Pine, although some are of the contrary opinion) the flowers small and yellow, or white, the roote is like that of Sorcery, the other is a kinde of *Sedum* with branches of a cubit long crooked like an anchor, the leafe like the former, but larger with a white flower and seede, and smelleth all like the Pine tree (or Pitch tree as *Lugdunensis*) leaves: the third which is the male which is a small herbe, having white hairy small leaves, the stalke also rough and tender, with yellow flowers; the seede groweth under the leaves, and smelleth also as the Pine (or Pitch leaves) both these are of quality like the former but weaker.

1. Chamæpitys vulgaris. 2. Chamæpitys altera.

1. *Chamæpitys vulgaris.* The ordinary or common Ground Pine.

Our common Ground Pine groweth low, seldome rising above an handbreadth high, shooting forth diverse small branches, set with slender small long narrow grayish or whitish leaves, somewhat hairy, and divided into three parts or many parts, many bushing together at a joint, and sometimes also some growing scatteredly upon the stalkes, smelling somewhat strong like unto Rosen; the flowers are very small, and of a pale yellow colour growing from the joynts of the stalkes, all along among the leaves, after which come small long, and round heades: the roote is small and woodily perishing every yeare.

2. *Chamæpitys altera prior.* The sweete Ground Pine.

This other Ground pine is also a small herbe, growing up with many hairy and hoary white slender branches, not above an hand breadth high, whereon are set many small long leaves, yet shorter than the former, hairy also and hoary white set in tufts or bushes, but growing by couples close together all along the stalkes, cut in, or divided into some parts, of a strong but sweeter sent, by much than the former: at the toppes of the branches grow the flowers many together, of a pale yellowish white colour: the roote is somewhat long and fleshy like the roote of Succory or Dandelion, with many fibres thereat, but smaller.

3. *Chamæpitys Austriaca Clusij.* Clusius his Ground Pine of Austria.

This kinde of Ground Pine hath diverse square strong hairy stalkes, a foote long, with many joynts on them, whereat grow two somewhat long and hard leaves, somewhat like unto the next but broader, greene and slimy on the upper side, and somewhat hoary and full of veines on the under side, divided into three or foure parts, or sometimes into more, somewhat hot in taste but not unpleasant, nor of any displeasing sent: from the joynts sprute forth smaller branches, with the like leaves on them but lesse divided, and toward the toppes nothing or all but smooth, and long like unto Rosemary leaves: from the upper joynts and ends of the stalkes and branches stand diverse gaping flowers, like unto Dragmander, of a deepe purple or violet colour, for the most part, but sometimes of a byerly red colour, and sometimes of a bleaker blew, or skie colour, the lower leaves or chappes of the flowers being whitish, spotted with reddish spots: after which come blackish shining somewhat long and couered seedes, foure for the most part inclosed in every of those rough huskes, wherein the flowers stand: where of the roote is composed of many blacke and hard strings, growing somewhat deepe in the ground, and springing a fresh every yeare.

4. *Chamæpitys adulterina seu Pseudo Chamæpitys.* Bastard Ground Pine.

The bastard Ground Pine is a small low bushing herbe, very like unto the common kinde, having small hairy stalkes, set full of long hairy leaves all alongst them, parted into three long parts, of no hot or sharp taste, but an unpleasant bitterish smell, the flowers stand at the joynts with the leaves, at the toppes of the branches, very like unto those of the common Ground Pine, but of a white colour, and somewhat greater: the seede that followeth is grayish, greater than the common and rounder, foure for the most part contained in every huske: the roote is somewhat thicke and white and dieth the Winter.

The Place.

The first is the most common in our land, yet not growing in many other shires there of then *Kent*, as farre as ever I could yet learne: but three of grow eth in many places, from on this side *Dartford* almost to *Sarbritton*, *Chatham* and *Rochester*, and upon *Chatham* downe hard by the Beacon, and halfe a mile from *Rochester* in a field high, a route called *Jessey*. The second is more rare to be found saith *Penn*, who onely saw it on the dry hills

and

1. Chamæpitys, sulfurea Clusij. Clusius his sulfure Ground Pine.

2. Chamæpitys vulgaris sive Ajugo Chamæpitys, or Ground Pine.

and higher meadowes of *Saxony*, but beard it grew also by *Genua*. The third *Clusius* saith he found plentifully a mile and a halfe from *Vienna* in *Austria*, and in other places there abouts. The last *Clusius* saith groweth in unmanured places of *Spaine*.

The Time.

They all flower and give their seede in the Summer moneths.

The Names.

It is called in Greeke χαμαιπίτυς, and in Latine also *Chamæpitys, quasi humilior, vel pinea*, as I said before; it is called also in Latine *Abies* and *Picea*, *ab abiendo* or *piceo*, as *Pinus* doth, but of the most, *ab abscindo pinum*, *Pinus* à *pendendo abortum*, and as *Pilus* saith, *Dictus pinus abortus, & ab eo pix Pinea*: some also, (as it is likely) the Ecclipsis of *Abies*, call it *Pix*, and adde thereto *Arthritica*, or rather *Anthritica*, because of the properties concerning helpe to the gout and other joint aches: the first is generally in these dayes holde by the best to be the true kind of *Pinaster*, and not the first as *Matthiolus* and others make it: the second is *Chamæpitys prima Dodonæi* of *Pena*, and called also *Pinus* for the fents sake, and is the third sort both with *Anthemis* and *Dodonæus*, the third is remembred first by *Clusius*, from whom others call it *Chamæpitys Asiatica*, and *Cupressus* of *Bauhine*, it is most likely to be his *Chamæpitys Asiatica*, mentioned in his *Pinus*, and described in his *Prodromus*. To all also *Clusius* calleth *Pinea Chamæpitys* and *Label Chamæpitys sulfurea*; *Dodonæus* calleth it *Chamæpitys Pinea*, he putteth two figures thereof, whom *Lugdunensis* followeth, the first it is called in *English* Ground Pine, Ground Ivie after the Latine word *Ivia*, and Field Cipresse after the low *Dutch* name *Veldt Cypres*, and lastly not after the *German* name *Fichten apffel*, for which name *Matthiolus* findeth fault with *Tragus*, whole *German* Apothecary he informed him, and saith it is called by the *Germans* at Cologne, or Colen more longer the more lovely, which as *Dod.* and *Label* say, is the more proper name of *Dulcamara*, or sweet Nightshade; it is called of the *Italians Chamæpitys*, and *Ivia*; and of some *Cupressola*, *Pinetta* and *Ivetta*, of the *French Ivette Musquée* and *aratique*; and of the *Arabians Hamapitys* and *Chamapitys*.

The Vertues.

The decoction of Ground Pine drunk, doth wonderfully prevaile against the Iliaque passion, and torsion of any inward paines arising from those diseases of the reines and urine, and is specially good also for the infirmities of the liver and spleene, for it cleanseth the grosse impure blood, and expelleth it, which it doth by urine, and openeth the body, to which purpose they were wont in former times to take galles, wash the powder thereof, and the pulpe of figges: it doth also marvellously helpe all the diseases of the mother, eyther to worke outwardly or outwardly, procuring the courses, expelling the dead child and afterbirth, yea it is held to prevaile against the nine parts, that it is utterly forbidden to women with child, in that it will cause abortment or delivery before the time: It is as powerfull and effectuall also in all the paines and diseases of the joynts, as gout, cramp, sciatica, sciatica and aches, either the decoction of the herbe in wine, taken inwardly or applied outwardly to

for foule sinne together: for which purpose the pilles that are made with the powder of Ground Pine, and of *Hermodactyles*, with *Venice* Turpentine are very effectuall; these pilles also are of a speciall good use for those that have the dropsie, to be continued for some time: the same also is an especiall good helpe for the jaundise, and also for those that have any griping paines in the belly or joynes; or any other the inward parts: it helpeth also all diseases of the braine, proceeding from cold and flegmaticke humors and distillations, as also for the falling sickenesse: it is an especiall remedy for the poison of the Aconites of all sorts, and other poisonfull herbes, as also against the stinging of the Scorpion, and all other venemous creatures; it is a good remedy for a cold cough especially in the beginning, or that is bee not growne inveterate: it procureth also sweate if he bee anointed, saith *Pliny*, but applied like other ludorickes, it is likely to bee more convenient: for all these purposes aforesaid the herbe being tunned up in new drinke, and drunke, is almost as effectuall, but farre more acceptable to weake or dainty stomackes: And the distilled water of the herbe also hath the same effect but more weakely: the conserve of the flowers doth the like, which *Matthiolus* much commendeth against the palsie: the greene herbe or the decoction thereof being applied, dissolveth the hardnesse of the wemans brests, as also all other hard tumors in any other part of the body: the greene herbe also applied, or the juyce thereof with some hony, doth not onely cleanse putride and stinking, foule and malignant and virulent ulcers and sores of all sorts, but bealeth and conglutinateth or soldereth up the lippes of greene wounds in any part also: *Matthiolus* commendeth certaine pilles against the Palsie, which are made in this manner; Take faith he, of Ground Pine, Stœchas, Betony and Rosemary flowers, of each one dram, of Turbith one dram and a halfe, of Agarick two drams, of Colocynthis halfe a dram, of Ginger and Sal gemme of each ten graines, of Rubarbe one dram and a halfe, of Spiknard leaven graines, of the powder called *Hiera picra simplex* halfe an ounce, of *Euphorbium* one dram; let all these be made up into a masse, according to art, with the juice of Ground Pine; (but I would and thinke it more convenient, I am sure more durable, that it be made up into a masse, with a Syrupe made of Hony or Sugar and the juice of the herbe,) for so they will not dry or wax hard so soone, of a dram whereof let nine pilles bee made; and three of them taken by those that are paralitick every night when they goe to bed; and this saith he will give a present and speedy helpe.

CHAP. LXI.

Cochlearia. Spoonewort or Scurvigrasse.

ALthough our English Scurvigrasse groweth plentifully in the salt marshes, in many places of our land, and might therefore be set among the other marish plants, yet because I am to set downe the other sorts, let it also take up place here for companies sake.

1. *Cochlearia vulgaris.* Common Scurvigrasse.

Our ordinary English Scurvigrasse hath many thicke fat leaves, more long then broad, and sometimes longer and narrower, sometimes also smooth on the edges, and other whiles a little

1. *Cochlearia vulgaris.*
Common Scurvigrasse.

2. *Cochlearia major rotundifolia sive Batavorum.*
Dutch or Garden Scurvigrasse.

waved,

Original from UNIVERSITY OF MICHIGAN

waved, but all these formes are to be seene, as also plaine smooth and pointed, & sometimes a little hollowed in the middle, and round pointed, of a sad green colour, & somewhat brownish sometimes, every one standing by it selfe upon a long foote stalke, which is brownish or greenish also, from among which rise small slender stalkes, bearing a few leaves thereon like the other, but longer and lesser for the most part; at the tops whereof grow many whitish flowers, with yellow threds in the middle; standing about a greene head, which becommeth the seed vessell, which will be somewhat flat when it is ripe, very like unto some of the kinds of *Thlaspi* or Treacle Mustard, wherein is contained reddish seede, tasting somewhat hot: the roote is made of many white strings, which sticke deepely in the middle, wherein it chiefly delighteth, yet will it well abide in the more upland and drier grounds, and taketh a little brackish or saltish even there, but nothing so much as where it hath the salt water to feed upon.

2. *Cochlearia major rotundifolia sive Batavorum.* The great Dutch or Garden Scurvigrasse.

This Dutch or Garden Scurvigrasse (which is most knowne and frequent in gardens) hath divers fresh green and almost round leaves rising from the roote, nothing so thicke as the former, yet in some places, as in very strong dunged ground, very large, even twice so bigge as in others, nothing at all dented about the edges, nor with any sensible hollownesse, perceived in the middle, every one also standing upon a long hoarie stalke; but among these rise up divers long slender weake stalkes, higher then the former, and with more store of small white flowers, at the tops of them, which turne into smaller pods, and smaller brownish seede then the former: the roote is white, small and threddy: the tast of this is nothing salt at all, but hath an hot aromaticall taste almost like spice.

3. *Cochlearia minor rotundifolia,* Small Dutch Scurvigrasse.

This small Scurvigrasse groweth like the last, with many small roundish leaves, sometimes a little crumpled on the edges, not bigger then the nayle of ones little finger, every one upon his owne foote stalke, which rise in the winter if it be sowed before winter, or else it rise from its owne sowing; otherwise if it bee sowed in the spring, it shooteth forth divers long slender stalkes lying on the ground a foote long or better, whereon grow such like small round leaves, very thinly set up to the tops, whereon doe stand many small white flowers, like the last, but much smaller, according to the proportion of the plant, with small seede answerable thereunto: the roote is very small consisting of a few fibres, which perish as soone as it hath perfected the seede, and so spring up againe in the same place where it doth shed its seede; for doe what you can almost, if you will save any ripe seede, there will be some shed before you can gather it.

4. *Cochlearia minima rotundifolia,* The least Scurvigrasse.

The least Scurvigrasse is in all things like the last, but that it is much lesser, not growing above three or foure inches long, but lying upon the ground like *Herniaria* or *Polygonum*: Bauhine in his *Prodromus* setteth down another small one, as though it differed from this last, which therefore he calleth *erecta* upright, when as I observed no other differences, and therefore I thinke may be the very same growing in another place.

The Place.

The first groweth all along the Thames side, on both the *Essex* and *Kentish* shore, from *Woolwich* where brackish Sea water is felt, round about the Seacoasts even to *Dover*, as also from *Dover*, round about the coast to *Portsmouth*, and even to *Bristow* where it is had in plenty: but I have not heard by any that it groweth in Northern coasts at all: But the other with round leaves groweth in the marshes in *Holland* in *Zealand*, as also in the Low Countries *Holland*, as also in the other places of *Lincolnshire* by the Sea side and thereabout, as I have seen also found growing upon *Faulconbrough* hill in *Lincolnshire*, affoorded me by a worthy Gentlewoman Mistresse *Tunstall*, remembred in my former booke for many things, found growing in those parts by her selfe, which were not knowne to be growing in England, and thereof shee sent me up some for a present from the south: I heare also that it groweth nigh unto a Castle in the Peake of *Derbishire*, which is not farre off, at the least from the Sea, and that the late Earle of *Rutland* and divers other personages of good note, have brought from thence for their owne use; it prospereth well in Gardens being sowen in some moist and shadowed places, and yet it will endure the Sunne also: many in many upland countries of this land, doe use to sow good quantities thereof, for their owne spending, or to make profit thereof to sell unto others: the smaller sorts have beene brought unto us from *Denmarke*, where they grow in an Iland called *Hoveen*.

The Time.

They all flower betimes even in *Aprill* oftentimes and in *May*, and give their ripe seede quickly after.

The Names.

It is thought that none of these were knowne unto any of the ancient Greeke or Latine writers. For some doe imagine it to be the *Britannica* that *Pliny* maketh mention of in his 22. and 5. Chapter, where *Cæsar Germanicus* his Souldiers were cured of the disease that raigned amongst them, called by the Dutch *Stomatice* and *Scelerotyrbe*, in plaine English the Scurvey; (which is a disease incident and more frequent those that are at Sea, then that live upon the land, but yet many have it that never went thither, or neere the sea.) which *Pliny* describeth to have a blackish leafe somewhat long and a blacke roote, &c. which I like likely he taketh from *Dioscorides* his *Britannica*, whom *Galen* also followeth, saying it hath leaves like Docke, but hairy, and a small roote: *Gesner* also taketh it to be *Britannica*, yet assuredly this our *Cochlearia* you may well perceive by comparing them cannot be *Britannica*: it is so called from the forme of a shell, round as well as hollow, we call them most commonly Scurvigrasse, and not sooner were the Latine writers to distinguish them, call the one English, the other Dutch Scurvigrasse: *Lacuna* tooke the second leafe for *Telephium*: the *Germans* call it *Leffelkraut*, the Low countrymen *Lepelcruyd*, and the *French* men *cuillier*.

The Vertues.

The *English* Scurvigrasse is more used for the salt taste it beareth which doth somewhat warme and sharpen, the *Dutch* Scurvigrasse is of better effect, and chiefly used, if it may be had by those that have the Scurvey, generally also to purge and cleanse the blood, the liver and the spleene; for all which diseases it is very singular good to be taken by taking the juyce in the spring, every morning, falling in a cup of drinke; the decoction is good to the same purpose, and the herbe tunned up in new drinke, either by it selfe, or with other things. For it openeth the

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

tions and evacuateth cold distempered and pleguatick humors, both from the liver the seate of blood, and the spleene, wasting and consuming both the swelling and hardnesse thereof, and thereby bringing to the body a more lively colour: the juyce also helpeth all foule ulcers and sores in the mouth, if it be often gargled therewith, and used outwardly doth cleanse the skinne from spots, markes or scarres that happen therein: the conserve made of the leaves thereof, I meane the round leafed kind, is a fine delicate medecine for weake and tender stomackes, and worketh to the same effect, although a little slowly.

CHAP. LXII.

Fumaria. Fumiterrie.

There are diverse kinds of *Fumiteries*, as they shall be declared by and by: but there are accounted as kindes thereof, the *Fumaria bulbosa*, or *Radix Cava*, whereof I have set forth all the sorts in my former booke: I will therefore here only give you some figures of the same without further declaration; yet of such of late kindes as we have received from *Canada*, one which shall here set forth accordingly.

1. *Fumaria vulgaris.* Common Fumiterrie.

Our common fumiterry is a tender sappy herbe, sending forth from one square slender weake stalke, and leaning downeward on all sides, many branches two or three foote long, with finely cut and jagged leaves, of a whitish or rather blewish greene colour, some what like unto Coriander leaves: at the toppes of the branches stand many small flowers, one above another, made like little birdes, of a reddish purple colour, with whitish bellies: after which come small round huskes, containing small blackish seedes: the roote is yellow, small and not very long, full of juyce while it is greene, but quickly perishing with the ripe seede. In the cornefields of *Cornwall* this beareth white flowers.

Contenta.

2. *Fumaria vulgaris flore tenuifolio.* Fine leafed Fumiterrie.

This small Fumiterry is growen not so high but more upright than the former, with slender square stalkes, whose lowest leaves are very like unto those of the former Fumiterry, & of the same colour but smaller, but those that grow above upon the stalke, are smaller and finer cut in, and the higher the finer and smaller, the highest even as small as Fennell leaves: the flowers grow in the same manner that the other doe, but rather more store together, of a deeper reddish purple colour, mixed with white and yellow, the seede and roote is small and white, but like the former: this is not altogether so bitter, but more sharpe than the other.

3. *Fumaria nasturtii effigie.* Candie Fumiterry.

This Candy fumiterry groweth with crooked bowing square stalkes, like the common, and of the same

3. *Fumaria vulgaris & tenuifolia.*
Common smale-leafed Fumiterrie.

4. *Fumaria lutea montana.*
Yellow Fumiterrie.

heighe,

6. Fumaria lutea alba.
Climing Fumitory.

8. Radix Cava viridiflora.
Hollow roote with a greene flower.

7. Fumaria tuberosa flore viridi.
Round rooted Fumitory with greene flowers.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

leaves are many cut in and divided as the last, and of the same colour, but somewhat broader, and more pointed: the flowers at the tops of the branches are like the other but lesse, and of a white colour, tainted with a purple spot: the seede and roote differ not from the former.

4. *Fumaria lutea.* Yellow Fumitorie.

This yellow Fumitory groweth like the other Fumitories, about a foote high, with many leaves like unto the common Fumitory, or like unto those of the *Fumaria bulbosa*, or Ramping Corydalis, the bottom roote but smaller: the stalke blew and greene colour with them: the flowers are yellow and in some places white, and grow at the tops of the branches like the other, in forme of little birdes as *Matthiolus* saith: their seede (London and Paris, but *Lobel* and *Lugdunensis* say they are flerre fashion, like unto the *Fumaria Bulbosa*, or Ramping Fumitory) are like unto the other, and yet both of them give the figures of *Matthiolus*, with the leaves of common Fumitory: five little pikes, and not flerre fashion like the Pilewort: after the flowers are past come small horned or long pods, like unto the *Chelidonium majus*, or Rankle corne, but lesser, wherein is contained small shining greene and round, and somewhat flattish seede: the roote is compacted of many white long strings, and tender fibres, bolning knobs together, which perisheth not as the former, but abideth many yeares, shooting forth new stalkes the old ones alwayes perishing.

5. *Fumaria filipendulæ folio.* Indian Fumitorie.

The stalke hereof riseth to the height of a foote high, the leaves are in forme and colour like the ordinary or the tall Fumitory, ending in greene all the winter: the flowers grow like fashion at the tops of the stalke, formed like those at the Hollow roote, whose bellies are bluish and mouthes gold in part yellow: the seede is contained in crooked long pods, being rough, harrish and yellowish: the roote is thicke and bitter, the whole plant is more bitter than the ordinary, and the leaves more effectuall.

6. *Fumaria scandens tuberosa.* Climing Fumitorie.

The climing Fumitorie riseth up with small slender stalkes, not able to sustaine themselves, but are holden fould by certaine small tendrels, or tenders growing at the ends of the smaller branches, as any thing that standeth high unto it, whereby it climeth upon the hedges or other bushes, it sendeth forth diverse stalkes or small twigs, set two or three together, not dented or divided on the edges at all, of a blewish greene colour, very like unto Fumitory: at the joynts likewise of the small branches come forth many small whitish flowers, tipt with purple, set together nothing like the former, but made like small long hollow bodies of high flowers, ending in five small points, after which come small seede couched in small broad husks or pods: the roote is small and long, shooting downe deepe into the ground, and abideth the winter, shooting forth new branches, for the old perish every yeare.

7. *Fumaria tuberosa flore viridi.* Bulbous Fumitory with a greene flower.

This hath diverse greene stalkes, with such like leaves thereon as the small Hollow roote hath, but somewhat longer and greater: at the toppes of the stalkes stand small greenish flowers set in small greene leaves: in all places with simple small greene leaves set under them the roote is two or three times bigger than the roote of the small *Lutea Fabaria rotunda*, but yellow like unto it, and the stalkes and leaves and flowers, perishing as quickly with them.

8. *Fumaria tuberosa Americana.*
Knobbed Indian Fumitory.

This kinde of Fumitorie hath two small round solide knees like knuckles, with diverse small fibres thereat, from betweene which riseth up a stalke of finely winged leaves, two set together at a joint, severally divided, and so finely cut that they almost resemble Juniper leaves, of a blewish greene colour: the flowers have sundry colours in them, but supposed of some to be but white, it is almost without cutter lent or fable.

3. Fumaria longo racemo Americana flagellis. 9. Et Italica Anetolana.
Indian Fumitorie. Knobbed Indian Fumitorie.

The Place.

The first groweth as well in the corne fields, almost every where, as in gardens also, and that with white flowers in *Cornwall* in their corne fields. The second groweth in the fields of *Sussex* in many places, as also in the fields and vines at *Stanmore*, *Hampton*, and in other places also. The third groweth in *Kent* from whence *Lobel* had the seede. The fourth groweth in the vales in *Cumber* and *Lancaster*, in the North parts of *England*, and in many other places in *England* that we know also. The fift groweth in *England* also, but the place not set down called *Corydalis*. Finally the tedge sides, and stony banks, in some places of *Bohemia*, in the low Countries, and about *Rome*, *Florence*, and *Montpelier* in *France*, it is found about *Naples* with a yel-

low

low ſt, wet, as it is reported: the fourth is found likewiſe in the woods of *Germany*: and the laſt in *Apulia* or the *Weſt Indies*.

The Time.

They all flower early even in May for the moſt part yet the yellow flowreth much later, as many times not till Auguſt, and their ſeede ripeneth ſhortly after.

The Names.

It is called in Greeke καπνος and κνεωρος, *Capnos* and *Capnion*, *quaſi fumus, ex quod ſuccus ejus lachrymationem parat inſtar fumi, & exhilarationem oculis affert*, in Latine *Fumaria* & *Fumus Terræ*: of the *Arabians Aſchenegi*: of the *Italians Fumiterre* and *Fumoſtano*: of the *Spaniards Palomera*: of the *French Fumeterre*: of the *Germans Erdrauch* and *Dunben Kropf* as *Tragus* ſaith, and of the *Dutch Grotten* and *Duyve Kervel*. The firſt is of all Authors called *Fumaria* or *Capnos Fumaria* of *Lobel*. The ſecond is called *Fumaria minor*, or *bulboſa*, to diſtinguiſh it from the other. The third is remembred by *Cluſius* by the ſame in the rule, and it may be alſo the *Syriaca* of *Camerarius*. The fourth is called *Fumaria Corydalis* of *Matthiolus*, and of ſome as he ſaith *Sphin* of *Geſner* and *Tabernæmontanus Fumaria montana* of *Lobel*. *Fumaria lutea minor*, who taketh it alſo to be *Chelidonium capitis* of *Ætius*, of *Camerarius* and *Anguillara Corydalis*, of *Cæſalpinus Sphin altera*, and *Solis Illirici* or *Solisequia herba* of others. The fifth hath its name in the title, reckoned a kind of the fourth. The ſixt is called *Capnos* of *Lobel*, who ſaith it is alſo called of ſome *Aphana*, of *Dioſcorides* it is thought to be the ſixth *Capnos Plinij*, which hee ſaith was called in his time *Solſequium*, and ſaith alſo that ſome called it *Corydalis*, and *Sphin*; and the common ſort *Corydalium*, but it is alſo *Fumaria altera*, and *Capnos phœnicites*, as *Geſner* doth alſo: but divers of the beſt moderne Herbariſts doe rather thinke that the *Radix Cava* is the *Capnos prior Plinij* then this; *Camerarius Fumaria Clusij*, or *Bauhinus Fumaria flaccida minor*, and is his ſixt *Fumaria*, and yet is the ſame with his ſecond, if there be any error and a letter ſo ſome doe ſet it downe. The ſeventh is the *Radix Cava viridi flore* of *Lobel*, which although *Bauhinus* thought it to be referred to the *Radix Cava* as a ſort thereof, yet the roote ſheweth it to belong to the *Capnos tuberoſa radice*, and ſo both his deſcription and the title which afterward he amended do declare it. *Avicenna* call it *Schahtereg*, and *Schaterreg*. The *Italians Fumoſtano*; the *Spaniards Palamilla*; the *French Fumeterre*; the *Germans Erdrauch* and *Katzenkrel*; the *Dutch Erdreoel* and *Duyvekervel*.

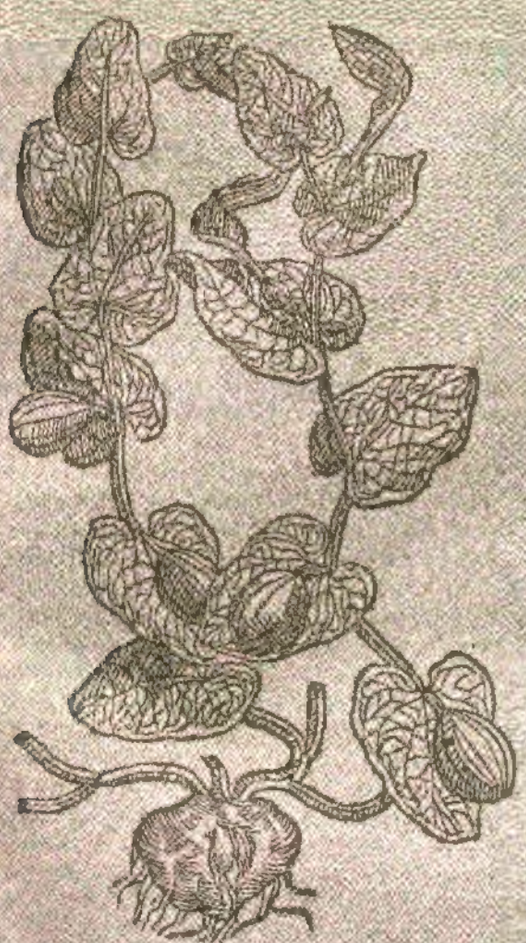
The Vertues.

y the bitterneſſe of common *Fumitory*, (it is by diverſe of the beſt moderne Writers held to be hot, and cold, as diverſe others from the *Arabians* have ſet downe) and ſharpneſſe joyned therewith, it deſtroyeth cleanſe, and by the ſaltneſſe doth ſtrengthen and binde after the cleanſing. The juyce or ſyrupe made thereof, the decoction made in whaye by it ſelfe, with ſome other purging or opening herbes and rootes, to ſtirre worke the better, is ſelfe being but weake, is very effectuall for the liver and ſpleene, opening the obſtructions and clarifying the bloud from ſalt ſith choleriſke and aduſt humors, which is the cauſe of the lepry, ſcabbes, ſcurfes, and itches, and other ſuch like breakings out in the skinne, and after the purging doth ſtrengthen all the inward parts, not leaving any evill qualitie behind it, and therefore is reckoned a moſt ſafe remedy againſt all diſeaſe that riſe from thoſe humors, or from obſtructions that are the cauſe of choleriske and putride fevers: the ſame is good alſo for the jaundiſe, and ſpendeth it by the urine, which it procureth in abundance, as *Tragus* ſaith. The juyce thereof ſaith *Tragus* and the pouder of the roote of *Eſula* prepared in equall proportion, to is a dramme provoketh vomiting where there is cauſe, being taken in warme water and cureth the ſ given becauſe it is ſomewhat windie it is good to mix aniſeede and fennelſeede with it: the pouder of the drie herbe given for ſome time together, hath cured a melancholy perſon as *Braſſavola* ſaith, but the ſeede is the beſt operation for all the purpoſes aforeſaid. The diſtilled water of the herbe is much uſed alſo, and thought to do good effect in all the former diſeaſes; and beſide, as *Tragus* ſaith conduceth much againſt the Plague or peſtilence, being taken with good treakle, which it driveth forth by ſweate: the ſame water alſo with a little ſugar and honey of Roſes, helpeth all the ſores in the mouth and throate, being gargled often therewith: the water dropped into the eyes cleareth the ſight; and taketh away the rednes and other defects in them although it doe cauſe ſome paine for the preſent, and bringeth forth water or teares: *Dioſcorides* ſaith that it hindereth any haire ſpringing of the haires on the eye liddes, if after they be pulled away the eye browes be anointed with oyle that hath Gun Arabeck diſſolved in it; the juyce of *Fumitory* and of Docks mingled with vinegar, and the eyes gently waſhed or wet therewith, cureth all ſores of ſcabbes, itches, wheales, pimples or puſhes that are in the face or hands, or in any other part of the skinne of the body. The leſſer or fine leafed *Fumitory* and the climing *Fumitory* worke to the ſame purpoſes but more weakely: the yellow *Fumitory* is alſo effectuall in moſt of the diſeaſes aforeſaid, and beſides that it provoketh urine abundantly: it is very effectuall for choleike taken greene or dry in wine for many dayes. Thoſe *Fumitories* with hollow and trime rootes are of them effectuall, both againſt poiſon and the peſtilence being made into pouder and drunke, and alſo againſt palſy laid to ſweate: the ſame alſo provoketh urine and helpeth the jaundiſe: the ſeede being braied and drunke helpeth fluxes and laskes: the rootes are alſo ſingular good to heale and drie up putrid and running wounds.

Chap. LXIII.

Ariſtolochia. Birthwort.

Although divers doe thinke that none of the *Ariſtolochia's* or Birthworts doe purge opening at all, yet becauſe *Meſues* the great *Arabian* Phyſitian, numbreth it among his purging plants, *Dodonæus* doth in the ſame manner: I thinke it not amiſſe to doe ſo likewiſe. Of theſe Birthworts *Dioſcorides* and *Galen* have onely made three ſorts, which are the round, the long, and the ſmall Birthworts. *Pliny* hath added a fourth, which he calleth *Piſtolochia*, or *Polyrrhizos*, of which there are ſome differences obſerved in theſe latter dayes, which ſhall be declared in this Chapter.



1. *Ariſtolochia rotunda vulgatior*. The more ordinary round rooted Birthwort.

This round rooted Birthwort, ſendeth forth diverſe long trayling ſquare ſtalkes, ſometimes halfe a yard

or better, not able to ſtand upright, but lie or leane downe to the ground, with few or no branches iſſuing from them, but with many round yellowiſh greene leaves full of veines ſtanding at diſtances without order, one beyond the other, every one upon a ſhort foote-talk; at every ioynt with the leaves, from the middle of theſe ſtalkes upwards to the top commeth forth one long hollow flower ſpeece, ſmaller at the bottome, broader at the top, with a long peece or flipper as it were, at one ſide of the top, bending downe both of them of a deadiſh yellow or ſomewhat browniſh colour, and ſomewhat blackiſh purple on the inſide: this flower *Dioſcorides* compareth to a cap or hood, which as it ſhould ſeeme was their faſhion in his time. After the flowers are paſt come in their places ſmall round and ſomewhat long fruite of diverſe ſizes, ſome as bigge as a Wallnut without the ſhell, ſome as bigge as it is with the outward greene ſhell, and ſome leſſer than both, which when it is ripe openeth into three parts, ſhewing the ſeede lying in order within it, ſeparated by certaine skinnes ſomewhat flat and round: the roote is tuberous, bouched out diverſly, of a darke or ſwart colour on the outſide, and more yellow within.

1. *Ariſtolochia rotunda vulgatior.* Round rooted Birthwort.

2. *Ariſtolochia longa vera.* The true long rooted Birthwort.

3. *Ariſtolochia Clematitis.* The running rooted Birthwort.

2. *Aristolochia rotunda altera.* Another round rooted Birthwort.

This other Birthwort is like the former for the manner of growing, but the stalkes are more and shorter, the leaves are somewhat greater and have each stronger foote stalke, the flowers are of a pale or whitish purple on the outside, and browne on the inside, with a few haires set therein, scarce to be discerned as is small to all sorts: the fruite is somewhat longer and yeare fashion, more pointed at the end: the seede is flat, somewhat like unto the seede and seed-vessell of Rue: the roote is like the other, but a little yellower.

3. *Aristolochia longa vera.* The true long rooted Birthwort.

The long rooted Birthwort is so like unto the round, that it is very hard for one not throughly exercised in the knowledge of both to distinguish them: the chiefe differences be these, the stalke is shorter, the leaves smaller, harder and paler, the flowers are more whitish and greenish, but like in forme, the fruite is somewhat long like a peare, somewhat like the other, or tall round rooted Birthwort, but not so much pointed: the seede differeth not, but the roote hereof is long and not round or taberous like the other, as bigge as a mans wrist sometimes or bigger, but most usually lesse, of halfe a foote or a foote in length sometimes.

4. *Aristolochia longa Hispanica.* The Spanish long Birthwort.

This Spanish kinde differeth very little from the last recited long rooted Birthwort for in the flower and roote is the onely difference to be observed; the flower in this is somewhat more purple, both the flipper or eare, and the inner side of the toppe of the flower: the roote likewise is shorter for the most part, and blunter at the lower end, or nothing so much pointed.

5. *Aristolochia Clematitis.* The running rooted Birthwort.

The running rooted Birthwort, groweth with longer, stronger and rounder stalkes than the former, even three or foure foote long, branched oftentimes like the long rooted kind, whereon grow much larger and broader leaves, and of a paler greene colour, then any of the other: at the joynts with the leaves come forth the flowers as the other sorts doe, but whereas none of them bring above one flower at a joynt, this bringeth three or foure like unto the rest for forme, but of a pale greene colour like the long: the fruite hereof likewise is greater then any of the other, as the seede is likewise: the roote hereof hath a stronger sweete sent then any of the former, and is smaller, of the bignesse of the bigger rootes of *Asparagus*, many growing from one head, and running very farre under ground, and springing up againe in many places, of so enduring a nature as Couch grasse almost, for if never so little a peece, be left in the ground as broken off from the reste, that is taken up, it will shoote forth leaves, and there grow againe, so that oftentimes it becommeth no lesse a plague to ground than a couch, or any other such like running or creeping herbe.

6. *Aristolochia Clematitis Betica.* Spanish Climing Birthwort.

The Spanish climing Birthwort, hath diverse small long twining branches, spreading into many other sorte ones, running upon small trees and hedge bushes, winding themselves very much about them, like unto the greater Bindweedes, or like unto Hoppes, and often creeping them, whereon doe grow severall leaves, on long footestalkes, being round and broad, somewhat like unto the Scammony of *Dampelus*, or unto the one Birthworts, but sharper pointed, smooth and greene on the upperside, and of a whitish purple underneath: the flowers stand singly at the joynt, as the former sorts, and not as the last, having the longest footestalkes, of the same forme, but of a red or darke purple colour and hairy on the inside; the fruite is as great as the last, and so is the seede, but openeth it selfe, at the lower end contrary to all the former sorts: the roote runneth by the ground like the rough Bindweede, whereunto it is very like, of a pale whitish colour on the outside, and the bignesse of the last, of nothing so strong a sent as the former, and of no unpleasant, but of a sharpe and an astringent taste.

7. *Pistolochia vulgaris.*
The lesse roote Birthwort.

8. *Pistolochia Cretica semper virens.* Ever greene bushie rooted Birthwort.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd

Original from UNIVERSITY OF MICHIGAN

3. *Aristolochia rotunda.* The bulby rooted Birthwort.

The bulby rooted Birthwort hath many slender long branched stalkes, a foote long or more, streaked and couered as both the long and the round, whereon grow at distances as in the former, diuerse round leaues smaller, rougher, and blacker than the long, whereunto it is not like, but a little waued as it were about the edges: the flowers also are very like them, but in some very darke, and in others of a greenish yellow colour: the seede is round and somewhat long, and round at the end or point like vnto the fruite of the fifth round kinde but smaller, which openeth it selfe also as the last before doth at the bottome next vnto the stalke, and sheweth such like seede within but smaller: the roote is many, and small, bigger then bullrushes for the most part, shooting from one head with many small fibres thereto, of a yellowish colour as all the rest are: this foileth the leaues in winter as all the former doe.

4. *Aristolochia Creticalonga viuens.* Ever greene bushie rooted Birthwort of *Candy*.

The ever greene bushie rooted Birthwort of *Candy*, sendeth forth many very slender flexible and trayling cornered stalkes, branching into diuerse other smaller, about a foote long or better, and of a sad greene colour, whereon are set round leaues long pointed, full of veines, but lesser than the former, and of a sad greene colour, abiding all the winter: the flowers are like vnto those of the long kinde, standing vpon long foote stalkes, of a very sad red colour on the outside and yellowish within: the fruite and seede is smaller than in any other: the roote likewise are like the last but smaller, and smelling somewhat sweet.

The Place.

The three last more ordinary kinde grow as well in *Narbone* and *Prouence* in *France*, about *Montpelier* in the fields and vineyards, especially the running kinde, that it maketh their wine, where it is frequent, to rellish there of, as also in *Spaine* and *Italy*: the other three that are like vnto them, *Clusius* saith he found in *Spaine* in diuerse places: and *Hamilius Belus* saith in *Candy* also, in his last Epistle to *Clusius*, and *Petrus Bellonius* in his 3. booke of obseruations and 17. chap. doth also. The seaventh groweth in the stony Olive yards of *Prouence* and *Spaine*, and the last in *Candy*.

The Time.

These doe not flower with vs vntill the middle or end of *July*, and their fruit doth hardly ripen before the winter, yet in the warmer countries they flower and seede early: some of these doe flower much later with vs, if with all the care we can vse vnto them, we can preserve them in the winter, as both the forts of long rooted and bully rooted kinds, for the other are more hardy.

The Names.

It is called in Greek ἀριστολοχία quasi ἄριστα λοχεύουσα, *i. prima parturiens*, but not *prægnantibus* as *Pliny* hath it, it is good to helpe women that are ready to be deliuered, and that are deliuered, and not those that are with child, not ready to be deliuered, for in such it may cause abortment, or deliuery before the time: In former times, when ignorance had laid in a cloud all sorts of learning and knowledge, from all our Climatian world, many false herbes were obtruded for the right, and in those errours many lyed and dyed: but the industry of this last age hath lesse ned out, found and detected many, and among others this of *Aristolochia*: many taking the *Rotunda Dioscoridis* to be it, and the *maior* to be the *Pistolochia* of *Pliny*, but all now by the light and knowledge of the true are ashamed that any such errour should at any time creepe in among wise men. There is also some controuersie among the later authors, which should be the *Aristolochia Clematitis* of *Dioscorides*: the Apothecaries of *Italy* in and before *Matthiolus* his time, vsed this roote of *Aristolochia Clematitis* in stead of the true long Birthwort, not knowing either the true long or that vsed their *longa* was *Dioscorides* his *Clematitis*: *Fuchsius* and others found out this errour, wrote against it, and shewed that is was not the long one of *Dioscorides*, but his *Clematis*; but *Matthiolus* contendeth against them with many words, both for it, and because they found fault with the rest in *Dioscorides*, who saith that *Aristolochia Clematitis* hath slender brakches, somewhat round leaues like vnto Houseleeke, and the flowers of Rue: The Greeke words ἀριστολοχία κλήματίς ἐστι παρόμοιον ἔχουσα τὸ φύλλον τῷ πεπερεῖ, and they thought it should be rather ὅμοιον γὰρ ἐστι τὸ φύλλον ἀσάρῳ παρόμοιον, because the *Aristolochia Clematitis* hath round leaues like *Asarum*: but *Matthiolus* in shewing that the words are the same that *Dioscorides* hath also who wrote the same that *Dioscorides* did, as also that *Serapio* and *Auicen* haue the same words, and that therefore the text is not corrupted, would thereupon conclude, that the *Aristolochia longa*, then vsed in the Apothecaries shops, could not bee *Dioscorides* his *Clematitis*, and the rather, because the flowers of his *Clematitis* are like Rue, which those of the *Aristolochia longa* are nothing like, againe he saith the roote are small, longer then the other, and haue a thicke barke that couereth them, but the longe *Aristolochia* of the shops hath a thinne rinde as all know, that haue seene it: yet *Matthiolus* is forced to grant, that the *Aristolochia longa*, that was vsed in the Apothecaries shops, was not the same *Aristolochia longa*, that *Dioscorides* maketh mention of, how then could he not perceiue it not to be his *Clematitis*, when he had set forth both the long and the round, and knew that the *Aristolochia longa* of the shops, was like vnto the other two sorts, but differing in roote only from them: but saith he, he thinketh it might be the *Pistolochia* of *Pliny*, or a *species* of that kind of long, whereof no mention is made by the ancient writers, yet how far from likelihood these words of *Matthiolus* are, for others, I direct but allredy the rest of *Dioscorides*, and to likewise of those that haue followed him, cannot be exempt from blemish, or else neither we, neither any before vs, haue or know *Dioscorides* his *Aristolochia Clematitis*: for he in describing the three kinds of *Aristolochia*, maketh the two former to agree in leafe, flower and fruit, and to differ onely in the roote, whereunto all doe agree, but in declaring the *Clematitis*, he letteth downe the leafe and flower, to be Rue like, differing, but therewith not what fruit it beareth, yet maketh it agree with the other two in properties, although lesse forcible: but seeing there is another herbe knowne to be so like the other two *Aristolochias*, and to differ in nothing from them, in nature, as in the roote, which is sweete, small and longer then any of the other, as *Dioscorides* maketh his *Clematitis* to bee, and the very name *Clematitis* answerable to the plant, what should let it to be the right, and indeede it is so accounted of all now a dayes without doubt or question, notwithstanding the error of *Dioscorides*; as also that their *Aristolochia longa* of former times, according to *Lonicerus* iudgement, and those Monkes, that commented vpon *Mesues*, is *Dioscorides* his *Clematitis*: Another doubt there is in like sort of late dayes, what *Aristolochia* was ment by *Andromachus* senior, that he appointeth to be put into his *Theriaca*, for his elegiack verses maketh no distinction: and because *Galen* doth shew in *secundo alimentorum*

alimentorum that *Andromachus junior*, *Andromachi senior* his son, in setting downe his fathers *Theriaca* in prose doth explaine divers things, that were doubtfull in his verse, as for the *Mel Gecropicum* he expresseth it *Mel Atticum*, for *Centaurium* without difference either of greater or lesser, he setteth downe the leaves, and for *Aristolochia* which was left indefinite, he setteth downe *longa vel rotunda*, the small. Now here lyeth the doubt, what *Aristolochia Andromachus* and *Galen* should meane, by this *longa vel rotunda*. *Matthiolus* seemeth to answer this doubt, in shewing that they would not meane any other *Aristolochia* then the *Clematitis*, because they mention but three sorts and this *Clematitis* is the smallest roote of the other, and that the *rotunda Aristolochia*, is not the Long of *Dioscorides*, whose rootes he saith were of the thicknesse of a finger; when as of the true Long none are found so small unlesse they be very young rootes, nor yet any other different kind from the *Clematitis*, as divers all thinke; and yet *Galen in lib. 6. simp. med.* in setting downe the properties of all the three sorts of *Aristolochia*, commendeth the round as most excellent, and of most subtill parts, and to all purposes more effectuall then both the other: the Long he saith is nothing so subtill, or of so thin parts, but is more hot and cleansing; and of the *Clematitis* he saith onely that it is sweeter in smell then the other two, and therefore is more used in sweete ointments then otherwise, and is more weake for medicines, or the cure of any disease; why therefore the *Clematitis* should be taken for *Andromachus* Treacle with our Apothecaries I doe somewhat admire, seeing *Galen* saith that the others are more effectuall for all purposes. The severall appellations of authors of these *Aristolochias* are not to divers, that they needs any long repetition, for they all as it were agree together, the variation being so small, that it is not worthy the reciting; onely I will shew you how *Bauhinus* in his *Pinace* doth distinguish them severally differing from the titles I give them; the first here set forth, he calleth *Aristolochia rotunda flore ex purpura nigro*: the second he calleth *Aristolochia rotunda flore ex albo purpurascente*: the third hee calleth *Aristolochia longa vera*: the fourth *Aristolochia longa Hispanica*: the fift *Aristolochia Clematitis recta*: the sixt *Aristolochia Clematitis serpens*: The seventh *Aristolochia Pistolochia dicta* (and to *Aristolochia Polyrrhiza* of *Lobel* and *Pliny*) the last he calleth *Pistolochia Cretica*. The *Arabians* call it *Zaranad Mustnera* and *Zarcanda*, *Italians Aristologia*, the *Spaniards Astronomia*, the *French Serapine* and *Fuserne*, the *Germans Osterlucy* or *Hasenwurtz*: the *Dutchmen Osterlucye* and *Haesenwruyt*.

The Vertues.

Galen, lib. 6. simpl. med. as I shewed you before sheweth the severall properties of these *Aristolochias*, & roote saith he of *Aristolochia* is of most use for medicines, being bitter and somewhat sharpe, the round is the most subtill of them all, and of more effect for all diseases; that which is called *Clematitis* is sweeter in smell then the other two, and therefore those that make sweete ointments, doe use it in their ointments, but it is of less force and vertue in the curing of any disease; the Long hath lesse tenuity of parts in it, then the round, but is not without efficacy, for it hath a cleansing and heating power therein, yet it cleanseth and digesteth lesse then the round, but healeth no lesse, yea peradventure more, and therefore the long is of more use, for to be have needs of a meane cleansing in the tuberous swellings of the flesh, and in fomentations of the mother, & where there is needs of a stronger extenuating facultie, there the round is of more use: and therefore the rote Birthwort, doth more helpe to cure those greefes and diseases, that rise from the obstruction or abundance & grossenesse of raw and windy humors: it drawes forth thornes, and splinters, &c. out of the flesh, it heales all putrefactions, it cleanseth and maketh sound foule and filthy Vlcers, it cleanseth the gums, and the teeth, & maketh them white; it is profitable for those that are troubled with the shortnesse of breath, with the Iliacke, with the Falling sicknesse, or with the Gout, if it be drunke with water, (or wine rather) as also for those are burstlen or are troubled with Crampes or Convulsions, or shrinkings of the sinewes and veines, and is profitable as any other medicine whatsoever: and thus farre are the words of *Galen*, in the place before noted. *Mesues, Paulus Ægineta* and *Actius* do shew the purging qualitie therein, which *Dioscorides* and *Galen* like knew not (as in *Rubarb*) or past it over in silence, who saith, that the roote either of the round or running Birthwort, doth purge downeward flegmaticke and choleracke humors also; it cleanseth the lunges and the parts of the breast, from the toughnesse and rottennesse of humors; whereof a plaine demonstration is, that it helpeth those that are flegmaticke or short winded very much: if it be taken inwardly or applyed outwardly to the place, mightily draweth downe womens courses, expelleth the dead child and afterbirth, and in the paines of labour hath very good effect to cause the more speedy ease and delivery, and to cleare the parts, of what is annexed: the roote in pouder taken with Myrrhe & Pepper in wine, is used also for the same purpose, it resisteth poysons of sorts, the long resisteth the venome of Serpents, and other living creatures, the round resisteth all other kind of poyson: but *Pliny* inverteth this order: the roote of the round being taken in water, helpeth those that are troubled by falls, blowes, &c. as also the paines of the sides; the running Birthwort helpeth the falling downe of the mother, being either applyed in pessarie or in fume, and the place bathed with the decoction: it is found by experience in *Spaine* that the rootes of the Spanish running Birthwort with no lesse good successe, then the rootes of *Sarsaparilla*, to all the uses whereunto the *Sarsa* serveth: the distilled water of the green leaves & new in flower is profitable for all the diseases aforesaid, and in especiall preserveth from the Plague, & especiall good remedy for the winde collicke: the *Pistolochia* or bushy rooted Birthwort, is commended for all the aforesaid womens diseases, to be as effectuall as the other, and that it is very profitable for those that are troubled with Convulsions and Crampes, or those that have beene bruised by a fall, if it be drunke with water, the seede worketh more strongly: the roote of the round Birthwort doth draw forth broken bones, or any other hurtfull thing lying in the flesh, if the fresh roote be applyed and laid thereto: the pouder of the dryed roote is of singular good use in all eating, or running sores, scale and scabs, as also that are hollow and Fistulous, by cleansing and filling them up, or causing the flesh to grow kindly, especially for Fistulaes, if a little Hony, and the roote of Iris or the Flowerdeluce be mixed with it: it healeth all wounds in the head: the fumes thereof, or the pouder in a quilted cap, stayeth all Fluxes and distillations of rheume from the head: and it is an usuall saying, that without Birthwort no Chirurgion can get any great cure: the long Birthwort is used as well as the round, in most of those diseases either inward or outward, and some also doe hold that the *Clematitis* or running kind is no lesse effectuall, but you heard the judgement of *Galen* concerning it. *Aetius* in his 15. Booke and 8. Chap. saith that the fishermen in Cyprus call the roote of the round Birthwort the venome of the earth, and that having bruised it and mixed it

Lime and Chalke, and cast it into the Sea, all the Fishes within a great way thereof would with incredible desire gather themselves thereto, and presently upon the taking thereof become as dead, whereby they might easily be taken: this *Lonicerus* noteth it as an errour in *Pliny*, who referreth that quality to the roote of *Aristolochia* which should be attributed to *Cyclamen*, which he saith is called by the Greekes ἰχθυοκτόνον, *piscium interimens* because it killeth them.

CHAP. LXIIII.

Mercurialis, Mercurie.

UNder the titles of *Mercuriales* I must comprehend also the *Phallos* of *Theophrastus* and *Dioscorides*, for that they are out of doubt congeners of the same kindred: they are in face and forme the one so like the other: and with them I thinke it not amisse to remember in this place also, the *Mercurialis foliosa* & *altera* of *Tragus*, called by *Lobel*, *Noli me tangere*: for although *Gesnerus* place it with the *Ballotines*, yet others reckon it with the Mercuries.

1. *Mercurialis vulgaris mas & fœmina.* French Mercury, the male and female.

I comprehended as you see, both the male and the female Mercury under one description, because as all things else both rise from the seede of the one as Hempe doth, and they both are so like, that but for the flowers and seede, that shew their difference, they could not be distinguished the one from the other: it riseth up with a square greene stalke full of joynts, two foote high or thereabouts, with two leaves at every joynt, and branching like wise from both sides of the stalkes, set with fresh greene leaves, somewhat broad and long like unto the leaves of Pellitory of the wall, but lesser and much about the bignesse of the leaves of Basill, finely dented about the edges towards the tops of the stalkes and branches, at every joynt come forth, in that which is called the male, two small round greene heads, standing together upon a short foote-stalke, which growing ripe are the seede, not having any flower, that ever I could discerne: in the female the stalke is longer, knee fashion, and set round about with small greene husks, which are the flowers made like small branches of grapes, which give no seede that ever I could finde, but abide in that manner a great while upon the stalkes without shedding: the roote is composed of many small fibres, which perisheth every yeare, at the first approach of winter, and raiseth it self up againe of his owne sowing, for where it is once suffered to sow it self, the ground will never want it afterwards, even of both sorts, for I yet never saw it grow in any place, where either of them was wanting.

2. *Mercurialis sylvestris Cynosorchidis vulgaris.* The ordinary wilde Mercury or Dogs Mercury.

This Dog Mercury is likewise distinguished into male and female, and riseth up with many stalkes, slenderer and lower then Mercury, and without any branches at all upon them; the male is set with two leaves at every joynt somewhat greater then the female, but more pointed, and full of veines, and somewhat harder also in handling, of a darker greene colour, and lesser snipt or dented about the edges at the joynts, with the leaves come forth longer stalkes then in the former, with two hairy round seedes upon them, twise as bigge as those of the former Mercury: the taste hereof is herbie, and the smell somewhat strong and virulent: the female of this kind hath much harder leaves, and stand upon longer foote-stalkes, and the stalkes also are longer, from the joynts come such like long or rather longer spikes of greenish flowers as are in the former female Mercury, with many small threds in them, which give no seede, no more then the other Mercury: the rootes of them both are many, and full of small fibres, which runne under ground, and runne themselves very much, not perishing as the former Mercuries doe, but abiding the winter, and shoote forth new branches every yeare, for the old dye downe to the ground.

1. *Mercurialis mas & fœmina.*
French Mercury male and female.

3. *Cynosorchis vera Dioscoridis Bauhino.* The true Dogs Mercury by *Bauhinus*.

The true Dogges Mercury is a tender small and soft herbe, and riseth up like unto the ordinary Mercury, with a round greene creased stalke, about a foote high or with many joynts, branching forth from every joynt; wherein commeth forth at the first two small leaves, and somewhat round like unto Chickweede, after which two other spring forth from the same joynt, which are much larger and broader, and from the same place also afterwards come divers other smaller leaves then the first, and this proportion it holdeth, not at one joynt alone, but at every one thorough the whole plant: from the lowest joynt almost of the stalke and branches, up to the top, where come forth three or foure small whitish greene flowers, with many threds in the midst of them, which turne into small hard round seede, like unto those of Mercury but somewhat lesser, greene at the first, but of a blackish dimme colour when they are ripe: the roote is white, long and fibrous.

4. *Phallus*

1. Cynocrambe vulgaris.
The ordinary wilde or Dogs Mercury.

2. Cynocrambe altera Matthioli & Dodonæi.
The other Dogs Mercury by Matthiol.

3. Phy[illegible]
Childes Mercury, Male and Female.

4. Mercurialis foemina Matthioli & Dodonæi.
The Female Mercury.

5. Mercurialis foemina Italica Matthioli & Dodonæi.
The other Dogs Mercury by Matthiol.

6. Mercurialis foemina Matthioli & Dodonæi.
The Female Mercury.

7. Mercurialis foemina Italica Matthioli & Dodonæi.
The other Dogs Mercury by Matthiol.

8. Mercurialis foemina Matthioli & Dodonæi.
The Female Mercury.

9. Mercurialis foemina Italica Matthioli & Dodonæi.
The other Dogs Mercury by Matthiol.

4. *Phyllum mas & fœmina.* Childing Mercury male and female.

Childing Mercury also is divided into two kindes, as the former Mercuries are, whereunto it is so like in all the parts thereof, that many have beene of opinion, that it is but plaine Mercury, growing in a hotter Country. It hath a branched square stalke (I give you one description for them both, as I did in the former, although others give them severall) full of joynts and branches, in the male lower and more upright, in the female higher and more bushie: at the joynts stand alwayes two soft woolly leaves, somewhat narrower and longer, than in the former, and not dented or but seldome about the edges, of an acide and salcish taste: at the joynts in the male come forth short stalkes, bearing two small round seedes together at the toppe, like unto the male Mercury, (for it doth not give any flowers) which are of an ash colour before they are perfect ripe, but then they grow to be more blew: in the female the stalkes are longer, and beare many small pale mossie flowers, which seldome beareth any seede, which when it doth it is small and round like the other, sometimes two and sometimes more growing together: the roote is white, hard and woodie, of the bignesse and length of a finger, perishing every yeare, and raysing it selfe againe from it owne seede, in the naturall places: this hath a stronger sent and taste, than any of the former Mercuries: *Dioscorides* his description of this *Phyllum* is inverted, for unto the male he giveth spiked or bushie heads, and unto the female seedes like poppie: but as hee saith himselfe *Crateuas* was his author, and not his owne knowledge.

3. *Mercurialis sylvestris non ramosa vulgo dicta, sive Perficaria filiquosa.* Wilde Mercurie called Quicke in hand.

This kinde of wilde Mercury (which for the varietie of the forme hath beene diversely named of writers) riseth up with a round joynted stalke, two foote high sometimes, branching from thence in many places, whereat continually standeth but one leafe upon a very slender tough foote stalke, most like unto those of *French* Mercury, but longer pointed, and somewhat smaller at the stalke, not so finely, but as it were grossely indented about the edges, being thinner, softer, and of blewish greene colour; from every joynt with the leafe from the middle upwards, and at the toppes of the branches also commeth forth one long browne foote stalke, as small and fine as any haire, bearing one flower thereon, and sometime two or three, somewhat close together, hanging downewards, composed of five leaves a peece, somewhat like unto those of the Hollow roote, but greater, of a faire gold yellow colour, *Bauhinus* saith it is found also of a paler colour: two of them that stand like wings at the sides, are larger than the other two that stand under them, which are small and round, the lowest is longer than the other two small ones, and broade at the end: the uppermost endeth in a short crooked horne or heele behinde: the bottomes on the inside is whiter than the rest, which have sometimes some red spots in them: after their flowers are past, there come up in their places, small long joynted pods, hanging downewards, striped as it were all the length of them, wherein is contained small long and somewhat flat seede, of a duskie colour, which is so hardly gathered, in regard that even before it be thorough ripe, if it be but very lightly handled, the pods will breake, and twine themselves a little, as the pods of some certaine pulses will doe, and the seed will leape forth, yea for the most part, the very shaking of the branches by the winde, causeth the pods to breake open, and shed their seede on the ground, where the ripest may best be gathered if they be taken in time: the roote is blackish and threddie, perishing every yeare: the taste hereof is small and waterish, as *Columna* saith in the greene herbe as my selfe can testifie, and little other wise in the dried, and which gave him no offence nor me also, either in the tasting or handling, but whether there were any further danger in taking a greater quantity, because *Lobel* saith it was venemous, was I doubt but onely an heare-say by tradition, yet neither he nor I would make any further experience therein.

The Place.

The two first Mercuries are found wilde in diverse places of our owne Country, as very plentifully by a village called *Brookeland* in *Romney* Marsh in *Kent*; the other called Dogge Mercury is found in sundry places of *Kent* also, and elsewhere, the female kinde is more seldome found than the male: the true Dogges Mercury is not found wild with us, neither the childs or childing Mercuries, but grow about *Montpelier* in *France*, and in *Spaine* and *Italy*: the last groweth in the shadowie woods of *Italy*, *France*, and *Germany*: it hath beene found likewise by the shadie woodsides of the mountaines and their vallyes in *Wales*, by an industrious Gentleman and Herbarist, Mr. *George Bowles*, and will abide in our Gardens, every yeare sowing it selfe being set in a shadowie place.

The Time.

They all flourish in the Sommer Moneths, and therein give their seede: but the Childs Mercury flowreth so late with us, that it hardly beareth ripe seede. The quicke in hand flowreth and presently after seedeth, in his naturall place about the middle and end of *August*, but in gardens in June and *July*.

The Names.

French Mercurie is called in Greeke [illegible] *Limnesium & Limnesium heraclea, & Mercurii herba & Mercurius Parthenium*; in Latine *Mercurialis*, because as *Pliny* saith it was found by *Mercury*: Dogges Mercury is called [illegible] *Cynos* and *Cynocrambe* which is *Canina Brassica*, but because it hath no agreement with any Cabbage (unlesse you would say it were meate, or a Cabbage for a dogge) others have called it in Latine *Mercurialis Canina, propter quam causam*, others *Mercurialis sylvestris*: The childs or childing Mercury is called in Greeke [illegible] *Phyllon & Phaopsyllum quasi Oleifolium*, *Theophrastus* in his ninth booke and 10 chap. saith that they called one herbe *Phyllum Arrhenogenon*, and another *Thelygonon Marsupoli & Fœminiparum*, which *Severinus* thinke is not the former *French* Mercury, because he saith they have leaves like Basill, whereunto the *French* and not the Childs or childing Mercury is most like, and the rather for that *Dioscorides* appropriateth to his Mercuries those effects of bearing male and female children, that the *Phyllum* of *Theophrastus* and *Dioscorides* hath. The *French* Mercury is generally of all writers almost, called *Mercurialis mas & fœmina*, *Cordus* upon *Dioscorides* thinketh them to be the *Phyllum Arrhenogenon*, and *Thelygonon* of *Theophrastus*; and *Ruellius* calleth them *Mercurialis tefticulata & spicata*: the *Italians* call it *Mercorella*, the *Spaniards Mercurial*: the *French Mercuriale & Viuoble*: the *Germanes Bengelkraut*, and the *Dutchmen Bingelcruyt & Mercurial*. The second is called *Mercurialis sylvestris*, by *Tragus*, *Lonicerus*, *Cordus & Thalius*, & *Cynocrambe* by *Matthiolus*, *Fuchsius*, *Dodonæus*, *Camerarius* and *Lobel*, who in one figure representeth both the male and female.

Columna

Columna calleth it *Mercurialis annua*, and *Bauhinus Mercurialis mentana teſticulata & ſpicata*, neither of them both thinking it worthy of the name of *Cynocrambe*, for that they knew it was not anſwerable to *Dioſcorides* his *Cynocrambe*, who doth not make it a Mercury, whereof there is male and female, for if it had been ſo he would have remembred it, but he putteth it indefinitely not naming either male or female: The third is called *Dodonæus*, who firſt ſet forth the figure and deſcription thereof in his *Matthiolus*, *Cynocrambe vera Dioſcoridis*, and *Rana* in his deſcription of *Mani Bubuli*, *Cynocrambe legitima Belli*. *Ceſalpinus* tooke it to be an *Alſine*, and *Columna* calleth it *Alſine ſpecies prima nova*. The fourth is generally taken of all to be the *Thyſſelinum* of *Dioſcorides* and *Theophraſtus*. *Bauhinus* calleth it *Thyſſelinum teſticularum* and *ſpicatum*, as he did the former Mercuries. The laſt is called of *Tragus Mercurialis ſylueſtris altera*, in his Chapter of Mercury, but putteth the figure thereof in the chapter of *Ebulus*, of *Lonicerus Tithymalus ſylueſtris* of *Camerarius*, *Tabernæmontanus*, *Lobel*, and *Gerard*, *Noli me tangere*, who alſo calleth it *Balſamina Capenſium*. It is alſo called *Perſicaria ſiliquoſa* of *Camerarius*, *Tabernæmontanus*, *Lugduneſis* and *Lobel*, of *Gerard* *Impatiens herba*, of *Ceſalpinus Calaminthe altera*, of *Columna Teſſeranthus*, and of *Lugdunenſis Chryſes*, *Bauhinus* calleth it *Balſamina altera, ſive Noli me tangere*. I have called it *Noli me tangere*, and placed it in the Chapter of Mercuries, and given it an *Engliſh* name, propes for it as I take it, but there I will let it as they pleaſe.

The Vertues.

The decoction of the leaves of Mercurie, or the juyce thereof taken in broth or drinke, and with ſome Sugar put to it, to make it the more pleaſant, purgeth choller like and watereth humors: *Hippocrates* commended it wonderfully for women diſeaſes, which none of the Phyſitions of our dayes, I thinke ever put in proffit, he applyed it to the ſecret parts to eaſe the paines of the mother, and uſed both the decoction of it to make women courſes, and to expell the afterbirth, and the fomentation or bathing for the ſame cauſes, he alſo gave the decoction thereof with Myrrhe or pepper, or uſed to apply the leaves outwardly againſt the ſtrangury, or the diſeaſes of the reines and bladder; he uſed it alſo for ſore and watering eyes, and for the deafneſs or paines in the eares, by dropping the juyce thereof into them, and bathing them afterwards in white wine or decoction thereof made with water and a cocke chicken, it a moſt ſafe medicine to be taken againſt the ſtone of reines: it alſo cleanſeth the breaſt and lungs of ſlegme troubling them, but it doth a little offend the ſtomach: the juyce or diſtilled water thereof, caſt or ſnuffed up into the noſtrils, purgeth the head and eyes of cumbe and rheumes, that diſtill downe from the braines into the noſe and eyes, as alſo ſometimes into the eares: they uſe to drinke two or three ounces of the diſtilled water with a little Sugar put to it, in a morning faſting, open the body, and to purge it of groſſe viſcous and melancholicke humours; as alſo mixing it with Manna taken from Roſe buddes, and Manna diſſolved therein, for the ſame purpoſe, which thereupon ſomewhat reſembles *Cassia*, which purgeth choller alſo; It is wonderfull (if it be not fabulous) that the ancient writers, *Dioſcorides*, *Theophraſtus* and others doe relate, that if women uſe theſe herbes either inwardly or outwardly, for the dayes together after conception, and that their courſes be paſt, they ſhall bring forth male or female children, according to that kinde of herbe that they uſe: *Matthiolus* ſaith that the ſeede of both the kindes of *Mercurie*, that is both male and female, boyled with wormewood and drunke, cureth the yellow Iaundiſe, in a moſt ſpeedie and marvelous manner: the leaves themſelves or the juyce of them rubbed upon warres or bound upon them for a certaine time, doth take them cleane away: the juyce mingled with ſome Vinegar, helpeth the ringworme, ſcabs, tetters, tetters and the itch. *Galen* ſaith that who ſo will apply it outwardly in manner of a plaiſter to any ſwellings or inflammations, ſhall finde it to have a digeſting quality, that is, it will digeſt and ſpend the humours that was the cauſe of the ſwelling, and ſtay the inflammations proceeding thereupon, it is frequently uſed to very good effect given in glyſters, to evacuate the belly from thoſe humors that be offenſive therein, and worketh as well after that manner, as if ſo much Senne had been put into the decoction. The common Dogges Mercury is ſeldome uſed, but may ſerve in the ſame manner, and to the ſame purpoſe that the other is put to, for purging waterith and melancholicke humours. The ſolides Mercury, although no other hath written of any purging qualitie in it, yet the forme thereof ſo like unto Mercury, and the ſaltiſh acide taſte, ſhould demonſtrate in my opinion an irritating quality: *Theophraſtus* and *Dioſcorides* have onely mentioned the chilling quality, he willeth men to beare either males or females, that uſe this herbe, according as is before ſayd of *French* Mercury. The *Noli me tangere*, or the Quicke in hand, hath a ſtronger purging quality, but it is by vomite, and therefore I thinke *Lonicerus* and *Tragus*, have put it under the names of *Tithymales*, as neereſt partaking of their nature, which cauſed *Lobel* and *Pena* to ſay, it was venemous and deadly, and yet ſay it wanteth not his proofe for the effects, but ſhew not what they are: *Camerarius* alſo ſaith ſome doe apply the diſtilled water of the herbe upon the places pained with the goute, with good ſucceſſe.

CHAP. LXV.

Malva. Mallowes.

THere are three kinds of Mallowes, one with whole leaves, but little inciſed or cut in on the edges, called *Malva*; an other more deepely jagged or cut called *Alcea*, the third more ſoft in handling called *Althea*. Of each of theſe three diviſions the varieties ſhall be reckoned together by themſelves, that every kinde may be ſeparated. Some of each of theſe kindes I have ſet forth in my former Bookes, whoſe deſcription needs not to be here repeated, and thoſe are *Malva Hiſpanica flore carneo ample*. The ſpanish Mallow, *Alcea vulgaris flore carneo*, Vervaine Mallow with bluſh flowers. *Alcea crocea* [illegible] Mallow, or good night at noone. *Alcea fruticoſa pentaphyllea*, cinquefoile Mallow. *Tubariſſa ſive Alcea Ethiopica*. Thorny Mallow. *Bamia ſive Alcea Ægyptia*. The Mallow of Egypt. *Althea frutex* [illegible] Shrub Mallow with a white or purple flower. *Malva hortenſis Roſea ſimplex & multiplex*, diverſe colored [illegible] Ihockes ſingle and double of many colours; and *Malva criſpa*, *French* Mallowes; yet the figures of ſome of them that are next at hand I will inſert here: thoſe which remaine to be increaſed I ſhall remember in this Chapter.

Digitized by

Divisio prima. The first Division.

1. *Malua vulgaris flore purpureo.* The common Mallow with purplish flowers.

The common Mallow hath many large soft greene roundish leaves, yet somewhat cornered and dented about the edges, standing upon long foote stalkes next the ground, from among which rise up, diverse round greene stalkes growing in time to be three or foure foote high, especially in good grounds, and to be more hard and almost woody, especially at the bottome, divided into many branches towards the tops and with many lesser leaves, and more divided upwards; where it bringeth forth many flowers, standing in soft husks, which flowers twine themselves, at their first shooting forth before they open themselves into five large, broad pointed leaves, of a fine delayed purplish red colour, with many stripes or veines running through every leafe, of a deeper colour, which maketh the flower seeme very beautifull: after which come round flat cakes, with many blackish seede, set in order, round about in them: the roote is long and white, growing downe deepe into the ground, tough and somewhat woody.

2. *Malua vulgaris flore albo.* Common Mallow with white flowers.

This Mallow groweth like the former, both for leaves and height of stalke, the cheefest difference consisteth in the flowers, which are not fully so large as the former, and are of a pure white colour, without any stripe or veine, of any other colour running thorough them, the seede and roote are also alike.

3. *Malua sylvestris minor.* Small wilde Mallow.

This small Mallow lyeth with his branches upon the ground, having many smaller and rounder leaves, not cut in, or very seldome, and lesse dented on the edges than the common: the flowers hereof are very small and white: the seede and roote are like the common.

4. *Malua Montana.* The mountaine Mallow.

The mountaine Mallow, hath his lower leaves as large as the common wilde Mallow but longer, with some round divisions or cuts therein, but not deepe, somewhat like unto an Ivye leafe: the stalke groweth not so great and high as the common, with smaller leaves thereon, upwards somewhat rounder and lesse: the flowers are like the common, and so is both seede and roote.

5. *Malua tricuspis sive Africana.* The Sommer Mallow.

The Sommer Mallow hath soft round greene leaves, without divisions, yet dented about the edges, somewhat paler underneath: the stalke riseth up to but halfe a yard high, bearing smaller leaves, and a little divided somewhat like those of Marsh Mallowes: the flowers are of a paler purplish colour then the common and lesser, the bottome of whole leaves are of a deeper colour, standing upon longer foote stalkes, and not so many together, the seede is small, and so is the roote, and perisheth with the first cold or frost that commeth; but sometimes if the Sommer be kindly, it giveth his ripe seede, before any frosty nights doe come.

6. *Malua Arborea* Tree Mallow.

The tree Mallow groweth with us to be a great tall tree more likely then an herbe, having his stemme somewhat wooddy, and oftentimes so great in compasse that no man can graspe it round with both his hands, the

leaves are ewife as great and large as any comonne Mallow and as soft and woolly in handling as the Marsh Mallow but not so white or woolly, yet often somewhat crumpled about the edges: the flowers not the first yeare of the springing up with us, but in the second Sommer, if the sharpe Winter hath not nipped his stalke in the first yeare; not then being growen to his full strength, being more tender then afterwards; it putteth forth branches, with leaves on them, but smaller, among which stand fare great and large deepe purple flowers, with stripes and veines in them like the common Mallow: after which rise such like round cases, with blackish seede in them, but larger according to the proportion of the plant, but seldome commeth to maturity in our countrie: the roote and stalke perish usually with us, after it hath abiden two yeares at the most with us; whereas in the warmer and naturall places, it abideth diverse yeares, and groweth to be as high and great as many trees.

2. *Malua arborea marina nostras.* English Sea tree Mallow.

This tree Mallow of our owne countrie, is very like the former tree Mallow, having a woodily stemme, as great as a mans arme, of a ruffet or hoary colour; whereon grow soft whitish woolly leaves, almost as large as the other, and as smooth as velvet: the flowers hereof are large, and of a whitish or delayed purple colour, like in forme unto a wild Mallow flower, but somewhat large, yet not so great as the former: the roote is white, great and woody, with diverse long strings annexed unto it.

3. *Malua Rosea arborea Indica.* The Indian tree Hollihocke.

If I should (Reader, I perceive) like of a mole hill make a mountaine in the description hereof, I might be laid over redious, howsoever he by his elegant Latine stile, may palle with greater delight to the reader, both in his ample narration and fabulous concertation betweene Art and Nature, in that he giveth a gracefull *Valete plaw* to ende the long journey: but this large volume will not admit such spacious relations, and therefore I will abreviate his long discourse, with as briefe a description as the subject will permit, and referre those to the author that list to reade all at large. In a small time (that is in two or three yeares in a warme countrey) this riseth up to be like a pretty great shrubbe or small tree, whose stemme or trunke being somewhat white and woodily, five or six inches thicke covered with a smooth whitish barke: whose lower branches being pruined, the upper boughes spread into a round compasse, whereon are set diverse broad rough leaves somewhat like to Vine leaves, cut into severall partitions and nicked about the edges, of a fare greene colour on the upper side and grayish underneath, on thicke long and rough reddish foote stalkes, sometimes but one, and often two or three at a joynt, which doe abide the Winter without falling away: at the toppes of the branches come forth the flowers standing in greene huskes divided at the toppes into five parts: in some of these plants the flowers will be single, consisting of five, six, eight or tenne large crumpled leaves, all white or a little bluish towards the edges: in others the flowers will be very double, and as large as a Provence Rose of the same colours, but after they have abiden a while blowen open they change more bluish and on the fading deeper, these changes are often seene in one and the same day, yet very rarely not in two or three dayes abiding: in the middle of the flowers standeth a greene head compassed with many yellow threds as the Rose hath, which head growing to maturitie, hath sundry ridges and furrowes on the outside and full of seede within, distinguished by severall partitions, and are reddish somewhat small long round and crooked, and a little hairie at the backeside, yet seedes have beene rarely taken out of one seede vessell: the roote is long, white and woody diverslie spread under ground, with sundry small fibres issuing from them.

Divisio secunda. The second Division.

1. *Alcea vulgaris flore Malvæ Verticillatæ.* Fine cut or Vervaine Mallow.

The lower leaves of this Vervaine Mallow are soft and greene, somewhat like unto the wild common Mallow leaves, but lesser and more cut in on the edges, besides the denting, but those that grow up higher upon the stalke, (whose barke may be broken into threds like hempe, and is sometimes as high as the ordinary wild kinde is) are more cut in and divided, somewhat like unto Vervaine: the flowers hereof are of a paler purple colour than the common mallow, but in small not so much divided into severall leaves, and laid flowen, but abiding whole, entire, or little forced, and without those stripes oftentimes, being forth and somewhat thining: the seede and seede vessell are like the common Mallow, the roote also is long rough and white, but somewhat more woody within.

2. *Alcea vulgaris, flore albo.* Vervaine Mallow with white flowers.

This Vervaine Mallow that beareth white flowers, doth somewhat differ in leaves from the former, for that they are more finely cut in on the edges, than it is: in the flower consisteth a chiefe difference also, which is white, yet rending all the rest, both seede and roote differ not.

3. *Alcea minor.* Small Vervaine Mallow.

There is a lesser kinde of the Vervaine Mallow, never growing so great or high, but always abiding lower, like unto the small Mallow: both the leaves hereof are more divided and cut in on the edges, and more finely into five parts, and deeply dented also: the flowers are purple like the ordinary Vervaine Mallow, but lesser, and that maketh the difference.

4. *Alcea minor hirsuta.* Small hairy rough Vervaine Mallow.

The small hairy Mallow hath many very low and hoary stalkes, not above a foote high, divided into lesser branches, set with diverse small hoary hairy leaves, cut into three or more divisions at the tops of the stalkes and branches, grow diverse large purple flowers, like unto the first, but every one standing in a hairy huske, almost prickly: after which is contained blacke seede, contained in those hairy huskes, that bore the flowers: but more closely and thicke than in the rooves is of a pale browne colour, about the length of an inch, with small fibres hanging at it.

5. *Alcea vel Ketmia aegyptia.* The Egyptian Muske Mallow.

One sort of Aegyptian Mallow I have, as I said in the beginning of this Chapter see forth already, but this differeth from that in these particulars, both stalke and leaves, are all hairy over: the leaves are parted into seven or more parts or cantles: the flower is sharper pointed, more yellow, and as sweete as Muske, and so is the blacke seede also, but more neare unto Civet, which is like unto the seedes of Myrtle berries, but greater: the roote is great and thicke: the whole plant is full of lymie juyce, and of an herby taste.

Divisio tertia. The third Division.

2. *Althæa vulgaris.* Common marsh Mallowes.

Our common marsh Mallowes hath divers soft hoary white stalkes, rising to be three or foure foote high, spreading forth many branches, the leaves whereof are soft and hoary, or woolly, somewhat lesser then Mallow leaves, but longer pointed, cut for the most part into some few divisions, but not deepe: the flowers are many but smaller then those of the Mallow, and white or tending to a bluish colour, after which come such like round cases, and seede as is in the Mallow: the roots are many and long, shooting from one head of the bignesse of a thumbe or finger, very plaine rough and bending like Liquorice, of a whitish yellow colour on the outside, and more white within, full of a slimie viscous juice, which being layd in water, will so thicken it, as it were gelly.

3. *Althæa Peregrina.* Marsh Mallow of *Peregrine*.

This Peregrine Marsh Mallow differeth nothing to nought, stalkes or leaves from the former, but onely in leaves, that they are somewhat harder in handling, and in the flowers which are much larger and greater then those of Virginia Mallowes, and of a purple colour for the most part: yet there is found that beare white flowers as large as the former, and some that have not so large flowers as the very largest then those of the common kind.

4. *Althæa frutex peregrina.* The strange shrubbe marsh Mallow.

This Mallow (howsoeuer it hath some affinitie round greenish soft branched stalkes, like the former marshe Mallow, set with divers long leaves, and gray underneath, resembling the olive but long, pointed at the tops of the stalkes and branches: it hath very white flowers, made of five large leaves a peece, standing like a Hollihocke with a tuft of white threds couering a middle pomell, rising out of a greene huske, which when it were ripened and dried at the toppe before the flower liuely, without any great likenesse Hollihocke: all the stalkes die downe every yeare to the ground, the roote is tender white and fleshy, abiding safe in the earth all the winter.

4. *Althæa frutex non ita Ericæ folia.* Ever greene marsh Mallowes.

This evergreene marsh Mallowe, hath many faire large whitish greene leaves, some what thicke, full of veines and rough or hairy, but white or hoary underneath, cut in or divided into five parts usually, somewhat like a Bryonie leafe: the stalkes are hoary white and round, rising to be two or three foote high, having such like large leaves upon them, and smaller also among them, standing all of them upon long fiorestalkes: the flowers are like unto those of the Mallowes, and much about the same colour, consisting of five broad pointed leaves, having many red threds in the middle, after which come flat leafed heads, such as other Mallowes have, wherein is contained such like small seede: the roots are dispersed into severall parts under ground, and dye not, but receive some of the leaves upon them all the winter, although the stalkes dye downe and perish to the ground.

2. *Althea palustris Cyrini flore.* Red flowred marsh Mallow.

Althea frutex. Shrubbe marsh Mallow.

5. *Althea lutea sive Abutilon Avicennæ putatum.* Yellow marsh Mallow.

The yellow Mallow or marsh Mallow riseth up with one soft woolly greene round stalke for the most part, and seldome with more, divided oftentimes even from the bottome into divers branches; at every joynt stand severall large round leaves as soft as velvet, pointed at the ends, and dented about the edges, hanging downe at the end of long stalkes, which stand forth right; the flowers stand singly but one at a joynt with the leafe, which is small and yellow, compoſed of five small pointed leaves, standing in a small greene husk, which being pull, there succeede soft greene *pods* or seede vessels, turning blacke when they are ripe, compoſed of many small hornes or pods, set together like unto an head or seede vessell of Fraxinella, in every one whereof is conteyned small blacke roundish seede: the roote is not great nor long, but with divers fibres at it, and perisheth every yeare.

6. *Abutilon Indicum Camerarij.* *Camerarius* his white Indian marsh Mallow.

This Indian marsh Mallow riseth up with an upright straight hairy stalke, shooting from the joynts in divers places small branches, whereat likewise are set such like soft round and pointed leaves, as are in the last hanging downwards for the most part, at the end of long stalkes which are somewhat hairie also: the flowers stand in the same manner that the other doe but are somewhat larger, and of a white colour, and yellow at the bottome, with divers threds in the middle: the roote is full of small fibres, and perisheth every yeare, in the like manner.

7. *Althea palustris Cyrini flore.* Red flowred marsh Mallow.

The red flowred marsh Mallow sendeth forth many soft leaves, somewhat like unto those of the ordinary marsh Mallow, but not so soft or whitish, but of a pale greene colour on the upper side, and whiter underneath longer also and dented somewhat deeper about the edges, standing upon long footestalkes, among which rise up divers round greene stalkes, three or foure foote high, bearing the like leaves on them at severall distances: from the joynts of the leaves towards the tops of the stalkes, and at the tops of them likewise come forth the flowers, consisting of five leaves longer and narrower then in other Mallowes, not broad but pointed at the ends, of a deepe reddish purple colour, tending to an orenge, and sometimes paler or more delayed, and in some plants of a white colour, with divers threds standing in the middle, about a small greene head, which in time becommeth the seede vessel, growing like the cod or seede vessel of the Birthwort, of a sad brownish colour on the outside, parting into five divisions, wherein lye small brownish seede: the roote is long, white and tough, somewhat like a marsh Mallow, but nothing so great, or mucilaginous, that is flymie.

8. *Althea arborescens Provincialis.* Tree marsh Mallow of France.

This tree marsh Mallow is very like unto the Shrubbe Mallow, set forth in my former booke, but yet is not the same, differing in some not able points from it: for although the stemmes thereof are more woodily then the former tree Mallow, yet are they not altogether so hard and woody as the shrub Mallow, but growe with much higher, even to a mans height sometimes, having many whitish hoarie leaves in the naturall places, but of a whitish greene growing in our climate and not hoary at all, somewhat rough, broad and rolled, and not so long pointed as the Shrubbe Mallow, yet cut into some divisions, and dented at the edges; as the toppes of

Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

the stemmes and likewise from the sides growe many flowers like unto those of the marsh Mallowes of as deepe a colour almost as the wilde mallow, yet smaller then those of the shrub mallow, after which such like flat huskes and seede as the other mallowes give: the roote is great and woodie, spreading the branches under ground, abiding long, and sometimes holding the stalkes with the leaves upon them all winter, the tops being cut off, yet sometimes also if the winter be over sharpe or backen pinched or bitten into a warme place, or defended from the extremitie thereof, they will perish downe to the ground, but the next yeare fresh ones will arise againe from the roote.

56. *Althæa fruticosa Cretica.* Shrub marsh Mallow of Candy.

The Shrub marsh mallow of Candy, in the second yeare after it is sowen riseth up with diverse woodie grosse stalkes, covered over with much downe or woollinesse, three or foure foote high, whereon grow long leaves, cut into corners, and dented about the edges, ending in a point: the flowers grow at the tops of the stalkes, made of five leaves like mallowes and broad at the points, but of a fine delayed red colour, tending to a bluish, having a tuft or pointell in the middle, compassed about with white threds, which flowers are nothing so great as the former, being not much bigger then the flowers of the ordinary marsh mallow, after which come such like round cases and seede as they give: the roote is long, rough and white like the common marsh mallow, but more woodie, and endureth divers yeares, shooting forth new branches in the Spring.

The Place.

In the first division common Mallowes are knowne to growe every where; but that with a white flower more rare growing not in very many places, but in Kent in diverse places, as at *Hasted* and at *Tenham*, in *Northamptonshire*, &c. and in diverse other places; the third is found under hedges and walls in many places; the fourth is often found upon hills: the fifth in *Spaine*: the sixt tree Mallow groweth neere *Nemes*, and the *Tarbone* shore, and on the *Apian* shore also; in which places it abideth many yeares: the seaside Mallow groweth in an Iland called *Planis*, three miles from *Kings Road*, and five miles from *Bristow*, so about the Cottages neere *Hurst* Castle, over against the Ile of *Wight*. The eight was first brought into (I meane the seede) into *Rome* or some parts of *Italy* where it was sowne; whose increased seede afterward communicated into hotter Countries. The first of the second division, is very common in *Kent*, as in many places of our owne Land, being in some places more frequent, than the common wilde mallow; it groweth in a field, as you goe to *Hamsted* Church from the towne; but the second which beareth a white flower, at *Ifreham* in *Kent*, the third is likewise found in some places of *Kent*, the next two are sometimes found with us. The fourth groweth at the foote of the mountaine *Iura* in *Helvetia* by *Stevens*: the fift in *Egypt*: the first of the third division or marsh Mallowes groweth in most of the Salt marshes, from *Weymouth* downe to sea, both on the *Kentish* and *Essex* shore: the second in *Hungary*; the third was brought out of *Africa* as *Lobel* saith; the fourth is not knowne from whence; the fift groweth in many places of Italy, as the way goeth neere unto lakes, rivers and ponds; the sixt is thought to come from the Indies, but is more likely to be found in some places of *Italy*, it is so like the former, and sent by *Iosephus de Castilione*, to *Camerarius*, who caused it to set out the figure thereof. The seventh *Camerarius* saith be found in *Italy* abundantly about the river Po, not far from *Angoulesme*, where men passe the river: The eight groweth in *Provence* of *France*, as *Lobel* and *Pena* say, but in *Tuscia* among the *Apennines* as *Camerarius* saith, who hath set forth a figure, which is very like unto the same as he saith, with that of *Lobel*: The last was sent to *Clusius* by *Iosephus de Castilione*, which he grewe in *Cassel*.

The Time.

They all flower all the Summer Moneths, even until the winter pull them downe, yet the tree Mallow, the tree marsh Mallow, and *Egyptian* Mallow, doe flower later than the rest, the yellow, the Indian and Cowred Mallow, doe flower in the latter end of Summer, yet so as if the yeare be not kindly, there seede is not gathered ripe from them, but from the tree and *Egyptian* Mallowes never wanting, except that they perish of our owne Land.

The Names.

It is called in Greeke [illegible] *abominanda cruore*, yet it is written [illegible] in *Epicharmus* and *Aristophanes*: in the *Aulularia* of *Plautus* they are called *Malachinæ*, that dyed cloth into a purple colour, and by *Columella* such thick cattle, which is not easily interlaced except at the [illegible]

Of Malache prime & under the name fusen.

Turner thinketh that he meane it by the leffer Mallow and that it purgeth his leaves and flowers with the seede. *Plinie* hath *Malope quæ malache*, which he referreth to the mannured, and in Latine *Malve quæ [illegible] dicuntur*, in English *Mallow* or *Mallow*, either from the softnesse of the leafe, or from the softning of the belly and hard tumors, or peradventure from the Latine. The *Arabians* call it *Cobeiza* and *Cobeiza* and the seede thereof *Bozer Cobeiza*, the *Italians Malva*. The *Spaniards Malua*, the *French Mauue*. The *Germans Pappele*, the *Dutchmen Malue*, and *Kaes-cruyt*. The Garden Mallowes, which we call *Holyhocks*, *Rose Mallowes*, *Mallow Roses*, and by the *vulgar* in *Italy* in admiring the beauty and sweetnesse doe call them *Rose pleyne* or *Trionfanti*, beyond the Seas Indies, and some also as the *Frenchmen* doe *Wood Rose*, for their beautifull flowers shew themselves, from the end of Summer untill winter: [illegible] in Greeke, in Latine, is taken from *ἀπὸ τοῦ ἁβρὸν*, *gratum*, *quod ejus radices cibi instar sint*, saith *Lobel* and *Pena*. *Italians Malmalue* and so doe some in Latine call this *malva efficacior Malva*; but others more truely spell the word to the *Arabs*, and *Malva salvatica* and *Malva Hispanica*, of the *Spaniards Malua* and *Malua [illegible]*; of the *Germans Pappele wurtzel* and *groene wurtzel*, that is *Radix Malvæ viridis*. *Malva Hispanica*, *Malva Arabica* in Greeke *μαλάχη ἑλληνικὴ* Latine *Malva*, of the heading and cooling diseases it is also called *Malache* and *Malache sativa* and *Malache hortensis*, and *Malache Malvæ*, with the *Arabians* also of some Latine writers, of *Barbarus*, *Apuleius*, from the excellencie of the effects, of *Malva* is called *Archangelica*, *Malva sylvestris*, but that is thought more fitly to agree to the *Holyhocke*, which *Dioscorides* saith, groweth in a few moneths to be so great, that the stalkes serve as staves for men to walke by, and of some *Olus Iudaicum* the Iewes pot herbe. *Plinie* in his 19. Booke and 5. Chapter calleth it *Malvacea*

Original from UNIVERSITY OF MICHIGAN

faith is differed from the *Parsley roote*, in being more knotti and slender, not to be eaten in meates but good for medecines, and in the 86 Booke and first Chapter, he faith *Ibiscus* is like unto *Parsnep* which hath with a manifest tongue of smell in time, that from the whitenesse length and likenesse of the roote of *Althea*, unto the *Parsnep*, would conclude it a *Parsnep*, without regard of other forme or qualities of the *Archisos*, *Chara*, *Clauina*, and *Rapa* named and *Serapio* in one place *Althea*, of the *Italians Malvaviscus*, and I thinke from them doore latter Authors call it *Malvaviscus* derived as it were from *Malva* and *Viscus*, of the *Spanish Malvavisco*, of the *French Guimauve*, of the *Germans Ibisch* and *Mahurtz* or *Hubarts*, of the *Dutch* wine *Hundt* and *witte Malue*, wee in English call it marsh Mallow, from the place where it chiefly groweth in the salt marshes as I said before, or white Mallow from the colour of the leaves, and of some *Vitis*.

The first of the first division is called of the *Arabians valcara*, and of some *Syriacke Malua*, of *Serapio Malua Regina*. The third is called *Malua sylvestris* or *Agrestis* of most, and of *Lobel* and others *Malua sylvestris vulgaris*. The fourth is *Alcea* or his fourth Mallow, which he calleth also *Hibiscus* and *Abutilon*, but of *Lugdunensis Malua crispa* or *Alcea*, the fifth is called by *Clusius Malua crispa*, and of *Lobel Malua folio crispo*. The first of the five Mallowes is called by *Matthiolus Malua maior* and *Arborea*, and to like unto of *Lobel*, of *Dodonæus* & *Camerarius Malua arborescens*. Hee was never had any other author to expresse it before now wee therefore call it *Mallow* of *Virginia*, the eighth is called by *Lugdunensis* in his booke of *Rariora Rosa Syriaca*, because he first received the seede thereof from *Syria*, but as he saith *Lobel* called it *Malua Ispanica*, others *Indica*, of the naturalls *Peru*. I have as you see joyned it to the Hollihocke, and because it abideth greene always like the tree Mallow, I have intended it *Indian* tree Hollihock, if any think better to alter it, *per me licet*. The first of the second division is called *Alcea* and *Alcea vulgaris* of most authors, and *Lugdunensis* and some others it is called, *Canabis sylvestris*, and thought to be that of *Dioscorides*, he only calleth it *herba Sagarum*. The third is the *Alcea* of *Matthiolus*, *Tragus*, and others. The fourth *Lugdunensis* calleth *Alcea villosa Dalechampij*; the fifth is thought by *Lobel* in his *Italian* deliration of *Alcea Dalechampij*, called *Hibiscus Aegyptius*, which as he saith the *Egyptians* call *Alcemoschi*, because of the seed like Muske, and saith that the Turkes doe counterfeite Muske with the seedes thereof, and confirmeth *Serapio* in the name *Abutilon* of *Avicen*. and not the other that is so called; this is very like unto the *Alcea Egyptia*, the weed is least and in top former leaves, but more hairy cut laid in the description, and therefore *Bauhinus* in his *Pinax* calleth it *Alcea Egyptia villosa*. The fifth of the third division is called *Althea* and *vulgaris* of most Writers, yet *Cordus* in *Dioscorides*, and in his History of Plants, calleth it *Malva palustris*, and *Gesner Malua Cornuum*, *Malua crassifolia*, *Malua sylvestris Matthioli*, of *Lobel Althea Indica*, as is before said. The second *Clusius* maketh his *Althea Pannonica secunda*, as I think, but as for third in his History according to *Dodonæus*, who calleth it *Althea flore purpureo*, of *Camerarius Althea flore grandi Atro*, & *Althea Pannonica*. The third, *Lobels Canadian* rejecteth in his History of *Canada* plants under the same title here. The fourth *Bauhinus* onely setteth forth under the name of *Althea flore roseo*, *Bupeti folio*. The fifth is called *Abutilon Avicennæ* of *Anguillara*, *Matthiolus*, *Dalechampius* and *Lugdunensis*, of *Lobel Althea floribus luteis*, *Crispis ut Rosæ Germanicæ* called it *Althea Aegyptia*, as also *Alcea Theophrasti*, but *Pena* in his *Italian* deliration, *Icones Stirpium*, calleth it against those that call it *Abutilon Avicennæ*, saying that it is like an *Althea palustris*, with a yellow flower, as that *Avicen* ascribeth to his *Abutilon* or *Arbutilon*, the leafe of a Quince which how saith *Avicen* hath true, and the root long, like a Mandrake, (where as this is round) and not long; *Dodonæus* likewise confesseth that it cannot be the yellow *Althea* of *Theophrastus*, because the roote of his *Althea* will condensate water, which the roote of this will not. The first, *Cæsalpinus* who had the seede from *Italy*, from *Joseph de la Torre*, chiefe Herbarist to the Duke of *Tuscane* or *Florence*, by the name of *Abutilon Indicum*, doth so call it also, saying it may be referred to the *Althea*: the seventh is thought to be the *Sida* of *Theophrastus*, which he mentioneth in his 4. Booke and 13. Chapter, for *Camerarius* calleth it *Sida vulgo*, but *Bauhinus* is against that opinion; for in reciting the roote of *Theophrastus*, he sheweth that *Theophrastus* maketh his *Sida*, grow an herbe growing within the water, and lifting up the leaves above the water, and bowing down the head after it hath done flowring unto the water againe, which this doth not: some therefore thinke that *Theophrastus* meaneth the *Nymphea lutea*, or yellow water Lillie, which hath the like properties, and the rather because it is a water herbe as all know, and that *Theophrastus* intending to shew those plants that grow in the fennes like to *Dioscorides* maketh no mention of water Lillies, which doth seeme strange, that like is not without, the chiefe reputation may seeme to be in the colour of the flower, which yet he plainely mentioneth not, but not in the forme: *Dodonæus* therefore calleth it *Althea herbacea flore purpureo*, and *Lobel Althea palustris Cæruli flore* as I doe, and *Bauhinus Althea palustris*. The eight is that *Althea arborea*, that *Pena* and *Lobel* set forth to grow in Provence in *France* neere *Arles*, and differed from *Clusius* his *Althea Pannonica secunda* set forth in my former Booke as he doth plainely shew in his Historie of plants, *Camerarius* calleth it *Althea arborescens* and *Lobels Tabernemontani*. *Lugdunensis* entendeth the first of *Clusius* which hee nameth *Althea Cannabis Dalechampij*, having round leaves and a white flower greater than the common *Althea*, but *Bauhinus* maketh his fourth and fifth *Althea arborescens*, to differ from themselves, naming the fourth *Althea frutescens folio rotundo serrato*, and referreth it to *Clusius* his *Althea frutex prima*, in his History of plants, which *Clusius* saith himselfe is not the same that *Lobel* calleth *Althea arborea Olivæ*; but maketh his fifth *Althea frutescens folio oblongo serrato*, to be *Lobels Althea arborea*, which *Camerarius* also doth acknowledge calling it *Althea arborescens*, yet *Lobel* would seeme to make them both one. The last is called by *Clusius Althea frutex tertia*, differing from both the former here, for *Clusius* there saith the seede came to him from *Candy*, and grew onely in his friends garden, so as how he imparted it.

The Vertues.

The young leaves both of the common and fine cut Mallowes, as also of the *French* Mallow and the garden Hollihocke, were in former times, and yet are in some countries eaten as a faller herbe, to mollifie and open the belly, either greene or boyled, as *Martiall* the Poet telleth in these Verses.

Exspectatum Aluum mihi villica Malua,
Arcula, & ouorum quas habet horta apes.

The leaves of any of the Mallowes and the rootes also boyled in wine or in water, or in broth, with Parsly or

or Fennell roots, doth helpe to open the body, and some also apply the leaves warme after they are boyled, to the belly for the same purpose, and is very convenient in hot agues, and other distempers in the body, for the mollifying quality, it not onely voideth hot cholericke and other offensive humors but eases the pains and torments that come by obstructions and costiuenesse of the belly; and therefore they are used in glisters according to those purposes; the same used by Nurses that give sucke to children, procureth store of milke in their breasts: the decoction of the seede of any of the ordinary Mallowes made in wine or in milke, doth prevaile and help all the diseases of the chest and lungs that proceede of hot causes, as exceoriations, the peurisie, pleurisie, and the like, if it be continued for some time together: the leaves and the roots worke the same effects, for any one of which of them they thinke best, or most ready at hand, agreeing to their composition: they helpe much also the excoriations of the guts and bowells, and hardnesse of the mother, and in all hot and sharpe diseases thereof, and to the *Ulcera Vesicæ & renum*: the juyce drunke in wine, or the decoction of them in whey, doth help forward to a speedy & easie delivery: the common *Mose* or Vervaine Mallow is thought to be most effectuall for burstnesse or ruptures, and the bloody flixe, and also for the shrinking of sinewes and the cramps: the distilled water of them when they are in flower, worketh to the same purposes, but more weakely, yet it is much commended to be used in hot agues or fevers. *Pliny* saith, that whosoever shall take a spoonefull of the juyce of any of the Mallowes, shall that day be free from all diseases that may come unto him; and that it is especiall good for the falling sicknesse. The syrupe also and conserve made of the flowers are very effectuall for the same diseases, and to open the body when it is costive or bound, by accident or a naturall disposition: the young leaves are often eaten with oile as a sallet: the leaves bruised and laid to the eyes with a little honey, taketh away the inflammations of them, which by sufferance might grow to a Fistula: the leaves bruised or rubbed upon any thing stung with Bees, Waspes, or the like, yea of the Scorpion, and the biting of the deadly Spider called *Tarantula*, and is laid presently to take away paines, redness, and swellings that rise thereupon, and keepeth them from stinking, if they be rubbed therewith aforehand; and as *Dioscorides* saith, the decoction of the leaves and roots helpeth all sorts of poyson, so as the poyson be presently voided by vomite; a pultis made of the leaves of the flowers, boyled and bruised, whereunto some Beane or Barley flower and oyle of Roses is put, is an excellent medy against all hard tumours, and inflammations of impostumes and swellings of the coddes and other parts, and easeth the paines of them, as also against the hardnesse of the spleene or liver, to be applied to the place: the juyce of Mallowes boyled in old oyle and applied, taketh away all roughnesse of the skinne, as also the fall of the haire, the scurfe, dandruffe, or drie scabbes in the head or other parts, if they be anointed therewith, or washed with the decoction: the same also is effectuall against the scaldings by water and burnings by fire, as also helpe also the disease called Saint *Anthonies* fire, and all other hot red and painefull swellings in any part of the bodie: the flowers of Mallowes boyled in oyle or water, (as every one is disposed) whereunto a little hony and allume is put, is an excellent gargle to wash any sore mouth or throate, for it cleanseth and healeth them in short space, if the sores be bathed or washed with the decoction of the leaves, roots and flowers, it helpeth much the defluxions of rheume from the head, which rose out of the stomack, & if the head be washed therewith, it helpeth the falling and shedding of the haire thereof: the greene leaves (saith *Pliny*) beaten with vinegar and applied draweth out thornes or prickes in the flesh. The *French* and curled Mallowes, and the Hollihocke, are of the same nature in quality, and work to the same effect that the other do. The Marsh Mallow is the chiefest Mallow of all other, as most effectuall to all the diseases before specified, and therefore as I said before, it was called *Althæa*, for that it was *Althe* as good in effect as the other; the leaves are likewise used in stead of the common Mallowes, to loosen the belly gently, and are effectuall in decoctions of glisters for to ease all the paines of the body, open the straight passages, and making them lubricke, whereby the stone may descend the more easily and with lesse paine out of the reines and kidnies and the bladder, and to ease the torturing paines concealing thereto: the leaves are of more especiall use for those purposes, as well as for the diseases of the breast and lungs, as coughs, hoarsenesse of the throate and voyce, wheesings and shortnesse of breath, &c. being boyled in wine, in whey, water and double: the roots boyled in water very well, and after they be strained forth the decoction boyled againe with sugar, to a just consistence and thereof made into rowles or trochisces, or the like, and so *hydromeled* and mixtified for all the purposes aforesaid: the roots and seeds of the Marsh Mallow, boyled in wine or water, is with good effect used by them that have any excoriations in the guts or the bloody flixe, so much by any binding qualitie in them, as by qualifying the violence of the sharpe cholericke humors that are the cause thereof, and by the sliminesse easing the paines and healing the sorenesse, and in some measure stopping the further emption of bloud therefrom, at that time, or any other affects it is profitably taken of them that are troubled with ruptures, crampes or convulsions of the sinewes, and boyled in white wine for the impostumes of the throate, called the Kings evill, and of those kernells that rise behind the eares, and inflammations and swellings in womens breasts: the dried roots boyled in milke and drunke, are specially good for the shin gout. *Hippocrates* used to give the decoction of the roots, or the juyce thereof to drinke, to those that were wounded and were ready to faint, thorough the expense and losse of bloud, and applied the same mixed with hony and fermented unto the wounds: the roots boyled in wine he gave also to drinke, to those that had received hurts by falles or falls, or by blowes and stripes, to those that had any bone or member out of joynt, and to those that had swelling paine or ache in the muscles, sinewes, or arteries of the body: it is great *Mithridates* receipt in all the and therefore he prescribed it in any cartilaginous place: The Mucilage of the roots, and of the seed and whole purslane, is much used in pultises, ointments, and plaisters, that serve to mollifie and digest, as also to ease and the inflammations of them, and to give ease of the paines in any part of the body: the seede taken or drie, mixed with vinegar cleanseth the skinne, of the morphew, and all other discolourings of the and being bathed therewith in the same, the seede of the yellow Mallow hath been found effectuall in the Marsh Mallow hath been also) to be of singular good effect against the stone, strangurie, or difficulty halfe at the most being made into powder, be given at a time, and if the effect wrought not the second time, or the third, and it will give helpe: it provoketh urine and easeth the paines thereof, and of the stone: it is used by the Turkes to procure rest and sleepe, as *Prosper Alpinus* saith: the juyce or powder of them, or of the seede, is used with good effect, to cleanse and heale greene wounds, by closing up the lippes of them quickly: The rest of the Mallowes doe participate of the properties of the

in that all of them have in some measure or other that clammie juyce that is in them.

Chap. LXVI.

Melochia sive Corchorus. The Iewes Mallow.

The Iewes Mallow (for unto that family I referre it, both for some forme like thereunto, but more for the properties) is a small low herbe, rising up a foote and a halfe high, from whose stalkes shoote forth diverse branches on all sides, whereon grow many leaves without order, up to the toppes, which are somewhat longer and broader than the leaves of *Basill*: those lowe likewise shorter and broader, almost round, yet all of them pointed, and finely nicked about the edges, having at the bottome of each leafe a small thred as it were on each side: which are of a little fayrish calle, the flowers come forth singly for the most part, but one standing at a place, every one upon a short foote stalk, consisting of 5 broad small pointed leaves, of a yellow colour, with some threds in the middle, which being past, there rise up slender long pods, somewhat like unto those of Swallow-wort, which when they are ripe, open into five partitions, shewing within them small seede, somewhat like unto *Nigella*, but lesser, rusty of a blewish greene colour: the roote is somewhat long, with many threds or fibres thereat, which perisheth every yeare.

Melochia sive Corchorus.
The Iewes Mallow.

The Place.

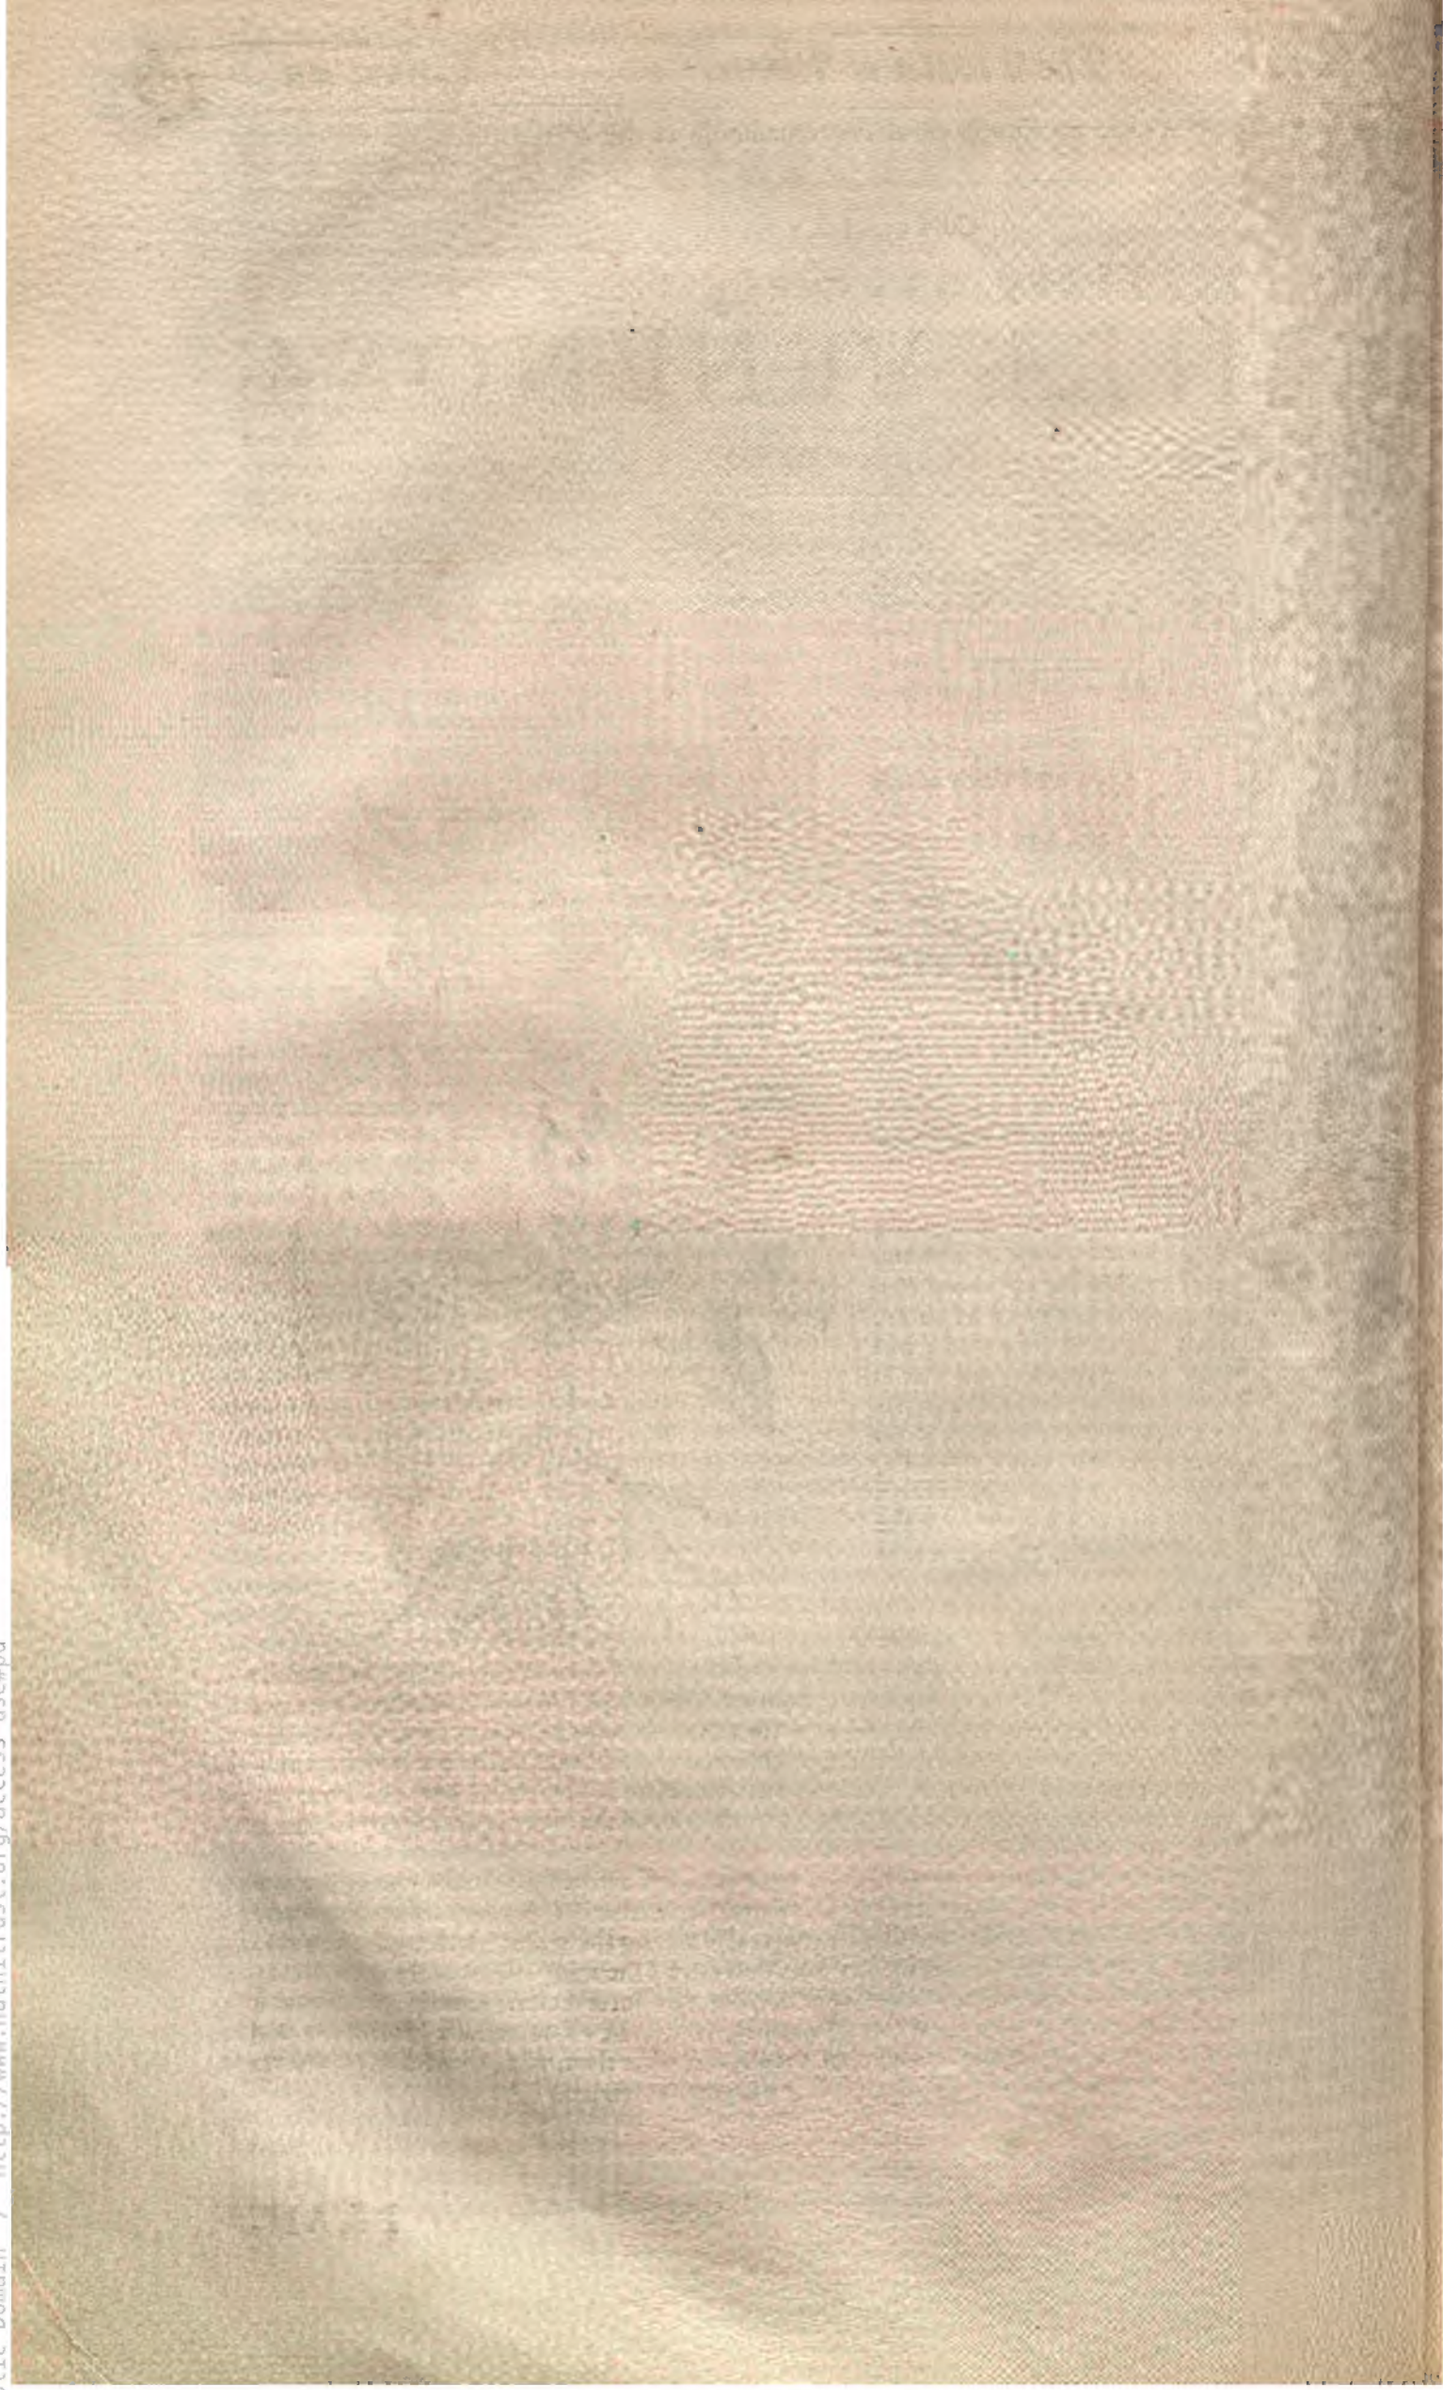
It groweth in *Apulia*, *Syria*, *Egypt*, and those places abundantly, in the gardens where it is sowne, as also in many places of *Spaine* and *Italy*, but the naturall place is not knowne. It is so familiar in *Egypt*, as *Alpinus* saith, that the scall or meales (meate that is made without a dish thereof, being boyled in water or fresh broth, is not thought to be sufficient plentifull.

The Time.

It seldome flowreth with us in regard that our Summers are not hot enough to bring it to maturity, for having often sowen it, we could never have it grow above an hand high, the first cold ayre in the night causing it to perish quickly.

The Names.

It is called of most *Melochia* or *Molochia* of *Seraphio*: it is thought by *Lobel* to be the *Corchorus* or *Cucorus* of *Pliny*, which he mentioneth in his 25 booke and 22 chap. but not that which he speaketh of in his 25, booke and 13 chap. which is that of *Dioscorides* and *Theophrastus* in his 7 booke and 7 chapter, for that is generally thought to be *Anagallis* or *Pimpernell*, as you shall heare when we come to it; *Rauwolfius* saith in his *Journall* that in *Syria*, *Egypt*, &c. they call it *Malachi*, and is that *Olus Iudaicum* that *Prosper* speaketh of. *Matthiolus* thinketh that *Halimus* or Purslane is the *Melochia* of the *Moores* and *Arabians*, because it was usually eaten as a pot herbe.



The Vertues.

It is as *Alpinus* saith in faculty very like unto the marsh Mallow, for it is much used to suppurate, digest, resolve, and mollifie all hard tumors: in that the mucilage thereof is more slimie than that of the marsh Mallow, a dramme of the seede he saith is usually taken at a time to purge plentifully all sorts of humours: the decoction of the leaves is very familiarly used against dry coughes, hoarsenesse of the throate and voyce, and shortnesse of breath, and with sugar candy is a present remedie: the oyle thereof is used so familiarly by the *Egyptians* in their meales as *Alpinus* saith, and that they seldome eate without it, notwithstanding that it breedeth many obstructions, and the vitious nourishment that it giveth, though little, turneth into melancholy and other diseases.

Vnto this Classis also might be added diverse other herbes, some whereof are set forth in the foregoing, and others in the succeeding *Classis*, such as they doe more especially partake with that Tribe where-in they are placed, as *Eryngium* before, and *Polypodie* afterwards, and diverse others also among the bulbous and tuberous rooted, set forth in my former booke, as Daffadills, Sowbread, &c. And thus have I shewed you not onely all the strong purgers, but many others that are but moderate, conducing or helping to open or loosen the belly. And now it is meete that I convert my stile to another Classis, or sort of herbes, which are those that are venemous, and deadly, or dangerous at the least; as also deepie and hurtfull Plants, and after them with those that are *Alexipharmace*, the Antidotes, or Counter-poysons, of poysonfull or dangerous Herbes.

PLAN.

PLANTÆ VENENOSÆ NARCOTICÆ NOCIVÆ, ET ALEXIPHARMICÆ.

VENEMOVS SLEEPIE AND HVRTfull *Plants*, and their *Counterpoysons*.

CLASSIS TERTIA, *THE THIRD TRIBE.*

CHAP. I.

Aconitum Lycoctum. Wolfes Bane.

I Have in my former booke given you the knowledge and description of some of the Aconites or Wolfes bane, and therefore I shall not needs to describe them againe, I will onely recite them unto you, and so follow on with the rest: those already set forth are these, *Aconitum hyemale*, Winter Wolfes bane, *Aconitum luteum pontica parte*. The earlier whitish yellow Wolfes bane. *Napellus verus flore cæruleo*. Blew Helmet flower, or Monkes hood, and *Anthora*, the lesloome helmet flower or counterpoyson Monkes hood, yet some of their figures I will insert among the rest.

1. *Aconitum Pannonicum serotinum flore albido*. Late flowring Wolfes bane.

This late pale yellow or whitish Wolfes bane, hath as large leaves as the other, that I have set forth in my former booke, and divided into as many partitions, cut also on the edges some what deepely, but of a fresher greene colour, and not rising or springing up out of the ground, for almost a moneth after the former is come up; the stalke with leaves thereon, riseth to be foure or five foote high, as the other doth, and with as long a branched head, of pale yellow coloured flowers, almost whitish, as it doth; but floureth later by almost a moneth, than the other: the cods, seede, and roote, differ not from the other.

2. *Aconitum flore Delphinii majus*. The greater leafed Wolfes bane, with Larkes heele flowers.

This Wolfes bane, hath diverse greene leaves, rising from the roote, of a very fair or darke greene colour, standing upon reasonable long foote stalkes, cut in on the edges, into five deepe divisions for the most part, even to the stalke, some what rough or hairy, each part whereof is also dented about the edges: from among which riseth up a reasonable great and strong hairy round stalke, about two foote high, having some such like leaves thereon, as grow below; at the toppe whereof is set many flowers spike fashion, one above another, which are fashioned some what like those of Larkes heeles but larger and thicker, with a short thicke crooked heele, behind them, of a very dead or sad blewish purple colour, seeming as if they were rugged or mouldred withall, which addeth a greater evill favoured nesse unto them, on the outside, but of a little fresher or more lively blew colour, and smooth on the inside: after which doe come diverse small rough cods, standing together like as other *Aconites* and *Columbines* doe, wherein is contained a rugged blacke seede: the roote is somewhat rooke long and blackish, with diverse hires and long stringes fastned thereunto, whereby it taketh strong hold in the ground: both stalkes and leaves dye all downe to the ground every yeare, and shoote forth new every spring.

3. *Aconitum flore Delphinii minus*. The finer leafed Wolfes bane with Larkes heele flowers.

The lesser Larkes heele Wolfes bane, hath diverse smooth greene leaves, upon very long foote stalkes, but they are not altogether so large, or of so sad a greene colour, and much more finely cut in and divided into many jagges or parts, than the former: the stalke also riseth not up so high, and beareth some smaller and finer leaves thereon, which endeth in a smaller spike or head of almost as large flowers, with a short spurre or heele behind, as the other, but of a fairer blewish purple colour, and more lively, as well on the outside as inside: the cods and seede alwaies like the former, but the roote differeth having three or foure thicke short blackish rootes, ending in small long strings, tassled together at the head.

4. *Aconi-*

6. Aconitum autumnale. The Harvest Helmet flower.

7. Aconitum maximum cum bulbis. Great Woolfes bane with a bending top.

4. *Aconitum cæruleum minus, sive Napellus minor.* The small blew Helmet flower.

The small blew Helmet flower riseth up with a round greene stalke, two or three foote high, whereon grow divers darke greene shining leaves, cut into five partitions very deepely, each of them somewhat cut upon the edges, very like unto the leaves of the greater blew Helmet flower, but that these are not so finely devided, and the divisions are somewhat broader: the top of the stalke is divided into two or three branches, each whereof beareth one flower, and seldome two or three, of a very faire deepe blewish purple colour, very like in forme unto the other great Helmet flowers, but that the flower is smaller, and the crest of the Helmet riseth higher, then in that; after which come small pods like the other, and such like seede: the roote is round like a Bullome, big below and small above, and encreaseth thereby, giving such like roots, with smaller fibres thereat, then as the greater roote.

5. *Aconitum hyemale præcox.* The early flowring Woolfes bane.

The early Helmet flower or Woolfes bane, riseth up very early in the spring, with many thicke shining darke greene leaves, cut into five divisions, and they againe somewhat devided or cut in on the edges, but not so finely as those of the greater Helmet flower, neither whitish underneath as they are, but rather of a paler greene on the one side and shining, as well as the upper side: the shining round greene stalke riseth not fully so high as the Helmet flower, being not much above two foote high, having divers leaves thereon, like those below, but smaller, and at the top but a few flowers, in comparison of the other Helmet flowers, but are like unto them both for forme and colour, being of a most brave, deepe blewish purple colour: after which come three pods standing together for the most part, and no more, wherein lyeth such like round blackish seede, as are in all the rest of this kinde: are very like those of the greater Helmet flower, and encreaseth as much, by seeing of sundry such like seeds.

6. *Aconitum cæruleum Autumnale.* The Harvest Helmet flower.

This late flowring Helmet flower is very like also unto the smaller Helmet flower, rising as high and having such like darke greene leaves somewhat shining, devided in the same manner, but somewhat larger: the flowers grow in long tufts, of a faire blewish purple colour, the pods and seede are like, but the roote hath onely divers blackish strings or fibres, set at the severall rutes of heads, which are not Turnep like nor Bullous like, as the greater and lesser Helmet flowers are, which maketh the difference, besides the time of the flowring which is not either of the other, that is not flowring until *August*.

7. *Aconitum maximum cum bulbis.* Great Woolfes bane with a bending top.

The great Woolfes bane hath very long and slender stalkes, even three or foure foote high, devided at the top into many branches, with long spikie heads, of very large flowers, which for the weakenesse of the stalkes and the weight of the many flowers growing together, bow downe their heads: for the flowers are greater and larger then in any other Helmet or Woolfes bane flowers, and of a paler blewish purple colour, then in the Helmet flower: the leaves also are larger, and more devided then in any, except the lesser Woolfes bane,

with Lathes heele flowers: the pods are greater and ſtand three or foure together, with larger rough blackiſh ſeede in them: the roote is thicke and long, ſomewhat like unto the rootes of the greater Helmet flower, and encreaſeth ſuch like heads by it in the ſame manner.

8. *Aconitum purpureum aliud.* Another purple Helmet flower.

This other purple Helmet flower hath larger leaves then the other, of a ſadder greene colour and ſhining withall, but inciſed after the ſame manner: the ſtalke likewiſe groweth very high and often ſpreadeth into ſundry branches, bearing large purple blew flowers in longer ſpikes then the other: the ſeedes and rootes be much like the other Helmet flowers.

Aconitum hyemale. Winter Woolfes bane.

This is deſcribed in my former booke.

Vnto theſe kinds of *Aconites* may be referred the *Anthora* or *Anitthora*, ſet forth in my former booke, for that in the outward face and forme of growing, it doth ſo nearely repreſent them, that it made *Cluſius* thinke it muſt alſo be of the ſame deadly quality with them; and although the name doth import it to be the remedy againſt the poyſon of the herbe *Thora*, which ſhall be ſhewed in the next Chapter, and ſo might challenge to be rather inſerted among the *Alexipharmaca*, Counterpoiſons, yet becauſe both it is as I ſaid ſo like unto thoſe former *Aconites* in the flowring, and yet is the remedy againſt the poyſon of theſe *Aconita*, as well as of that *Thora*, I thinke it fitter to mention it here then there, and give you the figure and properties thereof likewiſe, among the vertues, although I have ſaid ſomewhat of them formerly.

The Place.

None of theſe plants grow naturally wilde in our country that ever I could certainly learne, although Doctor *Turner* in his life time, ſeemed to affirme, that he ſaw ſome of their kinds growing on certaine hills in *Northumberland*: they all grow in Woods and ſhadowie places in *Italy*, *Germany*, and other places.

The Time.

Some of theſe flower earlier and ſome later then others, according as their ſides reliſhe; the laſt flower in the end of *May* or beginning of *June*.

The Names.

It is called in Greeke ἀκόνιτον *Aconitum*, *ita dictum* ſaith *Plin.* *quia in multis cautibus naſcitur, quæ ἀκόναι nominantur, ubi nullo ferro aut pulvere quidam nutritur*, which *Ouid* expreſſeth in the ſeventh booke of his *Metamorphoſi* in theſe verſes.

Quæ quia vel cuntur duris ſaxiſque creatur
Hyrſuta ἀκόνιτα vocant .....

Theophraſtus ſaith it tooke the name ἀπὸ τῆς ἀκωὴ τὴν ἰσχύν, *Is autem ſucus eſt Pardalianches, quod ad Heracleam Ponticam*, which *Pliny* ſaith againe in his ſixt booke and firſt Chap. *Portus Acone ſeptima Aconiti dicta*. But *Pena* miſliking theſe deriuations ſaith, *Aptior fuerit Nomenclatura a verſutia, ſi quem ab herba ſucco, veſtutiæ, quibus aut ſecute ſpicula a venatoribus affigebantur, aut ſubulæ, ſeu lamnæ ſubtiles, ac pernicioſæ aſſerrentur, quam ſi a cautibus, aut a patre cognomine dediſſet*: yet ſaith he *poſſe rerum inſtitutorem ſic dixiſſe, quemadmodum & Græci nonnulli ſentiunt & nos ſæpe*, for even ſo *Xenophon* in *Cyropædia* ſaith, *Eſt ſeu vellem, ſeu nollem, ſuccus quidam ex herbis quibuſdam. Neque enim jaculari neque in hominem collimare permitterebamus nobis*: it is called *Lycoctonon* & *Cynoctonum* becauſe it killeth Woolves and Dogs, in Latine *Aconitum* & *Lapparia*, for the ſame cauſes: for the name of *Aconitum* was referred to many ſorts of poyſons, and poyſonous herbes, one much differing in face, though not quality from another, as hath beene ſhewed before in the white Pillebot and others, and may be hereafter more as occaſion ſhall ſerve. It is called of the *Arabians Chamechadi* or *adie dadi*, *ſtrangulatores lupi*, of the *Italians Aconito* & *Luparia*, of the *Spaniards Yerua mortal lobo*, of the *French Tuelloup*, of the *Germans Wolffswurtz*, of the *Dutch Wolfswortel*. The firſt kind here ſet downe is called by *Geſner* in *hort. Ger. Aconitum primum flore albo*, *Camerarius in horto* under the name of *Aconitum Lycoctonum flore luteo* diſtinguiſhing both the kinds very well, ſaying the greater hath the largeſt leafe and faireſt greene colour and flowreſt, later then the other, it is thought to be the firſt kind of *Aconite* that *Matthiolus* giveth onely the dimble figure thereof. The ſecond is called of *Clusius Aconitum Lycoctonum flore Delphinii ſp. Bellicum*, of *Camerarius Aconitum flore Delphinii* of *Geſner in horto Germaniæ Aconitum cæruleum aliud*, of *Bauhinus Aconitum cæruleum birſutum flore Conſolidæ regalis*: the third is the *Aconitum flore Delphinii* of *Dodonæus* and *Lobel*: of *Dale hampius Aconitum Lycoctonum cæruleum ſp. flore Delphinii Dodonæi*: it is probable to be the fourth *Aconitum* of *Matthiolus*, *Bauhinus* calleth it *Aconitum cæruleum glabrum flore conſolidæ regalis*: the fourth is called *Aconitum Lycoctonum tertium cæruleum parvum* of *Dodonæus*, of *Lobel Lycoctonum cæruleum parvum ſicle Napelli*: it is the tenth *Aconitum* of *Cluſius*, who ſaith and ſo doth *Geſner* alſo, that is called in *Italy Thora Italica*, and of the *Chymiſtes* there *herba Iudæi*: of *Bauhinus Aconitum cæruleum minus, ſive Napellus minor*. The fift is called *Aconitum Lycoctonum* 4. *Tauricum* by *Cluſius*, and by *Bauhinus Aconitum violaceum ſive Napellus ſecundus*. The ſixt is the *Aconitum Lycoctonum alterum* of *Dodonæus*, and is the ſeventh *Aconitum Lycoctonum* of *Cluſius*, which he ſaith is called alſo *Autumnale*: The ſeventh is the eight *Aconitum Lycoctonum commutatum* of *Cluſius*, *Bauhinus* calleth it *Aconitum ſylveſtre commutatum*: the laſt is called by *Cluſius Aconitum Neubergenſe* and by *Bauhinus Napellus tertius*. I call all theſe kinds Woolfes banes and Helmet flowers, not onely for a diſtinction from the other ſorts that follow (for all theſe are in face and forme of growing, and in leaves, rootes, flowers and ſeede one, not much differing one from another) but to ſhew you that it is even *Dioſcorides* his diſtinction, who maketh this kind *Aconitum ſylveſtre*, which he ſaith was called *Lycoctonum* and *Cynoctonum*, although his former *Aconitum* called *Pardalianches* did kill Woolves as well as this, and that ſuch different herbes ſhould not goe in Engliſh under one common name of Woolfes bane, whereby it ſhould bee hard to underſtand in the naming of them what kind is meant.

The Vertues.

All theſe plants are poiſonous and deadly to mankinde, to be taken inwardly any manner of way, as that fearefull accident happened, whereby ignorance the leaves of *Lapparia* or *Napellus*, being put as a ſallet herbe with others, many that did eate thereof died, after the violent paſſions they endured for the time, it is alſo as deadly to Dogs, Wolves, and other creatures, who ſhall take thereof, either the juyce of the herbs or roote, or the herbe or roote it ſelfe, put into fleſh, and given them to eate: In the juyce of the rootes eſpecially, the hunters of wilde

Original from UNIVERSITY OF MICHIGAN

beasts, doe use to dippe the heads of their arrowes they shoote, or stabbe any thing at the wilde beasts, and killeth them that are wounded therewith speedily, yet it is said that the flesh of the beast so killed is not dangerous but safe, and eateth more tender than of others of the same kinde, not boiled in the same manner, but abide undressed for a day and a night. The ordinary physicall remedies that is to be used for any that have eaten of these herbes, is first to procure vomiting, with all the speede possible, to avoid as much of the evill humour that remaineth in the stomacke as may be; and secondly glisters, both to cleanse the bowells, and draw the poysonous quality downewards that way: and thirdly preservatives to defend the heart and vitall spirits from swounding on, or the blood from putrefaction or congelation; which are effected by taking Mithridate, or rather Venice Treakle, which is more appropriate for poysons; as also to drinke the decoction of *Origanum*, Rew, Pennyroyall, Wormewood, or Wormewood wine; as also Southernwood, *Chamepitis*, or ground Pine, and *Contrayerva*, a dramme of the true *Opobalsamum* taken with honey is much commended, and to be laid to, Poppey, Rue, of each a little quantitie taken in wine. Some commend also to drinke that wine, wherein Iron or Steele or silver, made red hot hath beene quenched. *Petrus Apponensis* in his Booke of poisons, commendeth the use of *Terra Lemnia*, a dramme or two, thereof to be taken in warme drinke; but above all hee saith that *Aranea longa*, or the long vncased Earthworm, is the most especiall antidote or remedy against all Aconites: this behold the wonderfull goodnesse of God, who although he hath given to these plants so deadly faculties, yet hath he endued them also with other properties, very benefitiall to mans health: as that the juice or distilled water of *Pentaphyllum* of both sorts, dropped into the eyes, taketh away the inflammation or redenesse in them, and preserveth them from any haw, or pinne or webbe, growing in or upon them. It is said likewise by *Pliny*, that if any be stung with a Scorpion, or other venemous serpent, or have taken any other poison, that to take of that next will expell the other; for finding another enemy already possessing the part that he would worke upon, it striveth to overcome his malignity, and spendeth his force wholely upon it, and thereby freeth nature. It raiseth (but this were a desperate cure for a desperate disease) and that by the touch onely of this Aconite, a corpse dead, and rotted againe by what Hellebor; how true this is I leave to every one to judge of as he shall thinke fit himselfe: but certainely if either the rootes or seedes of these Aconites, or of the other Helmet flowers be beaten into powder, or the juyce of them boyled with oyle, or Hogges fat, and the head and body anointed therewith, it will kill lice and vermine breeding therein; the eye also wherein the leaves, roote, or seede hath beene boyled, doth the same and cleanseth the head also from scurfe and dandraffe. *Galen* saith that they are good for foule vlcers and sores, to consume the dead flesh, so as the sores be not in the mouth or privie parts, which by reason of their vicinitie, to the spirits and life are not to be dealt with in such sorte: and the Helmet flowers (these all thought to be of one nature, howsoever it is spoken but of one that is the more common) A certaine preservative Antidote or remedy against the poison thereof, or to be made with the Mouse that feedeth upon the roote of *Napellus*, or Helmet flower, saying, that that Mouse is the Treakle thereof, and being taken in the whole substance, resisteth the venome of the *Napellus*, and freeth them from all danger; which Mouse *Aloadius* saith he hath often found, and saith it is that which *Actius* calleth *Napellus Mosis*, having the same properties against the poison of *Napellus*, that the plant it selfe so called hath. *Petrus Apponensis* also saith, that the Mouse that feedeth upon the rootes of *Napellus* is the *Treacle* against the *Napellus*, if it be dryed and two drams of the powder taken: but *Antonius Guainerius*, a famous Physitian of *Pavia*, in his Treatise of poisons disliketh it, saying, that it cannot be a Mouse, that *Actius* maketh mention of to feede upon the roote of *Napellus*, but that there are three great Flies that feede upon the flowers, whereof his Antidote is made that expelleth the poison: and thinketh impossible the industry of a certaine student in Physicke, desirous to know the truth hereof, who diligently hunted for this Mouse, but could neither find or see any, or that any rootes had beene eaten or bitten by Mouse or other thing, but found abundance of Flies feeding upon the leaves, which thereupon he made his Antidote with these in stead of the Mouse he made an Antidote, which he found to be very effectuall, not onely against the poysons, but chiefely that of the *Napellus* or Helmet flowers. *Petrus Pena, and Matthiolus de Libro* both this opinion, and experience of *Guainerius* his student by their owne travaile also, who not finding any Mouse nor hearing thereof by any the Shepheards, and others living in those mountaines of *Provence*, where *Napellus* groweth in great abundance, so that ever they had found any Mouse to feede thereon, should as they supposed feede of certaine great Flies, with blew greene heads and wings, like unto *Cantharides*, feeding upon the flowers, when as they could not finde any other living creature, to touch or taste it; the cattle every where being eaten by the Castle that fed thereby, but not any part thereof once touched. And therefore doubteth that this *Mouse*, was mistaken by the *Arabians* for *Mus montanus* the Circle mouse as well as the Latine, being neare in letters the one unto the other: (for the roote of this *Napellus* killeth Mice as the name expresseth, *Myophonon* doth import:) of which Flies as they say, and not of any Mouse, to make an antidote as well against the poison of the most venemous Spider called *Tarantula*, as also against all other poisons whatsoever, or pestilent, or contagious diseases, and is made after this manner. Take twenty of the Flies that have fed upon the flowers of *Napellus*, of *Aristolochia* and *Bellamonte*, of each a dramme, whereof a dramme is to be taken at a time. Or this Antidote is to be made with *Terra Lemnia*, Bayberies and Mithridate of each one dramme, and twenty Flies that have fed upon *Napellus* of Thora and oyle a sufficient quantitie, to make it up into an Electuary. You may see hereby the various opinions and Writings of men, *Matthiolus* and *Aponensis* saying they have found and used the Mouse, that fed on the *Napellus*, and *Guainerius*, *Pena* and *Lobel* denying it, which (whether true and most probable, is in part shewed before, and in this may be confirmed, that *Mathiolus* and others write, that the *Aconitum Lycoctonum*; whereof *Napellus* is a kind and as some) is also called *Myophonon*, *Myophonos*, that is *Adricida*, because it killeth Mice, as well as Wolves, and therefore they could not live by it if it would kill them. The *Anthora* or Counter poison of Monkes hood, is said by all Authors that it groweth neere or hard by the *Napellus* or *Thora*, although *Gerard* saith the contrary, and adviseth that it be not planted neere the *Napellus* or Helmet flower, for feare of drawing the venemous qualitie thereof unto it. The roote of *Hugo Solerius*, to purge the body very strongly, of waterish and vicious humours, both by vrine and by the stoole the quantitie of a beane, be taken in broth or in wine: by reason of the exceeding bitternesse of the same it killeth all sorts of wormes in the body: it is also saith *Guainerius*, by mine owne experience availeable as effectuall *Diptamnus* unto all the purposes whereunto it serveth: the powder of the roote taken as hath been said, is a speciall remedie and speciall remedie against the windie collicke, which the *Sauoyards* about *Dauin*, where it groweth

ilantly, know very familiarly, and call it *L'herbe du maschon*, that is, the wind colliche herbe, and fo[r]saith that of having two round roores, the one will be full and folide one yeare, (as it is in the *Cyclamen* or *Sowbread*) and the other lanke, which changeth to be folide the next yeare, when the other that was folide in the former yeare, will then become lanke; that the folide roote will eafe the winde chollicke, and the lanke procure it: the lanke roores alfo vfed inwardly, is not onely the chiefe and principall Antidote or remedie, againft the poyfon of theife Wolfes banes, and Helmet flowers, but of the Leopards bane, which fhall be defcribed in the next chapter, and all other poyfonous herbes whatfoever: and againft the venome of all ferpents and other venemous beafts or creatures, and is alfo a moft foveraigne remedy againft the plague or peftilence, and all other infectious, or contagious difeafes, which raife fpots, pockes, or markes in the outward skinne, by expelling the poyfon from within, and defending the heart, as a moft foveraigne Cordiall.

CHAP. 11.

Aconitum Pardalianches five Thora, Leopards bane.

Of this fort of Leopards bane, there are accounted two feverall forts, differing in bearing more leaves, one than another, as alfo in the greatneffe of theire, and of the whole plante, which yet might rather be attributed, to the fertility or barrenneffe of the foyle, wherein they grow: but as they are remembred by others, fo I muft proceede alfo, and fet them forth here unto you.

1. *Aconitum Pardalianches five Thora minor.* The leffer Leopards bane.

The Leopards bane is a fmall low herbe, rifing up with a fmall ftender round ftalke, little more than halfe a foote high, bearing about the middle thereof but one fmall ftalke or hand leafe, for the moft part, but fometimes two or three one above another, and fometimes two together, which are round fomewhat like the leafe of *Afarum*, but leffer, fmooth, and of a blewifh greene colour full of veines therein, fomewhat unevenly dented about the edges, not compaffing the ftalke, but ftanding from it, upon fhort foote ftalkes: the toppe of the ftalke is divided fometimes into two or three branches, with a fmall narrow leafe at the joint, and one fmooth pale yellow flower at the toppe thereof, fomewhat like unto thofe of *Cinquefoile*, or five leafed grafle, conffting of many of foote, and in fome of five round pointed leaves, with a fmall greenifh head in the middle: which when their flower is fallen, groweth to be a fmall head, conffting of many fmall feeds clofed together, like unto the heads of diverfe forts of *Ranunculs*, or Crowfeete: the roote is compofed of feven eight or more, fmall long round very white ftanding roores, fomewhat unevenly as it were brauched out like knots or joynts in diverfe places, plainely to be difcerned in fome, but in others not, being plaine and fmooth, ending in a fmall long fibre, and all of

1. *Aconitum Pardalianches five Thora minor.* The leffer Leopards bane.

2. *Aconitum Pardalianches Dioscoridis, Matthioli & aliorum Herbas Anglicum ejt.* Small yellow winter Aconite or Leopards bane with flowers like to Helmet.

Original from UNIVERSITY OF MICHIGAN

them fattened at the head thereof, like unto *Asphodill* rootes, of the most pestilentiall qualitie, that hath been found in any other herbe.

3. *Aconitum Pardalianches sive Thora maior.* The greater Leopards bane.

The greater Leopards bane, is in all things like unto the lesser, before described, but that it is greater, and riseth higher, having larger leaves, and finely dented about the edges, and two or three standing together about the middle of the stalke, some smaller than others, and sometimes one above another, and some small among the narrow ones at the joints and branches forth into two or three parts or more, bearing every one his small yellow flower, like the former: the seede and roote is also like the other.

3. *Aconitum Pardalianches Matthioli icon nostrum.* *Matthiolus* his fained Leopards bane.

I thinke it not amisse to set forth unto your view that figure of *Matthiolus*, which he (as it should seeme) would be drawne according to his owne fancie, taking his patterne from this *Thora*, and desirous to expresse it to some nearer resemblance unto *Dioscorides* his description, of *Aconitum Pardalianches*, hath set forth a foure square rough leaves, and one long crooked roote, launched out in diverse places, like unto the tayle of a Scorpion, which figure bred a great contention betwixt *Gesner* and him, *Gesner* laying to his charge, that he had not only not described it, but fained it, and that there was no such herbe, *in rerum natura*, because it was made so artificially, and with such figures, which all other rootes have, whereby they draw nourishment out of the earth. *Matthiolus* in the defence to that point alledgeth, that *Dentaria* which we call Tongwort, hath an herbe, being a roote consisting of scales, as it were set together; as also in that other roote called *Dentaria bulbifera*, which as *Matthias Gilch*, the *Germans* call *Sanicula alba*, and he setteth forth among the *Synonima*; but the Author of the new Herball printed at *Lyons* wher was *Joannes Molinæus* and going under the name of *Dalechampius*, but if ever writers called *Lugdunenses*, taketh upon him the defence of *Matthiolus* his incertaine in his appendix to the generall history, and sheweth the same figure of *Matthiolus*, with a stalke of leaves and flowers added to that the former wanted, and with all giveth the description thereof in this manner; it riseth up (saith he) early in the yeare, if the spring be milde, with his stalk, before any of the lower leaves appeare, as the Colte-foot maketh his burre doe; having foure small round hairy leaves upon the stalke, set by couples at distances, the flowers many growing in a tuft, or round head together at the toppe thereof, of a pale yellow colour with many purplish threds in the middle: when the flowers are past, then commeth up the leaves, which are foure at the first, and are almost round, hairy and greene on the upperside, and hoary white underneath, full of ramifications running through them, and full of small pores: the roote consisteth of many knots and joints like unto a Scorpions taile, in the same manner as *Matthiolus* hath set it forth in his figure: thus he saith groweth on the Alpes at *Trent*, not farre from the chiefe Mountaines of the *Carthusians*, in a rough rockie place, which they call *Scala*, that is, the ladder, because the way of the rocke, is cut out into steppes, to get up to the toppe: and saith that he saw with his owne eyes, and that an Apothecary of *Trent*, who had diverse plants growing therein his garden, and abiding many yeares, from whom he obtained the whole plant to set forth, to end the controversie betweene two such worthy men; and yet this figure is much suspected also to be but counterfeit, by *Colonna* the 44. page of his *minus cognitarum stirpium*, &c. by *Bauhinus* and many others: but if I might shew mine opinion, I would rather thinke that *Matthiolus* set forth his figure a little artificially from the *Doronicum orientale*, which hath round leaves and such a like roote: if I be mistaken let it be accounted my error.

The Place.

The first groweth in shadowie places, on the snowie hils in *Savoye*, where there is scarce any dust or earth for the rootes to grow in, neere unto *Susa*, and in the toppe of *Iuga*. The second groweth in the higher, among those Alpes of the *Valdesies*, that respect *Italy*, called *Vallesiacum* and *Lugranum*, as also upon the mountaine *Baldus*, which is not farre from *Verona*; the last his place is declared in the description.

The Time.

They all but the last doe flower in June, and July, which are the spring Months of the Alpes, and the seede is ripe in August.

The Names.

It is called in Greeke by *Dioscorides* ἀκόνιτον ὁ παρδαλιάγχες, *Aconitum Pardalianches*, because the herbe the Leopards, Wolves, and all other foure footed beasts very speedily. It is called of diverse also *Thora*, from the Greeke word θόρη, that is, *corruptio*, *venenum aut mors*. *Theophrastus* describeth it in his ninth Booke of Plants, 17. Chapter, under the name of *Thelyphonon*, because it is a speedy death to females; or because being put into the secret parts of females, it speedily killeth even within a day. *Gesner* and others take it to be *Lycoctonum* of the 4. his 17. Booke and 10 Chapter, which he saith is an herbe so called by the *Scythes*, where with they doe annoint their darts, to dippe their arrow heades in, when they hunt wild beasts, which they call *Cynoctonum*. *Gesner* himself was called of some in his countrie, *Lunaria*, because the leaves were round like unto a foil Mucone, himself calleth it *Thora Veronensis* and *Pardalianches Valesiacum*. *Clusius* maketh it to be his third *Aconitum primum*. *Lobel* calleth it *Thora Valdensium*. *Matthiolus* in contempt of *Gesner* calleth it *Pardalianches minus*, as though it were but a base kind of *Aconite*, without force or vertues, (which it seemeth he rather of the heate of his contention, and correlation with *Gesner*, who alledged that this was the true *Aconitum Pardalianches* of *Dioscorides* than in the truth of the matter) it being the roatest to *Dioscorides* his description in all parts as well as in the rootes which are shining white like Alablaster, and the strongest and deadliest of that manner of herbes. It may be called in *English*, either round leafed Wolfes bane, or Leopards bane to distinguish it from the former.

The Vertues.

Dioscorides giveth no other properties to this kinde of *Aconite*, then death to all foure footed beasts, even to them in deed, besides the helpe it giveth to the eyes in easing their paines, being put into those parts that are for that purpose: *Theophrastus*, and *Plinie* after him say, that it is a remedy against the Scorpion, being taken in warmed wine, for as hurtfull nature is to finde out an enemie in nature, whom it may kill, against whom it useth and spendeth its strength, to overcome it, that it might free nature of danger, even so doth *Plinie* call it *Scorpius* because the roote was like a Scorpions taile, it seemeth also it was upon the like occasion called *Thora*, because it killeth Serpents; for they say, that the Scorpion is a stonied, and looseth both strength and mo-

Original from UNIVERSITY OF MICHIGAN

being early touched with the Aconite, and receiveth life and strength againe, if it bee touched or rubbed with white Ellebor. It is found by most certaine experience, that it is the fiercest and speediest poyson, surpassing all other, that groweth on the ground; and that they used to lay in the former times, there was not found any remedie against it, although many things had been ervyed, but of later times the industry of man hath found out that *Antigonus* an Counterpoyson, which is the *Antidote* before declared. *Gesner in Thesauro Euonymi*, reporteth that if a sword, dart, or arrow, be but touched with the juyce thereof, and therewith either man or beast wounded, tho' any blood be drawne, the malignity thereof so quickly pierceth inwardly, that it presently killeth, corrupting and congealing all the blood, unlesse that part round about the wound be instantly cut away, and that it killeth any wild beast so wounded, after three or foure leapes or springings, but that which is more wonderfull in my opinion he saith that the flesh of that beast so killed, is not deadly or dangerous to any that shall eate thereof; therein peradventure like the baite that is given to fish, to make them lye on the toppe of the water, easie to be taken with ones hand, and yet not fit for man to be eaten, and *Pliny* saith it killeth fish, whereby as her saith it is knowne, that that poyson is an enemie to the blood. For he saith, that if any blood should fall into the pot, where the poyson is kept, it will presently loose its strength. It is said also that it is so pernicious, that if it be but held in the hand a little time, it will almost take away the senses; as also, that one but smelling thereto, after he had gathered it fell downe as dead, and with much a doe was recovered.

Chap. III.

Doronicum sive Aconitum pseudum. The supposed Wolfes bane.

THose adjoyne this herbe *Doronicum*, next unto the Wolfes banes, because many doe hold it a kinde thereof, which how true or false you shall heare by and by in his place. Of this kinde there are found diverse sorts, differing either in roots or leaves one from another, and some for the likenesse, or flowers, or manner of growing, are referred unto them, as shall be presently declared.

1. *Doronicum vulgare.* The most common supposed Wolfes bane.

The most common *Doronicum* (that hath beene longest known unto us, and kept in our gardens, many of the rest being found of later yeares) hath diverse leaves rising from the roote, every one standing upon a long foote stalk, which are somewhat round, greater than the Romane Sowthistle leaves, soft and gentle in the handling, somewhat hayrie and of a fresh greene colour; from among which riseth up diverse greene roundish stalkes about a yard high or more, parted at the toppe, sometime into one or two branches, every one carrying a large flower, somewhat like the Corne Marigold, but much larger, having many narrow long yellow leaves, as a border set about a middle thrummie, somewhat yellower, which when it falleth away, turneth into small whitish downe;

1. *Doronicum vulgare.*
The most common supposed Wolfes bane.

2. *Doronicum minus.*
The lesse supposed Wolfes bane.

with

3. *Doronicum Scorpioides.*
Scorpion rooted supposed Woolfs bane.

with very small blackish seede, which is carryed away with the winde: the roores are small, thicke and short, creeping at first vnder the vpper crust of the earth, with divers small fibres, shooting from them downe into the ground and increasing diverse tuberous roores round about it, which are tender and white somewhat whitish and with some joynts therein, and greenish on the vpper side next into the vpper face of the ground: that would make these roores to resemble a dead Scorpion, because of the joynts, which are like scales therein; the former part next the leaves, being thicke to be the body, and the other part being small to be the taile, which is somewhat sweete in taste and a little bitter, with some austere clammynesse joyned therewith.

2. *Doronicum minus.* The lesser supposed Woolfes bane.

The lesser *Doronicum* hath divers leaves, longer and narrower then the former, somewhat like vnto Ribwort Plantane, but hairy and of a yellowish greene colour; the stalkes are slender and rise nothing so high, nor are much branched, but among the like yellow flowers as the former, somewhat paler whereof is small not like the former being without those joynts to plain in them.

3. *Doronicum Arabicum radice.* Scorpion rooted supposed Woolfes bane.

This Scorpion rooted *Doronicum* hath large round hairy leaves, like the first, somewhat waved or unevenly dented about the edges, of a sadder greene colour and somewhat bigger; the stalkes have divers narrower leaves thereon, the flowers are yellow as the leaves thereof dented at the ends, the seede is like vnto other, but the roote creepeth not so much, but is somewhat longer thrust downe into the ground, with joynts growing downwards, branched as it were on each side with young roots, and ending in a small point, with divers long fibres set vnto them.

4. *Doronicum Austriacum angustifolium.* Small supposed Woolfes bane of *Austria.*

This small *Doronicum* of *Austria* hath fewer leaves then the second, but soft, long, narrow and hairy like them, greene and somewhat shining on the vpper side, and of a paler greene vnderneath of a sharper biting taste: the stalke is slender, hairy also but smooth, and striped all along; whereon are set divers narrower leaves, compassing at the bottome, vp to the top, where there standeth but one large flower for the most part, like vnto those of *Doronicum*, but of a deepe yellow colour, which turneth into downe, with small blacke seede therein, not carryed away with the winde, in the like manner: the roote is small and joynted somewhat like vnto the rest, not increasing to fast, with divers long fibres thereat.

5. *Doronicum humile Styriacum Clusij.* The low Styrian supposed Woolfes bane of *Clusius.*

This low *Doronicum* hath many large and somewhat rouud leaves, dented about the edges like vnto those of Scorpion before expressed, standing vpon high footestalkes: the stalke is lower then it, having some leaves thereon longer and narrower then those below, and at the top (not having any branches) one flower larger then any of the former, but like vnto them, with many long yellow leaves, set about a middle brow with yellow thrumme: the roote is somewhat long, blackish on the outside and joynted but not plainely to bee discerned, the joynts being vpwards, and not downewards as they doe, in most of the rest, with some other roots growing from it, having many long white fibres underneath it.

6. *Doronicum Germanicum.* The supposed Woolfes bane of *Germany.*

The *Doronicum* of *Germany* hath divers broad hairy leaves, of a yellowish greene colour on the vpper side, whitish and smooth vnderneath lying on the ground somewhat like vnto broad Plantane leaves, or rather vnto the Groundwort *Senecio*, having some long ribbes therein: among these leaves riseth vp a stalke, sometimes many, bearing long leaves, at every joynt; at the top it brancheth forth into two or three, or more sometimes, bearing every one a faire large flower, set as it were in a rough cup, which consisteth of some pale yellow leaves, dented at the ends, as a pale or border about the middle, which is made of many small flowers of foure leaves a peece, of a deepe yellow colour, as it were the thrum. *Bauhinus* saith that there is another hereof seene found in *Styria*) with blew flowers, which being past, the head turneth into downe, and is caried away with the small blackish seede therein: the roote is small, yet joynted like the former, but not plainely to be discerned, of a sweete scent and a bitter biting taste, having many fibres vnderneath, or some manner of fets, whereby it is increased.

7. *Doronicum maximum Austriacum.* The greatest supposed Woolfes bane of *Austria.*

This great *Doronicum of Austria* shooteth forth many faire greene leaves from the roote, lying round about which are broad, hairy, rough and somewhat round jointed at the ends, every one standing vpon a long stalke: but those which are set vpon the stalkes, which rise three or foure foote high or more, are longer then those below, set without order, and compassing it at the bottome like Tobacco leaves, all of them finely vnevenly dented about the edges: the flowers vpon the toppes of the leaves of the stalk are large and yellow like vnto the common *Doronicum*, which after they are past, the greenish seede with the downe, are conveyed both away together with the winde: the roote is thicke and joynted like vnto the rest, increasing as much as any other.

8. *Doro-*

8. *Doronicum Helveticum incanum.* The hoary Helvetian supposed Woolfesbane.

The hoary *Doronicum* of Helveria, riseth up with a round hollow greene stalke, a foote high or more, beare thereon divers leaves somewhat longer and more pointed, then those that grow next the ground, some whereof are round, and others long and round, yet all dented about the edges, of a pale greene colour on the upper side, with a white rib in the middle, and of a mealie hoarinesse under neath, as the roots stalke is also: the flower is great yellow that standeth at the top of the stalke, with many long narrow leaves, not dented at the edges, but round compassing the middle thrumme: the seede is carried away with the downe, like unto others: the roote is small, joynted, and as it were scaled like the rest.

9. *Doronicum Helveticum humile.* The low supposed Woolfesbane of Helveria.

This low *Doronicum* of *Helvetia* or *Switzerland*, hath many thicke, darke, greene, hairy leaves, and of a pale greene underneath, lying next the roote being somewhat long and round and dented about the edges, from among which riseth up a short hairy stalke, not halfe a foote high, with very long and narrow leaves set thereon, parted at the toppe into two or three small branches, bearing yellow flowers, of a meane size or bignesse in comparison unto the rest.

10. *Doronicum Americanum.* Supposed Woolfesbane of *America.*

This strange *Doronicum* hath divers very large leaves next the ground somewhat rough and hairie, divided into five parts, each part being five or six inches long, and two inches broad, pointed at the ends and deeply dented on the edges into three parts: from among which riseth up sundry smooth round stalkes set with the like leaves but somewhat lesser and lesse divided, and some little or not at all: at the top of every stalke standeth one large yellow flower like unto the former, the bordering leaves being long and narrow, and the middle thrumme with, and made as it were of many flowers set thicke together: the roote is great thicke and hard, full of many long strings. I have here given you two figures thereof, the one taken by us, the other by the *French*.

11. *Radices Doronici vulgo officinarum, & Radices Mechoacanæ & Labellinges Doronico genuino Arabum vel exhibite.* The Apothecaries *Doronicum*, and the true one of the *Arabians* as *Pona* thinketh.

I have here likewise particularly given you the figures of the rootes of two sorts of *Doronicum* as they are supposed to be, the former most generally received by all or most both writers & Apothecaries for their medicines, whose description is set downe before the other *Pona* in his *Italian Baldo* setteth forth supposing it to be more like the true *Doronicum* of the *Arabians* then the former, which doth not agree thereunto either in forme or vertue for *Avicen* in the 208. Chap. of his second Booke, and *Serapio* in the 325. Chap. of his Booke of simples doe describe their *Doronicum* to be a roote of the bignesse of ones thumb, of a hard and heavy substance, of a yellowish colour on the outside and browne within, with some white veines, and is hot and dry in the third degree: that *Serapio*, but saith *Pona*, I know no other roote more properly doth represent that *Doronicum*, then that of *Mechoacan*, which is often found among the *Mechoacan* or blacke Ginger, that is brought us chiefly from *Dominica*, which *Lobel* calleth *Mechoacanæ varietas*, having divers circular knotted lines as it were like joynts on them.

10. *Doronicum Americanum.*
The supposed Woolfesbane of *America.*

11. *Doronicum antiquorum Pona.*
Lobel his rare varieties of *Mechoacan* and the *Arabians Doronicum* by *Pona*.

sides, and is verie and heavy full of white veines therein when it is broken: it is also very sharpe, quicke biting and aromaticall in taste, and therefore saith he, having all the notes of true *Doronicum*, it can be no other then the true and legitimate *Doronicum*, from whom the ancients being so pregnant, I know not well how to dissent, yet leave it to others to judge as they shall finde cause.

The true rootes of the *Doronicum* in the apothecaries shops are missed, which should have beene in this table, but are expressed in the fift figure.

The Place.

The first groweth on the hills in *Savoy*, beyond the lake *Lemanus*, and in other places, both of *France* and *Germany*: the second groweth not farre from *Bordeaux* in *France*. The third on the woodly hills about *Trent*, and in *Austria* also as *Clusius* saith: the fourth *Clusius* saith he found on divers hills in *Austria*. The fift likewise about *Norberg* in *Styria*. The sixt is found in many places of *Germany*, in the medowes and elsewhere, and as it is thought, on the hilly grounds in *Northumberland*. The seventh groweth in many places, both of *Austria* and *Hungary*, as *Clusius* saith: the eight upon the *Alpes* in *Switzerland*: the ninth also on the same hills about *Vienna*, and the last came from the *French* colony about the river of *Canada* and nourished up by *Vespasian Robin* the *French* kings Herbarist at *Paris*, who gave Mr. *Tradescant* some rootes that hath encreased well with him and thereof hath imparted to me also.

The Time.

They all flower early for the most part, that is in *May*, and some of them in the *Autumne* againe.

The Names.

The name *Doronicum* which is given to all these plants is derived from the *Arabian Duronegi* or *Doronge*, for it is not remembred by any of the ancient Greeke or Latine Authors, except *Aëtius* who calleth it *Camelæodion*, divers have accounted it among the *Aconites*, as *Matthiolus* calling it *Pardalianches*, and referreth it to *Pliny* and *Theophrastus* their *Aconites*, whose roots are like Scorpions, as the outward face or forme of these are, which bred the suspition; when as the properties of these are not like their *Aconites*, to kill wilde beasts speedily with their Darts, or Arrowes dipped in the juice thereof; or to be a cauſtike herbe, able to eate away the flesh of a wound, and cause it to fall away: who having received it from *Cornutus* of *Padua*, defameth it to all the world, to be a poyson not fit to be used inwardly in mans body, and that those Physitians that follow the *Arabians* to put it into Cordiall medicines, doe very ill, and little respect the health of man, because both as *Cornutus* writeth unto him, and himselfe upon tryall made as he saith found to be true, that it will kill dogs, the roots being given them in flesh, which report of theirs how soever he true in dogs, may notwithstanding be not true, being given to other beasts, and may be safely given and without danger to men: for divers things that are wholsome to man, and which we often use without scruple, or doubt of danger, as *Aloes* and bitter Almonds, yet given to a Fox, either of them will quickly kill him, as *Plutarch* reporteth; and the *Camelæon* Thistle as *Fabius Columna* writeth it downe, will kill dogs and swine, &c. and yet was most soveraigne Antidote against the poyson of Serpents, the roote being drunk in wine, and besides killeth the wormes in children without any further harme, as also even Muske, Saffron, and other things being taken in too great a quantity will kill any man: others hold them to be wholsome, as it hath beene certainly and often found true by good experience, that divers of these sorts are very effectuall to helpe many diseases in men, as you shall heare by and by, and therefore it is not probable, that there lyeth any venemous quality hid underneath those good ones; and besides, *Gesner* saith that he had taken much and often thereof, and had given it to others without any danger or harme; and *Pena* and *Lobel* reporteth that *Johannes de Vrede* did eate many roots thereof without any danger, or sense of paine thereby: and therefore doth advise others, not to abdicate the plant wholly from mans use, nor to dispise it for such fancies. *Arabian* authors, that have appointed it to be put into *Electuarium de gemmis*, *Electuarium Diamargaritum*, *Aromaticum*, and *Diamoschum dulce*, and others, as the most Cordiall medicines of all other, and whereof there was never harme taken whosoever did use them, or to say that any that followed their prescriptions were guilty of the death of any man. *Dodonæus* was also of the same minde with *Matthiolus* for a while, but afterwards found his owne errour and reclaimed it; but it is much doubted, whether this be the *Doronicum* of the *Arabians* or no; for *Leonicenus Pena*, in his Italian description of *Aloes Rodiæ*, as I said before, refuteth it, accounting it an auncient received errour, and therefore giveth us the figure of *Lobels Mechoacan*, for the true *Doronicum*, the faculties of these being quite contrary to their *Doronicum*, for besides a little sweetenesse and clammy taste in the roote, it hath little or no other taste, except that being fresh, some of them have an aromaticall, and some a bitterish sweet taste, like unto juice of Licoris: but the roots of the *Mechoacan* are of an aromaticall, sharpe & biting taste: the joynts in the roots of the ordinary *Doronicum*, very likely might cause the later age of the world to erre, in taking it to be the right: but leave we these controversies, and attend the varietie of names and properties of these sorts of *Doronicum*, which may better perswade us of the good to be reaped from them. The first is as I said the most common, both in the Gardens of our country and others, and is most usually called *Doronicum Romanum* of all writers: or with a sweete roote. The second *Clusius* and others call *Doronicum minus* and *Austriacum*, *Bauhinus* calleth it *Doronicum plantaginis folio*. The third *Matthiolus* calleth *Aconitum Pardalianches*, *Pliny*, *Dodonæus Pardalianches alterum*, *Pena* and *Lobel*, *Doronicum Brachiatum radice*, but *Cæsalpinus* setteth out the figure more truely & calleth it his second *Doronicum Austriacum*. The fourth is *Clusius* his first *Doronicum Austriacum flore minus*, and *Bauhinus Doronicum longifolium hirsutie asperum*. The fift is *Clusius* his fourth *Narbonense*, which he calleth *Styriacum*, and *Bauhinus Doronicum latifolium flore magno*. The sixt is called diversly, by divers; *Matthiolus* calleth it *Alysma* or *Damasonium*, and thinketh it to be the right *Alisma* of *Dioscorides*, and so doe *Camerarius* and *Gesner*, (who calleth it also *Calthæ Alpinæ*) *Pena* and *Lobel* call it *Nymphæa Cæruleo alba*, as *Rondeletius* did take it to be. *Lugdunensis* setteth it forth under the name of *Pyrethrum montanum*, as divers did call it there abouts as he saith, and yet setteth it forth againe under the title of *Alpinus Matthioli*. *Gesner* likewise hath set it forth in two severall places, under two severall titles, the one under *Calendula Alpina*, the other under *Chrysanthemum Latifolium*. *Clusius* calleth it *Doronicum Germanicum*, and saith his *Pentadactylon* or *Doronicum sextum*, is the same or very like, for both he and divers others doe set it forth, with smooth and hairy leaves, also as it is found to growing in divers and sundry places. The seventh is *Clusius* his *Doronicum Austriacum tomentosum*, which *Bauhinus* calleth *Doronicum maximum folio caulem ample amplexante*. The eighth and ninth

Bauhinus

Pentaphyllon forth forth in the 4 *Capitulum* and *Crux*, under the name titles they are here beare, the certain knowledge of *Pentaphyllon* either *Pentaphyllon Americanum*, and *Cornutus Americanus Helleborastrum Canadense*, but the upper leaves on the stalke, with the flowers and fruite, declare it to come nearer to the kind of *Ranunculus*; the tuberous roots likewise seem to shew it. They may all be called in *English*, either *Ranunculus* according to the *Latine* name, for so they both *Italians*, *Spaniards*, *French*, *Germanes*, and *Dutchmen*; or as I have entituled them supposed Woolfes bane, both that the name may differ from the former Woolfes banes, and to give you to understand that they are supposed to be dangerous, because as I find before the outward forme of the roote, like unto Shrimpes or Prawns, and the leaves round like unto the leaves of Sow bread or Cowcumbers, have caused many to think them to be the *Aconites* of *Theophrastus* and *Dioscorides*; but *Columna* hath treated very learnedly hereof in the 8 Chapter of his Booke of Plants aforesaid: I referre you, for it were too tedious a matter for me here to stay upon.

The Vertues.

The one *Doronicum* is held to be a soveraigne Cordiall, and to resist the poyson both of beasts and other creatures, to cleanse the breast and to helpe the cough, and to rid those humours that cause paines in the joints, our *Doronicum*, although it be not the true of *Serapio* and *Avicen*, yet it is no *Aconite*, as *Matthiolus* and others have supposed; for as is before said, both *Gesner* tooke it often, and a good quantitie was given to dogges in powder, that he might find the operation of it, yet found no harme thereby; and *Gesner* saith he tooke of it many times, without any harme; but what especiall good they found by it, is not remembred for *Gesner* maketh not any mention thereof: yet the juyce thereof is found to be good, for those eyes that are hot and red, and full of paine, by reason of hot and sharpe rheumes falling into them, to allay the heate, to take away the rednesse, and to give ease of the paines and prickings in them. *Gesner* saith that the hunters, and also heards that live in the mountaines of *Austria*, doe no lesse ute and commend the roote of the third and last sorte, here set forth, which grow with them more frequently than the others, as the least best known remedie, then they doe the roote of the yellow *Auricula ursi*, against the swimming or turning in the head, which is a disease subject to those places, rising from the feare and horrour, of such steepe downe falls and downe right rockes, which they doe and must continually passe, in seeking for and hunting the wild Goates, and therefore as they there call them *Gemsthiere*, that is, *Rupe aprum videns*, as *Clusius* doth interpret it; and there hath been found in their maw es a certaine stone, called by *Bauhinus*, in his Treatise thereof *Bezoar Germanicum*, in the middle of which stones, some of the rockes have beene found almost whole, which the wilde that they took in chase of, singly, without taking any harme thereby, and that the stones bred thereout are Cordiall, and found to be of no lesse worth, as the other *Bezoar*, saving they are all in forme, and places of growing, one to like commodious, if all were sufficiently made, would performe the same effect. For the fine form here expressed (which is also called *Cochlea Alpina* of some, *Alysson* or *Dentellaria* of others, and *Dorycnium Germanicum* of others, all the growing in the Alpes *Matthiolus*, as *Iosias Simlerus* saith, in his Commentarie of the Alpes, that is *Alysson* in many parts of the world, which they have found, and do continually ute to procure womens courses, and to rule the paines and diseases of the mother) is very effectuall against the poyson of the fish called *Lepus marinus*, as also the operation of the Shrew, and the poyson of a Toade, and is also profitable for them that have eaten *Cicuta*, in any drinke whatsoever; it is good for a cough, for them that have the bloody flixe, or any other paines or griping in the body or bowels, by reason of ill or putrifying humours gathered therein: it is also helpefull to those that have epilepsies or convulsions, and ache or paines in the joynts and sinewes, and is very powerfull to be taken with the seed of Carrots made, to expell wind, or the stone in the reines or kidnies, if the decoction thereof in wine or water, the same tast of the herbe and roote be taken: it is applied also outwardly, to ease the paines and inflammations of apostumes and sores: the flowers hereof doe procure neesings.

Chap. IV.

Ranunculus. Crowfoote.

There are so many sorts of Crowfoote, some of the Woods, some of the Medowes, some of the Mountaines, some of the Water, some of the Rockes, and some of the Gardens; that I proceede in a methodicall manner, and to ease my selfe and the Reader of any such confusion and intricatie, I thinke it best to distinguish or divide them into severall formes, or orders, that so they may be the better apprehended and understood, for otherwise it would be too great confusion, to huddle so many together: and because I have already set forth in my former Booke many whose flowers being small and full and rare, were fittest to adorne that Garden, I shall not needs trouble any of them againe in this worke, but referre you thereunto to be informed of them: but in flowing you, I will give you the figures of some of them, and of the *Anemones* which are nearest unto them, and divide every of them into their severall order, and begin first with those of the Woods.

Divisio prima. The first Division.

Ranunculi nemorosi. Wood Crowfoote.

1. *Ranunculus nemorosus albus simplex.* The single white Wood Crowfoote.

The single white wood or wilde Crowfoote, riseth up with two or three stalkes, about an hand breadth or better, out of the middle whereof, come forth usually three stalkes of leaves, each being somewhat hard and cut in on the edges into three parts, of a sad greene colour, and deeper edg; the stalke rising up two or more inches high, bearing at the toppe one single flower, hanging downe the head for the most part, made of five leaves, somewhat broad and almost round pointed, of a light blewish colour on the outside, and white on the inside open, but white afterwards, and more white on the inside, having a few white threds in the

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

3. Ranunculus nemorosus flore luteo.
The yellow Wood Crowfoote.

middle, tipt with yellow, standing about a greene head, which in time growing ripe, is somewhat like other heads of Crowfoote, composed of many small seedes set together: the roote is usually of the bignesse of a wheate straw stalke, not growing downe deepe, but creeping long wise under the upper crust of the ground, spreading out into diverse small knobs like branches, of a darke browne colour on the outside, and white within, and of a sharpe biting taste, inflaming the mouth.

2. *Ranunculus nemorosus ac minor albus.* The least white Wood Crowfoote.

This small wood Crowfoote, hath such like leaves as the former single white kind hath deuided into three parts, and each of them into other against, standing upon little long foote stalkes, but they are much lesser, so that the whole leafe hereof, is not much bigger than one of the Diuisions, or parts of the other: the stalke is verie small with a few leaves thereon, in two places more devided than the lower, little more than two inches high: on the toppe standeth a white flower, consisting of five white leaves, with a few yellowish threds in the middle: the roote is small and long like unto the other.

2. *Ranunculus nemorosus flore carneo.* The single bluish wild Crowfoote.

The single bluish wilde Crowfoote, is both for forme, of growing, in stalkes, leaves, flowers, and rootes, like unto the former, so that untill it beare flower, there can hardly be any difference discerned, but when the flower appeareth, it thereby it selfe much more reddish on the outside, and of a faire pale purple, or bluish colour on the inside, which maketh it a distinct species of it selfe, differing from the rest.

3. *Ranunculus nemorosus flore purpureo serotino.* The single purple Wood Crowfoote.

This purple kinde is also like the other, and differeth from them chiefely in the stalke which is somewhat brownish, and in the flower, which is of a pale purple blewish colour, like unto a pale violet flower, none of these have any great store, but yet a little, and more than the yellow kinde which followeth next.

4. *Ranunculus nemorosus luteus.* The yellow wood Crowfoote.

The yellow Wood Crowfoote groweth in the same manner that the former doe, and with such like stalkes of leaves, but they are not so broad, nor so hard in handling, and are more deepely cut into more long and narrower parts, yet each alike dented about the edges especially towards the ends of the leaves, and of a darker greene colour: from betweene these stalkes of leaves, shooteth forth sometimes but one, and sometimes two or three stalkes, with every one a flower thereon, somewhat smaller than the former, consisting of sixe usually or of seaven, and sometimes of eight leaves, which are of a faire pale yellow colour, with many yellow threds in the middle, the seede and rootes are like the former: this hath a small or no smell at all. Vnto these belong that sort of Crowfoote that *Dodonæus* calleth *Trifolia* having the leaves parted into three, slope about the edges, and with a yellish white flower.

Trifolia lutea Dodonæi.

5. *Ranunculus nemorosus Moschatellæ dictus.* The Muske Wood Crowfoote.

The Muske Crowfoote, hath three or foure slender pale greene stalkes of leaves, somewhat deuided at the edges of them, not halfe a foote high, and not of halfe that height in some places, very like in proportion to those of the Hol-

Anemone vitifolia Dodonæi.
Dodonæus his vitifolia Anemone.

9. Ranunculus montanus Matthiolo dictus.
The Mountain Wood Crowfoote.

7. Ranunculus sylvaticus dictus secundus Trag.
Sylvane Wood Crowfoote.

8. Ranunculus Plinianus &c.
The white Pliny's Crowfoote.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

few roote, but smaller, and of a paler shining greene colour, from among which rise upone or two small stalkes with two such like leaves thereon, but smaller, and a little above them a small round greenish yellow head, which spreadeth not into leaves, but into foure or five little mossie heads of threads, and so abideth a while, having no other flower, and passe away into many small kernelly seede: the roote is small and somewhat long, composed as it were of many small very shining white chicke scales growing upwards, and having many white fibres at the head of them, of a little sweetish bitter, sharpe and biting taste: the leaves have a little sweete sent, somewhat like unto that kinde of Crowefoot, called Muske, yet more in the naturall places than in Gardens, when it is translanted into them.

4. *Ranunculus nemorosus duke secundus Tragi.* Sweete Wood Crowfoote.

The first leaves of this kinde of Crowfoote, are round somewhat like unto Violet leaves, and not devided at all, but those that rise next after them, are more devided, somewhat like unto the leaves of the last, and so those that grow after and upon the stalkes are more devided than they: the flowers are small, and of a faire shining gold yellow colour, standing at the toppes of the stalkes, like unto the other common kindes of Crowfoote: after which come the seede many set together in a head, like a small Strawberry, as divers other Crowfoote have: the roote is compacted of many white strings and fibres, like unto others: neither roote or leafe of this kind, hath any sharpe or biting taste in them, but are almost insipide.

5. *Ranunculus Virginianus albus.* The white *Virginia* Crowfoote.

The white *Virginia* Crowfoote shooteth forth from a reddish thick tuberous roote with some small fibres thereto, three or foure somewhat large broad whitish greene leaves upon long foote stalkes, rent or torne on the edges for the most part, among which riseth up a slender round naked stalke five or six inches high, bearing one white flower at the toppe, made of tenne or of twelve small narrow and pointed leaves, with a few yellow like threds in the middle, set about a greenish umbone, which in time groweth to be a long slender pod, wherein is contained round whitish seede.

The Place.

The most kinds of these are found growing in Woods, Groves, and Orchards, some of them in our owne land in many places, the rest in many places of *Italy*, *Germany*, &c. The first is found as well by the brooke sides that passe by Medowes, as in Woods, and by hedge sides.

The Time.

They doe all flower very early in the Spring, in March sometimes, or at the furthest in Aprill.

The Names.

The first foure are diversly called of diverse Writers, for some call them *Ranunculi nemorosi*, or *nemorosa* and *sylvarum*, others *Anemones sylvestres*, or *nemorosa* but in regard none of these do beare any downy head of seede, as all the *Anemones* doe, I rather hold with their judgement, that referre them to the kindes of *Ranunculus* or Crowfoote; yet *Clusius* thinketh that they may be reckoned as kindes of wild *Anemones*, and saith that diverse did thinke them to be the *Anemone sylvestris*, that *Theophrastus* calleth *ἀνεμώνη λευκάνθεμος*: the Italians call them *Targoni salvatici*, wilde Gingers either because the rootes of them all, are very sharpe, hot and biting the tongue like Ginger, or rather as I thinke, because the rootes doe grow a little spreading into severall parts, very like unto Ginger. *Tragus* calleth them *Ranunculus sylvestris*, whereof there are two sorts as he saith, *simplex* and *flore pleno*, one that beareth white flowers and an other yellow: *Iohannes Thalius* maketh them his third kinde of Crowfoote: *Gesner* calleth the first white one *Ranunculus Phragmites*: I have therefore upon more mature advice entituled them Wood Crowfoote, and set them in the first ranke or division: the second is called by *Lobelius Ranunculus nemorosus Anemones flore minore*: the third, fourth and fifth, have their names in their roles: the sixt is diverfly also called, for *Caspar* calleth it *Moschatella*, and some other *Moschatella pratensis*, that it may differ from the *Moschatella carulea* of *Lugdunensis* called also *Hyacinthus parvus caulescens*: *Lobel* calleth it *Ranunculus bulbosus septentrionalium herbida multosa flore*: *Tragus* and *Gesner* make it to be a kinde of *Aristolochia*, for so they accounted the *Radix Cava* to be, and thereupon as *Camerarius* saith, divers did as well account it a kinde of *Capnos* as small Crowfoote. *Lugdunensis* calleth it *Denticulata* from the forme of the roote which is made as it were of many teeth set together. The seventh is *Tragus* his second *Ranunculus sylvestris*, and *Lobel* his *Ranunculus acris, comus*. The last hath not beene set forth by any before.

The Vertues.

By reason of the hot sharpe biting taste of the foure first sorts, they are found no lesse to exulcerate the skinne being applied, than any of the other sorts of Crowfeete; yet they may be well used to eate away and consume hard tumours, as also to take away scarres and other blemishes, and warts upon the hands, &c. and to eate out the corrupt matter in the feete, the leaves or roote especially, being bruised and bound to for a certaine space. They are said also to consume foule ulcers that are much corrupted and stinking. The 6. and 7. sort are not known to be used. Unto this Division appertaine those other sorts of *Anemones sylvestres flore pleno*, set forth in my former Worke.

Divisio secunda. The second division.

Ranunculi pratenses & arvenses. Field Crowfeete.

1. *Ranunculus pratensis dulcis.* Sweete Meddow Crowfoote.

This Meddow Crowfoote (which I call sweet, not as *Gerard* doth because is smelleth sweete, but in regard it hath no sharpe biting or exulcerating taste, as most of the other Crowfeete have, but is so sweete and pleasant, that many in *Germany* and other places, doe stew the leaves, when they are young among other herbes, that serve to eate) hath diverse great broad, darke greene leaves, spread upon the ground, a little hayrie, cut in on the edges into five divisions, and a little dented also about, especially at the ends, and of a paler yellowish greene on the underside, of a sweete and not unpleasant taste, as I said before, among which rise up diverse hayrie stalkes, with some leaves upon them, much more divided and cut into smaller and narrower parts, than the lower: at the toppes whereof stand many faire yellow flowers, so like unto the next fielde Crowfoote, that is very violent, sharpe and exulcerating the skinne, that it can hardly

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

be knowne from it: the seed likewise that followeth is like thereunto: the roote consisteth of many white strings. Of this sort there is one that beareth double flowers, and is planted in gardens onely for the beauty of the flowers.

2. *Ranunculus pratensis erectus acris vulgaris.* The common upright field Crowfoote.

The common field Crowfoote (whose branches stand upright and bend not downe againe unto the ground, neither creepe thereon, or spread, taking roote againe in diverse places, as the next doth) hath many large darke greene leaves, cut into diverse parts, somewhat like unto the last, thus many might judge it a kind of the same; but the taste declareth the difference, which is very violent, sharpe and biting upon the tongue, and blistering the skinne, if it be layd thereon, no lesse than any exulcerating or corroding herbe can be, and will have some blacke spots upon them now and then, but not in all, or all places: the flowers are many, and of a gold yellow colour, after which come small heads of seedes: the roote is fibrous as other Crowfoote are. Of this kinde also there is one with double flowers, which I have set forth in my former booke. Flore pleno.

3. *Ranunculus pratensis repens.* The common creeping field Crowfoote.

This creeping Crowfoote, that groweth commonly in fields and gardens also, is very like unto the last described Crowfoote, both for leafe, flower, seede, and roote, but that this is more hayrie and creepeth with his branches upon the ground, taking holde by small white fibres which it sendeth forth at the joynts, and spreadeth farre thereon, his branches also rather leaning then standing upright, or rising so high: but the yellow flower and sharpe biting taste of the leaves is almost equall with the former. Of this kinde there is also one with double flowers nourished in gardens. Flore pleno.

4. *Ranunculus arvensis.* Crowfoote of the plowed lands.

This Crowfoote hath diverse smaller leaves, than any of the former, divided into many narrower parts, of an overwarme greene colour, the stalke is about a foote or more high, bearing some leaves thereon, more jagged than the lower, and more divided at the toppe into other branches, bearing pale yellow flowers after which come rough pointed seedes, set in heads many together: the roote is compoled of many white fibres or strings.

5. *Ranunculus bulbosus sive tuberosus.* Knobbed Crowfoote.

The knobbed or round rooted Crowfoote, hath diverse leaves rising from the roote, much more cut in and divided than any of the former except the last, every one standing on a short footestalke, of an overwarme greene colour, among which rise up diverse slender stalkes, a foote, or halfe a yard high, with some leaves thereon at the joynts, more divided, and into longer and narrower parts than those below; at the toppes whereof, stand severall faire gold yellow shining flowers, made of five leaves like the former sorts, with many threds in the middle, standing about a greene head, which after the flowers are past, groweth to be more rough or prickling than the former: the roote is white and round, of the bigusse sometime of a Wallnut, and often much lesse, being na

5. *Ranunculus bulbosus.* Knobbed Crowfoote.

Ranunculus Anglicus bulbosus. Bachelours buttons.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Original from UNIVERSITY OF MICHIGAN

bigger than a beane, or sometimes an hasell nut, with some long fibres at the ends especially of it, of a more sharpe biting taste than any of the former.

Bulbus Anglicus. Of this kinde is that thought to be, that beareth double yellow flowers one out of another, and called *Anglicus* set forth in my former garden, whose figure is here extant also. As also one whose flower is single and colour an Orange.

Bulbosa flore rubro simplici.

6. *Ranunculus Echinatus Creticus.* Small prickly headed or Crowfoote of *Candye.*

This small Crowfoote hath many stalkes, rising from a threddy roote, round and smooth, full of branches fearle rising a foote high, at every joynt standeth one broad sad greene crumpled leafe, upon a very long foote stalke: the flowers at the toppes are small, and of a pale yellow colour; and the heades of many small seeds and browne set together, are some what sharpe and prickely.

7. *Ranunculus Apulus quibusdam.* The small early Crowfoote of *Apulia.*

This small early Crowfoote, which some take to be the *Batrachion* of *Apulia*, hath diverse small and fine leaves, lying upon the ground not so much divided as the last, but cut into three divisions, for the most part two of them deeped at the ends, and standing upon short foote stalkes, of an inch or two long, compassing one another at the bottomes of them: from among these leaves rise up diverse weake stalkes, bowing and leaning downe to the ground againe; at the joynts whereat grow such like leaves, as grow below, standing each of them upon his short foote stalke, and with them also commeth forth at each joynt, a small short stalke, bearing a flower consisting of five leaves, of a faire pale yellow colour, with diverse yellow threds in the middle; after the flowers are past, there follow five or six small cods or hornes, pointed and crooked at the ends, wherein be small brownish round seede, somewhat like those of the Winter Wolfes bane: the roote from the head downe shooteth forth many white fibres, whereby it taketh fast hold on the ground, encreasing into several knobs: both rootes and leaves are no lesse sharpe and biting than any of the former.

8. *Ranunculus pratensis repens flore luteo Bononiensis.* Meddow Crowfoote of *Bononia.*

The leaves that rise from this thickish threddy rooted Crowfoote, are round like and hayrie, dented on the edges of a sad greene colour, and about an inch broad, standing upon very long foote stalkes, but those that grow upon the stalke are larger, and for the most part round also, a little divided into some parts, but open in the middle: the stalke is about a foote high, bending a little downe to the ground, and as it were creeping there into smaller branches, with large leaves at the joynts, standing upon long foote stalkes, and small pale yellow flowers set on the toppes of them, with a few yellow threds in the middle about a greene head, which when they are to be ripe, hath many sharpe or prickely browne seedes set together.

9. *Ranunculus minimus Apulus.* The small Crowfoote of *Naples.*

This small Crowfoote being the least of all the rest, hath a few small leaves, growing from the roote, cut into three parts somewhat like unto an Ivie leafe, each of them upon a small long hayrie foote stalke, more than the nayle of ones finger: the stalke is about a foote high small and slender, and a little hayrie also, with some leaves thereon, and small yellow flowers at the toppe: the seede is small in heades like the other kinds, and the rootes small and fibrous.

10. *Ranunculus Pannonicus maximus.* The great Crowfoote of *Hungary.*

The great Crowfoote of *Hungary*, is the greatest of all these sorts of Crowfoote, having diverse cornes broad, thicke, sappy, pale, greene, shining leaves, not much lesser than Figge leaves, cut into five partes or sections, and each of them endented about the edges, being somewhat hayrie withall, a little sharpe and biting upon the tongue, but not so much, as most of the former sharpe sorts are: the stalkes are great, strong and somewhat hayrie, two foote high, spread at the toppes into diverse branches, whereon stand faire gold yellow flowers, like unto other Crowfoote, and such like heades of seede following them: the roote are many white fibres or strings, shooting downe from a head into the ground. Very like hereunto is the great Crowfoote of *Candy* set forth in my former booke but that the rootes are compoled of long kernelly knots, whose figure I have here unto you.

Creticus latifolius.

11. *Ranunculus Illyricus minor.* The lesser Crowfoote of *Sclavonie.*

The lesser Crowfoote of *Illyria* or *Sclavonie*, hath for three or foure narrow grayish greene leaves, dividing foure or five or more parts, standing upon long foote stalkes, and of a silver white shining colour underneath: the stalkes are slender and round, but small, about a foote high or more, having some such like leaves there upon the middle, and spreading into three or foure branches, every one bearing a small shining pale yellow flower consisting of five leaves, and sometimes two together upon a stalke: the roote is compoled of many small grayish kernels, set very close and hard together in a bunch with some fibres thereat.

12. *Ranunculus Illyricus major.* The greater Crowfoote of *Sclavonie.*

This greater kinde is both in leafe stalke and flower, greater and larger than the former, the leaves darker and greener on the upperside, and not fully of so silver a white colour underneath, the flowers of a deepe yellow colour, and greater, but the roote hath not so many small graines or kernels set together, as that I have observed, but more with strings, whereby it is nourished and maintained.

Flore alio & flore minore.

Of this kinde some have beene found growing in *Apulia* in the Kingdome of *Naples*, with a white flower and another with a reddish flower.

13. *Ranunculus Lusitanicus autumnalis simplex.* The single *Portugall* Crowfoote.

This *Portugall* Crowfoote hath many broade leaves, lying upon the ground, almost round yet pointed, finely dented about the edges, not divided at all, but somewhat hayrie full of veines, and of a dark greene colour on the upperside, and of a yellowish greene underneath, which continue all the winter, not falling away but fresh doe spring up: from among these leaves shoote forth two or three small slender hayrie stalkes of a foote high, bare without leaves, bearing each of them one small yellow flower, compoled of five, and sometimes of sixe leaves, with some yellow threds in the middle, which fall away most usually without bearing any seede, in regard it bloweth so late in Autumne, but in the naturall places, and sometimes with us in yeares be very hot, and fitting for it, it beareth a small head of such like seede, as the field Crowfoote doth: the roote is made of small round whitish long kernels or pieces, many set together, somewhat like the former but greater and longer. This kinde *Clusius* observed in the Olive-yards about *Lisbone*, to grow with large

The more early Crowfoote of Gerarde.

11. 12. *Ranunculus Hispanicus major & minor.*
The greater & lesser Spanish Crowfoote.

13. *Ranunculus Lusitanicus tuberosus.*
The Portugall Anemone.

pled or twolne leaues, like as it were blisters upon them, and bearing the flower with eight or ten leaues sometimes as if it were double, whereof he giueth a figure, but the seede will beare such like plants, as he setteth the other to be, and therefore giueth no other mention or description thereof.

14. *Ranunculus Autumnalis flore multiplici.* Double flowred Autumne Crowfoote.

This is so like the last in the manner of the growing and flowring, that onely the double yellow flowres is the difference.

15. *Ranunculus grumis radicis Rotundis.* Meddow Crowfoote of *Renoura* with kernelly roote.

This Crowfoote hath a roote made of many small long and round white kernels, or graines set (as it were) with diverse long fibres at them, from whence rise up somewhat round leaues, but deepely cut in (as the rest) into three parts, somewhat like unto those of the round rooted Crowfoote, sustained by long foote stalkes, somewhat hayrie; from among which rise up the stalkes, that are hayrie also, and about a foote high, with leaues set thereon at two severall distances, much more cut in and jagged than those below, not diuided into many branches, whose flowers at the tops of them are yellow, like unto other field Crowfeete: the head full of rough seede that followeth, is sharpe pointed, and shorter than others.

16. *Ranunculus Graecus tuberosa folio.* Jagged Field Crowfeete of *Padua*.

The rootes of this Crowfeete consist of long whitish strings, sending forth many darke greene smooth leaues very much jagged or cut into diverse parts, somewhat like unto the leaues of the knobbed Crane's bill, but larger, each of the cuts being larger and broader than they, which are cut in againe, so that the whole leafe being almost round, is halfe a foote long, and neere so broad also, set upon a foote stalkes, an hand breadth long, from among which rise up, diverse smooth greene crested stalkes, about two foote high, spread into branches, having like cut leaues on them, and small pale yellow flowers at the topper, with many threds in the middle, like unto others, after which cometh a small round knappe or head of seede.

The Place.

All these sorts of Crowfeete doe grow in fields, meddowes, and arable grounds, many of them in old new land, especially the first five sorts; the rest by their titles may be understood from whence they came.

The Time.

The first and the great *Candye* sort are the earliest in flower, which is about March and Aprill, and the 13. and 14. are the latest that flower of all the rest, which is not untill September: all the other in May and June.

The Names.

It is called in Greeke βατραχιον, and there after in *Latine* Ranunculus, *non solum quia folia quae ei sunt ranae imitantur, sed potius quia loca palustria amat, ubi plurimum degunt*: in *English* we call them Crowfeete, rather than Frogwort after the *Latine*, from the divisions of the leaues, as I thinke, and therefore some call them *Pedes galli*, according to *Pliny*, yet some writers thought them to be *Coronopus seu corvi* of *Dioscorides*, and from hence

11. *Ranunculus multiplex flore subpleno, Double Rooted autumne Crowfoote.*

Ranunculus Cretticus latifolius, Yellow leavde leated Crowfoote of Candy.

It is moſt likely our *English* name of Crowfoote came, they have alſo diverſe other *Engliſh* names, as King Cups, gold ruppes, Baſinets after the French Piſſabeds, Bolts, Troll flower, and Locker Goulons, which two laſt are more proper to the eight kinde in my former Booke of the *Doloms Ranuncolo* and *Pie Carolino*; of the *Spaniards Tersa belada*, of the *French Grenoillette*, of the *Germanes Hanen fuss*, and of the *Dutch Hanen voet*. The firſt is *Tragus* his firſt *Ranunculus dulcis ſive pratenſis* by *Fuchſius Chryſanthemum ſimplex*, by *Dodonæus* in his *French* Herball and by *Lugdunenſis Polyanthemum ſimplex* by *Tabermontanus Ranunculus dulcis*, & by *Bauhinus Ranunculus pratenſis erectus dulcis*: the ſecond is the *Ranunculus luteus* of *Tragus*, the *Ranunculus pratenſis ſarrefix caudiculis* of *Lobel*, & the ſecond *Ranunculus luteus* of *Dodonæus* & *Lugdunenſis*. *Thalius* calleth it *Ranunculus polyanthemus maculatus*, and *Gerard Ranunculus Batrachoides*: the third is called by *Lobel Ranunculus pratenſis repentes caulinulo*, by *Thalius Ranunculus polyanthemos primus*, by *Dodonæus* and *Lugdunenſis Ranunculus hortenſis primus*, by *Tabermontanus Ranunculus arvenſis*, and by *Bauhinus Ranunculus pratenſis repens hirſutus*: the fourth is called by *Lobel* in his *Icones Ranunculus arvenſis*, as it is in the title, by *Dodonæus* and *Lobel* in his obſervations *Ranunculus ſylveſtris erectus*, by *Cordus* in his hiſtory of Plants, *Ranunculus laperalis*, by *Geſner* in horto *Germanes Ranunculus arvenſis*, and by *Bauhinus Ranunculus arvenſis echinatus*: The fifth is called by *Tragus Ranunculus exiguus* or *ſolerotiſſimus*, and by *Geſner* in hort *Germanes Ranunculus Flammula dictus*, by *Lobel Ranunculus bulboſus*, and by *Dodonæus* two *Pemptas*, by *Brunfelſius Cornutus* and *Cornupeta parvus*; it is generally taken to be, and ſo called *Batrachium Spaldi*, *Bauhinus* calleth it *Ranunculus pratenſis radice verticilli modo rotunda*. The ſixt is called by *Lobel* in his *Italian* deſcription of Mount *Baldus*, *Ranunculus echinatus Creticus*, which he with he had from *Signior Jacomo* of *Venice*, *Bauhinus* calleth it *Ranunculus ſylveſtris echinatus Creticus*: the ſeaventh is called by *Cluſius Ranunculus Alpinus quinquefolius*, *Pona* and *Lobel* ſet it forth in their *Adversaria*, under the name of *Ranunculus palaſtris, ranunculo vulgari ſimilis ſed minor*, but as *Bauhinus* ſaith in his *Pinax* and *Prodromus*, they confound it with the other *Ranunculus palaſtris rotundifolius lævis*, and therefore he calleth it *Ranunculus palaſtris echinatus*, not that it groweth in the earth, round but in wet fields. The eighth is called by *Bauhinus Ranunculus rotundifolius repens rotundus*. The ninth is called by *Columna Ranunculus minimus Apulus*, as it is in the title, and by *Bauhinus Ranunculus arvenſis parvus folio ſeciſo*. The tenth is called by *Cluſius Ranunculus Pluviopilus*, and *Lobel Ranunculus Monregalis*, which *Bauhinus* calleth *Lobelii imo folio ſeciſus*. The eleventh is generally called of moſt writers, as alſo with all *Herbals* *Ranunculus Illyricus major*, and is the fourth *Ranunculus grumoſa radice* of *Cluſius*, and by *Bauhinus Ranunculus ſanguineus anguſtifolius grumoſa radice major*. The twelfth is called by all *Illyrians major*, being of the ſame kind, which *Bauhinus* therefore calleth, *Ranunculus ſanguineus anguſtifolius grumoſa radice major*, and is mentioned by *Columna* in the ſame place with the other. The thirteenth is called by *Cluſius Ranunculus autumnalis*, and *Lobel* in his laſt *Ranunculus grumoſa radice*, whereof he maketh two ſorts, and hath two figures upon the diverſities of the leaves and flowers, it is therefore called *Lobelianus* by *Lobel*, *Dodonæus*, *Dalechamp* and all others, ſaving *Bauhinus*, who calleth it *Ranunculus lacinioſus bulboſus Aſphodeli radice*. The fourteenth is remembred by *Jacobus Cornutus* only in his Booke of Canada plants. The fifteenth is called by *Bauhinus Ranunculus grumoſa radice folio Ranuncali bulboſi*. The laſt is called alſo by him *Ranunculus Geranii folio*, as it is in the title.

The

The Vertues.

The first of these kindes, being of no sharpe or biting taste, is held to be harmelesse; for the Germanes as I saith, use to eate it familiarly among other herbes: but the others are sharpe and doe exulcerate the mouth especially the fift kinde more than any of the rest, and therefore not to be used inwardly in any case; the second and third sorts here expressed, are often times used to be laid to the wrists of the hands, to drive away agues, the leaves being bruised, with a few cornes of bay salt, and a little glasse of windowes, beaten small and mixed together. *Camerarius* saith that they in *Germany* used to apply the roote of the fift kinde to plague sores, to draw them to maturity and breake them, yet it is no other likely but the other sharpe rootes will doe the like, for they will breake tumours and draw impostumes being wisely applied; and *Tragus* saith, that even those that are not sharpe, doe dissolve and dissolve hard tumors in any part of the body, being applied: a peece of the roote of the second Crowfoote put betweene those teeth that doe ake, or into an hollow tooth, taketh away the paine many times, it either breaketh those that are hollow, or causeth them to fall out: some write, that rubbing the finger, by causing more paine thereon, than is felt, by the toothach, it taketh away the paine: the decoction of the leaves of the field Crowfoote, healeth scabs and the itch, but they must not be suffered to abide long in the places; it is likewise used to stay the falling of the haire, the head being washed therewith, being made warme but not to scald thereon above two or three houres, and then washed off with fresh warme water: it is availeable that if the roote be bruised, and applied unto a foule ulcer, it will cleanse and take away all the filthy and filthy matter therein, leaving the sore faire to be healed up with other convenient things, but it must not lie on the sore less it worke too forcible: all these sharpe Crowfeete, have the same operation to take away wartes, the scabbed ruggednesse of nailes, markes, spots, and blemishes in the skin, and all the other properties ascribed to these sorts of Crowfeete, mentioned in the former division: besides being mixed with vinegar they breake *Scrofulæ*, or the small kernells under the eares, and of the necke called the Kings Evill, applyed to the *Hæmorrhoides* or piles that swell and bleede not, helpeth to dissolve or take them away: but in hand must it be applyed to those that are open and bleede. The distilled water of the herbe, whilst it is fresh worketh safely to all the purposes afore said, and as some report is given with good successe inwardly, as some Holland poulder, or the *species* called *Lithontripton*, to provoke urine when it is stopped, and to break stone; the dryed roots of such of them made into poulder, and put into the nose procureth neezing.

Divisio tertia. The third Division.

1. *Ranunculo Montani.* Mountaine Crowfoote.

Of some of these Crowfeete I have intreated in my former Booke, by the name of *Ranunculus montanus humilior*, of two sorts, and is the first small figure set here also, *Ranunculus montanus albus store simplici*, which is the second figure here, and the double sort among the other garden sorts hereafter. *Ranunculus Thalictri* and *Ranunculo folio* both of one figure, being the third in place: and then *Ranunculus Thalictri folio Asphodeli radice* the fourth: and *Ranunculus gramineus flore luteo simplici & duplici* the fift, which are all againe described: but there are a great many other sorts which I will here bring to your consideration some of them.

1. *Ranunculus montanus maximus albus.* The greater white Mountaine Crowfoote.

The great white Mountaine Crowfoote differeth from the lesser single white mountaine Crowfoote set forth in my former booke (whose figure I give you here in the second place) chiefly in that that the leaves of this Crowfoote, being somewhat hairy and very large, are divided to the stalke into 3. and each of them somewhat deeper cloven about the edges, resembling the leaves of the Globe Crowfoote but larger and standing upon foote stalkes, that are hairy and a foote long almost: the maine stalke is long great and hairy, bare almost of leaves into the top, where it branches out into flowers, under which are the joynt three large leaves, much more divided than those below the flowers are many, each standing upon a foote stalke very large and white, consisting of five leaves so large, that the whole flower seemeth to be as a single purple fringed Daffodil, and very sweete withall, having many yellow threds in the middle, about a greene head, where unto being ripe the seede groweth many set together: the roote is long and long, but as it were bitten off in the halfe, with many long blackish strings hanging thereat.

2. *Ranunculus montanus Pennæi.* The great purple mountaine Crowfoote.

This great Crowfoote hath foure or five or more very large and hairy leaves, rising from the roote upon long hairy foote stalkes, each whereof is devided into five or more parts, deeply cut in unto the middle, and likewise about the edges and of a darke greene colour on the upper side, and grayish, or as it were hairy beneath, among which riseth up a strong round hollow stalke, hairy also, about a yard high, bearing a long spike at the top much divided, and from thence spreadeth into three or foure or more small branches, each having a small leafe or two, about which standeth the flower, consisting of five round leaves of a purplish colour on the under side, and about the edges of the inside, but pure white on the rest of the inside, having many yellow threds in the middle, about a greene head, which beareth many blackish and blackish seedes (like unto the seedes) the roote is composed of many long fibres or strings, and hairy as it were at the head thereof.

3. *Ranunculus Plantaginis folio.* Plantaine leafed Crowfoote.

This *Pyrenean* Crowfoote hath three or foure leaves rising from the roote, set at pretty long distances having somewhat long and broad like unto Plantaine leaves with ribs therein, set more pointed at the ends and cut or dented about the edges, but smooth and plaine with some veines running through the length of them, pointed at the ends of a whitish or grayish greene colour, circled at it were with a white border round, firme, and greene, about a foote and a halfe high, bearing two or three longer leaves set round some and compassing the stalke, which deuideth it selfe at the top, into two or three small branches every of them a small long leafe at the foote thereof, and a reasonable large flower at the head of them consisting of five white round pointed leaves, with many yellowish threds in the middle, and a round head, which afterwards growing ripe hath many seedes set together, like unto divers other sorts of Crow-

Ranunculus montanus albus simplex & duplex.
Single and double white Mountaine Crowfoote.

Ranunculus Pyrenæus albus duplex.
The white double mountaine Crowfoote.

the roote is compoſed of many white ſtrings or fibres, faſtned to a head which is ſomewhat hairy, and abideth many yeares, but the leaves periſh quite in the end of Summer, and are renewed in the ſpring.

4. *Ranunculus Pyrenæus albus duplex.* Double white Crowfoote of the *Pyrenæan* hills.

This Crowfoote differeth little from the laſt but in the flowers which are not ſo many together, and conſiſt of two rowes of white leaves.

5. *Ranunculus montanus Betonicæ folijs.* Mountaine Crowfoote with Betony like leaves.

This ſmall Crowfoote hath divers leaves riſing from the roote, ſomewhat broad and long, full of ſmall veines which make it ſeeme rugged every one upon a little ſhort footeſtalke, roundly dented about the edges and round at the point or end, very like unto the leaves of Betony, but that they are ſmaller, of a brownish greene colour on the upper ſide, and of a ſilver white ſhining colour underneath: the ſlender hayrie ſtalke that riſeth up in the middle of thoſe leaves, doth ſcarſe exceede the length of ones hand, bare or naked without any leaves unto the top, where it beareth one flower onely, like unto the laſt deſcribed ſingle Crowfoote but ſmaller, conſiſting of five ſmall white leaves, pointed at the ends with ſome yellow threds in the middle, having five ſmall greene leaves under it, as a huſke wherein it is ſet: the ſeede is contained in a ſmall rough head like unto other Crowfeete: the roote is a ſmall tuft of white fibres, ſomewhat like unto the roote of Betony: the whole plant both leaves and rootes are bitter, with an exceeding auſtere or aſtringent binding taſte, whereby it is judged not to be hurtfull or offenſive, but rather acceptable to the ſtomacke, and may be profitable for moyſt and cold diſeaſes thereof.

6. *Ranunculus gramineus, bulboſus.* The bulbed graſſeleafed Crowfoote.

This bulbed graſſeleafed Crowfoote hath divers very long and narrow, ſmooth grayiſh, greene leaves, ſomewhat hairy at the bottome, and with ſome long veines therein; from among which riſeth up a tender ſtalke, about a foote high, with two ſmall long leaves thereon, not branched at all, but bearing out of a ſmall huſke of five greene parts, one ſmall faire ſhining yellow flower, like unto other Crowfeete, as is the ſeede alſo, being many ſet together on a long head, and every one pointed with a crooked end: the roote is ſomewhat round at the bottome, with a long necke upward, covered with a blackiſh hairy coate or covering, with divers thicke and round fibres growing underneath, thicker at the ends then at the heads with ſome ſmall hairy fibres at the end of them: within that outer hairy coate is found a round bolbous roote, like unto that of *Gladiolus* or Corne Flagge: the one ſet upon the other which was the elder, and ſeemed as it were ſhrunke.

7. *Ranunculus gramineus perfoliatus.* Thorough leafed graſſe Crowfoote.

This ſmall thorough leafed graſſe Crowfoote ſendeth forth from a ſmall fibrous roote, divers narrow grayiſh greene graſſie leaves, about two inches long, yet ſomewhat broader then the laſt; from the middle of whom riſeth up the ſtalke, higher then the leaves, having two long leaves about the middle thereof, broad at the bottome and imbracing the ſtalke, like unto that ſmall kind of yellow Century, that hath his name from that effect, which branccheth it ſelfe at the top, bearing two or three very ſmall greeniſh yellow flowers, conſiſting of five broad leaves, ſomewhat bended inward, and not layd fully open: the head of ſeede is ſmall, but like unto

the

the great Crowfoote described in my former Booke. Of this kinde there is another whose leaves are somewhat broader, and the flowers more spread open, and with sharper ends. *Folio latiore.*

8. *Ranunculus montanus pumilus alter angustifolius.* Another small narrow leafed Crowfoote.

There is another of this laſt kinde, which groweth a little bigger and higher, and beareth but one yellow flower upon the toppe of the ſtalke, larger than in any other of theſe three laſt graſſe Crowfeete.

9. *Ranunculus Asphodeli radice flore luteo.* Yellow Crowfoote with *Aſphodill* rootes.

I have in my former Booke ſet forth one of this kind very like hereunto both for forme of flowers and rootes, whoſe figure you have before: this other differeth from it in the leaves (the former being ſomewhat broader than this, very like unto the ſmall *Thalictrum*) which are very ſmall, narrow and much divided, very like unto the leaves of the greater *Bulbocaſtanum*, or earth Chеſnut; ſome lying upon the ground, and others ſtanding more upright, each ſtanding upon a reddiſh hairy foote ſtalke, which with the leaves is very nigh halfe a foote long, in the middle of whom appeareth a greene head before the ſtalke is riſen, and beareth it at the toppe thereof, as it riſeth; which when it is ripe ready to blow, theweth to be but one faire ſhining yellow flower, (whereas the other hath many white ones) conſiſting of five round pointed leaves, with many yellow threds in the middle, ſtanding about a greene head, which in time groweth ſomewhat longer than in other ſorts of Crowfeete, having many crooked ſeedes ſet together thereon, but much ſmaller than in many of the other: the ſtalke is ſingular, not many, but hairy and reddiſh, ſeldome branched, but bearing two or three divided leaves towards the toppes, ſomewhat broader that thoſe below, upon ſhort footeſtalkes, at ſeverall diſtances one above another, on both ſides thereof: the roote is compoſed of diverſe tuberous, round and ſomewhat long clogs, ending in a very long fibre, very like unto the other.

10. *Ranunculus altera ſpecies Neapolitana Aſphodeli radice.* The pale Crowfoote of *Naples*, with *Aſphodill* roote.

This Crowfoote of *Naples*, hath many thicke cloggie rootes, joyned together at the end, greater above and ſmaller downewards, of about a thumbes length, with many ſmall fibres among them, from whence the firſt leaves that riſe up are broad ſomewhat deeply cut in on the edges on both ſides, but thoſe that follow next are much more divided, and into many parts, each part cut in alſo and dented beſides on the edges, and ſtanding upon long foote ſtalkes, which are broader at the bottome than above, and compaſſe one another at the foote, for a little way upward, being ſomewhat hairy alſo, greene on the upperſide and whiter underneath: the ſtalke is round and hairy, about a foote and a halfe high, having diverſe leaves thereon, much more divided than thoſe below; and at the joynts with the leaves, toward the toppes come forth long branches, with ſmall jagged leaves on them, under a ſmall tuft of three or foure large pale flowers, of five broad or round pointed leaves, of the breadth of ones naile, with many yellow threds in the middle: the ſeede is ſmall, round, flat and pointed, many ſet together on a long head.

11. *Ranunculus montanus hirſutus latifolius.* Great hairy Mountaine Crowfoote.

The firſt leaves of this Crowfoote are round, like thoſe of Doves foote, very hairy, of a blackiſh greene colour, and ſoft, divided or cut into three parts, each of them alſo parted into three ſmaller diviſions, ſtanding upon

2. *Ranunculus montanus Pennæi.*
The great purple mountaine Crowfoote.

3. *Ranunculus plantaginis folio.*
Plantaine leafed Crowfoote.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Original from UNIVERSITY OF MICHIGAN

long hairy footestalkes, yet those that follow are broader, more divided and hairy, among which riseth up a straight hollow stalke, a cubite and a halfe high, with diverse leaves set thereon, and parted toward the toppe into many branches, having small pale yellow flowers on them, like unto others of this kinde, and seede also in the like manner: the roote is long made of many fibres.

13. *Ranunculus montanus lanuginosus folijs Ranunculi graminei repertis.* Woolly mountaine Crowefoote.

The roote of this Crowfoote hath reddish strings or fibres, sending forth a small soft woolly stalke, about a foote high, devided into many branches, with pale greene leaves set thereon, being soft and woolly, and standing on woolly long footestalkes, an hand breadth long, devided into three principall parts, and each of them into other and deeved about the edges, very like unto those of the Meadow creeping Crowfoote: the flowers hereof be small at the toppes of the branches are yellow, but larger than the last.

15. *Ranunculus saxatilis maior flore.* Rocke Crowfoote with large flowers.

This Crowfoote hath many small leaves rising from a long fibrous roote, set upon long foote stalkes, each broad as the nayle of ones hand, parted into three small jagges, and they againe into two or three other, some what soft and woolly: the stalke that riseth up among these, is scarce an hand breadth high, somewhat woolly also bearing but one large flower at the toppe, of a shining gold yellow colour, made of five leaves, with many deeper yellow threds in the middle.

14. *Ranunculus saxatilis folijs rotundis.* Rocke Crowfoote with roundish leaves.

This small Rocke Crowfoote, hath a few somewhat round leaves spread upon the ground, thicke and hairy, scarce a nailes breadth, yet devided into small peeces, which also are cut in on the edges, standing upon short footestalkes, scarce an inch long: the slender woolly stalke that beareth it rise from the bottome, riseth not above halfe a foote high with some leaves at the foote of the branches, and many yellow flowers of five small leaves at the toppes: the roote is small and fibrous.

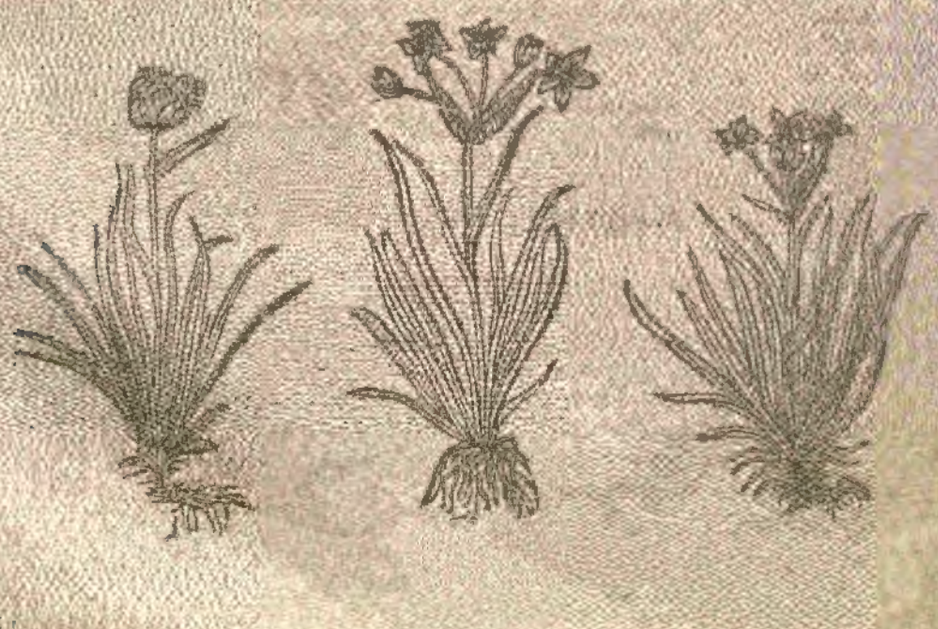
15. *Ranunculus minimus saxatilis hirsutus.* The smallest hairy Rocke Crowfoote.

This smallest Crowfoote spreadeth diverse very small, and somewhat round hairy leaves, cut into three round parts, and deeved about the edges, standing upon small long hairy foote stalkes, in the middle of which riseth up, a small slender hairy branched stalke, not above two or three inches high with small yellow flowers, at the toppes, like unto the rest, and so is the seede that followeth, the roote likewise is small and fibrous.

16. *Ranunculus villosissimus Monspeliacus.* Small red hairy Crowfoote of *Mompelier*.

This red hairy Crowfoote of Mompelier, hath a small roote made of many reddish fibres, from whence spring up diverse thicke small and

4. *Ranunculus Pyrenaicus alius duplex.* Double white Crowfoote of the Pyrenian hills.



5. *Ranunculus montanus tenuifolius, Montayne Crowfoote with very small leaves.*

7. *Ranunculus gramineus profundus.* Deepcut leafed grasse Crowfoote.

Ranunculus albus non perforiatus latifolius.

8. *Ranunculus rotundifolius segetalis.* Another small narrow leafed Corne

hairy leaves, at the foot being devided into diverse peeces, some wherof are round, and other sharpe pointed; but those that rise up with the hairy stalke, are devided into long and pointed peeces, and as it were prickly at the ends, but of an unevен length, some being longer and shorter than others; which stalke being of an hand breadth high, and branched at the toppe, hath a small devided leafe, at the foote of every of those small branches, that beare yellow flowers of a meane bignesse, like unto others of this sort, the whole plant is covered with reddish soft haires, that it seemeth as if it were reddish it selfe.

The Place.

All these sorts of Crowfeete grow upon the Mountaines, some in *Germany*, some on Mount *Iura* by *Savoy*, some by *Montpelier*, and others in the Kingdome of *Naples*, or on the *Pyrenean* hills, none of them being knowne to grow wild in our countrie.

The Time.

They dos all of them flower about May and Iune, and their seede is ripe quickly after.

The Names.

The first kinde which is of two sorts, *Clusius* maketh to be his second kinde of Mountaine Crowfoote, of two sorts, but this is the first of his. *Lobel* calleth it *Aconitum Ranæ facie*, and is the first *Ranunculus montanus* of *Bauhinus* in his *Pinax* which hee calleth *Narcissiflorus*: the second is *Clusius* his third Mountaine Crowfoote, which he saith Dr. *Perry* a Physition of our *London* Colledge, sent him the figure and description, finding it on Mount *Iura* neere *Geneva*; and is *Bauhinus* his five *Ranunculus montanus hirsutus purpureo cæruleo flore*, and saith it is the *Aconitum candidum cæruleo Delphinii* that *Lugdunensis* set forth, but how can this with a high stalke and a purplish flower be called *Candidum* and *cæruleo* without a stalke I know not: the third *Clusius* nameth *Ranunculus Pyrenæus albo flore*, whose leaves as he saith are like unto those of Plantaine, and therefore with most Herbarists is called now adayes *Ranunculus plantaginis folio*, and so doth *Bauhinus*, who likewise seemeth to thinke, that it may be the *Ranunculus Phaniceus Myconi*, for the resemblance of the long leaves, like unto those of the Date tree; but herein, in my opinion he is much mistaken, for that the roote of that *Ranunculus* is *Bulbosus*, and therefore more likely to be another, as I shall shew you by and by the fourth and fifth have no other names changed in their titles, being plants never set forth by any before, but growing on one of the Alpes, which the Inhabitants call *Mons fenis*, & sent the one by *Maund*, & the other by *Pellerius* unto Dr. *Lobel* the first *Fabius Columna* finding on the hill *Esquiulo*, in the Kingdome of *Naples*, calleth it *Ranunculus leptophyllos cepæformis bulbosus*, or *Ranunculus bulbosus graminea montanus*, which *Bauhinus* ex eruption calleth *Ranunculus graminea folio bulbosus*, and as I think doth more nearely resemble, the *Ranunculus Phaniceus Myconi*, set forth in the great Herball called *Lugdunensis*, which hee saith groweth plentifully at the foote of the hills of *Santa Maria Montiferato*, and the places there about, and as he saith there, hath *bulbous* rootes and long narrow leaves, and so hath this, but the former hath neither. The seventh and eight with the other of the same kinde are likewise plants never written of by any other before, and therefore their titles must stand as they doe. The ninth *Fabius Columna* found likewise in the hills *Campoclarenses* and *Esquiulo*, and calleth it *Ranunculus montanus Leptophyllos Alphodeli radice* which is very like unto that with *Alphodile* rootes, which I have set forth in my former Booke, having leaves like the small *Thalictrum*, and a white flower but this hath yellow, which as I there said, *Lugdunensis* setteth among the *asphodilifereous* plants, and calleth it *Oenanthe Matroli*, because he finding it on the rockie or stony hills in *Spaine*, referred it unto *Oenanthe* in regard of the rootes; but the flowers and seede demonstrate it plainely to be no such plant, but a plaine Crowfoote, as both by the comparison and mine owne inspection (having had it growing in mine owne Garden many yeares, and keepe it with others) may truely be testified: The tenth *Fabius Columna* found likewise on the contrary colder side of those hills *Esquiuli*, and called it, as it is in the title: the last five sorts have their names in their titles, as *Bauhinus* calleth them in his *Pinax* and *Prodromus*.

The Vertues.

Most of these sorts of Crowfeete being hot and sharpe in taste, and exulcerating the skinne, no lesse than many of the former, cannot be but of the same quality with them, and although there hath not so many and manifold trials beene made of those being most of them but of late invention, yet no doubt but they may be applied, for the same purposes, according to their degree, in being more or lesse sharpe than others: onely the fourth sort that hath leaves like Betony, for the fortune sake of the flowers, being joyned to this family, as is said in the description, hath no such hot sharpe or exulcerating propertie, but as is there said being somewhat bitter, and exceeding astringent in taste, is held assuredly to be friendly to the stomacke, as other things that are of the same qualitie of bitternesse and astriction; which helpe to stay and drie up the defluxions of humors, be they colder, that fall from the head upon the stomacke and lungs, and to preserve them from putrefaction caused thereby.

Ranunculi hortenses. Garden Crowfeete.

THose Crowfeete that are chiefely nourseſt up in Gardens, should follow next, but that I have already described them in my former Booke, selecting all those that beare flowers of any beautie, out of all the rest of the Tribe or Pavilion, to tare that Garden with all as was most fit and proper, whosoever therefore are desirous to see their descriptions or know further of them, I must referre them to that Booke wherein they may see and reade the same as there expressed. The *Anemones* also or Wind flowers and *Pulsatillas* as being kindes of Crowfeete their sharpe taste and exulcerating qualitie declaring the same, should beare a place here with the rest, but that they are all likewise described aforehand, yet I thinke it not a misse to give you some figures of them to beautifie this worke and to please your eyes.

Anemone maxima Chalcedonica flos.
The flower of the great Windflower at *Constantinople.*

Anemone Constantinopolitana flore simplici purpureo.
The cleane leafed Windflower with a single purple flower.

Ranunculi palustres & Aquatiles. Marish and Water Crowfoote.

Such sorts of Crowfeete likewise should follow, and be joyned to the rest, as grow in Morish grounds or Watery places, if I had not set and propounded to my selfe an other manner of method to follow in this Worke; I must referre therefore all those that are desirous, to be satisfied with the knowledge of them unto their proper place, where they shall be intreated of all together, with all other sorts of herbes, naturally growing in such places, which is the Classis of Morish and Watery plants.

CHAP. V.

Mandragoras Mandrake.

ALthough I have declared in my former Booke the diversities of Mandrake, both male and female, yet I thinke it not a misse to remember them here againe, being a plant both of that worth and rarenesse, and dangerous and profitable qualities therein, especially *soporiferous*: whereof some ensuing plants doe partake.

1. *Mandragoras mas vulgatior.* The more ordinary male Mandrake.

This male Mandrake throsteth forth from the roote (which groweth somewhat great and downe right, in some but with one, in others with two, three or foure twines or branches, devided a little below the head or crowne, and diverse small fibers besides, blackish on the out side, & whitish within, without other shew of mans or womans parts, what soever cunning knaves may forme other rootes by Arte, to be like what they please) many large leaves lying on the ground greater than any Beete leaves, whereunto *Dioscorides* compareth them: from the middle of whom rise up fourty foure greene flowers, made of five round leaves apeece, each standing on a small slender foote stalke within a greene five leafed huske wherein afterwards is the fruit set, being of the bignesse of a reasonable Pippin, and as yellow as gold when it is thorough ripe with divers round whitish flat seedes within it and of an heavie or strong stinking sent: this is the true description of the plant and therefore those idle fancies of the Mandrakes and Womandrakes, as they are foolishly so called, which have beene expos'd to guilded view both in ours and other lands and countries, are utterly deceitfull being the work of cunning knaves, onely to get money by their forgery: doe not misdoubt of this relation no more than you would of any other plant set downe in this booke, for it is the plaine truth whereon every one may relie.

2. *Mandragoras mas alter.* Another male Mandrake.

I saw in my Lord *Wootton*'s Garden at *Canterbury*, whereof Mr. *John Tradescant* had then the keeping an other

Original from UNIVERSITY OF MICHIGAN

other sort of male Mandrake whose leaves were of a more grayish greene colour and somewhat scolded together differing herein from the forerecited kinde which grew there hard by this also, but whether fruit it bore could not be assured having never borne any as they said.

3. *Mandragoras femineus*, The female Mandrake.

The female Mandrake hath likewise many leaves lying on the ground, but smaller, narrower, more crumpled and of a darker greene colour, resembling those of *Lettice* as *Dioscorides* compareth them: the flowers also rise from among the leaves, each on his slender footestalke as in the former, but of a pale with purple colour: the fruit that followeth is much smaller than those of the male, but round like them, and not peare fashion as some have thought, (for *Clusius* who saw diverse of them, growing naturally in sundry places in *Spaine* denieth it) of a paler yellow colour when they are ripe, and of a more pleasing, or rather of a lesse heady scent, than the apples of the male, wherein are contained such like seede but smaller and blacker, the roote also is like the former, blackish without and white within, neere unto the same forme, parted into more or fewer branches, as nature listeth.

Mandragoras mas & femineus.
The male and female Mandrake.

The Place.

They grow in woods and shadowie places, and the female by rivers sides, in diverse countries beyound the Alpes, but not on this side naturally, as in *Grecia*, the Iles of *Candy*, and others in the Mediterranean sea, *Italy* also and *Spaine*: within they are nourished up as rarities in Gardens, the male in sundry places, but the female onely with the curious, as being both farre more rare to get, and more tender to keepe.

The Time.

The male flowreth in March and the fruit is ripe in July the female as *Clusius* saith, he found in some places in *Spaine* in flower in February, and in the same moneth in other places of *Spaine* it had ripe fruit, but within where it is best preserved, it flowreth not untill August or September, and the fruit seldome or never openeth.

The Names.

It is called in Greek μανδραγόρας and *Mandragoras* also in Latine, *quod ad eandem ut pleraque alia pestes gignat*, some also as *Dioscorides* saith in his time called it ἀνθρωπόμορφον and *Circæa*, because *Circe* the great enchantresse used it as is thought in love matters, *Pythagoras* called it ἀνθρωπόμορφον ἐκ τετραπόδων, because the roote hath some likenesse of a mans body with two legges, but without armes: they are called also *Mala canina* of *Serapio*. *Dioscorides* saith the female was called θρίδακος ἔχουσα of the Lettice like leaves, and λευκὴ, as the male was called *Gnachalon*, the fruit of both is round, but of the female as *Dioscorides* saith, like ἀκροδρύοις, and not μηλοειδὴς, as *Ruellius* his Translation hath it, which caused some to figure it peare fashion, especially seeing *Ortuinus* who followed *Dioscorides* most neerely compareth the fruit as well to ἀκροδρύοις as peares, but you heare before *Clusius* hath denied thereof, as an *oculatus testis* of all those that he saw. To him I fall out otherwise, it might be rather accounted *lusus naturæ*, than the ordinary properties in nature. *Dioscorides* his third sort called *Morion*, is not *Theophrastus* his *Mandragoras* as *Cordus* thought, which *Theophrastus* saith hath a stalke as *Elleborus*, *Cicuta* and *Abrotonum*, but is much controverted by diverse, being not yet knowne what herbe it is, and peradventure also not to *Dioscorides* himselfe, for he relateth but by heare say, he doth many other things which were not of his owne knowledge. *Matthiolus* defendeth *Dioscorides* against *Brasavolus* and *Encelius*, who judged that *Brasavolus* thought the *Morion* of *Dioscorides* his *Morion*, which he describeth *ut supra* or *infra*, to grow nigh unto caves in hilly woods, to have lesser white leaves than those of the white Mandrake, a Spanne long lying about the roote, which are also white, longer than ones hand, and of the thicknesse of ones thumbe *grandiori ut sine latebis*, that if some of the roote be given any man in breast or breath, it will take away the use of reason and sense, causing to sleepe for three or foure houres, after the same manner of disposition as when he spoke the Verse when there is cause to burne or cut off any member, (that is, to call him mad a deryes or dead that the paines may not be so sensible) by the same words of *Dioscorides* it doth plainely appeare to me, that *Morion* another species of the former which hath no stalkes, for the leaves lie taught and prostrate upon the ground about the head of the roote: but *Pliny* hath faulted foulely in describing the *Morion* after those of *Theophrastus* and *Dioscorides* to be one, and transferring that which is proper to either. The sundry fables heard reported in *Matthiolus* and others are not to be heard to be related, which if any desire to know them, may reade them in their Authors or Relators. The *Arabians* call it *Jabrum*, the *Italians Mandragora*, the *Spaniards Mandragola*, the *French Mandragore* and *Main de Gloire*, the *Dutch Alraun*, the *Dutch Mandragora*, and we in *English* Mandrake.

The Vertues.

The Mandrake as *Galen* saith is of an exceeding cold qualitie even in the third degree, yet hath it some heate in the barke of the roote as some drinckle, and in the apple some moisture, whereby it is of a temperate vertue causing sleepinesse or drowsinesse, as *Leonhart Fuchsius* in his Herball to the bible maketh report

an experiment of his owne, that upon a fuddaine became drowsie, sitting at his booke in his study, and musing what should be the cause, found that it proceeded from the scent of one of these apples, which he had laid on a shelfe therein, which being removed he found no further inconvenience: the barke or the juice taken to drench is given to those that in their sickenesse cannot sleepe, the decoction of the roote in wine also doth the same, and is exhibited to those (as is thereafter) whose are to be seared, or a limbe or member to be cut off, to induce the fitte sence of paine: the condensate juice taken to the weight of one scruple in sweete wine, purgeth flegme and melancholy by vomit like unto Hellebor, but taken in a greater quantity it killeth: it is used also in pessaries, either of it selfe, or with other emollient things to take away the hardnesse of the matrix, to procure their courses, and to expell the dead birth. But see that not above halfe a scruple be used at a time: the said juice is also used with thicke oyntments that coole inflammations in the eyes: the leaves are likewise used for the same purpose, as also impostumes, and difficult, all hardnesse, knot and kernels in the flesh, and take away the fear of burning, being often rubbed therewith: the roote beaten with vinegar and applyed to those inflammations, called Saint Anthonies fire, doth heale them, and applyed with honey or oyle, taketh away the sting of Serpents. It is said that if a wry be bold with the roote here of the boanes together, it will so mollifye it, that it will take what forme or impression you will give it: the apples and especially the seeds in them, doe purge and evacuate the hot matter, as Serapio Avicen, and Paulus Ægineta after Dioscorides have set downe, which perad-venture is Rachel's meaning to be available for her hot and dry body, which was the cause of her barrennesse, (and her beauty argueth a probability of such a constitution) desired the more earnestly the Mandrake apples that Reuben Leahs sonne had brought his mother, as it is Genes. 30. v. 14. the strong scent of these apples is remembred also Cant. 7. 13. although some would divert the signification of the Hebrew word דודאים, (which is the same in Arabick) unto Violets or some other sweete flowers, that Rachel desired and the fruite of Citrus or Adam apples as that in the Greeke text: Hannibal the Carthaginian Captaine is said to have obtained a famous victory over the Romanes by infecting their wines with the apples of Mandrake, whereby being made drowsie they left their walls unmanned.

CHAP. VI.

Solanum. Nightshade.

There are diverse sorts of Nightshades, properly so to be called, and there be some other that are referred hither onely for the likenesse of the leaves, flowers, or fruite, or for the properties in the operations of their: these are referred unto the Nightshade, I have already spoken of diverse in my former booke, whereunto I referre them, that would be enformed of them, not meaning to repeate them heere againe, for denominations in this place, which are *Mirabilis Peruana*, the Mervaile of *Peru* or of the world. *Pomum amoris fructu majore*, Apples of love the greater sort, *Strammonium flore Pomum Insanum, magna flore pleno, & purpureo, & Datura Turcarum flore albo simplici & flore duplici purpureo*, Thorne apples the greater, with a single white, or single purple flower and the lesser with a single white flower, or a double purple flower. *Solanum arborescens* or *frutescens*, called also *Pseudocapsicum Dodonæi*, or *Amomum Plinii*, *Solanum Americanum*, & *Cerasa Indiana*, Tree Nightshade, the Mummie tree, or Winter Cherry tree: & *Solanum vesicarium* or *Alkekengi*, Winter Cherries. *Patatas* or *Virginia* called of many, apples of youth, and of *Raulinus* in his *Aggregatis Solanum tuberosum esculentum*, and thought by *Clusius*, that it did in many things resemble the *Pyracoumon* of *Dioscorides*, moved chiefly thereunto from the likenesse of the figure thereof, which he saw in a written copy of *Dioscorides*, that had figures; as also that it might be *Arachidna* of *Theophrastus*; but referreth it downe in his History of Plantes, by the name of *Papas Peruvianorum*, and called by the *Indians*, or *Spanish Papa*, as *Ximenes* and others say: and although the common wild Nightshade is not dangerous, as divers others are, nay planted in Gardens with us as it was in former times, to be as a potherbe or sallet herbe usually eaten, (but now always utterly refused,) and therefore called Garden Nightshade, yet let us set it with the rest of the kindred and not dissjoine it from them.

1. *Solanum vulgare*. Common Nightshade.

The Common Nightshade, hath an upright round greene hollow stalke, about a foote, or halfe a yard high, bushing forth into many branches, whereon grow many darke greene leaves, some what broad and pointed at the ende, soft and full of juice, larger than the leaves of Basill, else somewhat like and a little unevenly dented about the edges, at the toppes of the stalkes and branches, come forth three or foure or more white flowers, made of five sharpe pointed leaves a peece, standing on a stalke together, one by or above another, with yellow pouders in the middle, composed of foure or five yellow threds set together, which afterwards turne into so many pendulous greene berries, of the bignesse of small peaze, full of greene juice, and small whitish round flat seede, lying within it: the roote is white and a little woodly, when it hath given flower and fruite, with many small fibres: all the whole plant is of a waterish insipide taste, but the juice within the berryes, is somewhat offensive, like unto a thin mucilage, and is of a cooling and binding quality.

2. *Solanum vulgare baccis rubris*. Red berryed common Nightshade.

I call this common Nightshade, because it is in all things like the former common Nightshade, except that the leaves here and there somewhat harder and rougher, and the berries when they are ripe, are either of a yellow, or of a yellowish red colour, the whole plant growing also little bigger then the other: this sort we have had out of *Spaine*, but endured not a winter with us, being more tender as comming out of a hotter Country, where it endureth many yeares, and it may be, that it is but a degeneration by reason of the climate, as it happeneth in sweete French seede and divers other things which change by transplantation.

3. *Solanum Somniferum*. Sleepy Nightshade.

Sleepy Nightshade riseth up, with divers thicke round soft woolly stalkes, divided into other branches, whereon grow many soft woolly, but greene broad round leaves, very like unto Quince leaves, two always set at a joynt one against another, of somewhat a hot taste as *Clusius* saith: the flowers come forth at the joynts with the

Original from UNIVERSITY OF MICHIGAN

the leaves, all along the ſtalkes and branches, three or foure together round about them, which are long and hollow, ending in fiue corner-wiſe long and pointed leaues, of a pale white colour, which being ripe, there riſe vp in their places ſmall yellowiſh red berries, yet bigger than thoſe of the former, ſet in woolly huskes, the roote is thicke, long and hard, and of a brownish colour without.

1. Solanum somniferum vulgatius nigrum. The true ſleepy Nightſhade of the ancient writers.

This Nightſhade riſeth vp with three or foure or more thicke round ſtraight whitiſh ſtalkes about a yard high or more, parted into ſome other branches, hard to breake, ſet with many faire broad leaues very like vnto *Mandrake* leaues, with ſmall footeſtalkes vnder them, but always two at a ioynt, but many ſtanding ſingle at the ioints with the leaues, from the middle of the ſtalkes vpwards, come forth diuerſe reddiſh flowers together conſiſting of foure leaues a peece after which follow ſmall ſtriped and pointed greenish huskes, but red when they are ripe, very like vnto the bladders of the Winter Cherries, but ſmaller, with a red berry within it in like manner, the roote is ſomewhat great and woody, couered with a whitiſh barke, not very thicke, of a ſubſtance and iuiſe like raſte. Becauſe the ſtrength of the ſeeds, which *Matthiolus* hath, and *Cordus* after him, let forth for the true *Somniferum* of the ancients doth not beare bladder like huskes as *Theophraſtus* ſaith, lib. 9. c. 11. it hath it cannot be the right, but this only which hath ſuch.

2. Solanum somniferum Syriacum altius erectum. Tall true Nightſhade of another ſort.

The other ſleepy Nightſhade hath an vpright ſtalked or cornered ſtalke, with many leaues thereon, being longer and narrower than the laſt, and more inclining downeward to the ground, full of veines running long wiſe and ouerthwart therein, at the ioynts of the ſtalke, from the middle part vpward, come forth ſeuerall pendulous flowers, hanging by very long ſtalkes, being long and hollow like vnto a Bell-flower, of a purplish colour, each of them ſet in a large greene huske, dented or cut into fiue parts at the edges, but not very deepe: wherein after the flower is paſt, ſtandeth a round berry, of a deepe blackiſh purple colour, enclоſed therein to the middle, and hauing like a Crowne, at the head of the berry; which is full of a winelike iuice, and many ſmall white ſeeds within it: the roote is great and ſpreadeth many great branches with ſmall fibres alſo, vnder the ground.

3. Solanum lethale. Dwale or deadly Nightſhade.

Deadly Nightſhade groweth ſometimes to the height of a man, but vſually it riſeth not vp aboue three or foure foote high, hauing round greene ſtalkes, ſet with diuers large leaues, much greater than any of thoſe before, ſmooth and of a darke greene colour, ſet vpon very ſhort footeſtalkes, among which at the ioynts with the leaues come forth ſeuerall long mouthed flowers, dented at the brims, of a faint deadish purple colour, ſtanding in a greene huske; which after the flower is fallen containeth a great round berry greene at the firſt but of a ſhining blacke colour like ſhining of poliſhed iet, when it is ripe, full of a purplish iuice, and many whitiſh ſeeds lying therein. The roote is great, growing ſtowing deepe into the ground, and ſpreading great branches thereon, and beſides creeping vnder ground, eating vp in ſeuerall places diſtant, quickely ſpreading ouer a ground: the plant hath no good ſmell nor taſte, but vnlouely and bitter and very pernicious.

Of this kinde there is another ſort, whoſe leaues are leſſer, and of a darker greene colour, ſtanding vpon longer footeſtalkes, and the flowers are not ſo great and large as the other.

4. Solanum ſadum ramboliferum luſitanum. Hoary Indian Nightſhade.

Cluſius in his fourth booke of *Exotickes*, declareth that one Dr. *Cole*, or *Caninius*, going with *Drake* Maſter to *Nombre*, and other places, in the *Eaſt Indies* (but dying by the way in comming home) had gathered ſome herbes, and put them vp into a booke of papers, which being viewed by *Cluſius*, hee found among many others, this dryed plant without leaues, which yet he referreth to the kinds of Nightſhade; the ſlender ſtalkes were about fiue inches long, and hoary white, bearing many ſtarre-like berryes, hanging downe out of fiue ſpotted huskes or cuppes of a brownish red colour, of the bignеſſe of pepper cornes, ſtanding in a rank or roulell, wherein were white ſeedes like to thoſe of Nightſhade, but not ripe.

5. Solanum maximum rubrum Virginianum. Red Nightſhade or Red weed of *Virginia*.

This great Nightſhade plant, which from the likeneſſe of the leaues we haue called a *Solanum*, and referred thereunto, groweth vp with a great thick round reddiſh ſtalke, of the thicknes of ones thumbe at the leaſt, 4. 5. or 6. foote high or more, ſet with faire great leaues very large freſh greene leaues full of veines, ſome greater and ſome ſmaller and ſtanding reddiſh: from the ioynts where the leaues ſtand from the middle of the ſtalke vpwards, come forth ſeuerall long ſtalkes bearing the flowers which are very ſmall conſiſting of foure leaues a peece of a pale red or bluish colour, diuers ſtanding together as it were in a ſmall long cluſter, which after bring forth ſmall blackiſh

Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

blackish round seede, foure usually set in one husk: yet is seldome scene to ripen in our country, the roote perisheth and prospereth great with us, but perisheth if it be not defended from the frosts in winter, which usually rot it, but in the naturall places it groweth as big as a mans legge, (for such hath beene sent me, with rings or circles to be seene in the middle when it was cut like unto a *Bryonie* roote) and above a foote long.

2. *Solanum Mortuum parvum flore, sive Morabilis Peruana minor.* The small Mervaile of Peru.

This small Mervaile of the world, or of *Peru*, groweth in the same manner, that the greater kinde doeth you in my former booke doth, but nothing so great or high, having such like leaves set on the stalkes, but smaller and rounder: the flowers likewise being of a red colour for the most part, and made of one leafe, spreading into five parts at the brimmes, like the other, are so small, that the whole flower of this is scarce so bigge as the lowest part, or division of the greater flower, the seed that followeth, and the roote likewise are answerable in proportion to the rest of the plant.

The Place.

The first groweth wild with us, under old walles, and in rubbish, the common paths and sides of hedges and fields: as well as in other countryes, either hot or cold, as also both in their and our gardens, without any manuring. The second groweth only wild in the hotter countries of *Spaine*, *Italy*, &c. The third *Clusius* saith is found not farre from *Malaga* in *Spaine*, and *Matthiolus* saith in *Italy* also. The fourth *Alpinus* saith, groweth in *Candy*. The fifth as *Matthiolus* saith, groweth on the hill *Salvatine* in the County of *Goritia* in *Italy*, and in *Peru*, and in some think in *Syria*, and the East Countries thereabouts. The sixth groweth wilde not onely in many, and divers woods of *Germany*, but in divers places of our owne Land, as in the Castle yard of *Framlingham* in *Suffolke* under the Colledge wall in *Cambridge*, and in many places of that County also at *Ely* and at *Cranford* among the Limes, at the end of the Towne: in Moore Parke in the Parke of Sir *Percivall Hart* at *Lullam* Hall in *Kent*, in the County yardes in *Barling* Parke likewise, as also in the way that leadeth from Sir *Percy Hart* to *Pooters*, hard over against the gate of a great field called *Wennell*. The seventh is declared in the description. The eighth groweth in *Virginia*, *New England*, &c. from whence the seed and Plants were first brought to us. The last came as the greater sort did from the *West-Indies*.

The Time.

They doe all dye downe to the ground in winter, although some doe shoote a freshe in the spring, as the first 5. 7. 8. 9. doe, yet the third being more tender as comming out of a warmer Country, doth hardly endure, or perisheth utterly by the extremities of our winters, especially if it be not housed or well defended, and even the two first that dye every yeare, and rise of their owne sowing, doe not spring out of the ground, untill it is late in the yeare, as not untill the latter end of *April* at the soonest.

The Names.

It is called in Greeke of some [illegible], but more usually [illegible], in Latine *Solanum* & *Solatrum*, *Solanum quod vitreum*, *coprestum*, *solatrum vel solatrum dictum sequi*, as *Pena*, in *Solanum nigrum*, *quibusdam in proprium nomen plures vel pauciores bacas gerit quam vitreum*. *Theophrastus* supposeth *malus insanus* & *Bassus*, *vitis* to be *solanum insanum*. In Latine *Solanum* & *Solatrum Luna lupina* & *Luna vulpis*. *Plinie* saith it was called also *Strumum* and *Cucubalus*, but they are thought to be rather bastard names, and not to be proper to this plant, the *Arabians* call it *Hamch alhamdeb*, *Hamch alnoeg*, & *Hamch alchakel*, the *Spaniards*, *Yerva Mora*, and *Morella*, the *Italians Solatro*. The *French Morelle*. The *Germans Nachtschat*, and the *Dutch Nachtschade*, and *Nachtschade*. In *English Nightshade*, *Morrell*, *Petty Morrell*, and in some places *Wandberries*. *Dioscorides* reckoneth up foure sorts, [illegible] *solanifolium*, and *vitis folio glauco seu incano*. *Theophrastus* in his 7 booke and 14 chapter, maketh but two sorts of *Solanum*, *Solanum vitis folio*, *melanchasium ferens*. *Some also do put down a third sort*, *Solanum vitis folio*, *alterum adfert*. The first is generally called by all writers *Solanum simply*, or *vulgare*, or *hortense*, because it is most usuall and generally every where to be had, and was planted in gardens as other herbes for foode, but now not used, but Physically: the second is called of *Cordus* in his History of Plants *Solanum furiosum*, and of *Gesner* in *Germany* *Solanum rubrum & luteum*, and is remembred by others also. The third is generally received for the true *Solanum somniferum* of *Dioscorides*, but by *Matthiolus*, *Gesner*, *Guilandinus*, *Lobel*, *Clusius*, *Dodonæus*, *Lobel*, *Ceesalpinus*, *Castor Durantes*, *Camerarius*, and *Lugdunensis* doe it is downe: *Prosper Alpinus* only opposeth against it and sheweth that the fourth here set downe, which in his booke *de plantis Ægypti*, he saith hath bladders, and small red berryes in them, is the right sort, as *Dioscorides*, *Theophrastus* and *Pena* doe describe *Solanum somniferum* to be. The fifth *Matthiolus* calleth *Solanum somniferum alterum*, and so doe *Camerarius*, *Gesner*, and *Lugdunenses*. *Dodonæus* calleth it *Solani lethalis aliud genus*. The sixth is generally by the Dutch called *Bella Donna*, either *per Antiphrasin*, because it is blacke, or as the *Moores* doe account them fayre, to have the smell blacke within, or as some have reported, because the *Italian* Dames, use the juice or distilled water thereof for a shewe, peradventure by the excessive cold quality, to take away their high colour, and make an ill looke paler. *Matthiolus* calleth it *Solanum tertium*, and so doe *Ceesalpinus*, and *Camerarius*. *Prosper Alpinus* calleth it *Solanum furiosum alterum*. *Lobel*, and *Lugdunenses*, *Solanum somniferum*, *Dodonæus*, and *Clusius* *Solanum furiosum*, so doth *Tabernæmontanus*. *Gesner*, *Solanum sylvaticum*, *Anguillara*, *Guilandinus*, *Dodonæus*, *Tragus*, *Lobel* doe take it to be *Morella tertia* of *Theophrastus*, but not of *Dioscorides*, for they are so much differing from another, as though they had lived in two severall worlds, to give names to herbes, the one not knowing of the other. The *Germans* call it *Schlaffbeere* and *Dolwurtz*, it is called in *Bohemia*, *Durnitz* [illegible]. The fourth *Clusius* maketh mention of, in the fourth booke of his *Exotickes*, by the name of *Solanum* [illegible] and *Bauhinus* thereupon calleth it as I doe in the title, *Solanum Indicum hirsutum coronopifolium*. The sixth have referred as I said before, to the kindes of *Solanum*, for the likenesse of the leaves although much lesse, and call it *Indicum*, both for the colour of the stalke, and from the colour that it giveth, but the [illegible] with doe both colour their skinnes, and the barkes of trees where with they make their boates, and other things, as we are informed: the *Indians* themselves call it [illegible] and our *Suffolke* people that have seene it in *Virginia*, call it *Red weede*, but according to the Latine name, red *Nightshade* of *Virginia*. The last differeth sort in his *Frondosus* and *Vimen*, under the title here expressed, not being mentioned by any other writer.

The Vertues.

The ordinary or common Nightshade is wholly used to coole all hot inflammations, either inwardly or outwardly, being no way dangerous to any that shall use it, as most of the rest are; yet it must be used moderately, for being cold and binding in the second degree, the distilled water onely of the whole herbe is thought and safest to be taken inwardly; the juyce also clarified and mingled with a little vinegar, is good to wash the mouth and throate that is inflamed: but outwardly the juyce of the herbe or berries, with oyle of Roses, and a little vinegar and cerusse, laboured together in a leaden Morter, is very good to anoint all hot inflammations, Saint *Anthonies* fire, and all other grieved places, that are molested with heate, as the head ache and frenzies, anointing the temples and forehead therewith, as also the heate and inflammation in the eyes: it doth also much good for the shingles, ringwormes, and in all rotting, fretting & corroding ulcers, and in weeping or moist Fistulaes, if the juice be made up with horse dung and applied therunto a pellary dipped in the juyce and put up into the matrixe stayeth the immoderate fluxe of womens courses; a cloth wet therein and applied to the testicles or cods, upon any swelling therein giveth much ease: as also to the goute, that commeth of hot and sharpe humours; the juyce dropped into the eares, easeth those paines that arise of heat or inflammation; *Pliny* saith moreover, that it is good for hot swellings under the throate. The sleepie Nightshade of both sorts are of one and the same qualitie, being cold in the third degree, and drie in the second, comming neere unto the propertie of *Opium* to procure sleepe, but somewhat weaker, if a dramme of the barke of the roote be taken in wine, but not to exceede that proportion for feare of danger: the seede drunke doth powerfully expell urine, and is also good for the dropsie; but the often taking thereof in too great a quantitie, procureth frenzie; the remedy whereof is, to take good store of warme honied water: the roote boyled in wine, and a little thereof held in the mouth, easeth the paines of the tooth ache; *Pliny* saith it is good to fasten loose teeth: the juyce of the roote mingled with honey, is good for the eyes that are weake of sight. It is more effectuall in all hot swellings and inflammations then the former, in regard it is colder in qualitie, the juyce of the herbe or roote, or the distilled water of the whole plant being applied: the deadly Nightshade is held more dangerous than any of the other, for it is enough to be cold in the fourth degree: the juyce of the leaves, and a little vinegar mixed together, procureth rest and sleepe, (when upon great distemperature, either in long sickenesse, or in the jealous hot fits of agues, rest and sleepe is much hindered) if the temples and forehead be a little bathed therewith: as also taketh away the violent paine of the head, proceeding of a hot cause: the leaves bruised or their juyce may be applied to such hot inflammations, as Saint *Anthonies* fire, the shingles, and all other fiery or running cankers, to coole and stay the spreading: the danger is very great, and more in the use of this outwardly, than in any of the former, and therefore there had needs of the more heed and care, that children and others doe not eate of the berries hereof, least you see the lamentable effects it worketh upon the takers thereof as it hath done, both in our owne land, upon lundry children killed by eating the broth wherein the leaves were boiled, or the berries, and beyond the sea in the same manner: yet some doe hold that two ounces of the distilled water hereof is effectuall to be taken inwardly without any danger, against the heart burning, and other inflammations of the bowells, and against all other hot inflammations of the skinne or eyes, giving ease to the paines. It hath beene often proved, that one scruple of the dried roote hereof infused in a little wine five or seven houres, and then strained hard through a cloth, that if this wine be put into a draught of other wine, whosoever shall drinke that wine, shall not be able to eate any meate for that meale, nor untill they drinke some vinegar, which will presently dispell that qualitie, and cause them fall to their viands, with as good a stomacke, as they had before: this is a good jeft for a bold unwelcome guest. The *Virginia* Nightshade is a familiar purger with them in *Virginia*, *New England*, &c. where they take a spoonefull or two of the juyce of the roote which worketh strongly; but we having tried to give the dried roote in powder have not found that effect.

Chap. VII.

1. *Solanum lignosum sive Dulcamara.* Wood Nightshade or Bitter Sweete.

Although this plant hath no dangerous quality therein, and yet is properly any Nightshade, more than the outward conformitie in some sort, yet because many learned Authours have reckoned it as a sort thereof, and called it by that name, let me also place it with them, and shew it you in this place, thus it groweth up with many slender winding brittle woodie stalkes, five or six foote high, without any claspers, but moulding it selfe about hedges, or any other thing that standeth next unto it, covered with a whitish rough barke, and having a pith in the middle, shooting out many branches on all sides, which are greene while they are young; whereon grow many leaves without order, somewhat like unto the leaves of Nightshade, but that they are somewhat broad, long, and pointed at the ends, with two small leaves, or rather peeces of leaves, at the bottome of most of them, somewhat like the Sage with eares, and many of them likewise, but with one peece on the one side, sometimes also those peeces are close unto the leaves, making them seeme as it were jagged, or cut in on the edges into so many parts, and sometimes separate from, making the leaves seeme winged or made of many leaves: and are of a pale greene colour: at the toppes and sides of the branches come forth many flowers, standing in fashion of a long umbell, upon short foote stalkes, one above another, which consist of five narrow, and long violet purple coloured leaves, not spread like a starre, or very seldome, but turning themselves backwards to the stalkes against whereon they stand, with a long pale yellow pounsell in the middle sticking forth, which afterwards turns into round and somewhat long berries, greene at the first, and very red, soft and full of juyce when they are ripe, of an unpleasant bitter taste, although sweetest at the first, wherein are contained many flat white seedes: the roote spreadeth it selfe into many strings under ground, and not growing into any great body: the barke also of the branches, being chewed, tasteth bitter at the first, but sweeter afterwards.

2. *Dulcamara flore albo.* Wood Nightshade with white flowers.

Of this kinde there is another that differeth not from the former, more than in the flowers, whose inner

leaves are white, and the pointell yellow.

The Place.

This groweth ufually by ditches ſides, and hedges, where they may climbe up upon them, the firſt almoſt every where: the ſecond is very rare and ſeldome to be met with, yet it groweth by Saint *Margarets* Church in *Romney* Marſh, and neere unto *Bromefe* houſe on *Southwarke* ſide, when *Gerard* wrote thereof, but now is not there to be found. *The Time.*

The branches abide diſpoiled of leaves all the Winter, yet periſh not, but ſhooteth forth new leaves in the Spring, and flowreth about July, the berries are ripe in Auguſt. *The names.*

This hath not beene remembred, by any of the ancient Greeke Authours, although ſome of the moderne Writiters, have annexed Greeke names upon it, calling it *δενδρομορον, Dendromoron*, which is *Solanum arboreſcens*; and *ωνομορον Onomoron*, that is, *Dulcamara* or *Amaradulcis*; diverſe doe thinke it to be *Mala inſana* of *Theophraſtus*, *Matthiolus* tooke it to be *Vitis Idæa* of *Diſcorides, lib. 4. cap. 183.* Others in returning it to the Nightſhades, call it *Solanum lignoſum* or *frigidum* or *rubrum*. It is called of the *Germans Bitterey te lieber* and *Hunds beere*, becauſe the ſhepheards uſe it for their cattell, when they are troubled with that diſeaſe they call *Hunſch*, of the *Dutchmen Affrank*, of the *French Morelle de bois*; and we in *English* Bitter ſweete, Wood Nightſhade, and Fellonwoorte of ſome. *Tragus* would referre it to the *Hedera Clematis*, or *Smilax* of *Theophraſtus* in his third Booke and laſt Chapter; or unto the *Smilax lævis* of *Diſcorides*, ſet forth in his fourth Booke and 14^e. Chapter. *Dodonæus* diſliketh, that that kinde that beareth white flowers, may be *Cyclaminos altera* of *Diſcorides*. *Guilandinus* tooke it to be *Sabraſtrum* of *Pliny, lib. 24. cap. 5.* but all erroneouſly: the learned of *Monspelier* as *Pena* and *Lonicerus* thy called it *Cercos*; whereunto it as little agreeth, as the *Cercis* ſet forth in the next Chapter, as you ſhall there underſtand. *Bauhinus* calleth it *Solanum frutescens, ſive Dulcamara*. *The Vertues.*

Dulcamara ſive Solanum lignoſum.
Wood Night ſhade.

Both leaves and ſtalks are hot and drie, aſtringent and cleanſing. *Tragus* ſheweth the manner of taking a medicine for the yellow laundife, called for the ſtrophe ſaith *Dodonæus*, although it be inveterate, by driving it forth gently both by urine and the ſtoole, in this wiſe: Take ſaith he, a pound of the woodie or Nightſhade, cut it ſmall, and put it into a new earthen pot, whoſe cover hath an hole in the toppe, with two pints of white wine, cloſe the joynts of the pot with paſte, and ſet it on the fire to boyle gently, untill halfe part be conſumed; which afterwards being ſtrained forth, take a draft thereof morning and evening: the juice of the leaves and berries is thought to be good for them that have beene bruſed by blowes or falls, to diſcuſſe and avoid the congealed blood, and heale the part affected afterwards: it is held alſo effectuall to open the obſtructions of the liver and ſpleene, but ſo often as I have given it by appointment I have knowne it to purge very churliſhly. Some alſo uſe the drinke before preſcribed againſt putride feavers or agues. The countrie ſhepheards of *Germany*, as *Tragus* reporteth, doth uſe to hang it about their cattells neckes, when they are troubled with the diſeaſe they call *Die Hunſch*, which is a ſwimming in the head, cauſing them to turne round: diverſe countrie people alſo uſe the berries bruſed and laid to the finger that hath a Felon thereon to cure it.

CHAP. VIII.

1. *Circæa Lutetiana major*, The greater Inchantera Nightſhade.

THE likeneſſe alſo of this plant in ſome part thereof, hath cauſed it to be referred unto the Nightſhades by diverſe, and to muſt I untill a fitter place may be knowne, the deſcription whereof enſueth. It ſetteth up with diverſe ſmall round pointed ſtalkes, moſt uſually ſtanding upright, ſometimes leaning downe to the ground, and taking roote at the joints, about a foote or more high: it is of a ſtrong ſtalke, which are ſtraight and round almoſt at the bottome, and very long pointed at the top, without any denteſ from the edges: ſome compare them unto the leaves of Nightſhade; others unto thoſe of the wall-bete; of a ſhining greene colour on the upperſide, and render, lout, or gentle in the handling, as if it be a little hairy, and of a darke grayiſh colour underneath: from the middle of the ſtalke upwards the flowers grow ſpike faſhion, many ſet together one above another, which ſhew to be of a purple colour, while they abide hidden unblowne open, but being blowne are ſmall white five valued flowers, ſomewhat daſht over eſpecially at the brimmes or edges, with a light ſhew of bluſh, with many brown yellow threds in the middle, where after they are paſt, came ſmall rough round beads, like unto ſmall berries, that are incloſed in huſkes or little garments in the like manner, wherein are included ſmall ſhining blacke round ſeede, ſomewhat like

Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

seed, of *Pedicoryx* of the vvall, but lesser: the roote is small, very white, and full of joynts, from whence it shooteth forth and creepeth every way under ground, quickly spreading a great compasse: the taste hereof is somewhat sweetish and waxeth withall.

2. *Circæa lutetiana minor.* Small Inchanters Nightshade.

This small Nightshade is in all things like the former, but that it groweth much smaller in every part, although it grow in the same places with it.

The Place.

They grow in moist and shadowye places, and sometimes at the rootes of old rotten trees in woods, and sometimes by the hedge sides or borders of fields.

The Time.

They spring up in *Aprill*, are in flower in *June*, give their seede in *August*, and perish downe to the ground afterwards, the rootes abiding safe in the ground.

The Names.

These were not knowne to any of the ancient writers, that we can finde, but are usually in these dayes, called by all Herbarists *Circæa*, because in the outward forme, it is like the *Circæa* of *Dioscorides*: *Lobel* and *Pena*, call the greater *Circæa Lutetiana*, not knowing the lesser, we adde *major* for a distinction between them, the former is called also *Circæa Monspeliensium*. *Tragus* calleth it *Lappa sylvestris*, because the small heads of seed, are rough like small burres. Ioe he judgeth the *Amaranthus minor purpureus* to be the *Circæa* of *Dioscorides* and *Pliny*, *Iohannes Thalius* in *Hercynia sylva* (which is ioyned with *Camerarius* his *hortus Medicus*) calleth them *Helxine sylvestris, flore flosculis minor & niveo*, and saith that they are like in leaves, unto the *Helxine*, that is called *Parietaria*. *Gesner* in *horto Germaniæ*, calleth it *Ocimastrum verrucosum* (not being before knowne by any name) because the leaves in the forth, are like *Basill*, and the rough heades, like unto rugged warts; *Tabernæmontanus* calleth it *herba Dr. Stephani*; *Raubinus* calleth the greater *Solanifolia Circæa alba major*, as doe doth the lesser *Solanifolia Circæa Alpina*, which *Fabius Columna* calleth *Circæa minima*. Many also have taken the *Moodrake* of *Theophrastus* to be *Circæa* of the ancients, because he saith it was so called by some in his dayes: and some the *Mouse-eare* of *Theophrastus*, to be this *Circæa*, and have attributed the vertues thereof unto it: but assuredly none of these herbes, nor that in the former Chapter, is answerable unto the description of *Dioscorides* his *Circæa*, for although he saith the leaves of *Circæa* are like *Nightshade*, yet the flowers are many and blacke, and the seede like unto *Millet*, growing in small hornes: the roote also he saith is almost a foote long, three or foure together, being white, sweete in smell, and of no heating or warming property: so that as I said, none of these answer unto this description in all things, for the seede of none of them is contained in hornes or crooked cods, although *Tragus* saith the *Amaranthus* is; yet the rootes are not sweete, nor heating, nor of any use, when as the chiefest property of *Dioscorides* his *Circæa*, consisted in the roote applyed for many purposes. It is called in *English* of *Gerard*, *Inchanters Nightshade*, derived from *Circe* the great Inchantresse, mentioned by the ancient writers, but why he should call it also *Bindweede Nightshade*, (and his carelesse followers it so passe) I see no cause; for that name doth better agree, unto the wood *Nightshade*, set forth in the former Chapter, because it doth climbe like a *Bindweed*.

The Vertues.

There hath not beene any of the moderne writers, sithes *Tragus*, *Gesner*, *Thalius*, *Lobel* and *Pena*, or *Tabernæmontanus*, that have set downe any property, wherewith any inward or outward diseases may be helped thereby, but have over-passed them, as though none of all the Country people where they grow, made any use thereof: but assuredly the temperate qualityes, of cold and moisture therein, they may not unfitly, nor peradventure without good effect be applyed in hot grieses, as the Nightshade is, although it be dull and not altogether as it is: I doe not here set downe any of the vertues of *Dioscorides* his *Circæa*, because this is not it, neither doe we know what it is.

Circæa lutetiana major.
The greater Inchanters Nightshade.

Hh 2 Chap.

CHAP. IX.

Solana Pomifera. Applebearing Nightshades.

VNto the kindes of Nightshade I must, as divers other good authors doe, joyne sundry other plants which for their qualities, either more or lesse dangerous, or for their outward forme and proportion, doe somewhat agree with the former set downe.

1. *Solanum pomiferum hirsutum Lobely.* *Lobel* his hairie Nightshade.

It groweth like common Nightshade but greater, the leaves are like unto Tobacco leaves, the flowers are white, like the ordinary sort, the berryes are small and round, of an orient reddish colour, with white seedes within them of an insipide taste, almost without any heate or sharpenesse, and perisheth every yeare as Nightshade doth, this differeth from *Mala aethiopica*, although *Bauhinus* make them to be one, for it hath no prickes, or thornes, on stalkes, or leaves, nor is the fruite hard or crested.

Solanum fructu ipsum Americanum dictum Amomum Plinij. The Winter Cherry Tree.

This is described in my former booke.

2. *Mala Insana Syriaca.* Madde Apples of *Syria*.

This raging or madde Apple, riseth up with a great hard round purplish or brownish greene stalke, three foote high, divided from the bottome into divers branches, whereon are set many hairy broad rough leaves, somewhat unevenly cut in on the edges, and somewhat like the Thorne apple leaves; at the joynts with the leaves come forth severall large flowers, consisting of six large pointed leaves, in some plants white, in others of a deadish purple colour, with yellow threds in the middle; which being past there succeedeth large somewhat long and round fruite, in the warme countries, as bigge as a Cowcumber, but in others, lesser, and then a large great egge set in the same cup or huske, that contained the flower before, whose outward coate, is usually according to the flower it bore, either of a whitish greene, more yellowish, or of a purplish colour, or of a pale or wanne purplish colour, with a very thinne skinne or barke, and full of a waterish pulpe, and juice within, having many small flat whitish seedes within it, somewhat greater then doth the Apples of love, the roote is compoted of many strings, some great, others small, not thralling downe right into the ground, nor abiding but perishing with the first frosts.

3. *Mala Ethiopica.* Madde Apples of *Ethiopia*.

The Madde apples of *Ethiopia*, are somewhat like the former, but that it groweth not so high, nor spreadeth so much, but having one upright stalke, about halfe a yeard high, set here and there, with divers small prickes not very hard or long, and at severall joynts with jagged leaves, both lesser, and lesse cut in on the edges, then the former, especially the lowermost, having some prickes also in the middle rib, on the backeside, but the leaves that grow higher, toward the toppes of the stalkes and braunches, are much lesser, divided on the edges, the flowers stand dispersed on the branches at the joynts, consisting of five white white short leaves, with a long pointell in the middle, of divers threds joyned together, after which commeth the fruite which is round and a little pointed at the end, smaller and harder then the greater kinde of Love apples, and streaked, and furrowed withall in divers places, of an excellent red colour, and turning more deepe when it is ripe, having sometime small bunches on them, like unto other small apples, growing unto them; and containing a juicye pulpe within it, somewhat more sharpe then the former, but nothing so moist as the love apples, with such like flat yellowish white seede within it: the roote is a tuft of threds, perishing like unto every yeare, and seldome in these colder countryes commeth to maturity, to shew his beautifull colour or give good seede.

1. *Solanum pomiferum hirsutum Lobely.*
Lobels rough haired Nightshade.

4. *Mala Insana Europea.* Madde apples of *Europe*.

This kinde of madde apples, groweth with an upright round stalke, to the bignesse of ones finger, a foote and a halfe high, from whence spring forth at severall joynts, sometimes on the one side, and sometimes on the other, divers long, and somewhat broad greene leaves, unevenly cut in on the edges, and ending in a long point, three for the most part comming together, each of them upon a short foote stalke: at the top of the stalke grow the fruite, which are round reddish berryes or apples of the bignesse of a Plum, full of seede within them.

1. *Pomum amoris majus medium & minus.*

Apples of Love, of a greater, lesser, and middle sort.

These sorts of Love Apples, doe in all things so neerely resemble one another, both in the long trayling branches, the winged and divided leaves, the yellow flowers, and the red berries or fruite, as I have shewed in my former bookes, that I can adde no more thereunto.

The Place.

The first was brought out of *Spaine*, the second groweth plentifully wild in *Egypt*, as divers doe report, as also in

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

Syria, and these Eastern countryes: the third is thought to come out of *Ethiopia*, and the backe parts of Barbary: the fourth *Lagdunensis* hath, groweth in shadowie places, upon the *Apennine* Mountaines: the last likewise groweth in these Eastern Countryes of *Egypt*, *Syria*, *Arabia*, &c.

The Time.

The three last doe flowre late in the yeare, that is, not untill *August*, so that their fruites hardly attained to be any thing ripe with us, but the sorts of the last, doe usually ripen well, if the Summer be reasonable.

The Names.

The first is called by *Lobel*, *Solanum pomiferum hirsutum*, but is not *Mala Æthiopica* of *Dodonæus* and others as *Bauhinus* setteth it downe. The second is called in Latine *Mala Insana* of most writers, that is, mad Apples in English, (but many doe much marveile, why they should be so called, seeing none have been found to receive any harme by the eating of them:) in Italian *Melanzane* and *Melingrane*, and of the Frenchmen *Morelle faict Fallacieuse*, of the Spaniards *Berengenas*, of the French *Pommes d'amour*, but why they should so call it, *Ruellius* doth not know as he saith, when as there is another more fitly to be called by that name. *Germanus Melanzana* and *Dalechampius*: divers doe take this to be *Strychnon* of *Dioscorides*, and a kinde of *Physalus*, as also the third kinde of *Pliny*. Whereupon *Cesalpinus* as I thinke, calleth it *Solanum hortense* and *pomiferum*, of *Bauhinus Solanum pomiferum fructu oblongo*. *Hermolaus* is thought by *Lusebius*, and *Brasavolus* to be the *Strychnomanicon* of *Dioscorides*, but *Matthiolus* defendeth him, and reprooveth them for laying that imputation upon him, which he did not avouch. The third is called by *Tragus*, and others, *Æthiopica*: *Lugdunensis* calleth it *Capsicum rotundum Dalechampii*, but very erroniously, for this hath no fiery biesting quality therein as the *Cayssen* Cornes Peppers have; of *Bauhinus*, *Solanum pomiferum fructu duro striato laevi*. The fourth is called by *Lugdunensis*, *Hyoscyamus peregrinus Dalechampii*, and of *Bauhinus*, *Solanum pomiferum fructu rotundo*, I have called it *Mala Insana Europea*, because that growing naturally in our parts, it is so like unto the last, which is a kinde of *Mala insana*: the last is called, *Pomum amoris*, and *Mala* of *Malum aureum*, which *Anguillara* tooke to be *Lycopersicum*, or *Lycopersicon* as some have it (as I take it) others, and to be *Glaucium* of *Dioscorides*, which it cannot be, for that hath a yellow juice and leaves, as this hath not: *Cæsalpinus* saith it is called *Tomatle* by the *Americans*, and some others also would referre *Solanum furiosum*, whereunto it hath no quality correspondent, *Bauhinus* calleth it *Solanum Peruvianum rotundo striato malo*.

The Vertues.

Madde apples are eaten being first boyled in fat broth, with vinegar or salt, oyle and pepper, as a common Junket with the Venetians and others, as *Scaliger* saith, and neither breed freckles nor any other harme, as therefore he saith *nemo (meo quidem judicio) insanit dicendum*. Yet *Avicen lib. 2. cap. 455.* condemneth them, saying those that are old are very noisome and hurtfull, although the fresh ones be better: for by their unwholesome nutrimony it is gathered, that they are hot and dry in the second degree, and that therefore they engender Melancholy, the Leprosie, Cancers, the Piles, Impostumes, the Headache, and a stinking breath, breed loathsomnes in the Liver and Spleene, and change the complection into a foule blacke and yellow colour, make it to be boyled in Vinegar; so that it is to be admired, that *Averrhoes* should commend them, being dressed in that fashion. *Fuschius* saith that there is a superabundant coldnesse, and moisture, in the Madde apples, like as in Cowcumbers and Mushroomes: yet the beauty of the fruite worketh in some, and the unfainable acrimony in the palate in others, and the inciting to Venery in the most, (which these are thought to procure) do so farre transport a great many, that in *Italy* and other hot countries, where they come to their full ripenesse and proper rellish, they doe eate them with more delight and pleasure then we doe Cowcumbers, or the like, and therefore prepare and dresse them in divers manners; as some doe eate them raw, as Cowcumbers: some doe roast them under the Embers, and others doe first boyle them, pare them and slice them: and having strewed flower over them, doe fry them with oyle or butter, and with a little pepper and salt, serve them to the table. Some also doe keepe them in pickle, to serve for to spend in the Winter and Spring: but it is certainely found true, that they doe hardly digest in the stomacke, whereby they breed much windinesse, and thereby pervert bodily lust: that they engender bad Blood and Melancholicke humours, and give little nourishment to the body, and that not good: the Apples of *Ethiopia*, are of the same quality, although of a former kinde, not yeelding any good nourishment, but rather offensive to the body, for these two are *congeners* in forme, and therefore most likely in quality. The golden apples or apples of love, are cold and moist, more then any of the former, and therefore lesse offensive. These are eaten with great delight and pleasure in the hotter Countries, but not in ours, because their moisture is flashy and insipide, for want of the sufficient heate of the Sunne to their ripening.

CAP. X.

Solana pomifera spinosa. Thornye applebearing Nightshades.

THere are one or two more to be spoken of, to finish the family of the Nightshades, (for whose fruite is neerest in likenesse unto these Madde apples, the other to the Nightshades, that is, the Thorne apples should next follow, as being by all authors referred unto the former, but because I have already set forth all their descriptions, I shall not needs repeate them again.

1. *Solanum spinosum fructu rotundo, sive Pomum Hierosolymitanum spinosum.*

Thorny Nightshade of *Hierusalem* with round apples.

The leaves hereof are very like unto those of the former madde apples of *Europe*, but whiter and greener, with many small thornes on the middle ribbe of every leafe on the under side: on the stalke likewise are sparingly set divers thornes, and purplish flowers at the toppes of them being smaller then the former, after come smaller apples also, greene before they be ripe, changing yellow and brownish after wards, and somewhat sweete in smell, but as unsavoury, or without taste as the former.

The

Capsicastrum flore Persicum fructum maximo flore albo ex purpureo.
Capsicastrum flore stellato minimo flore albo simplici & flore purpureo simplici & duplici.

These are described in my former Booke, and the figures of the lesser sorts here exhibited.

Solanum pomiferum Indicum folio subrotundo.

Solanum pomiferum Indicum folio subrotundo.

Indian Apple-bearing Nightshade with round leaves.

This plant being onely mentioned by *Menardus*, in his history of those simple medicines, that come from the West *Indies*, is referred by *Bauhinus* unto his Classis of Thorne Apples in his *Pinax*, but should more properly in my judgement, be placed with the fruits, in the last Chapter going before, called Madde Apples, but that it hath farre more excellent properties. The plant groweth in manner of a shrubbe or hedge bush as he saith, of an excellent greenenesse, having leaves that are small, thinne and round, bearing long fruit, round at the lower end, and flat toward the stalke, like unto the *Malum insanum* or Madde Apple, of a greyish or ashe colour on the out side, and of a pleasant and gratefull taste, without any acrimony therein, having many very small seedes within it.

Stramonium minus flore purpureo simplici & duplici.
Single and double small Thorny Apples.

The Place.

The first groweth in *Syria* and *Palestina*, and other the countries neare there unto; the other groweth in the Mountaines of *Peru* onely, a Province in the *West Indies*, and the seede sent unto *Monardus* into *Spaine*, who sowed the seede, to make triall of the effects, were declared to be knit.

The Time.

It is not mentioned at what time either of them flowereth or beareth ripe fruite, but it is probable they varie not much from the season, of the other Thorne and Madde Apples, unto which they are so like in forme.

The Names.

The first *Bauhinus* calleth *Solanum pomiferum fructu rotundo*, which *Parkinson* (*superaemulo* of Naples, calleth *Pomum Hierosolymitanum*: the other *Monardus* saith came to him under the name of *Cachui*, as the *Indians* it is likely doe call it.

The Vertues.

There hath not any Physicall use beene remembred of the first; whereunto it serveth; but *Monardus* saith of the other, that was sent him out of the *Indies*, that it is of great estimation there, both with the *Spaniards* and *Indians* themselves, in that it provoketh urine, expelleth gravell and the stone in the kidnies and bladder, for which it is most commended; it breaketh the stone in the bladder, if it be not too hard and inveterate, or may by any medecines be dissolved, whereof there were many proofes (as *Monardus* saith) declared to his great wonderment; for as he saith, he did not thinke that the stone in the bladder could be dissolved, and expelled by any medicines: and that the cure thereof consisted onely, in the cutting of it out by a cunning hand: but it was said of this, that the seede taken in any fit and convenient water, for that purpose, will by little and little dissolve the stone into small gravell, which after it is expelled forth, will againe be gathered and grow into a hard stone.

Chap. XI.

Capsicum. Ginny Pepper.

THe *Ginny* Pepper in mine opinion is fitted to follow next after the family of the Nightshades, being in outward forme liken thereunto, as also being no lesse dangerous, although in a quite contrary nature. for this is as farre exceeding in heate, as the other in cold: hereof there are found out, or at least brought to knowledge many sorts in these dayes, which were not knowne to former times, or neglected and not so heedefully regarded at least, as they have beene of later time, especially by *Gregorius de Reggio*, a Capuchine Fryer, who hath observed a dozen severall varieties at the least in the fruite or cods, although very little differing in any thing else. All which I thinke it not amisse to shew you in this Chapter, with some others also not observed by him, but by *Cluyus* and others.

1. *Capsicum maximum oblongum foliosum.* The most ordinary *Ginny* Pepper with long huskes.

I have found this *Ginny* Pepper as a patterne, by which yee may frame the descriptions of all the rest, the chiefest difference consisting in the forme of the fruite whether you will call them huskes or cods, as shall bee shewed every one in their order. The plant it selfe riseth up with an upright brime round stalke, with a certaine path within them, about two foote high in our Country, and not above three foote in the hotter, spreading into many branches on all sides, even from the very bottome, which divide themselves againe into lesse smaller branches; at each joynt whereof come forth two long leaves upon short footestalkes, somewhat longer then those of Nightshade, else very like, with divers veines in them, not dented about the edges at all, and of a very light greene colour: the flowers stand severally at the joynts with the leaves, very like unto the flowers of Nightshade, consisting of five most usually, yet sometimes of six white small pointed leaves, standing open

open like a starre, with a few yellow threds in the middle: after which come the fruite (either great or small, either long or short, either round or square, as the kinds is, either standing upright or hanging downe, as the flowers shew themselves, either of this or that forme, as shall be shewed hereafter,) in this forme, somewhat long, about three inches in length, thicke and round at the stalke, and smaller toward the end, where it is not sharp but round pointed, greene at the first, but being full ripe, of a very deepe, crimson, shining red colour on the outside, which is like a thicke skinne, and white on the inside, smelling reasonable well, and sweete, full of many flat yellowish white seedes therein, cleaving to certaine thinne skinnes within it, which are broadest at the upper end, and smaller at the lower, leaving the end or point empty within not reaching so farre, nor also hooke but especially the seede, being of so hot and fiery a taste, that it inflameth and burneth the mouth, throate, for a long time after it is chewed, almost ready to choake one, that carefully taketh much of the same thereof: the roote is composed of a great tuft, or bush of threds, spreading plentifully in the ground, and perisheth every yeare in the hot Countreyes, after it hath ripened all his fruite, and with us, upon the first sharpe frost feeleth.

2. *Capsicum minus Brasilianum.* Small round *Ginny* Pepper.

This *Ginny* Pepper groweth in the same manner that the former doth, not differing therefrom in any thing but in the leaves, which being of the same forme, are not so great and large, and in the fruite which is small and round (standing some forthright, and some upright, but none pendulous or hanging downe, each of them on a long foote stalke) about the bignesse of a Barberry, but round and nothing lored, but of a darke or blackish yellow colour, enclining to red, and in another sort almost blacke, having such like seede within them as the former, and indeede seldome beareth ripe fruite in our Country. Those which we have had from the Barmudas where they are naturall, are of a yellowish red.

3. *Capsicum rotundum maius fructu longo.* The greater round upright *Ginny* Pepper.

The chiefest difference in this sort of *Ginny* Pepper, consisteth most in the forme of the fruite, which standeth upright, as the flowers doe, being great and round like an apple, even the greatest of all the sorts that are round fruited, of an excellent red colour when it is ripe, like unto a polished Corrall.

4. *Capsicum oblongum pyramidale maius.* The great upright spire fashioned *Ginny* Pepper.

This is much alike or very little differing from the first, the difference of the fruite is that this standeth more great below, and smaller, and smaller to the point, which is sharper then in the first, else it might seeme to be one being inverted, that is, either that turned upward, or this turned downewards, of an heave an orient red like colour as the last.

1 *Capsicum luteum.*

2 *Capsicum minus oblongum siliquosum, & alterum genus magis quadratum & grossum.* The small ordinary *Ginny* Pepper, with grey long leaves, and the fruite and seed.

Original from UNIVERSITY OF MICHIGAN

5. *Capsicum minus Pyramidale & 7. alia genus.* Small round Ginny Pepper, and 7. other sorts.

Capsicum rotundum & longum 13. 16. 17. & 18.

5. *Capsicum minus Pyramidale minus.* The lesser upright Spyre-fashioned *Ginny* Pepper.

As the fruite of this sort is lesser, by the halfe than the last, and not so sharpe or small at the end, but somewhat round, so the greene leaves also are smaller and narrower, and the stalke smaller and not growing so high: the flowers of this, as of all the rest, that beare their fruit upright, doe stand upright also, which is a certaine rule to know what fruit will be pendulous and what will be upright. The figures of both these last sorts are set on the sides of the former table.

6. *Capsicum exiguum erectum pyramidale.* The least Spyre-fashioned *Ginny* Pepper.

The forme of this small Spyre-fashioned *Ginny* Pepper, commeth so neare unto the second sort, that many may soone be deceived, in thinking them both one, that doe not beside them more precisely; for although they both agree in growing upright, and being small, yet those (of the second sort I meane) are short and round like unto a wild Olive, and ripe are smaller and longer, of an inch long at the least, and of a blackish red before they be thoroughly ripe, but then are as red as the rest: this groweth taller, fuller of branches, and more stored both with flowers and fruite, which make the goodlier prospect: the leaves also are no smaller, than in any other sort going before, and of the same darke greene colour with the rest.

7. *Capsicum Cordatum erectum majus.* The greater upright heart fashioned *Ginny* Pepper.

This sort of *Ginny* Pepper groweth to be but of a meane height, that is, not so high as most of the former, having large leaves, but not so small at the ends: the fruit is not pendulous or hanging downewards, with his stalke, but standing upright, being somewhat great flatted, and as it were bunched out at the upper end next unto the stalke, and smaller below, short and round pointed, somewhat resembling the forme of a mans heart, as it is intituled.

8. *Capsicum Cordatum erectum minus.* The lesser upright heart fashioned *Ginny* Pepper.

This differeth not from the last, but in the smallnesse of the fruit, standing also upright and being smaller by a third part, or neare an halfe, and shorter also: the figure of this is omitted, because it is the same with the next, but that this is upright and the other pendulous.

9. *Capsicum Cordatum pendulum.* Pendulous heart fashioned *Ginny* Pepper.

The fashion of this sort of Pepper, is somewhat like the greater upright heart fashioned Pepper, being neare of the same bignesse, but a little more uneven and not so round, but is of a red being ripe, and is pendulous hanging downe-wards, not standing upright as the other. There is another of this sort of pendulous Peppers differing in nothing from the greater but in being smaller.

10. *Capsicum oblongum Olivaria pendulum.* Pendulous Olive fashioned *Ginny* Pepper.

This Pepper hath small long and round cods, smaller below than above, being very like unto an Olive berry, but red being ripe, as any of the rest, and with the stalke hanging downeward.

11. *Capsicum oblongum Olivaria erectum.* Upright Olive fashioned *Ginny* Pepper.

This differeth from the last but in being greater than it, and standing upright and not in any thing else. The figure of this is not set to any of the tables; but this figure with eleven is next under the number twelve.

12. *Capsicum*

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

13. *Capsicum siliqua rotunda Cerasiformi.* Cherry fashioned *Ginny* Pepper.

There are two sorts of this Pepper, one which is fully round, like unto an *English* or *Flanders* Cherry, the other that hath a little point at the end thereof, this being a little bigger then the other, and both of them hanging downe.

13. *Capsicum siliqua lata & rugosa.* Broad and Crumpled *Ginny* Pepper.

The cods of this Pepper are some what large, greater above and smaller below, somwhat flat also and not round, but crumpled as it were or shrunke halfe together, and smelleth pretty sweete.

14. *Capsicum erectum majus longum.* Long and upright *Ginny* Pepper.

This Pepper is long and round, yet not like that, that carryeth the forme of an Olive berry, but much longer and of an equall bignesse all the length thereof, and standeth upright.

15. *Capsicum oblongum majus recurvum siliquis.* The greater crooked or horned *Ginny* Pepper.

The greater horned *Ginny* Pepper, hath great large cods, about five inches long, sometimes little or nothing crooked at the lower end, which is long and small, sometimes a little crooked or bended upwards, and sometimes very much.

16. *Capsicum oblongum minus recurvis siliquis.* The lesser horned *Ginny* Pepper.

This differeth from the last, in not being halfe so thicke or long, and keeping his end bowed or crooked constantly, not varying as it doths: both this and the last hang downe their cods toward the ground: the whole plant also groweth taller then the other.

17. *Capsicum bifurcata siliqua.* Double pointed *Ginny* Pepper.

This Pepper is very like the long upright Pepper, and much about the same forme and bignesse, being of an equall size almost, all the length thereof, but differeth from it in this, the lower end is parted as it were into two short round points, and is also a little smaller there then upwards, neither in colour nor any thing else differing from the rest.

18. *Capsicum siliqua flava breviore.* The shorter gold yellow *Ginny* Pepper.

It might be thought by divers, that onely see the cods of this Pepper, that it differeth from all the rest in manner of growing, as well as in the colour of the fruite, but it is not so; for it hath like leaves, stalkes and flowers in every part, and onely differeth in that it beareth cods, very like unto the first sort here set downe, which is the most common, but that they are shorter, and ending in a smaller or sharper point, and of a fine gold yellow colour, not red as all the other before are.

19. *Capsicum siliqua flava longiore.* The longer gold yellow *Ginny* Pepper.

This gold yellow Pepper differeth in nothing from the last, but in the cods, which are not so thicke as they, but a little smaller, from the middle thereof being longer, or lessening very finely unto the pointed end, of a fine gold yellow colour as the other.

20. *Capsicum caule pilosa.* *Ginny* Pepper with hairy stalkes.

This *Ginny* Pepper groweth with round greene stalkes; set full of white haires thereon, contrary to all the former sorts: at the joynts with the branches come forth two such leaves, as the first sort here set forth, but larger then they; the flowers are white, consisting of five leaves like the rest, but larger also then they; after which come the cods, greene at the first, as all the other are, but as red as the rest, when they are ripe, which are somewhat great and long, ending in a very long point, as in the seede, and not differing from the former sorts.

The Place.

All these sorts of Pepper, came first from the *West Indies*, called *America*, and the severall parts thereof, being reckoned as a parcell thereof, and our Sommer Ilands also, although we in *English* from whence we are, give it the name of *Ginny* Pepper, as though it originally came from thence: they are nourished with us in all the Provinces of *Europe*, and groweth in many places of *Italy*, *Spaine*, &c. Set in pots to stand in windowes of their houses, either for the pleasure of the beautifull greene leaves and fruite or cods, when they are ripe, or for the use it serveth, or both. *Clusius* saith it is not onely planted in *Spaine*, and *Portugall* in gardens, but in *Africa* also as he saith, for the profits sake they make of the fruite, which serveth in stead of pepper, in the stead of the *East Indian* Pepper.

The Time.

They use not to sow them untill the end of *March*, or beginning of *April*, no not in the warme Countries, they flower usually not before the beginning of *August*, at the soonest; and their bravered cods ripen successively, untill the beginning of Winter, and so will abide both with flowers and fruite, most of the Winter with us, but if they take any frosts with us, they presently perish, and therefore must be housed if any will preserve them.

The Names.

It is generally held that *Siliquastrum* of *Pliny*, *a siliquis quas producit*, and *Piperitis* of him also, and *Piper Aethiopicum* of *Avicenna*, and *Piper Indicum Rarum maiorem*, *Capsicum* of *Actuarius*, *Pima* thinketh it to be *Cummin* of *Aetius*: it is in these dayes diversely called, for some call it *Piper Indicum*, *Piper Americanum*, *Brasilicum*, or *Brasil-wort*, some *Calecuthium*, some *Hispanicum*, and some *Piper de Guinea*. Others that the *Indians* call it *Ari*, and besides the sorts here mentioned, he speaketh of one in the last Chapter of the 1. Booke, with blew colour, familiar in *Spaine*. Of the *Italians Pepe Cornuto*, and *Pepe d'Indea*. Of the *Spanish Pepe Indiano*. Of the *French Poivre d'Inde*, and *Poivre d'Espagne*. Of the *Germans Pfeffer Indianisch*, and some of the *Dutchmen*, we in *English* generally call it *Ginny Pepper*, and some *Indian* Pepper. The last sort best knowne, and still obtained in these Christian parts of the world, as mentioned by most of the later writers. *Fuchsius* calleth the first two, *Capsicum rubrum & nigrum*, and *Siliquastrum majus & minus*, *Matthiolus* calleth them *Piper Indicum*, and mentioneth three sorts, this first kinde, the sixth sort, and the seventh, which we figure in *Basilea*, his addition into him doth demonstrate. *Lobelius* called them, *Capsicum majus & minus*. *Gesnerus* tooke it to be *Cornu ovis* of *Dioscorides*. *Lobel* calleth them *Capsicum*, yet *Piper Indicum* is given unto the thirteenth is likewise remembred by *Fuchsius*, by the name of *Capsicum latum*, and *Siliquastrum majus*, and so doth *Dodonæus* also, and *Lugdunensis* from him, call it *Capsicum latum*, some also *Piper*

fore *Capsicum Cardanum*: the laſt is mentioned by *Camerarius* in his *Hortus Medicus* by the name of *Piper Indicum piloſa caule*: the moſt of the reſt are remembred by the ancient *Gregorius de Reggio*, and lame by *Rauhinus*.

The Vertues.

The Great Pepper of all ſorts (for herein they are all like) are hot and dry in the fourth degree, and beyond it if there be any beyond it, and are ſo fiery hot and ſharpe biting in taſt, that they burne and inflame the mouth and throate ſo extreamely that it is hardly to be endured; for if any ſhall eate thereof unadviſedly, it will bee almoſt ſufficient to choake them, and if it be outwardly applyed to the skin in any place of the body, it will cauſe rage it, and raiſe biſters in the ſame manner, as if they had beene burnt with fire or ſcalding water: yea the fierce vapours that riſe from the huſkes or cods, whole one doth but open them, to take out the ſeede, to riſe or ſowe, (eſpecially if they doe mince or beate them into powder) will ſo pierce the ſenſes by flying up into the head by the noſtrills, that it will procure abundance of neezings, and draw downe ſuch abundance of thin rheume, that it is to be admired, forcing teares very plentifully: and paſſing like wiſe into the throate, it will provoke a ſharpe coughing, and even cauſe a vomiting in that vehemencie, that all the bowells as well as the ſtomack, will be much perplexed therewith, and if any ſhall with their hands touch their face or eyes, it will raiſe ſo great an inflammation, both in the face and eyes, that they will thinke themſelves utterly ſpoyled, which will not bee remedyed in a long time, by all the bathing of them with Wine or cold water that may be uſed, but yet will paſſe away without further harme: if ſome hereof be caſt into the fire, it raiſeth grievous ſtrong and noyſome vapours, procuring ſneezings very fiercely and coughing, and even vomiting or caſting very ſtrongly, to all that be in the roome any thing neare thereunto: yet marke and obſerve the goodneſſe of our good God, that hath notwithſtanding all theſe evill and noyſome qualities, given unto man the knowledge how to tame and maiſter them, and caſte them to be ſerviceable and profitable for their health: for whereas if it ſhould be taken ſimply of it ſelfe, either in powder or decoction, it were ſcarſe to be endured, although in a ſmall quantitie, and by often taking would prove very dangerous to life, the way here ſet downe is found to be the beſt, both to be taken familiarly and often without offence in meate as well as medicine, as alſo to worke thoſe good effects in Phyſick wherunto it is conducible. It is *Gregorio de Reggio* his receipt, for take (ſaith he) of the ripe cods of any ſort of *Guinny* Pepper (for as I ſayd before, they are all in properties alike) and dry them well, ſtill of themſelves, and then in an oven, after the bread is taken out, put into a pot or pipkin, with ſome flower that they may be thoroughly dryed, cleanſe them from the flower, and their ſtalkes if they have any, cut them in clip them very ſmall, both huſkes and ſeedes within them, and to every ounce of them, put a pound of fine wheate flower (the ſame yee dryed them withall in the oven, may be part if yee will) make them up together into cakes or ſmall loaves with ſo much leaven, as yee thinke may be convenient for the quantitie you make; bake theſe as you doe bread of that ſize, and being baked cut it againe into ſmaller parts, and bake it againe, that it may be as dry and hard as biſket, which beaten into fine powder and ſifted, may be kept for any the uſes hereafter ſpecified, or may ſerve in ſtead of ordinary Pepper, to ſeaſon meate or broth, or for ſauce, or any other purpoſe the *Eaſt Indian* Pepper doth ſerve: for it not onely giveth as good, but rather a better taſte or reliſh to the meate or ſauce (yea and your wine and other drinke) but it is found to be ſingular good, to breake and diſcuſſe the winde, both in the ſtomacke and the collicke in the body: it is ſingular good to be uſed with ſuch meates as are flatulent or windy, and ſuch as breed much moyſture and crudities (whereof fiſh is reckoned one ſpeciall:) one ſcruple of the ſaid powder, taken in a little broth of Veale, or of a Chicken, doth wonderfully comfort a cold ſtomacke, cauſing flegme, and ſuch groſſe or viſcous humours as lye low in the bottome thereof to be avoided, helpeth digeſtion, for it provoketh an appetite to meate, provoketh urine, and taken with Saxifrage water expelleth the ſtone in the kidneyes, and the ſtrangurie that breedeth them, and taketh away the dimnes or miſtineſſe of the ſight uſed in meates, taken with *Pillole di Elefangino* doth helpe the dropſie: the powder taken for three dayes together in the decoction of Penyroyall, expelleth the dead birth, but if a peece of the cod or huſke, either greene or dry be put into the mother after delivery, it will make them barren for ever after: but the powder taken for foure or five dayes faſting, *with as* much Fennell ſeede, will eaſe all paines of the mother: the ſame alſo made up with a little powder of Cinnamon and oyle of bayes into a peſſarie, with ſome cotton wooll, doth bring downe their courſes if they have beene ſtayed: the ſame mixed with a Lohoc or Electuary for the cough, helpeth an old inveterate cough, being mixed with honey and applyed to the throate troubled with the ſquinſie, helpeth it in a ſhort ſpace, and made up with a little pitch or Turpentine, and layd upon any hard knots or kernells in any part of the body, it will reſolve them, and not ſuffer any more to grow there: mixed with ſome water and uſed, it taketh away the morphew and all other freckles, ſpots or markes, and diſcolourings of the skin; applyed with Hens greaſe diſſolveth all cold impoſtumes and carbuncles, and mixed with ſharpe Vinegar, diſſolveth the hardneſſe of the ſpleene: if ſome thereof bee mixed with *unguentum de ſtabiatre*, and the raines of the backe anointed therewith, it will take away the ſhaking fits of Agues: a plaiſter made thereof, and the leaves of Tobacco, will heale the ſting or biting of any venemous beaſt: the decoction of the huſkes themſelves made with water, and the mouth gargled therewith eaſeth the toothach, and preſerveth them from rottenneſſe: the aſhes of them being rubbed on the teeth, will cleanſe them and make them grow white that were blacke: the decoction of them with wine helpeth the Rupture that commeth of water, if it be applyed warme morning and evening: if they ſteepe it to ſteepe for three dayes together in *aqua vitæ*, and the place affected with the paſſie bathed therewith, will give a great eaſe of paine: and ſteeped for a day in wine, and two ſpoonefull thereof drunke every day faſting, will helpe a ſtinking breath, although it hath continued long; and ſnuffe up into the noſtrills, will correct and helpe the ſtinck of them which is proceed of flegme corrupted therein.

CHAP.

CHAP. XII.

Dorycnium. The supposed venemous plant *Dorycnium.*

THere are diverse plants set forth for the true *Dorycnium* of *Dioscorides* by diverse Writers, but the truth whereof agreeth with all the notes that he giveth of it, to these yet to this day, the true *Dorycnium* is not knowne to any that we can heare of: I will therefore here set forth unto you some of those plants which the most iudicious moderne Writers doe suppose may be referred the rather, as agreeing therewith in many things, and shew whereunto else they may most properly be referred.

1. *Dorycnium supposititium Monspelense & Hispanicum.*
The white shrubby Trefoile of Mompelier and Spaine.

The shrubbie Trefoile, which *Rondeletius* and other the learned of Mompelier, (as *Pona* saith) called *Dorycnium*, shooteth forth many woodily branches, browne at the borrome, and whitish towards the toppe, somewhat flexible, to the height of three or foure foote, as I have observed in mine owne Garden, whereon at certaine distances, come forth diverse small whitish leaves, three or five or more together set as a ioynt round about the stalke: at the toppes of the branches stand many small whitish flowers in ruffes, like unto the flowers of other Trefoiles, but smaller, which turne into small long cods with small round blackish gray seedes within them: the root is great, woodily, very long, and branched into many parts under ground, of a pale reddish or flesh colour within, covered with a darke browne thicke barke: which abideth diverse yeares, although the branches die downe to the ground, if there be care taken to defend it from the extremities of the frosts in Winter, for were it not, it would quickly perish: it hath little or no taste at all.

2. *Dorycnium congener Clusij.* Another Trefoile like unto the former.

This other as *Clusius* saith is very like the former, but more white or hoary, having shorter and broader leaves set in the same manner, three or five together upon the small bending branches, which are whiter and softer than they: the flowers are greenish and larger than the former, standing many together on a slender bunch, as *Lugdunensis* and *Camerarius* say the flowers are purple, or of a whitish purple colour, thus hath a saltish taste with some acrimony in it also.

3. *Dorycnium Dioscoridis forte Pona.* *Pona* his supposed true *Dorycnium* of *Dioscorides.*

This strange plant saith *Pona*, that was encreated from the seede sent out of *Candy*, to *Signor Contarini*, it grew in his garden, rose to the height of a foote and a halfe, spreading forth into many branches, whereon grow many small long and narrow rugged leaves full of veines, softer then the leaves of the Olive tree, set without order upon them: the flowers were fashioned like unto the blossomes of Pulse or Pease, of a white colour, and sometimes of a more yellowish colour: the seed he saith he did not see, (but surely it must give seede in cods or huskes:) for there are very few plants that beare peate or pulse like flowers, but they beare their seede in cods or the like) the roote is many small strings and fibres shooting from a head, which whether it die every yeare or abide, we have not yet learned: but *Dioscorides* saith that his *Dorycnium* hath a roote of the length of a cubit and of the thicknesse of a finger when it is growne old, which this as you heare hath not, and therefore if for nothing else, it agreeth not with the right *Dorycnium* of *Dioscorides*, and yet *Pona* saith, he hath not seene any plant that doth so nearely resemble the true *Dorycnium* as this doth.

4. *Dorycnium Creticum Alpini.*
The supposed true *Dorycnium* of *Candy.*

This plant doth so differ from others, that every one is ready to apply it to a severall plant, as his judgement and affection to some particular part thereof doth draw him, because it doth partake with divers plants, as you shall heare: it riseth with diverse straight upright woody stalkes, yet very flexible, divided into many branches from the borrome, all white or hoary: whereon grow many long thicke, and somewhat narrow white silver like leaves, set without order, at the toppes of the stalkes and branches, come forth many flowers together in a tuft or umbell, with some small leaves with them, every one whereof is broad, open at the brime, and round, consisting of one whole leafe, like unto a Bell-flower, or bindweed, which open by degrees, one after another, and not all together, whereby it doth continue the longer in flowring: after the flowers are fallen, come small rough huskes, wherein is contained blackish seed, like unto those of the Bindweedes, somewhat thicke and great: the roote is somewhat great and thicke not growing downe deepe into the ground, with many fibres thereat, which abideth many yeares in the warme countryes, yet the branches lose their

Original from UNIVERSITY OF MICHIGAN

2. *Dorycnium Dioscoridis foetu Pena.*
Pena has supposed true Dorycnium of Dioscorides.

3. *Dorycnium Creticum Alpinum.*
The supposed true Dorycnium of Candy by Alpinus.

leaves in winter, themselves yeelding new, and budding fresh in the spring but hardly endureth a winter with us, unlesse especiall care be had to preserve it, by keeping it in a large pot or, such like, and housing it untill the spring.

The Place.

The two first grow in divers provinces of *Spaine*, as *Clusius* setteth it downe, and the foremost about *Montpelier* also. The third and the last growboth in rocky or stony places neare the Sea, in *Candy*, from whence the seede or plants were first brought into *Italy*, and from thence to leverall friends elsewhere.

The Time.

They doe all flower very late in these parts, whereby their seede seldome commeth to perfection, and in these naturall not untill the Autumne.

The Names.

It is called in Greeke Δορύκνιον *Dorycnium*, and of *Creticus* as *Dioscorides* saith, ἀπὸ τοῦ Δ. & τῆς νήσου Κρήτης, and *Cretica*. some write it is called *Dorycnium quasi toxicum, quæ semula cuniculi aut velociter solenter fatale fuerunt, ut celeriorem interitum pernicies* saith *Pena*, but we cannot heare, that any of these plants have any *lethiferous*, much lesse venemous or mortall quality in them, as *Dioscorides* attributeth to his, and therefore the more suspitious that none of them are the right, although in the outward face, they may all of them, in some things resemble it. There are other plants also referred thereunto, as the *Phyllirea*, which *Gesner* in *hortis Germaniæ* taketh to be a kind like unto the *Vitis Idæa*, as also *Tithymalus cordatus*, or *Vesicaria nigra, sive peregrina cordifolia*, by *Cordus* upon *Dioscorides*. The first is called *Dorycnium verum*, by the learned of *Montpelier* as *Pena* and *Lobel* say, and *Anguillara*, and *Clusius* say the same also, yet *Clusius* calleth it *Dorycnium Hispanicum*, which was also true him as he saith, by *Ulisses Aldrovandus*, by the name of *Trifolium album*, but by *Cordus* in the place before recited, it is accounted false. *Bauhinus* in his *Pinax* reckoneth it among the spiked Trefoiles, calling it *Trifolium album angustifolium floribus, velut in capitulum congestis*. *Clusius* saith that the *Spaniards* about *Salamanca*, where he found it, call it *Myedieca*, *Gerard* called it venemous Trefoile of *Montpelier*, and of *Spaine*, making them to be two leverall plants, expressed by two figures, and Mr *Johnson* his corrector letteth them so passe likewise, but I had rather give it the denomination of *Dorycnium*, from the Latine, as most other nations doe, and call it *Dorycnium suppositium*, supposed *Dorycnium*, because it is but supposed to be right, or else from the Greeke, and call it shrubbe Trefoile onely, because it is not dangerous. The second is so called by *Clusius*, as it is in the title, but *Bauhinus* calleth it *Lotus pentaphyllos incana*. The third is called by *Pena* in his *Italian* booke, *Dorycnium Dioscoridis foetu*, but by *Bauhinus* in his *Pinax*, *Lotus altera folio trifurci*, and saith hee had the seede from *Hortensius Scellus*, out of *Candy*, by the name of *Lago Cymica*, which grew with him, but if the flowers be *Lotus* such as *Pena* describeth them to be, it cannot possibly come neere to any *Lotus*, and yet againe in his *Pinax*, *fol. 463.* he maketh it also to be *Cnicus altera affinis*, which how likely it is, let others judge. The last *Clusius* setteth forth in the *Appendix*, to his History of Plants, by the name of *Dorycnium Plateau*, because *Jacobus Plateau*, had it growing with him, from the seede received from *Candy*, and sent both the figure and description thereof

Original from UNIVERSITY OF MICHIGAN

unto *Chapes*, *Imperatus* also it is likely had it from thence, by the same name of *Doryenium*, for so *Brassa-* saith, he called it. and *Alpinus* in his booke *de plantis exoticis*, saith that they of *Candy* doe call it *Doryenium*. *Pona* doth not accompt it to be the right, but rather thinketh it to be a *Convolvus*, and calleth it *Convolvulus* *Creticus*. *Lugdunensis* calleth it *Cneorum album Didachampi*, and *Bauhinus* in his *Pinax* calleth it, *Cneorum humi folio alte virente crudo*.

The Vertues.

There hath not beene any experience made of any of these plantes, so farre as I can understand, that they are effectuall to any Physicall use, and therefore I can say no more of them; for seeing none of them are *soporiferous* as *Dioscorides* his *Doryenium*, or venemous, and was accounted as strong a *Toxicum*, to dippe their arrowes in, to kill wild beasts, as any other; I cannot appropriate the vertues of *Dorychnium* to any of these plants, as *Galen* accounted it meerely like unto Mandrake and Poppy, for the cooling property, and only dangerous if too much were taken thereof, in provoking too much sleepe.

CHAP. XIII.

Hyoscyamus. Henbane.

THe ancient writers hath made mention, but of three kindes of Henbane, the one blacke, the other white, and the third yellow; which denominations are not taken from the colour of the whole flower, but of the seede: but there hath beene some other sorts found out of later times; all which I thinke meete to set downe in this Chapter together.

1. *Hyoscyamus vulgaris*. Common Henbane.

Our common Henbane, hath very large, thicke, soft, woolly leaves, lying upon the ground, much cut or iagd on the edges, of a darke or evill grayish greene colour, among which rise up divers thicke and soft stalkes, two or three foote high, spread into divers smaller branches, with some lesser leaves on them, and many faire flowers, seene appearing above the huskes, and usually borne on the one side, ending in five round pointed leaves one above another, of a deadish yellow colour, somewhat paler towards the edges, with many purple veines therein, and of a darke yellowish purple in the bottome of the flower, with a small pointed of the same colour in the middle, each of them standing in a hard close huske, which after the flower is past, growes like (the huske of the Pomgranet flower, but that is not so well knowne unto us) the flower or huske of Beanes, and somewhat sharpe at the toppe points, wherein is contained much small seede, very like unto Poppy seede, but of a dusky grayish colour, the roote is great white, and thicke, branching forth divers wayes in the ground, so like unto a Parsnep roote, but that it is not so white, that it hath deceived divers, as you shall heare by and by; the whole plant more then the roote, hath an heavie evill soporiferous smell somewhat like unto

1. *Hyoscyamus niger vel vulgaris.*
Common or white Henbane.

3. *Hyoscyamus Creticus.*
Henbane of Candy.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

1. *Hyoscyamus albus.* White Henbane.

The white Henbane hath diuers large leaues, but not so great as the former, yet more soft and woolly and not so much jagged or rent in the edges, rounder also, and of a paler greene colour; the stalkes grow higher, and with fewer branches on them, the flowers are in forme like the other, but smaller and of a pale colour, enclining to a whitish yellow: the seed likewise groweth in such like hard huskes, but lesse prickely, and is whiter: the roote also is not much unlike, but lesser and perisheth every yeare that it giveth seede, the smell of this is nothing so heady and offensive as the other.

2. *Hyoscyamus Creticus.* Henbane of *Candy*.

The Henbane of *Candy* hath lesser and thinner leaues then the last, more white and woolly, and more cut in on the edges, deuided also, and standing upon longer foote-stalkes; the stalkes are more slender and short, having lesse like flowers, ending in hill-round leaues, standing in star above the brakes, of a faire yellow and some-time of a pale yellow colour, and purple at the bottome: after which come seede like the common kinde, but somewhat yellower in rounder heades or huskes: the roote is somewhat slender and short, like a Nauew roote, dying every yeare with us.

3. *Hyoscyamus Aegyptius.* Henbane of *Egypt*.

The *Egyptian* Henbane riseth vp with a strong woolly stalke, about two foote high, whereon are set lesser leaues, then vnder on the common kinde, and almost as much rent on the edges, especially those toward the bottome, but those that grow vp higher toward the toppe, are little or nothing cut on the edges at all, all of them being very white and hoary: the flowers stand every one of them at the ioynts with the leaues, and at the tops likewise, in such like huskes as the common doth, and of the same pale yellow colour, with purple veines therein, as the first blowing of them, but afterwards as they grow larger, so the colour changeth to be of a darke reddish colour, with veines of a deeper colour, and a whitish bottome, with a purple pointell, encompast with yellowish threds in the middle; after which commeth such like prickely heads, as the common kinde hath and such like seed after the roote is small and perisheth every yeare.

4 *Hyoscyamus Aegyptius.*
Henbane of Egypt.

The Place.

The first is commonly growing by the way sides, and vnder hedge sides, and walles: the second groweth by the Sea sides, in *Narbone* in *France*, neare where the River *Rhodanus* runneth into the Sea. The third groweth in *Candie*, and in *Spaine* also, from whence the seed being sent, hath growne with me and diuers others also. The last is naturall both in *Egypt* and *Syria*, and in our Gardens.

The Time.

They doe all flower in July, yet the strange kindes somewhat later, and from their seed growing ripe, and suffered to fall, it springeth vp againe every yeare, but the two last doe not make perfect their seede with vs.

The Names.

It is called in Greeke ὑοσκύαμος, quasi ὗς κύαμος porcina, quod a Graecis authoribus, paene hunc herbae omnibus porcis gratissimae fines apponi, proditum memoriae, siue propterea quod porcis in foris ita positis, aduenae aquae, non ut peculiares fortasse, carnium vitio ut cancros nascentes, ita eorum multiplicatus semitas effugiantur; in Latine also *Hyoscyamus*, and corruptly *Iusquiamus*, and *Apollinaris*, ab Apolline medicinae inuentore, vel quia apples cerebrum vitiosis humoribus solutis, eique mentem porrigit, quasi Apollinis vestra. Pliny saith that the Arabians call it *Altercum*, or *altercangonon*, but Scribonius saith the Latines call it *Altercum*, ab altercitando, quia cum vehementes altercationes excitant. Quarum Hyoscyamus dominatur. Coelius saith, it is also called *Priapeia*, quia lasciuo semine mouetur ad priapismum flaccidum. It is called by the Arabian Phisitions *Bengi* (which name differeth but little from *Banche* of *Serapio* in *Ebeta*, and *Canthephorus Aeschi*, so called of the *Persians* and *Indians* also of diuers places, and perad venture may be the same, for they say the plant is insipide, or without taste, and the seede both smaller then Hempe with which it is compared, and not so white: and which hath a great affinity as *Cluſius* saith, with the *Maſſue* of the Sweetes. Yet *Bauhinus* saith, that their *Maſſue*, is made of the great *Stramonium* or *Pomum ſpinoſum*) which procureth a kinde of sleepy drunkennesse, or alienation of the minde, as this doth, with some other effects resembling in nature, as may be seene in their workes, whereunto I referre those that would be further informed) of the *Italians Inſquiamo*, of the *Spaniards Veleño*, of the *French Iuſquiame*, and *Henne bane*, of the *Germanes Bilſenkraut*, of the *Dutchmens Bilſen wruyde*. The first is called by all authors *Hyoſcyamus vulgaris*, or *niger*, only *Dodonaeus* calleth it *flauus*. The second is likewise called *Hyoſcyamus albus* of all, and is but of one kinde at hand. *Bauhinus* seemeth to make two. The third is called by *Cluſius Hyoſcyamus Creticus*, and although he make two sorts of it *Bauhinus* doth, that followeth him, yet assuredly I thinke that they are both but one plant, as the determination doe declare. The last likewise is by *Bauhinus* diuided into two or three sorts, because *Cluſius* in some, setteth forth two figures, the one he nameth *Syriacus*, the other *peculiaris*; when in his description he saith they differ onely in the broadnesse of the leaues, the one from the other, which may happen rather by the fertility of the soile, wherein they grow, then of any other specificall difference. *Bauhinus* nameth

it *rubello flore*, and maketh it to be another sort from the *Egyptian* of *Cluius*, when as both *Clusius* and *Lobel* agree in this, that *Pauldanus* brought the seede from *Egypt*, and *Rauwolfius* saith he found it growing at *Aleppo*: so that the seven sorts of *Hyoscyamus* set forth by *Bauhinus*, are but these foure here recited, his two sorts of white, are but one; his two sorts of *Candy* are but one; and his two sorts, the one *rubello flore*, the other *fumoso flore*, and *cum* *Egyptiaco* are but one, even that which *Camerarius* calleth *Syriacus*, and *Cluſius* *Egyptiacus rubello flore*; but *Dioscorides* his third sort, which is the yellow, is not declared, which these it should be, the first being called *niger*, blacke, and the second white, are peculiarly set downe, and agreed upon by all. But the yellow, as I said is not so plainely determined, some taking the *Scythian* Tobacco to be the *Indian* kinde, being quite differing in effect, this being hot and hyperactive, the other cold and hypoactive, but if I might be allowed my verdit, I should say that the *Candy* Henbane is most probable to be the yellow and the *Egyptian* kinde the blacke, or a species thereof differing onely by the climate.

The Vertues.

The blacke or common Henbane, and the yellow, are both accounted to be more dangerous than the white, and therefore to be as much avoyded in inward medicines as may be, and that but in case of necessitie, where white cannot be had, for the white is cold in the third degree, and the other in the fourth, procuring deadnesse and senselessnesse of the parties, stupefied by the benumming qualitie; the white is in onely to be used inward Phisicke, which is most available to many good purposes, if it be wisely and conveniently applied, for the leaves of them all doe coole all hot inflammations, either in the eyes or any other part of the body, and are good to asswage all manner of swellings, whether of the cods, or Womens breasts, or else where, if they be boyled in wine, and either applied themselves or the fomentation warme: the same also applied to the gout asswageth the paines thereof, and of the Sciatica, and all other paines in the joynts, and other parts, which arise from an hot cause; it helpeth likewise the headach, and want of sleepe in hot fevers, applying it with vinegar to the forehead and temples: the juyce of the herbe or seede, or the oyle drawne from the seede doth the same, so doth the decoction of the leaves, to wash the sores of the head, but see that you doe not use it too often for feare of danger. *Dioscorides* saith that the seede is profitable against the defluxions of hot and sharpe salt rheume upon the lungs causing a cough, as also against the strangling and other paines of the mother, and to stay the great fluxes of their courses, and all other fluxes of blood: the oyle of the seede is helpefull for the deafenesse of eares and wormes in the eares, being dropped therein: the juice of the herbe or roote doth allay the paine, helpeth the toothach, if the roote be boyled in vinegar, and a little of the decoction be held in the mouth: some have also affirmed, that the fume of the seede being burned, taken into the mouth, not onely ease the paines, but cause the wormes to fall out from the teeth, but diverse cunning knaves to those that they would get money from, having caused such to hold their mouthes over warme water, cunningly conveyed small peeces of Lute strings into the water, to cause them to believe they were those live wormes, as there are peeces in the water: for the property of those Lute strings is, that feeling heate in the water, they will seeme to stirre, and move as though they were alive: but *Penn* sheweth that he knew a young woman that used the foresaid fomentation for her teeth, that after three had ease of them, was three dayes so troubled in her senses, that she seemed as if shee had beene drunke, being very merry and pleasant that time, which passed away without further danger: but I know a friend of mine, that having gotten some Parsneppe roots that grew in his Garden, by chance some roots of Henbane which grew amongst (which as I had before said somewhat like thereunto) were boyled with them, and he eating thereof, was very shortly after sore troubled with a drought, that nothing that he could take would quench it, no taste, or relish of any thing was taken away, suddenly also his sight was troubled that he could not discerne things as they were, but as if they were 3. or 4. fold, his urine also was quite stopped, so that notwithstanding he had great desire to make water, yet he could not possibly: in this perplexitie he continued most of the night, in which could he rest, or sleepe being in bed, but his urine by the stopping thereof grew to hot within him, and unable to passe it from him, caused him to bethinke himselfe of a pouder, himselfe had caused to be made, against the stone, which he caused to be given him, which suddenly caused him to make water, and that presently felt incredible ease in his whole body, for all the things that he had taken before did doe him no good, but by this meanes he quickly recovered his sight, and the other symptomes vanished, and before morning was as well as before the taking of that roote: the servants also that did care of the good Parsneppes boyled with these malignant roots were somewhat distempered, some more some lesse, each according to their feeding, and their owne dispositions working together: this I have related that you may know also the danger of this herbe, and of every part thereof; the seede is usually mixed with that of *Indian* to take fish, causing them that take it to turne up their bellies, and lie above the water as they were dead for a while; but they doe not long abide in this manner, but returne to their former state, swimme away: Hens also or other birds, that take of this seede will die, and the fume of the herbe burned, and brought into their roosting place will cause them to fall downe as if they were dead: the decoction of the herbe or seede or both, will kill lice and vermine whether in man or beast, which you shall prove if you receive in a dogge troubled with lice, being washed therewith, the lice will be soone found dead upon him, and some fall from him: the fume of the dried herbe, flakes, and seede burned, and the hands held over it, helpeth those that are troubled with swellings and chilblaines in the Winter, or their heeles that have kibes, and quickly heale them. The distilled water of the herbe is effectuall for all the purposes aforesaid. The onely helpe those that have taken Henbane, is to drinke Goates milke, much meade or honied water, Sack or other sweete wine, or if these be not at hand or will doe no good, Fennell seede, Beetle seede, the seede of Mustard or Radish, as also Onions or Garlicke taken in wine, doe all helpe to free them from danger, and restore them to their due temper againe. The white Henbane is as I said, the surest and most effectuall for medicines for the griefes that specified: the other sorts are of the qualities of the ordinary, but more dangerous than the white.

Cha-

CHAP. XIV.

Papaver. Poppie.

There are diverſe ſorts of Poppies, ſome tame and of the garden, others wild and of the feldes; of the Garden kinde ſome have ſingle and ſome have double flowers: of the wilde there are diverſe kindes, ſome of the corne fields moſt properly and plentifully, and therefore called Corne Roſe, or Corne Poppie, others whoſe heads of ſeede are ſmall & long, bending or bowing like an horne, and therefore called Horned Poppy, of which kinde one ſort groweth moſt uſually by the ſea ſide others by the pathes, hedges and bankes in fields: then that kinde called Spatling Poppie, differing from them all, as *Papaver Hirſutum* doth, although called Poppy: and laſtly, there is a ballard kind of wild Poppie, called in Latine *Argemone*, which although *Dioſcorides* reckoneth it not among the Poppies, yet he maketh it like unto the wild corne Poppie, both in heade and flowers, and like the *Anemones* in leaves, and as he ſaith with a round roote, wherein it differeth from ours. Of ſome of theſe kindes I have already ſpoken, and therefore needeth not to deſcribe them againe: the Garden kindes, with double flowers I have ſet forth in my former Booke of the Garden of flowers; as alſo a kinde of that wild Corne Poppie, that beareth double flowers: and in the Claſſis of purging plants, here before in this Booke, I have ſet downe all the ſorts of Horned Poppie; as alſo that kind of Spatling Poppie, that is ſo accounted with us: the reſt of the ſorts and kindes not ſet forth, are now to be entreated off: but I thinke it moſt fit to give you ſome of the figures before expreſſed, and to ſpeake of the ſorts of *Argemone*, in the next Chapter, and not in this.

1. *Papaver ſimplex ſativum album.* Single Garden white Poppie.

The Garden Poppie hath at the firſt, foure or five whitiſh greene leaves, lying upon the ground, which riſe with the ſtalke, compaſſing it at the bottome of them and are very large both broad and long, much rent or torne in on the edges, and dented alſo beſides: the ſtallke (for every roote for the moſt part hath but one) of the height of foure or five foote (hath ſometimes no branches at the toppe, and uſually but two or three at the moſt, bearing every one but one head, wrapped or folded in a thinne ſilme or ſkinne, which howeth downe, before it be ready to blow, and then riſing and being broken, the flower which was foulded within it, ſpreadeth it ſelfe open, and conſiſteth of foure very large white round leaves, with many whitiſh round threds in the middle, ſet about a ſmall round greene head, having a crowne or ſtarre-like cover at the head thereof, which growing ripe becommeth to be as large as the greateſt apple; (*Bellonius* ſaith the heades are in *Natolia* (where they make *Opium*) ſo great, that they will containe halfe a pint) wherein are contained a great number of white ſmall round ſeede, in ſeverall partitions or diviſions, next unto the ſhell the middle thereof remaining hollow

and empty: this head diuideth itselfe, and openeth not at the toppe vnder the crowne, as all the blacke kindes for the moſt part doe: all the whole plant, both leaues, ſtalkes and heads, while they are freſh, young and greene, yeeld a milke when they are broken, of an vnpleaſant bitter taſte, almoſt ready to prouoke vomiting, and of a ſtrong heady ſmell, which being condenſate, is called either *Opium* or *Meconium*, as you ſhall heare by and by: the roote is white and woodily, periſhing as ſoone as it hath giuen ripe ſeede: Of this white kinde, there is another in all things like vnto it, ſaue that the flowers, but eſpecially the head of ſeede is not ſo great by the halfe, and for the moſt part hath more branches vpon the ſtalkes: the ſeede is as white as the other, and as large or great. The varieties of the double garden Poppies are ſet forth in my former Booke.

Papaver ſatiuum ſimplex album.
Papaver ſatiuum ſimplex nigrum.

5. *Papaver ſatiuum ſimplex nigrum.*
Single garden blacke Poppie.

There is little difference to be diſcerned betweene this and the laſt mentioned, ſmall it beareth his flower, which in this is ſomewhat leſſe, and of a blacke purpliſh colour, without any purple ſpote in the bottome of the leafe as in the next; the head of ſeede is alſo not ſo bigge as the ſecond ſort of white ones, and openeth it ſelfe a little round about the toppe vnder the crowne, ſo that the ſeede which is very blacke, will fall out if one turne the head thereof downewards.

Papaver ſatiuum ſimplex flore rubro, &c.

3. *Papaver ſatiuum ſimplex flore rubro rubente, &c.*
Single garden red Poppie of diuerſe colours.

There be ſome other ſorts of this garden Poppie, which differ not onely ſomewhat in the leaues from the former, being leſſer, and in ſome crumpled and curled on the edges, but in the iagged edges alſo of ſome of the flowers, and ſpecially in the colour of the flower and ſeede, for the flower of ſome will be very red, of others pale, ſome of a Roſe colour, others of a murry colour, either deeper or paler, yet all of them haue a deeper ſpot ſomewhat large in the bottome of euery leafe: and as the flower varieth ſo doth the ſeede alſo, for the Roſe and pale coloured flower bringeth gray or aſh coloured ſeed, the Reddiſh and deeper murrey, not ſo pale ſeede, but more enclining to the blacke: the ſeedes of all theſe kindes, the white as well as the blacke or gray, if they be ſuffered to ſhed will ſpring vp againe the next yeare, and beare euery kinde

Papaver ſatiuum ſimplex album.
Single garden White Poppie.

4. *Papaver Roſeum.*
The Roſe or pale Roſe.

1. *Papauer ſpinoſum Americanum.*
Thorny Poppie of America.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Original from UNIVERSITY OF MICHIGAN

the same colour of flower and seed, and is not degenerate or vary, for ought that ever I could observe.

Papaver erraticum, Rhœas prior genuinus. Wilde red Poppy or Corne Rose.

The leaves of the wild Poppye are long and narrow, very much cut in on the edges into many divisions, of a fresh greene colour, but not whitish, and sometimes hairye withall; the stalke is blackish and hairy also, but seldom aboue a foote high as the Garden kindes, having some such like leaves thereon as grow below, parted into three or some branches toward the toppes, whereon grow small hairy heades bowing downe before the skinne breake, wherein the flowers are enclosed, which when it is full blowne open is of a faire yellow with red or crimson colour, and in some much paler, without any spot in the bottome of the leaves having round blacke spots in the middle, compassing a small greene head, which when it is ripe, is not bigger then ones little fingers end, wherein is contained much blacke seede, smaller by halfe then that of the Garden: the roote perisheth every yeare, and the seed springeth every yeare of its owne sowing. Of this kinde there is one that is lesser in all the parts thereof, and differeth in nothing else. *Ranbius* maketh mention of one of this kinde, that bore a great yellow flower, *Papaver luteum*, and saw it growe; and perchance might be the *Argemone flore luteo* in the next Chapter, but the plant was only brought dry unto him, gathered as he saith in divers wet places, on the *Pyrenæan* hils. The double wild Poppy is described also in my former Booke.

5. *Papaver spinosum.* Thorny Poppy.

Unto the sorts of Poppyes I thinke meete to ioyne this Thornye Poppy, not finding a fitter place; which hath at the first three or more whitish greene leaves lying upon the ground, flecked with white veines, which growing greater, are long, smooth, and not hairy, somewhat long and broad, rent or torne diversly on the edges, but not to the middle ribbe, having many corners or dentes as it were about them, whereat stand many small sharpe prickes or thornes, not having any white flecks or veines on the underside but in the white milkye veines are like to that wilde *Cardous* or Thistle, called our Ladies Thistle, and on the underside are more whitish, with some small prickes along the middle ribbe and veines, compassing the stalke at the bottome of them, which riseth to be two or three foote high, spreading forth into diverse branches, with the like but lesser leaves on them, and bearing at every of the toppes, one small head, enclosed in a rough skinne or huske, like as the Poppie have, from whence I thinke rose the name of a Poppy, given unto it, which being open sheweth fourth a small yellow flower, consisting of five leaves usually, yet sometimes it will have but foure, and sometimes six, with a small long greene prickely head in the middle, tipped at the top with a red spot which quickly weareth away, and with many yellow threds standing about it; after the flower is fall, for it continueth but a while, the head groweth ripe, having five or six ribbes from the toppe to the bottome, and in like sorte betweene the ribbes, armed with very small but cruell sharpe and short prickes, or thornes, wherein is enclosed round rough blacke seede twice as bigge as any Poppye seed: the roote is small and spreading, dying every yeare, every part of the plant yeelding a yellow juice.

The Place.

The Garden kindes doe not naturally grow wild in any place, I thinke, although *Dioscorides*, *Galen*, and others say, that the blacke kinde that shedeth his seede, groweth wilde, for I rather suppose that some seed happening there by chance, shed it selfe, and so was thought to grow naturally wilde, and being suffered to shed, will grow plentifully, though smaller, but in all Countries, at the least in all Christian Countries they are all sowen, and not found wild, so fare as I can learne, onely the first wilde kinde is plentifull enough, and many times too much, in the corne fields of all Countries, and also upon ditch banckes, and hedge sides: the lesser also is found in corne fields, but more rarely, as also in some other places. The thornye Poppy groweth in the *West Indies*, from whence the seede was first brought to us.

The Time.

The Garden kindes are usually sowen in the spring, which then flower about the end of May, and somewhat earlier if they spring of their owne sowing: the wilde kindes flower about from May until July, and the seed of the small is soone ripe after the flowring. The Thorny kinde flowreth seldome before Midsommer, and the seede is ripe in August, but is to be sowen in Autumne, or else it hardly springeth.

The Names.

It is called in Greeke [illegible] *quod defecatos sine mucro facit non vellere*, or as some thinke [illegible] *quod ejus vino somnus inducatur*, & *lenitibus tandem morbis auferat*, the Garden white kinde is called [illegible] and of *Dioscorides*, *Galen*, *Oribasius* and the blacke seede is called [illegible] *horned* or *prickle*, the wild kinde is called [illegible] *Rhœas*, that is *fluidum*, *quia flores proximo decidunt*; in Latine *Papaver Rhœas*, *erraticum*, *rubrum*, or *silvestre*: *Dioscorides*, *Galen*, and others, make onely the first great white kinde, to be the Garden kinde, and the blacke to be the wilde sort, the Garden kinde is called by the *Arabians* *Cachnech*, by the Italians *Papavero domestico*, by the *Spaniards* *Dormideras* and *Cascall*, by the *French Pauot*, by the *Germanes* *Mohn*, by the *Flemmings* and *Hollanders* of the *Netherlands* *Hasell* and *Maenzap*; of us in *England* Poppy, or Garden Poppye for the seed sake, yet in some Countries with us, some silver pinne, *Jubandine* rose without, and some crimson, and in many other places Checkerooles: the wild Poppy is called in *Italian*, *Papavero fiorrancio*, in *Spanish* *Amapolas* or *Pilas* and *Papaselas*: in *French* *Coquelicot*, *Pavot sauvage* and *Coquerets*, in the high *Dutch* tongue *Klappe rosen*, and *Feldmohn*, in the low *Dutch* tongue *Rodeblael*, *wilden blael*, and *Coolblaeseng*, in *English* Wild Poppye, Corne Rose, Headdie, and Canckers, *Fragus* calleth it *Argemone*. The Thorny Poppy is called generally by all now adayes *Papaver spinosum*, but of *Gerardus Cardui sedum Carolinthemum Peruanum*, by the *Spaniards* in the *Indies*, from whom the *Italians* had it *Figadi Inferno*, that is *Ficus Infernalis*, the figge of hell, because the prickly head is long and round, somewhat like a figge, and that whosoever should have one of them stucke on his shin gate, it would surely lead him to heaven or hell. The milkye juice gathered from the heades onely of the great white Poppye, growing in the East Countryes of *Asia minor*, towards *India*, and in divers other countries of those Seas, for it is there a great merchandise of much use and expence, as also in *Persia*, *Cappadocia*, *Galatia*, *Cilicia*, and *Natolia*, which is the lesser *Asia*, as I said before,) is that true and best *Opium*, that is or should be used in *Apothecaries* medicines, and is an ingredient of much respect, in their great compositions of *Theriaca* and *Mithridatium*, &c. whereof a small quantity hath beene gathered in some Christian Countryes: and my selfe and others in our owne land, have gathered a little from the greene heads, as they stand, and are but halfe growne

growne ripe, slit or cut with a knife in two or three places, that the milke issuing forth, may be gathered into some convenient thing, and hardned afterwards in the Sunne, but not at the fire, which will not be so white as that *Opium*, that commeth usually to us, which is rather *Meconium* as *Dioscorides* termeth it downe, which is made of the juice of both leaves and heades pressed forth, of the white as well as of the blacke Poppy: the true best *Opium* is somewhat of a whitish yellow or brownish colour, and giveth no such yellow tincture as that which is sophisticate and made with *Glaucium*, (which is the yellow juice of an herbe, with leaves like to horned Poppy, but divers have thought *Glaucium* to be the juice of *Chelidonia maior*, others of *Papaver spinosum*, and lastly *Bauhinus* and some others, thinke it to be of this thorny Poppy, because it giveth a yellow juice: but as *Bellonius* writeth, that to have any quantity of true *Opium*, it rather consisteth in the multitude of gatherers (for it must be both speedily gathered, and in the heat of the day) then in the great quantity of ground sowne therewith, it being a tedious worke; for a very small quantity can be but gathered by any one in a day, in every head yeelding but little, and must be attended to be taken from them, before it be dryed too much upon them.

The Vertues.

All the sorts of Poppy are cold in the fourth degree, but especially *Opium* or the condensate juice: as *Galen* and divers other authours doe affirme, yet *Matthiolus* thinketh thereat, thinking it rather to be hot, by the bitternesse and butternesse thereof, and is *Apostasium medicamentum*, that is such a medicine, that by procuring sleepe, easeth many paines for the present, which indeede it doth but palliate or cause to be quiet for a time; howsoever all use whereof, bringeth very often more harme, and a more dangerous disease then it hath allayed, that is insensiblenesse or impotencie of a part or member, which commeth to be the dead palsie, for although *Dioscorides*, *Galen*, and others write, that the white seed is familiarly taken in bread, and made into cakes and eaten with pleasure, and *Matthiolus* and divers others have observed that in our dayes, the white Poppy hath been sowen in *Italy* and other places, and much used, yea and the blacke seede also, although as they all agree, far stronger in operation, and onely medicinable, or onely to be used in Physicke to helpe diseases; for *Matthiolus* writeth that the inhabitants about *Trent*, doe sow the blacke seede in their fields and grounds, among their pease and other pulse, which they familiarly eate, being made into cakes, that are made of many folds, the seede being cast in betweene the folds, and so kneaded together, and yet hee saith, they are no whit more dronkie, then those that eate none of them: as also that in *Styria* and the upper *Austria*, the inhabitants presse the oyle pressed out of the blacke seede in their meates familiarly, in the stead of Sallet oyle, and finde no discovery of drowsinesse at all thereby; which made him as he saith, venture to give the creame of the same made up with barly water divers times, and in great quantity, in the hot fits of agues, and burning feavers, to allay thirst, and to procure rest, and hereby as he saith, he tooke of that feare of Poppy, that the auncient Physitians had by their grave admonitions, fashioned him withall in former times: the Garden Poppy seede also made into a Syrupe, is both frequently used in our dayes, and to very good effect to procure rest and sleepe in the sicke and weake, and to stay catarrhes, and defluxions of hot and thinne rheume, from the head unto the stomacke, and upon the lungs, causing a continuall cough, the forerunner of a consumption; but in these cases that force in those that are stronger, for the strength or debility of nature worketh divers effects, as not so well in this, as in all or most other things; the same also helpeth the hoarsenesse of the throate, and those that have lost their voyce, which the oyle of the seede doth likewise: the blacke seed boyled in wine and drunke is said also to stay the fluxe of the belly, and the immoderate course of women sickenesse: the empty heades of Poppy (as they are usually boyled in water, and given to procure rest and sleepe; so doe the leaves of the same prove effectuall, as also if the head and temples be bathed with the decoction warme, or with the oyle of Poppy, the greene leaves or heades bruised, and applyed with a little vinegar, or made into a pultis with barly meale, *Hermolaus*, cooleth and tempereth all inflammations, as also that disease called Saint *Anthonyes fire*. The gumme but I may rather say the *Meconium*, (which is the juice of the Poppy thickned) that is commonly used in the apothecaries shops, and is much weaker by the judgement of all, both moderne and ancients, then the true *Opium* is much colder, and stronger in effect, than any other part of the plant, but if we may know the temperature or qualities of things, by their taste and effect, we may rather judge *Opium* to be hot then cold, for as the latter have very hot parts in it. Witnesse the bitternesse thereof, the heate and sharpenesse that is felt in the mouth on the tasting, and keeping it in the mouth a while, that it is ready to blister both tongue and palate; also the grievous or heady heavy smell, as well in it, as in the whole plant: but it may be saith *Matthiolus*, as the bitternesse, heate, and sharpenesse in *Opium*, or *Meconium*, is rather accidentary then innate, and is thereof by mixture and adulterating of it with *Glaucium*, and to give a yellow juice, for our *Opium* if it be diluted it shew a brownish yellownesse; yet by his leave I may say, that even the fresh milke with us is hoarse and loathsome in smell like the *Meconium* or *Opium*, but because our ancients, who have found out the qualities of things for our knowledge, have so found and judged of *Opium*, I must as *Matthiolus* saith, leave the matter to defcant thereon, as reason and experience shall direct them: It is generally used as I said before in *Methridatium*, and in all other medicines that are made to procure rest and sleepe, and to ease paines in the head as well as in other parts, as I said before, or rather to palliate them, it is used also, both to coole burning agues, or frenzies, and to stay defluxions, which cause a cough or consumption, as also other fluxes of the belly or womens courses, and generally for all the properties that the seede or any other part of the plant is used for: also put into hollow teeth to ease the paine: it is used both in *vocales* and *aurenales* medicines with some, to stay fluxes and to ease paines, but *Galen*, and divers others in the former as well as in our times, have forbidden such medicines as too dangerous for the eyes, and even any other wayes used inwardly, as I have spoken, but with good correction and great caution, yet divers have found that applyed to the gout, it hath much ease of paine: The wild or red Poppy that groweth in the corne, while it is young, is a pot herbe in *Italy*, in many places, and in the territory of *Trent* especially, as *Matthiolus* saith, as also to prevent the sicknesse, which *Theophrastus* also saith in his 9. booke and 17. Chapter, was common in his time: a syrupe made of the flowers is with good effect, given to those that have a Plurisie, and the dryed flowers also boyled in water or made into powder and drunke, either in the distilled water of them or some other worketh the like effect; the same also is available, in all other cephalicall or pectorall grefes.

water of the flowers of the wilde red Poppyes, is held to be of much good vſe againſt fluxes, to drinke it evening and morning: it is alſo more cooling in quality then any other Poppy, and therefore cannot but be as effectuall in hot agues, feauers, and other inflammations, either inward or outward, the Syrupe or water to be vſed thereof, or the greene leaues vſed outwardly, either in an ointment as it is in *Populeon*, a cooling ointment, or any other waies applyed. *Galen lib. 7. simplicium medicamentorum*, ſaith the ſeede is dangerous to be vſed inwardly. *Gerard* was much miſtaken, to thinke that this wilde Poppy ſhould be that, which ſhould be vſed in the compoſition called *Diacodion*, and cyteth *Galen* for his authour, as if he had taught him that opinion, not vnderſtanding what kinde of Poppy *Galen* doth meane by wild Poppy, for he according as *Dioſcorides* doth before him hath done, accounteth onely the great white Poppy, whoſe heads are ſomewhat long, to be the garden or manured kinde, and the other blacke kind to be wild, and doth not meane this red Poppy, becauſe it is onely wild with us, and not ſowen, as whoſoeuer ſhall obſerue the places throughly ſhall finde. The thorny Poppy being but of late inuention, hath not beene applyed to any diſeaſe by any, that I can heare of.

Chap. XV.

Argemone. Baſtard wilde Poppy.

There is of the kindes of wilde Poppy diuers other ſorts, ſome deſcribed by others, and ſome not ſet forth by any before that I know, which being found in our owne land, ſhall be ſpoken of with the reſt.

1. *Argemone capitata rotundiore*, Round headed baſtard Wild Poppy.

This kind of wilde Poppy, hath diuers hairy greene leaues lying on the ground, ſomewhat longer and more diuided into parts, then thoſe of the former wild Poppy, ſomewhat like vnto the leaues of the thinne leaued *Anemone* or wood flower, as *Lobel* ſaith, but is ſeldome to found with vs, from among which riſe vp diuerſe rough hairy ſtalkes, more then two foote high ſometimes, bearing ſuch like leaues here and there on them, leſſer then thoſe below, all yeelding a yellow iuice or milke being broken, and on the top of euery branch one flower leſſer then the other wilde Poppy, yet conſiſting of foure round pointed leaues of a more delayed red colour, ſometimes hauing each of them a blackiſh ſpot in the bottome, and ſometimes without, with diuers blackiſh threds ſtanding about a ſmall greene head, which when it is ripe, is ſomewhat ſhort, rough and round, with ſome creſts thereon, and a little round head, but not a Crowne or ſtarre, like the Poppy

1. *Argemone capitata rotundiore.*
Round headed baſtard wilde Poppy.

2. *Argemone lutea. Cornbut Britannica.*
Yellow wild baſtard Poppy of Britaine.

pies

pies at the top, wherein is contained such like small blackish seed, as the former wild kind hath, but the roote is small and long, with many fibres thereat, and perisheth in the like manner after seede time.

2. *Argemone capitulo longiore.* Long headed Ballard wild Poppy.

This is in all things like the last, both for leaves, flowers, and seede, the chiefest difference is this from the former consisteth in the head with seede, which is longer then the other, smaller below then above, yet hath a little round head at the top, but no crowne, and is rough and hard like it.

3. *Argemone Alpina lutea.* Yellow mountaine ballard wilde Poppy.

The yellow outlandish mountaine ballard wilde Poppy, hath many smooth greene leaves, set on somewhat hairy long footestalkes, an handbredth long, which leaves are very couch and finely cut on the edges, resembling those of the *Coriander* leafed Crowfoote, from among which rise up divers bare or naked stalkes somewhat hairy withall, of halfe a foote high, at the toppes whereof stand one flower a peece, of a meane size, made of foure yellow leaves, with many whitish threds in the middle ripe with yellow, standing about a small long rough head, like the former kinde, wherein is contained small blackish seede: the roote is small and long, and shreddy at the end.

4. *Argemone Cambro-Britannica lutea.* Yellow wild ballard Poppy of *Wales*.

This yellow Poppy hath many winged large spreade leaves, lying upon the ground, that is, many leaves together on each side of a middle rib, each divided leafe being somewhat deeply cut in, in some places oftener, more then others of a deepe, but faire greene colour: among these leaves rise up, divers branched stalkes of a foote high, having some such leaves thereon but smaller, at severall distances, and at the tops of the stalkes and branches a faire yellow somewhat large flower, consisting of foure round leaves, with many yellow threds in the middle, standing about a long greene head in the middle, which when the flower is fallen, and the head ripe, is more then the former long headed wilde Poppy, but in the like manner smaller at the borrome and bigger at the top, with a small head thereon, containing such small blackish seed, lying within five cells, in the same fashion as the other Poppies doe: the roote is long, and growith on the outside, spreading into some branches, and many small fibres thereat, which perisheth not every yeare, as the other sorts before specified doe.

The Place.

The two first are often found as well in Corne fields, in *Somersetshire*, *Kent* and other Countries of these parts, as in the corner and borders of fields, and by the way sides. The third was found upon *Snowden* a hill in *Wales*, as also on some hils in *Italy*. The last groweth in many places of *Wales*, in the valleyes and fields, at the foote of the hils, and by the water sides, about a mile from a small village called *Aber*, and in the midway from thence to *Conwey*, the house of a worthy Gentleman Sir *John Conwey*, as also neere a Woodden bridge, that giveth passage over the River *Conwey* to a small village called *Rabon*, which is in *North Wales*, and in going up the hill leades to *Bangor*, as also neere *Angelsey* in the way to the said Sir *John Conwey* his house.

The Time.

All of them doe flower about the end of *June*, and in *July*, and the seed is ripe in *August*, in some places and in others later.

The Names.

It is called in Greeke Ἀργεμών, *quia argemas, id est, oculorum nubeculis tollit*, in Latine also *Argemone* of the Greeke word. *Pliny* in his 25. booke and 9. Chapter calleth it *Argemona*, and saith that they have made three sorts hereof, whereof the best was that, whose roote did smell like *Frankincense*, but in stead he maketh mention of foure sorts as in his 27. booke, & 12. chap. he saith, that *Anemone* is called *Argemonia* in the 26. booke, & 13. chap. he saith that *Lappa Canina*, whose roote smelleth of *Frankincense*, was called *Argemone*, and in his 26. booke, & 6. chap he saith *Ingenium* was called *Argemone*: in former times our ordinary *Anemone* was taken for *Argemone*, but now a dayes all our moderne writers do agree, that our *Argemone* is the same that *Dioscorides* wrote of, notwithstanding that he giveth to it a round roote which ours hath not; some make another sort of *Argemone*, which most doe not hold right: the first of these is called by *Lobel*, *Argemone tertia cauliculo*. *Bauhinus* calleth it *Argemone capitula breviore*, and thinketh it to be the same, that *Petrus Pena* in their *Adversaria*, call *Anemone minor Cretandi folio, flore Rutilo capitulo tetragono, seu Papaver rubeadentis*. The second is called by *Lobel Argemone capitulo longiore*, as *Bauhinus* doth also, but he taketh also to be the *Anemone Nobilis seu major vermiculata* of *Lobel* and *Pena*, in their *Adversaria*, when by the judgment of the best, that *Anemone* of theirs, is *Papaver cornutum majus flore luteo* of *Clusius*, *Matthiolus* and others, doth much differ from this *Argemone*, both in bignesse and colour of the flower, and in the head of seed being much longer and smaller then this: *Cordus* in his History of plants, and 68. Chapter, setteth it forth by the name of *Argemone*, which *Gesner* who set him forth knew not, because *Cordus* saith, it giveth a yellow juice like *Celandine*. The third is set forth by *Pona* in his *Italian Ballads*, and by *Bauhinus*, in his *Prodromus Pena*, under two titles as two sorts, when as allouredly they are both but one: The last was found as I told you before in many places of *Wales*, by *Lobel* in his life time, and therefore rightly ascribed to that Country.

The Vertues.

Dioscorides and *Galen* give unto this kinde of Poppie, a clensing qualitie and sharpe, that it is able to drive away spots that happen in the eyes, and such mistes, films and cloudes, that grow in them to hinder the light, and to allwage any inflammations; but others say, that it helpeth the bloudy flixe, the decoction thereof drunke in water and drunke, as also if it be boyled in wine and drunke, is a present remedy against the stinging of any venemous beast, and that two drammes thereof taken in wine, worketh the effects that is in other beaten while it is fresh, and applied to cuttes and wounds healeth them speedily; applied also to any part vexed with crampes or convulsions, many sores, cankers, or fistulas, to any blacke and blew spots in the eyes or on the eyes, by bruises or falles, doth helpe and heale them all: being bruised and applied with vinegar to the throat, healeth the quinsie, and applied to the place grieved with the gout taketh away the paine thereof, being rubbed upon Warts, it doth in a short time consume them, and take them away. There is no properties remembred belonging to any of the two last sorts.

Cel-

Chap. XVI.

Hypecoum. The *Hypecoum* of *Dioscorides* herbe.

Although *Camerarius*, *Dodonæus*, *Lobel*, and others doe reckon this small plant as a species, or sort of wild Cumin, and have referred it to with them, yet I dare not so call it, because I doe not finde either the face, or outward resemblance there of, nor yet the temperature and qualities, to be any way answerable thereunto, but rather unto the Poppies, I have therefore thought it fittest to joyne it next unto them, and doe rather incline to the judgement of *Cordus*, to account that plant to be the true *Hypecoum* of *Dioscorides*; unto which I will also adjoyne another small plant, reckoned also by *Lobel* to be of the kindes of wild Cumin, which I must call another *Hypecoum*, in that it is so like unto the other: And let me crave leave withall to insert here, as in an extravagant place, that kinde of wild Cumin, which is so accounted of most Writers, as not having a fit place to set it alone, in regard it may not be joyned with the true Cumin, which must be intreated of among the umbelliferes, and because this is in other Authors joyned with the former.

1. *Hypecoum legitimum Clusij.* The true *Hypecoum* of *Dioscorides* according to *Clusius*.

This small plant hath diverse long leaves lying on the ground very much divided, and cut into many parts, of a pale or whitish greene colour, so like unto *Fumatory* in the colour of the leaves, as also somewhat neere in the many divisions and parts thereof, that it will soone deceive one that doth but slightly regard it, but is smaller and thinner and more gentle to handling, yet is larger in *Spaine* than with us as *Clusius* recorderh; in the middle of them riseth up a stalke or two, with some leaves thereon, and divided towards the toppe into diverse branches; at the toppes whereof stand small yellow flowers, consisting of foure leaves, two whereof are larger than the rest, and stand one opposite unto another, the rest being very small and scarse discerned, but when the flower is blowen open after which doe arise long crooked flat huskes or cods full of joints, somewhat like unto the huskes of the *Scorpioides* of *Matthiolus*, but greater and longer: in the severall joints whereof lye severall square yellowish seede, very hardly to be taken forth, and separated from the huskes or skinnes: the roote is small, and a little stringy, dying every yeare at the first approach of Winter, and is very hardly made to spring, but by an Autumne sowing: the taste of the plant is unpleasant.

2. *Hypecoum alterum.* Another *Hypecoum*.

This other sort (for so I make it) is very like unto the former, but that the leaves hereof are not so broad and long, being more finely divided, somewhat like unto the Sefell or Hartwort of *Marseilles* or wild Chervill; the stalkes are smooth, full of leaves and bramches, whereat come forth yellow flowers made of five pointed leaves, and after them long pods, which hang downe and stand not upright: nor are crooked like the former, but joynted and with greater and yellow seedes within them, like unto those of *Galega* or Goates Rue.

3. *Cuminum sylvestre.* Wild Cumin.

Wild Cumin shooteth forth diverse long rough, or somewhat hard winged leaves, each whereof is finely dented about the edges; from among which riseth up a slender weake bending stalke, divided at the toppe into many parts, each whereof hath a round whitish soft gentle, and woolly head or ball upon a small foote stalke, like unto those of the Plane tree heads or balls, wherein is contained small seedes: the roote is small and white and quickly perisheth, with the hard blasts or dewes of cold nights, and seldome commeth to maturitie in our countrey, as I have often seene the experience my selfe.

1. *Hypecoum legitimum Clusij.*
The true *Hypecoum* of *Clusius*.

The place.

The two first groweth as well in Province, in the way to *Aples*, *Montpelier*, and other places in *France*, as in diverse Provinces of *Spaine* as *Clusius* saith: the other as *Lobel* saith, groweth in the same places in *France*, that the former doth: the last he saith likewise groweth plentifully in *Narbone* about *Aquæ Sextiæ*, and other places of *France*.

The Time.

All these flower with us, not untill the midst of Sommer, and give their seede late, but the last worst as I said, and seldome good although late.

The Names.

Dioscorides calleth an herbe in Greeke *Yellow* and *Greene Hypecoum* and *Hypecoum*, for which the Latines have no other name *Hypecoum*, after the Greeke; yet there is great doubt amongst many, what plant should be the right, some thinking the *Telephium minus* to be it, others thinking the *Argemone minor* of *Tragus* (which is the lesser *Papaver Rheas*) to be it: *Matthiolus* (according to his manner, that whatsoever was corroded unto him, and was not manifestly contradictory, was presently presumed for right, no marke there of wanting) maketh the *Horned poppie* of *Dioscorides*, which *Lobel* calleth *Papaver Cornutum luteum*, to be it, which I have set forth in my former Bookes. And lastly *Clusius*, and from him *Dodonæus* proposed this last plant, for the true *Hypecoum* of *Dioscorides*: *Clusius* affirming that of all the plants that he knew, there was not any that came nearer thereunto than this, unto whom I must also consent, for that neither the face nor the qualitie, as I

said

2. *Hypecoum alterum.*
Another *Hypecoum.*

3. *Cuminum sylvestre.*
Wild Cumin.

said before directly against it: it is also by *Matthiolus*, and *Caſpar Bauhine* who taketh it from him, as also *Camerarius*, *Lugdunenſis*, *Tabernæmontanus* and *Lobel* called *Cuminum ſylveſtre alterum* or *ſiliquoſum*, and *Cornucopiæ*: *Cluſius*, as I ſaid before, and after him *Dodonæus* and *Camerarius*, call it *Hypecoum & Lophium*, ſo doth *Bauhine* alſo, who quoteth *Matthiolus* in two places to call *Cuminum ſylveſtre alterum* both *Bellonii*, and this, but he quoteth *Geſner in horto Germaniæ* to call it ſo likewiſe; when in that place *Geſner* has *Hypecoum*, that of *Matthiolus*, which is the *Alter veſicaria*, and not this. *Cluſius* ſaith that the *Spaniards* in the Kingdom of *Granado* and *Murcia* doe call it *Cadoriga*. The ſecond is called *Cuminum ſiliquoſum alterum*, *Theophraſti* of *Lobel* and *Pena*, whom *Lugdunenſis* doth imitate; of *Tabernæmontanus Cuminum ſylveſtre 2.* and *Germanicum*. *Bauhinus* calleth it *Hypecoi altera ſpecies*, and ſo doe I, the face thereof ſo nearly agreeing unto it. The laſt is called *Cuminum ſylveſtre*, and *Diſcoridis primum* of *Matthiolus*, and ſo of moſt Writers, but *Dodonæus* of *Camerarius*, and *Capitatis globoſa* of *Bauhinus*. *Bellonius* in his obſervations ſaith, that in the Ile of *Lemnos* they call it *Lago Chimeni*, that is *leporum cubile*, which the inhabitants of *Lemnos* called at this day *Stalcomo*, and uſe in their meate inſtead of *Origanum* which they want, for as he there ſaith, it hath both the ſmell and taſte of *Origanum*; and for the likeneſſe, he there compareth the leaves with thoſe of Yarrow, and the ſtalke with thoſe of the *Romane* Nettle.

The Vertues.

The taſte of the two firſt is as I ſaid before unpleaſant as that of the Poppies, and therefore of a temperate inclining to the propertie of Poppie, whereunto *Dioſcorides* and *Galen* make *Hypecoum* to be like, there having beene any further experience made of either of the former plants, and therefore I can relate no more, unleſſe them: the laſt if it be the right wild Cumin of *Dioſcorides*, as by *Bellonius* his relation here before let downe may very well be, the ſeede is effectuall againſt the windineſſe, either of the ſtomacke, or of the bowells, which bringeth the mooſing paines and ſwellings with it, being taken in wine, and expelleth the poyſon of any venemous beaſtes: it is good for moiſt ſtomackes, that are troubled with raw crude humours: taken in vinegar, it ſtayeth the hickocke, and if it be applied with hony and raiſins to the face, or any other parte blacke or blew by ſtroakes and beatings, it will quickely take them away, and applied in the ſame manner to ſods when they are ſwollen, allayeth the ſwelling and taketh away the paine.

CHAP. XVII.

Arum. Wake *Robin* or Cuckow-pinte.

VNto this common *Arum* or Wake-Robin (which groweth wilde in many ditches and ſhadie [illegible] throughout all this kingdome, I muſt adde divers other ſorts, which in moſt things are like [illegible] ſo, as alſo another much differing from all the reſt, accounted the true *Colocaſia* of *Egypt*.

1. *Arum vulgare non maculatum.* Common Wake Robin without ſpots.

This Wake Robin ſhooteth forth three or foure or five leaves at the moſt from one [illegible] one whereof is ſomewhat large, and long, broad at the bottome next unto the ſtalke, and forked like unto [illegible]

leafes, ending in a point, without dent or cut on the edges, of a dad or full greene colour, each standing upon a thicke round stalke, of an handbreadth long or more; among which after they have been up two or three monethes and begunne to wither, riseth up a bare naked round whitish greene stalke, somewhat spotted and straked with purple, like the stalke of Dragons, somewhat higher than the leaves; at the toppe whereof standeth a long hollowe hole or hucke, close at the bottome, but open from the middle upwards, ending in a point; in the middle whereof standeth a small long pestle or clapper, smaller at the bottome than at the toppe, of a darke purplish colour as the hole or hucke is on the inside, though greene without, which after it hath so stoode for some time, the hole or hucke decayeth, with the pestell or clapper, and the foote or bottome thereof groweth to be a small long bunch of berries, greene at the first, and each of them when they are ripe, of a yellowish red colour, of the bignesse of an Hasell-nut kernell, which abide thereon almost until Winter: the roote is round and somewhat long, not growing downe right, but for the most part lying along, the leaves shooting forth at the bigger end, which when it beareth his berries is somewhat wrinckled and loose, another being growen under it, which is solid and firme, with many fibres or small threds hanging thereat, which in the beginning of the yeare, when the leaves begunne to spring yeelded a milky sappe being broken or cut: the whole plant is of a very sharpe and biting taste, pricking the tongue upon the tasting, no lesse than Nettles doe the hands, and so abideth for a great while without alteration; the roote with the sharpenesse hath a very strange clammynesse in it, stiffening linnen, or any other thing whereon it is laid, no lesse than starch: and in former dayes, when the making of our ordinary starch (which is made of the branne of wheate) was not knowen, or frequent in use, the finest dames used the rootes hereof, to starch their linnen, which would so sting, exulcerate and choppe the skinne of their servants hands that used it, that they could scarce get them smooth and whole with all the noynting they could doe, before they should use it againe.

2. *Arum vulgare maculatum.* Spotted wake *Robin.*

This *Arum* is in all things like the former, but that the leaves hereof are somewhat harder in handling, smaller pointed and have some blackish spots thereon, like the spotted Arsemart, which for the most part abide in the Summer longer greene then the former, and both leaves and rootes, are more sharpe and fierce then it.

3. *Arum maximum rotundiore folio.* Round leafed wake *Robin.*

This kinde hath somewhat larger leaves, then either of the former, and more round pointed, both at the end and at the bottome next to the stalke, having some white veines appearing in the leaves, and abiding greene longer in the Somaner, even almost untill Autumne, the hole or hucke, with the pestell or clapper, are both of a pale whitish yellow colour, in which things this differeth from the other and in nothing else: *Prosper Alpinus* setteth forth an other sort found at the bottome of Ida of the *Alpes* hills, whose leaves and flowers differ little from the second sort, but the roote is round like unto the rootes of the round rooted Cuckow: *Arum rotundo radice.*

4. *Arum Byzantinum.* Wake Robin of *Constantinople.*

This *Arum* of *Constantinople* hath a reasonable great thicke roote, of an hand bredth long, or there abouts, having many small round heades, breaking forth on all sides the roote, from whence come forth many fresh greene leaves, very like unto the two first sorts of *Arum* some whereof withe spotted with small blacke spots, others not having any at all; from among which riseth up a stalke, having such a like hole or hood, as the *Arum* hath, and a pestle therein which are of a purplish colour in those that have spotted leaves, and white in those

3. 2. *Arum vulgare maculatum & non maculatum.*
Spotted and unspotted Wake Robin.

4. *Arum Byzantinum.*
Wake Robin of *Constantinople.*

C. arietinum latifolium.
Broad leafed Egyptʼs colle.

C. arietinum longifolium.
Long or narrow leafed Egyptʼs colle.

C. arietinum Aegyptium rotundo semine longa radice vulgare Colocasia dictum.
The Egyptian Colcas or snake Root with a roundish and longer roote.

Faba Aegyptia fructus.
The fruict of the Egyptian Beane.

that have no spots, the leaves likewise of those that have spots, spring up for the most part before Winter, and the other not until the Spring, there hath not any fruite beene observed in this, by any that I can understand.

5. *Aristarum latifolium.* Broad leafed Fryers Coule.

The broad leafed *Aristarum* groweth in all things like unto the *Arum*, having divers faire greene leaves, whose middle ribbe from the upperside, as also some other of the veines are white sometimes, and somewhat thicker and rounder pointed then the *Arum*. the middle stalke bearing the flower (which is a crooked or bending hose at the top, with a small crooked whitish pestell in the middle, rising out of it,) is spotted with red spots, not rising fully so high as the leaves, which are nothing so sharpe in taste, as those of the Wake Robin, and doe alwayes spring up in the end of Autumne, abiding greene all the Winter: after the hooke or flower is past, and the greene leaves withered and gone, which will be in the Summer, then the berryes doe appeare on the toppes of the stalkes, greene at the first, and of a yellowish red when they are ripe, which abide untill the frosts cause them to wither, and the greene leaves begin to appeare: the roote is white and somewhat round, encreasing much by sets.

6. *Aristarum longifolium.* Long or narrow leafed Fryers Coule.

The leaves of this *Aristarum*, are very narrow and long, not rising so high as the former, but rather lying on the ground, and doth more seldome beare any hose, which is whitish small and long, with a very long and small reddish pestell in the middle, like unto a long worme, scarce rising above the ground, the berryes that follow are white and not red, the roote is white and round, smaller then the former, encreasing by sets, but not in so plentifull a manner.

7. *Arum Aegyptium vulgo dictum Colocasia extenuiore & oblongiore radice.*

The *Egyptian Colcas* or Wake Robin with a rounder and longer roote.

This *Egyptian* plant, hath beene the subject of much controversie, among many worthy and learned writers, both of our and of former times, some applying it to the *Faba Aegyptia* of *Dioscorides*, whose hooke containing the fruite was called *Ciborium*, and whose roote was called *Colocasia*, and others refuting that opinion, call it simply *Arum* and *Aegyptium*, because it was a speries or kinde of *Arum*, that is thought to bee naturall to *Egypt*, as also to other places, as you shall heare by and by, the description whereof is in this manner: It shooteth forth divers very large and whitish greene leaves, of the fashion of *Arum*, or Wake Robin leaves, pointed at the ends, but somewhat rounder, each of them two foote long, and a foote and a halfe broad, not so thicke and sappy as they, but thinner and harder, like unto a thinne hard skinne full of veines, running every way, and refusing moisture, though they be laid in water, standing every one on a very slender stalke, neere two foote long in the said places, which is now for all the very division of the stalke into two parts, as the wake Robin is, but more toward the middle, somewhat like unto the water Lillies, the division of each stalke at the bottome, being somewhat rounder then those of Wake Robin: betweene these leaves after many yeares continuance in a place confirmed, there riseth up sometime but one stalke of flowers, and sometimes two or three, according to the age and encrease of the plant, the standing and keeping (for all these helpe to the fortifying thereof, for else it would not beare any shew of stalke, or pestell, or flower, as many that not having seene any, have confidently set downe that it never beareth any) thereof in a large pot, or other such thing, and in a warme place and climate; each of these stalkes are much shorter, then those of the leaves, and beareth an open long husk at the top, in the middle whereof, riseth up for the most part three severall narrow huskes or hoses (and never one alone, as the *Arum* or *Aristarum* do) with every one their pestell or clapper in the middle of them, which is small, whitish and halfe a foote long, from the middle downwards bigger, and set round about with small whitish flowers smelling very sweete, the lowermost first flowring, and so by degrees upwards, which last not above three dayes, and from the middle upward bare or naked, ending in a small long point, after the flowers are all past, that lower part abideth, and beareth many berryes, like as the *Arum* and *Aristarum* doe, but much paler and smaller, the roote is great and bulbous, or rather tuberous, in some more round then in others which are smaller and long with the roundestie, as great as the roote of a great Squill or Sea Onion, (which I judge more properly, the bulbous roote thereof in my former booke to be a Sea *Hyacinth*) and one which *Alpinus* setteth forth in his *Historia Aegyptiaca*, with great long creeping rootes like the Reede, reddish on the outside, and whitish within, having many bulbous or tuberous heads, shooting from all sides thereof, whereby it is encreased, and with many great fibres growing there from into the ground.

8. *Faba Aegyptia Dioscoridis & Theophrasti vera radix Colocasia dicebatur.*

Dioscorides and *Theophrastus* their *Egyptian* Beane, whose roote was called *Colocasia*.

Because the *Egyptian Arum*, hath beene so much mistaken by many writers that have called it the true *Colocasia* of *Dioscorides* and *Theophrastus*; see me here shew you in this place, the description of the true *Colocasia*, that is the roote of the *Egyptian* Beane, as *Dioscorides* and *Theophrastus* have set it downe; to affront the false figure of *Matthiolus* his *Egyptian* Beane, as he set it forth in his commentaries upon *Dioscorides*, moulded from his owne imagination, and not from the sight of any plant growing in *rerum natura*, to make it answer the description, but hath failed chiefely in the fruite, which is not expressed like to the combe that wasps doe make, but farre differing as many have observed, and objected against him, although as he saith, *Odoardus* did shew it him at *Trent*, with many other rare plants, which he brought out of *Syria* and *Egypt*: the figure of the true fruite, *Clusius* hath set forth, in the 92. folio of his booke of exotick or strange things, which was brought by *Dutch* Marriners from forraine parts unto *Amsterdam*, but was not then knowne where it grew (their since to knowne to be the Kingdome of *Iaca* in the *East-Indies*) who was perswaded it might be the true fruite of their *Egyptian* Beane, unto whose judgement therein, both *Bauhinus* and *Columna* doe encline, and so doe I as you shall heare by and by more at large, but for brevities sake, I will draw both the description thereof by *Theophrastus* and *Dioscorides* into one. The Beane of *Egypt*, which some call the Beane of *Pontus* saith *Dioscorides*, (but *Theophrastus* unproperly neither *Egypt* nor *Pontus*, but onely calleth it a Beane) groweth in Lakes and standing waters plentifully in *Egypt* saith *Dioscorides*, which *Theophrastus* speaketh not of,) in *Asia*, that is in *Syria* and *Cilicia*, but there (saith *Theophrastus*) it doth hardly perfect his fruite, but about *Troas*, in a Lake, in the Country of *Cilicia*, it commeth to perfection, and beareth very large leaves (like those of the Butter-burre saith *Dioscorides*) the

Original from UNIVERSITY OF MICHIGAN

stalke saith *Dioscorides*, is a cubite long, *Theophrastus* saith the longest is foure cubits high, of the bignesse of a finger, like unto a fair reede, but without joynts, it beareth a flower, sweete as large as that of the Poppey, and double flowers, for so I interpret *in plenum copti*, the words of *Theophrastus*) of the colour of the Rose, after which is past commeth a round head called *Chorion*, or *Cibotium*, that is a small casket, (per *Metonymiam* saith they) kinde of drinking cup was so called also, whose forme peradventure was like this fruite here expressed) like unto the comb which waspes do make, wherein is contained thirty cels or the most, and in every cel of the flowre of, groweth a Beane, whose toppe riseth higher then the cell wherein it is enclosed, whose kernell is sweet which (say they) the inhabitants thereabouts put into clay, and thrust downe into the bottome of the water, with long poales, that it may abide therein and thereby make their encrease: the roote is very docke and great, like unto that of the Reede, but (*Theophrastus* addeth, which *Dioscorides* hath not) full of small prickes or thornes, and therefore saith he, the Crocodile refuseth to come nere it, least he should runne against the prickes therewith his eyes, wherewith he cannot see well, and is called *Colocasia* as *Dioscorides* maketh mention, but not *Theophrastus*, which is used to be eaten either raw or otherwayes sodden, that is seethed or roasted. The leaves saith *Dioscorides* are eaten while they are fresh and greene, but grow hard and blacke when they are old, being somewhat bigger then an ordinary Beane, which saith *Dioscorides* (*Theophrastus* making no mention of any qualities, or vertues of them) have an astringent or binding facultey, and thereby profitable to the stomacke, and helpeth those that have the fluxe of the stomacke and belly, and the bloody flux, the meale or flower of them used upon meate &c. or taken in broth: the huskes whereof saith he doth more good, being boyled in Sweet wine, the middle part of the beane which is greene and bitter, being bruised and boyled in Rosewater, and dropped into the eares, easeth the paines of them. Thus farre *Theophrastus* and *Dioscorides*. Now the description of this strange fruite is this, as he setteth it downe. This fruite did resemble a very large Poppy head, and at the toppe: and consisted of a rough or wrinckled shinny substance; of a brownish colour somewhat, whose circumference at the top was nine inches, and growing lesser and lesser by degrees, unto the stalke, as it seemed, did sustaine the flower, after which came this fruite for there appeared certaine matter, like unto wax, where in did abide: the upper part hereof was smooth and plaine, having 24 holes or cells therein, like unto certaine order, like unto the combe of ye Bees; in every one whereof was one nut, like unto a Chestnut almost an inch long, and an inch thicke in compasse, whose toppe was browne, ending in a point, like a Cone doth, the lower part having an hole or hollow place, where it (should seeme the fruite) stake in while it was in its place, whose kernell was rancide or mouldy, thus farre *Clusius*. Let me here also bring an eye witnesse or two, of this plants growing in the Ile of *Java*, *Ex. Indiæ Hesperiæ*, saith *Dodonæus* Physition, for the Dutch factory in the Kingdome of Ile of *Java*, sent into *Holland* a small booke, or scroll of certaine herbes, &c. growing in that country, with the vertues and uses whereunto the naturall do serve (which booke, as I understand by my good friends, Dr. *Daniel Heringhooke*, and Dr. *William Paddy*, both Doctors is kept in the Vniversity Library at *Leyden* in a close cupbord having a glasse window before it, whereby any one may reade so much thereof as lyeth open) at the end whereof is one by him set downe, under the title of *Nymphæa glandifera* thus described: the huske or cup (saith he) is rugged or full of wrinkles yet soft and spongie, like a Mushroome, and of a greene colour divided into twelve or fourteene cels (so that he saw here exhibited both 24 or places, in every one whereof is contained one fruite like unto an Acorne of a purple colour on the outside and very white within, the taste whereof is all ingenne and sweet what like unto all, like Acornes but rough and spongie: it groweth in Moorish places, and by rivers brinkes: the leaves are round and broad great and like unto those of the Water Lilly, and so is the flower also of a very strong smell as is the style of Aneseedes: thus farre Dr. *Heurnius*; whose description in my judgement is so punctuall out of *Dioscorides* and *Theophrastus* aforesaid, the description of the roote onely wanting, that I shall not take upon me to comment upon it, every ones judgement though meane, I suppose being able by comparing to make the parts: it is probable that *Clusius* having seene this booke and the figure hereof annexed to the description (some pronounce it (as I doe here) to be the true *Faba Ægyptia* of the ancients: there is no mention made in that booke of *Heurnius* by what name the *Iavanenses* or *Malayes* doe call it. The other eye witnesse I bring is *William Finchame* an *English* Merchant, as he is recorded in Mr. *Purchas* his fourth booke of Pilgrimes, lib. 4. *Sect.* 5. *p.* 429. that saith he often did eate of the fruite of a certaine herbe growing in a great Brooke or Lake two or three contes or miles long on the *North-West* side of *Ferapore*, which is about twelve contes from *Agra* in the dominions of the great *Mogull* called *Surrat* or *Cuzerat* in the *East-Indies*, which the people call *Lotus chachoes*, describing it to be like a gobler, that at the head conteining divers Nuts or stones within them: here let downe these things, as well to show you mine owne observations after *Clusius* and others, that so at length this is the true *Faba Ægyptia* of the ancients, as to provoke some of our nation to be more industrious as the *Hollanders* by whose care in their travels, this was first made known to us, to search out such rare matters yet in the parts of their abode, and other communicate them to such as are experienced, or having pennes to publish their labours in Print, if it may be, which I hold the better, according to Mr. *Purchas* example, whose observations have given so great an illustration in this matter, as well as in other things, by me also mentioned elsewhere in this worke.

The Place.

The two first are frequent enough in our owne Country. The third is found in some place of Germany. The fourth *Clusius* saith came among other rootes from *Constantinople*. The fift he also saith is found in *Portugall*. The first in *Italy*, in divers places. The seventh is not naturall in *Egypt* as I suppose, for it is not found to flower there, being planted for their onely use in meates which they seldome take without it, it groweth in *Candy* naturally as *Belonius* saith, and *Portugall* as *Clusius* reporteth, and in *Italy* also in many places and in the Country of *Salerne* in the Kingdome of *Naples* as *Columna* reporteth it, as also in the Island of *Java* where they use it as familiarly as in *Egypt*, and so recorded in the *Hollanders* Navigation thither. The last as I find before in *Java* and *Surrat*, and no doubt in sundry other places as *Theophrastus* remembreth, I therefore would not call it *Egyptia* as *Dioscorides* doth, being not proper to *Egypt*, where for many ages it hath not beene known to grow now at all, but assuredly if it were a naturall of *Egypt*, it cannot be quite lost, and might by good search be there found againe, if men industrious and of knowledge were employed

The Time.

The foure firſt ſorts ſhoote forth leaves, in the Spring, and continue but vntill the middle of Summer, or ſomewhat latter, their hoſes or huſkes appearing before they fall away, and their fruit flowring in Auguſt. The fifth and ſixt as I ſaid, doe ſhoote forth their greene leaves in Autumne, preſently after the firſt frоſts have pulled downe the ſtalkes with fruits, and abide greene all the Winter withering in Sommer, before which their huſkes appeare. The ſeventh flowreth with his hoſe and clappers very late, even in the warme countries, ſeldome before October or November, and the fruit doth there ſeldome come to perfection: the laſt (as may be gathered by the relation thereof) flowreth and beareth fruit in the Sommer time as other herbes doe.

The Names.

* It is called in Greeke ἄρον, and in Latine *Arum*, and ſome *Pes vituli*, becauſe the leafe doth ſomewhat reſemble a Calves foote; ſome alſo *Dracontea minor*, and *Serpentaria minor*: others againe from the figure of the peſtle or clapper in the middle of the hoſe, call it *Sacerdotis penis*, and *virga priapi*. *Simon Ianuenſis* calleth it *Arum* and *Herba Arum*; the *Syrians* as *Dioſcorides* ſaith call it *Lupia*: it is called of the *Arabians Iarie* and *Sarie*, and after them diverſe Apothecaries beyond the ſeas in their ſhoppes *Iralion*, *Aro*, *Gyaro*, *Gyaron* and *Balaſaron* as *Dacuſius* ſaith; In *Spaniſh Turnepa*, in *French Pied de veau*, & *pied or pied de preſtre*, *le vit de cheire*, in high *Dutch Pfaffenpuze*, in *Low Dutch calfs voete*; in *Engliſh* Wake Robin, Cuckow e pintle, Prietts pintle, Rampe, Buckrams, and of ſome Starch-wort. *Geſalpinus* calleth it with ſpotted leaves *Gichoracium* or *Trigarum*, after the *Italian* name, when as all others agree in the name of *Arum*, with the diſtinction of *maculis albis* and *nigris*, as the kind or ſort is; yet the third is called by *Lobel Arum magno Veſuvio*, and by *Banhinus Arum creticum album*, and by *Dalechampius* upon *Pliny Calla prima genus Plinij*. *Cordus in hiſtoria plantarum* calleth it *Dracunculus hortenſibus*, and ſo he ſaith is the ſame that *Matthiolus* calleth *Dracunculus major*. *Cluſius* calleth the fourth *Dracontium*, & it is moſt probable it is the ſame with *Matthiolus* his *Arum altud minus* with many ſmall rootes, which he ſaith he received from *Calceolarius* of *Verona*, and thought it grew upon Mount *Baldus*, becauſe he had ſent him many plants that grew there: but becauſe this is not mentioned in all the deſcription of Mount *Baldus*, it is more likely that *Calceolarius*, had it from *Conſtantinople*, or ſome other place in *Turkie*, and ſent it him as a rarity. The fift & ſixt are called *Aro ſarum* or *Aro* as *Plinie* ſaith, and diſtinguiſhed by the titles of *latifolium* and *anguſtifolium*. The *Spaniards* call it *Pezon del Fraile*, that is Fryer Friers, becauſe the hoſe doth repreſent the forme of a Friers cowle: the *latifolium Dalechampius* upon *Pliny* calleth *Calla altera genus Plinij*, yet *Tragus* thinketh that this *Aro ſarum*, ſhould be more properly the *Arum* of *Dioſcorides*, which is uſually eaten, for our *Arum* is ſo hot and ſharpe, that it is not to be endured, whereunto ſome others doe reply and ſay, that the *Arum* of the hotter countries is more mild, and yet the ſame in ſpecie: The ſeventh is called by the *Spaniards Manta de muerto ſpinoſa* from the largeneſſe of the leaves, and diverſely by divers late Latine Writers, ſome as I ſaid conſulting earneſtly, that it is the *Faba Egyptia*, and *Colocaſia* of *Dioſcorides*, or *Colocaſion* of *Nicander*, others flatly denying it and calling it *Arum Egyptium*, which ſeems *Pliny* vſeth: but it is not knowne from whom he had it: thoſe that hold and maintaine the former opinion, are *Bellonius*, *Alpinus*, *Cameranius*, *Lugdunenſis*, and laſtly *Cluſius*, who doe all conclude, that this plant which the *Egyptians* call *Colcas*, can be no other plant then the *Faba Egyptia* of *Dioſcorides* and *Theophraſtus*, although it beare neither flower nor fruit, and thereupon doe much ſuſpect the truth of their deſcriptions, becauſe there was never heard or found (as they ſay) any other that did anſwer in all things unto their deſcriptions, and that this did moſt nearely approach thereunto; both for that the name of *Colcas*, ſo nearely drawing to the Greeke name *Colocaſia*, and was ſo anciently continued among thoſe Nations of *Egypt*, *Syria*, *Arabia* and *Aſſyria*, and that the daily uſe of the roote to be dreſſed or eaten raw for their food and meate as they ſaid their *Faba* was; but the fruit or nuts was their foode and not the rootes, time having inverted both name and uſe: it is alſo called *Taloſſi* by the Inhabitants of *Iava* (but *Labah* in the *Malaian* tongue) which foundeth ſomewhat neere *Colocaſia*, as is recorded in the *Dutch* Navigation thither in *Anno* 1595. before ſpoken of, where it is ſaid alſo to beare neither flower nor fruit: but thoſe that hold the contrary opinion that it is but *Arum Egyptium*, and not the true *Colocaſia*, although commonly ſo called, are *Agrippa*, *Guilandinus*, *Matthiolus*, *Caſpar Bauhinus*, *Matthiolus*, *Geſner in horto Germaniæ*, *Dodonæus*, *Lobel*, and *Columna*, who have all of them in their times teſtified it, moſt of them having ſeene the flower or fruit, or both, that it beareth which plainely declareth it to be a kind of *Arum*, and that it is not the *Faba Egyptia*, whoſe roote was called *Colocaſia*: but *Fabius Columna* fully and moſt fully to the purpoſe, doth ſhew the truth, ſetting forth the deſcription of this *Arum Egyptium*, amply in every part, to beare leaves, flowers, hoſe or huſke with a peſtle or clapper therein, and berries afterwards, agreeing in all thoſe parts to the vulgar *Arum* and *Aſſarum*, although ſomewhat in a different manner, as every ſpecies of a genus doth; and with all doth defend the verities of *Dioſcorides* and *Theophraſtus* deſcriptions thereof, againſt all gainſayers, wondering that ſo many learned men ſhould not diſcerne the truth, but be led away to groſſely into errour, againſt ſo plaine declarations, that they make of the plant and every part thereof, that is of roote, ſtalke, leafe, flowers and fruit: the roote to be like the taſte of the Reede, but greater and not *bulboſe* like the *Arum*, to be armed with prickles or thornes, when as the roote of this *Arum*, or ſuppoſed *Colocaſia* is not ſo, then that it beareth a ſtalke a cubite or more high, which this doth not, and that it carrieth a flower thereon, bigger than that of the Poppie, and of a Roſe colour, which this hath no reſemblance thereunto; and laſtly that it beareth a head like a Waſpes combe, with many cells or diviſions therein, in every one whereof groweth a fruit or nut, bigger than an ordinary Beane, whereunto this hath no likeneſs: I might adde alſo the name of the head called *Ciborium*, or *Cibotium*, which as I ſaid ſignifieth a (mall) caſket, from the ſmalneſſe of the places, wherein the fruit ſtandeth, as alſo from the forme of the head with the fruit, like unto a drinking cuppe, uſed among the ancient *Greekes*; as alſo the fruite or Beane it ſelfe, notably knowne to all the Nations, both Greekes and others, that it was as a ſtandard for a certaine weight, whoſe true proportion was certainely knowne, and conſtantly maintained: the place alſo of the growing, being in the waters, is differing from that of *Arum*, the vertues and qualities as different from it, all which I have therefore ſuggeſted you, that every one may plainely ſee the truth, and hereafter be better perſwaded, if ſhow have erred in their opinion and judgement: And to ſhew the originall of this errour, as it is moſt probable it firſt roſe, I may ſay that the revolution of time, which bringeth on with it many ſlippes and errours, hath beene the cauſe thereof, which therefore wiſe men and judicious, muſt ſtill be carefull to finde out and reforme: *Belonius* in the 28. Chapter of his ſecond Booke of Obſervations, thinketh that *Herodotus* was the firſt, that was the

Original from UNIVERSITY OF MICHIGAN

cause of that errour, but I verily suppose it to be more antient, for *Dioscorides* saith in his Chapter of *Arum*, among the diverse names thereof, that those of *Cyprus* did call *Arum* by the name of *Colocasion*, and therefore it is most probable that diverse Nations, eating the roots of this *Arum*, as well as the rest, which were not hot and sharp in taste in those countries, as they are in these colder, did from the *Cyprians* call it *Colocasia*, because the roots of the *Egyptian* Beane, being also called *Colocasia*, was boyled and eaten as those of *Arum* were; and thus the name spreading, and the use of them encreasing by being peradventure, both more plentifull, to be had, and more easie to dresse, and more acceptable to the taste, than the fruite of the *Egyptian* Beane, it became of lesse esteeme, and in time to be so much neglected, that it was no more looked after and planted, whereby it became to be forgotten and unknowne at the last, and the name *Colcas*, was still maintained and imposed on those roots of *Arum*, as it had been the roots of the *Egyptian* Beane. Thus much I thought good out of my simple judgement to deliver, which if it doe not agree with truth and reason, I submit it to those that can bring better.

The Vertues.

Tragus reporteth that a dramme weight, or more if needs be, of the roote of that Wake Robin, that hath spotted leaves, whether it be fresh and greene, or dried it mattereth not; being bruised or beaten and taken, is a most present remedy never failing against both poyson and plague: some he saith take as much *Treacle* with it, for the more certainty: the juyce of the herbe taken, to the quantitie of a spoonefull or two, worketh the same effect: but if there be a little vinegar added thereunto, as well as to the roote before spoken of, it will some what allay that sharpe biting taste upon the tongue, which it causeth; the greene leaves stamped being bruised and laid upon any boyle or plague sore, doth wonderfully helpe to draw forth the poyson: the pouder of the dried roote of Wake Robin, to the weight of a dramme, taken with wine as much simply, or in forme of a Lohoc or licking Electuary, or the greene roote, doth wonderfully helpe those that are purse or broken winded, as also those that have the cough, having their stomacke, chest, and longs fluxed with moist flegme, for it breaketh and digesteth it in them, and causeth it to be easily avoided and spit forth: the milke wherein the roote hath beene boyled, is effectuall also for the same purpose: the said pouder taken in wine or drinke, the juyce of the berries, or the pouder of them, or the wine wherein they have beene boyled provoketh urine, and bringeth downe womens courses when they are stayed, and purgeth them effectually after childbearing, to bring away the afterbirth; it is said that it expelleth drunkennesse also; taken with Hisope, as it healeth the inward ulcers of the bowells; the distilled water hereof likewise is effectuall, in all the purposes aforesaid; and moreover a spoonefull taken at a time, healeth the itch; and an ounce or more taken at a time for some dayes together, doth helpe the rupture: the leaves either greene or drie or the pouder of them, doth cleanse all manner of rotten and filthy ulcers, of what part of the body soever they be, and is stinking sores in the note called *Polypus* and healeth them also: the water wherein the roote hath beene boyled, dropped into the eyes, cleareth them from any filme or skinne beginning to grow over them, or those mistes that may hinder the sight, and helpeth also the watering and rednesse of them, and whereby they become blacke and blew: the roote mixed with Beane flower, and applied to the throat or jawes that are inflamed, helpeth them: the juice of the berries boyled in oyle of Roses, or the berries themselves made pouder, and mixed with the oyle and dropped into the eares, easeth the paines in them: the leaves or roote beaten with hot ox dung, and applied to the gout, easeth the paine thereof: the leaves and roote also boyled in wine with a little oyle, and applied to the piles, or the falling downe of the fundament, easeth that, and so doth the sitting over the hot fumes thereof: the fresh roote bruised and distilled with a little white wine, doth a most soveraigne water to cleanse the skinne from scurfe, freckles, spots, or blemishes whatsoever: they yet some use the roote themselves bruised and mixed with vinegar, but that is too sharpe, and not to be used but when there is great neede, and with good caution, and not to abide long upon any place: there is a *Starch* made by art from the fresh roots, called *Cerfa farinaria*, which is as white as Starch or *Creuse*, and being dissolved in milke, or in the distilled water, of the roots and milke aforesaid, doth wonderfully blanch the skinne, hiding many deformities: the fresh roots cut small and mixed with a sallet of white Endive or Lettice, &c. is a most excellent dish to entertaine a knell feast, or unbidden unwelcome guest to a mans table, to make them goe with speed and drive him from his too much boldnesse; or the pouder of the dried roote, strawed upon any daintie meate, that may be given him to eate; for either way, within a while after the eating of it, it will so fume and pricke his mouth and throate, that he shall not be able either to eate a bit more, or scarce to speake for teares, and will so abide untill there be some new milke or fresh butter given, which by little and little, will asswage the heate and pricking, and restore him againe. Some use to lay the greene leaves of Wake Robin among their Cheeses, both to keepe them from breeding wormes, and to ridde them also being in them. The Friers Conke, as *Dioscorides* and *Galen* affirme, is farre hotter, and sharpe or biting in taste, than the common Wake Robin, which is not to be found in any part of Europe, whether *Italy* or *Spaine*, *France*, *Germany* or *England*, that I know, both hot and cold countries, but in all of them much milder and weaker than the *Arum* (which is noted by *Tragus* as I said before, to suspect that our *Arum*, was the *Arisarum* of the ancients) and therefore they used it, to be laid to eating, fretting, and running sores, to stay their spreading, and abate their malignitie, to put into fistulas and hollow ulcers, to helpe to cleanse and heale them up: a peece of the roots, put into the paps of any female creature, killeth them, causing them to die quickly; which thing is contradicted by some and held to be utterly untrue. *Cornutus Lusitanus* writeth, that in the *East Countries* it was used against the plague, whereof *Clusius* saith, it was not knowne unto his countrie men, untill he had travelled into *Spaine* and *Portugall*, and from thence gave them the knowledge thereof, by sending it unto them: but I doe mistake *Arisarum*, for *Arum*, which as you may see before, is found effectuall for that purpose. The roots in *Egypt* as it is milder in taste, although somewhat sharpe and bitter and slimie in eating, so it is held more medicinal, because it is more usuall in meate. All the East countries which the *Indians* call the *Easterne Syria*, *Arabia*, *Egypt*, &c. and *Java* also, and other places in the *Indies*, as you heard before doe not only eate the roots hereof boiled in the broth of flesh, and many other wayes dressed, not onely as a daily food as they thinke, to encreake naturall sperme or seede, and to cause a validitie also, and more powerfull use in the act of generation.

Gall

Chap. XVIII.

Christopheriana. Herbe Christopher.

BESIDES the vsuall sort of herbe *Christopher*, which hath beene knowne of a long time to vs, we have latelie gained an other sort as we suppose, the neare resemblance in face causing vs so to imagine.

1. *Christophoriana vulgaris.* Ordinary herbe *Christopher.*

Herbe *Christopher* shooteth forth diverse greene stalkes of leaves, halfe a foote long, which are made into three parts, yet some times into five, the lower parts standing for the most part one against another, or not much distant, and the other at the end of the stalke, each of these parts consist of three leaves separate a sunder, with small foote stalkes unto them, which are somewhat broad, and ending in a point, some of them cut from the edges more deepely, and all of them dented about the edges, of a sad greene colour; among these leaves rise up diverse somewhat weake, smooth, round stalkes, halfe a yard or two foote high, yet not bending but standing upright, having three or foure such like leaves thereon, as grew below, but with shorter stalkes; at the toppes of the stalkes stand a tuft or bush of white flowers, every one consisting of five small leaves, with many whitish threds in the middle; and after they are fallen come small round berries greene at the first, and blacke when they are ripe: the roote is blacke without, and a little yellowish within, and somewhat thicke with diverse blackish strings or great fibres annexed thereunto, which perisheth not, although the stalkes and leaves doe die downe every yeare, freshe springing up againe.

2. *Christophoriana Americana baccis nivers & rubris.* Herbe *Christopher* of *America.*

This stranger shooteth forth in the spring many reddish stalkes about a foote high with diverse leaves thereon, divided into many parts somewhat resembling the former, but larger, rougher, and of a ladder greene colour, at the toppes, where of standeth a large tuft of white flowers compoled in a manner wholly of threds, yet if they be more neerely viewed, there will appeare for every flower five small white leaves with their threds in the middle, compassing a round greene button, which comming to maturitie is either white with a purple tippe and foote stalke, or reddish wholly: the roote is blacke, thicke, short and knocked, not growing flowreswards nor creeping, but with many fibres thereat.

The Place.

The first groweth generally in the woods of mountaines, that are somewhat open and not too much shadowed, and other like places, as well in our owne as other countries. The other both in our Plantations, and the *French* in *America.*

The Time.

They flower after Midsomer, and the berries are ripe in August.

Christophoriana vulgaris.
Ordinary herbe *Christopher.*

Christophoriana Americana.
Herbe *Christopher* of *America.*

The

The Names.

It hath no Greeke, or fcarfe any good Latin name, although commonly with moft, it be called *Chriſtophoriana* or *herba ſanctæ Chriſtophori* but for what cauſe and reſpect I cannot learne, and many do doubt of the Saints name thinking it but compoſed as relative, bearing Chriſt according to the morall of the ſtory, and not eſſentiall and in deede: Some call it as *Lugdunenſis* ſaith *Napellus leuc anthemon*, and ſome *Aconitum baccifferum. Lugdunenſe* ſaith, it is called with them *Napellus ravenglii*, and ſo with *Matthiolus* as *Camerarius* ſaith, ſome againe call it *Coſtus niger*, *Penæ* and *Lobel* make a doubt whether it be not *Aſtræa* of *Pliny*, in the 29. Booke and 7. Chapter, becauſe *Aſtræa* beareth blacke berries like Ivie: but diverſe good and iudicious Herbariſts, doe rather take it to be *Bacchar*, for this hath not rough ſtalkes as *Aſtræa* hath, but a ſmooth; and *Panax Aſclepium* ſome preferre the ſoote of *Aſtræa*, to be the roote of *Sambucus*; *Bauhinus* calleth it *Aconitum racemoſum*, and ſeemeth to allow *Lobel* his opinion, whether it be not *Pliny* his *Aſtræa* or no. Some alſo doe call *Scrophularia* by this name of herba *Chriſtophori*. *Camerarius* ſaith is is called in high Dutch Wolfs worts, whereas *Tragus* and others ſay, *Ipſa eſt Lycoctonum*, that is, *Luparia* or *Lupicida* is ſo called alſo with them. *Camerarius* ſaith alſo it is called with them *herba ſanctæ Brigidæ*. But *Tragus* ſaith that a kind of Vetch or Pulſe, which he thinketh is the *Aconitum* of *Dioſcorides*, is called with them Saint *Chriſtophel herbe*: The other is called by *Iacobus Cornutus* in his *Canadenſium plantarum hiſtoria* *Aconitum ſive racemoſum Canadenſe*: but why *Panax* being no wound herbe, I ſee no reaſon unleſſe it were for want of a better name: but I thinke I have enumled it more truely, I am ſure more reſembling this herbe, than any *Panax* that I know.

The Vertues.

The Inhabitants of all the mountaines and places, wherſoever the firſt groweth as ſome Writers ſay, do generally hold it to be a moſt dangerous and deadly poiſon, both to men and beaſt, and that they uſe to kill Wolves here with very ſpeedily: it muſt therefore be cauteloully uſed, or rather utterly refuſed: but I much doubt whether thoſe Mountainers meane not rather that *Aconitum Lycoctonum* called *Lupicida*; and although many good authours hold it dangerous, yet cannot I in my judgement ſo thinke, not finding herein by the taſte any perilous qualitie; but I cannot learne what helpe this hath procured to any: *Camerarius* ſaith of his *Panax Cornutum*, that it is eaten familiarly both with the naturalls, and *French* inhabitants with them as a ſallet herbe.

Chap. XIX.

Clematides, Climers or Clamberers.

There are diverſe ſorts of Climers or Clamberers, moſt of which are ſharpe hot and caullike, corroſiverating the skinne, if they lie any little time thereon, and thereby dangerous, although not deadly; diverſe of them have beene declared in my former Booke, whereunto I referre them: but would be enformed of them, yet I thinke it not amiſſe to let you ſee ſome of their figures, the deſcriptions of the reſt ſhall follow.

1. *Clematis ſylveſtris & latifolia ſive Vitalba.* The great wild Climer or *Gerard*: Travellers Joy.

This wild Climer or Travellers joy, as ſome call it, hath in ſome place (eſpecially if it have ſtood long) growth a thicke and ſtrong ragged woodie ſtemme or trunke, with diverſe chops or rifts in the barke, of a grayiſh colour, from whence ſhoote forth many long pliant grayiſh greene branches, more ſtrong and woodie, than any of the other Climers, (ſo that their branches doe in many places ſerve as withes, to withhold garden and field gates, or to binde any bundle together,) their branches ſpread upon the hedges or trees whereever it ſtandeth next unto, dividing it ſelfe into many other twigges, whereon are ſet at the ſeverall joynts two long ſtalkes of winged leaves, conſiſting of five leaves, two and two together, and one at the end, indented on the ſides with ſmall notches, of a pale greene colour, and taſting ſharpe and hot, being put on the tongue, but not ſo much as the burning Climer or Virgins bower; theſe branches winde themſelves about any thing ſtanding neare unto them for a great way, but have no claſping tendrells, like the Vine, to take hold or winde it ſelfe thereby, as *Gerard* ſaith it hath, to farre as ever I could obſerve: at the joynts where the leaves ſtand, ſhoote forth likewiſe towards the toppes of the branches diverſe bunches or tufts of white flowers growing together upon ſmall long foote ſtalkes, with diverſe yellow threds in the middle, ſmelling very ſweet: and when they are paſt, there ariſe in their places ſeverall heads of many long hoary ſilver like plumes, as if they were feathers ſet together, with a brownish flat ſeede at the bottome of every of them, which abideth a great while even to the Winter, before they fall off, or are blowen away with the winde: The roote is great thicke and ſomewhat woddy, diſperſing it ſelfe into diverſe long branches under ground: the leaves fall away in the Winter and recover againe in the ſpring.

2. *Clematis ſylveſtris alterius Botices.* The great Spaniſh wild Climer.

This other wilde Climer hath ſuch like running or climing branches, but ſpreading farther with many of all the length thereof, whereat ſtand round about it diverſe hard and ſomewhat broad leave, each by it ſelfe on a ſmall foote ſtalke, and indented round about the edges, of as ſharpe and hot taſte as the former, where alſo ſhoote forth two claſpers on each ſide, whereby it catcheth faſt hold of any thing ſtanding in the way neere unto it: from the joynts likewiſe where the leaves ſtand, come forth (the flowers were not obſerved) many ſmall heads, in the ſame manner that the former hath, with the like plumed feathers, of a hoary white colour, but ſmaller ſeede below them, than the other.

3. *Clematis Cretica & Alpina.* The croſſe Climer of the Alpes.

This Croſſewort Climer hath many ſlender and more ſquare branches, than any of the reſt, ſomewhat hard and woodily, riſing to be foure or five foote high, ſtanding for the moſt part upright, or bending a little downewards, from whence ſhoote forth many ſmall twigges, not paſt foure inches long, whereon ſee at equall diſtances, two ſmall ſtalkes of leaves, all the length of the twigges, direct joyned alwayes at the ends of them, each whereof hard rough and full of vaines, of a ſad greene colour, of the bignes of Myrtle leafe, or bigger, dented thicke round about the edges; the flowers come forth ſingle,

Original from UNIVERSITY OF MICHIGAN

a tender long fpecial like, confifting of foure woolly and pointed leaves, laid open like unto a croffe, of a bluifh white colour, having in the middle thereof many fmall whiter leaves folded together: the roote fpreadeth very much under ground, which hath but very fmall fibrimes thereon, or none at all, but the leaves are fomewhat fharpe and hot in tafte.

4. Clematis Auriculata repens.

The creeping fiery Sea Climer.

This creeping Sea *Clematis*, fpreadeth abroad many creeping plants, jointed and crefted branches, about two foote long, covered with a very darke greene barke, from whence fhoote forth many winged leaves, a little dented about the edges, very like unto the *Clematis erecta*, or *Flamula Iovis*, the upright Virgins flower, conſiſting of five leaves, but moſt commonly of three upon a ſtalke, being narrower, harder and longer pointed: at the ends whereof commeth forth, a ſmall claſping tendrell, but thoſe that grow up higher upon the ſtalkes, and nearer unto the toppes, where the flowers doe ſtand, are much ſmaller and narrower: the flowers come forth many together, as in the other, but on long foote ſtalkes, which are white with many hairy threds in the middle of them: and after they are paſt, ariſe many round ſtar reddiſh ſeede, ſmaller than the other, three or foure upon a ſtalke together, plumed with a white feather, at the head of every of them: the whole plant is ſharpe and hot like unto the other.

The Place.

The firſt groweth in many places of our owne land, in the hedges of fields, & by the high waies ſides, in *Northamptonſhire*, *Bedfordſhire*, and *Eſſex*, but eſpecially in *Kent*, where from beyond *Rochiſter* to *Gravelend*, and from *Greenſted* along to *Canterbury*, you may ſee it in many

1. Clematis ſylveſtris alera Dodon.
The great ſmooth wild Climer.

2. Clematis Cretica Alpina.
The leſſer Climer of the Alpes.

places.

places. The second *Clusius* onely found in Spaine, betweene *Medina Sidonia* and *Calpe*, and in divers places thereof. The third was found upon mount *Baldus*, by *Iungermanus* as *Bauhinus* saith, but is set downe by *Iohannes Pona*, an Apothecarie of *Verona*, in his description thereof which he sent unto *Clusius*, that published and set it forth at the end of his history of plants, and was augmented afterwards by *Pona* himselfe, set forth first in Latine, and after that againe enlarged with many additions and set forth in *Italian* by the sayd yet *Bauhinus* saith it was found also very plentifully, both fairer and greater by Doctor *Burserus*, upon the hils of *Austria*. The last *Bauhinus* saith, groweth in many places of the *Adriatick* sea shore, and in those Ilands the *Venetians* there, called *Ues*, and *Istria fusca*.

The Time.

They doe all flower about *July*, and the feather like toppes of the crested ones, appeare in some places in the winter.

The Names.

They are called *Clematides* of their climing and spreading branches. The first *Bauhinus* calleth *Clematis Vestris lanuginosa*, and so doe I also. *Lobel* and *Gerard* call it *Vitalba, quasi vine arbour*, which Latine word I think was but derived from the French *Vigne*, or the French from the Latine: *Bellonius* saith, it is *Viburnum Gallorum* (and *Euchius* I thinke tooke it from him *arrecuerfo.*) as if the French *Vignes* were derived from *Viorna* whereof *Virgil* speaketh in these words.

Verum hoc tantum alias inter caput extulit arbor,
Quantum lenta solent inter Viburna Cupressi.

Wherein he compareth the statelines of *Rome* to the Cypresse tree, and the meanesse of other Cities to the lowly shrubbe *Viburnum*: but to it is not likely to bee, seing this *Viorna* will rise to the top of the tallest Cypresse tree, if it be planted nigh it whereon it may clime; that *Virgil* his comparison therefore may hold good we must find *Viburnum* to be a low shrub much differing from this, as you shall heare in his place: *Fuchsius* thought it *Vitis nigra*, *Dodonæus* calleth it *Vitalba*. *Anguillara* judged it to be *Atragene Theophrasti*, whereof he maketh mention in *lib. 5. cap. 16.* whereunto *Clusius* doth consent as being the most likely of any other plant, and *Penedel* doe not dissent therefrom, neither doe I for the reasons there shewed: it is also the *Vitis sylvestris* whereof he speaketh in his 16 Booke and fourth Chapter, and the *Clematis recta* of *Matthiolus*, the *Vitis sylvestris caulibus*, of *Cæsius* in *horto Germaniæ* the *Vitis sylvestris* *Dioscoridis* of *Anguillara*, and the *Clematis altera prima* of *Cordus* upon *Dioscorides*: the Italians call it *Vitalba*, the Germans *Lauen* and *Lipen*, the Dutch *Lin*, and in English of most country people where it groweth Honesbe; and the Citizens women call it Love, and verily coyned that name of the Travellours joy. The second *Clusius* calleth *Clematis altera Betica*, but *Bauhinus* that he might vary therefrom, *Clematis peregrina foliis precintis*: The third is set forth by *Pona* under the title of *Clematis Graveolens Alpina*, but *Bauhinus* to alter the title, calleth it *Clematis Alpina Geranii folio*: the last *Bauhinus* calleth *Clematis maritima repens*, as it is in my title and describing it in his Pinax, referreth it to *Dodonæus* his *Clematites*.

The Vertues.

None of these here described are used in Physicke, by any that I know, for although they are all hot and sharpe in taste, some more or lesse then others, yet are they not applyed to the purposes that the other are which *Dioscorides* and *Galen* speak of: both these and the other Climers whose figure I give you here, and the description in my former booke may very well serve to make Arbours in Gardens, Orchards, or else where for pleasure, for thereunto they are most fit, if any will to respect as to plant them. The other Climers are said to take away the scurfe, lepry, or other deformities of the skinne: but may not safely be used inwardly, although *Dioscorides*, *Galen*, *Pliny*, and others say it was used to purge the waters in the Dropsie. *Matthiolus* saith the water of the upright Virgins bower is effectuall in any cold grosse sore, and that some gave the leaves prepared in the quartane Ague: an oyle made thereof is used to heale those that have aches, crampes, and other paines come by cold, as also to helpe the stone and to provoke urine: the Periwincle was a great binder staying fluxes both at the nose and mouth if some of the leaves be chewed, the French doe use it to stay the menstruall course. *Dioscorides*, *Galen*, and *Ægineta* commend it against the laske and fluxes of the belly to bee drunke with wine: it is a tradition received with many, that a wreath made hereof and worne about the legs defendeth them from the crampe. The *Miracle of Virginia* Climer, although I have placed it among them for the manner of growing yet is it of a farre differing quality, the liquor within the fruite is very pleasant to the taste, as if Sucket or Iuber were mixed with it, or as others say, having a little acidities with it, so that it cloyeth not the stomacke though one take much thereof, nor giveth any bad symptome, but is held rather to move the belly downeward and make it soluble. *Aldinus* in his Farnesian Garden hath set downe many vertues thereof rather in an opinion I think then in verity, which I thinke were rather others fantasies then of his owne approbation: for in his owne judgement and tryall he findeth the leaves are of a sleepie property, smelling like unto Nightshade, having withall peradventure some deleteriall or deadly quality in them also, because (as he observed) that dogs eating of them were extinguished or kild.

CHAP. XX.

Apocynum sive Periploca. Dogs bane.

THere are three sorts of this *Apocynum* or Dogs bane differing chiefely in the climing, and in the forme of their leaves, and are dangerous to man and beast, but there are some others climers referred unto them, as well for their face and forme of growing and giving of milke, as for their violent and dangerous qualities, I have spoken of that kind that came out of *Virginia* in my former booke, whereunto I must refer them for the description that are desirous to see it.

1. *Apocynum latifolium non repens.* Broad leafed or upright Dogs bane.

This broad leafed or upright Dogs bane, a woodly stemme of the bignesse of once hoope, covered with a grey

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

ill barke, from whence arife diuers woodie ſtarke ſtrong growth branches ſcarce ſo winde but very angle & hard to breake, ſtanding for the moſt part vpright, and ſeldome crayling or laying hold of any thing that groweth neere it, having two broad darke greene leaues, but ſharpe and not round at the points, ſet at euery ioynt all along, but not very neere one vnto another, full of veynes, ſomewhat ſofter then the leaues, ſomewhat thicke alſo, whole ſtalkes and branches being broken yeeld a pale yellow coloured milke, but as *Theophraſtus* and other writers ſay, of a much deeper yellow, that is, in the warmer Countries, the flowers come forth at the ioynts with the leaues, and at the tops three or foure or more ſometimes ſtanding together, which conſiſt of five ſmall pointed leaues, of a whitiſh colour, yet larger then thoſe of *Aſclepias* or Swallow-wort, after which (in the hotter Climates, but neuer in ours that could be obſerued) grow long crooked and pointed cods, ſomewhat more hard and woodily then thoſe of *Aſclepias*, although nothing to much as thoſe of the Role bay tree, called *Oleander*, moſt vſually two ſtanding together vpon one ſtalke, but ſeuered at the bottom of the ſtalke, and are full of a ſilken white downe, wherein lye diſperſed many flat blackiſh browne ſeedes: the roote groweth downe into the ground ſpreading into ſundry branches, with diuers ſmall fibres thereat, this looſeth not his branches, but leaues euery yeere, new ſhooting forth euery ſpring.

2. *Apocynum Virginianum anguſtifolium primum.* Climing Dogs-bane.

The climing Dogs bane ſendeth forth from the roote diuers woodily branches, yet tough and flexible, of a darke grayiſh greene colour, and ſometimes browniſh eſpecially neere the ground, where it ſendeth no leaues at all vnto it is growne of any higneſſe or height, which winde themſelues from the Sun ward (as in all that I haue ſeene I haue obſerued) to a very great height, twenty foote or more ſometimes, if it finde whereon it may climbe higher, or elſe falling downe againe with his top, whereon ſtand at ſeuerall good diſtances, hauing at the tops where they ſtand thicker ſet together, two leaues longer and narrower then the former, and pointed at the ende, ſomewhat thicke, and of a deepe greene colour almoſt ſhining: the flowers ſtand in the ſame manner that the others doe, conſiſting of five thicke leaues, each of them pointed and ſomewhat bending backwards, ſeeming to haue two leaues a peece, one lying vpon another, like vnto thoſe of *Epimedium* or Barrenwort, the vnder moſt being greenish and larger then the vpper leaues, which lye vpon them, and are not ſo large as couer them wholly, but leaue the greene brims, or edges of the lower leaues to be ſeene round about them, which vpper leaues are of a darke purple or reddiſh colour, and cleaue ſo faſt to the lower, that it is very hard to ſeparate them: in the middle of each flower ſtandeth a greene pointell, incompaſſed with five darke yellow ſtiues, each of them tending inwards: after the flowers are fallen, appeare (in the warme countries, but not in ours) ſmall long cods, two alwayes ioyned together, but more ſtrictly then the other, bowing ſomewhat more outwards in the middle, and meeting almoſt together at the points, wherein lie ſuch like flat ſeedes, wrapped in the like ſilken downe: the roote ſpreadeth in the ground like the other, and ſometimes ſendeth forth ſuckers, whereby it is encreaſed: this likewiſe looſeth his leaues but not his ſtalkes in the winter, and puſheth freſh in the ſpring.

3. *Apocynum anguſtifolium ſalicis folio.* Willow-leafed Dogs bane.

This other narrow leafed Dogs bane groweth vp in the ſame manner, that the laſt doth, having two leaues ſet at every ioynt of the climing twigs, but they are not ſo thicke, but ſomewhat thinner, and much narrower then they, almoſt reſembling the forme of a willow leafe, the flowers are like the other, and blow as late, looſing his leaues in the winter, in the ſame ſeaſon.

4. *t. Apocynum reflum latifolium & anguſtifolium Americanum ſive maſculi & mares.*

The great and leaſſer vpright *American* Dogs bane.

Although I haue in my former booke giuen you both the deſcription and figure of the greater ſort of theſe Dogs bane (by the name of *Periploca Virginiana*, *Virginian* like, yet I think it not amiſſe to mention it here againe, & giue you the laſt figure thereof, referring you to ſee the deſcription, &c. there, and with it to ioyne a leſſer ſort which ſeemeth not with the rootes in the ground like it, but from many long fibres ſhooteth forth a round browne ſtalke, about halfe a yard high, hauing at each ioynt a paire of long narrow leaues, and ſuch a large tuft of flowers at the top, but of a deeper purple colour, which haue a certaine clammineſſe on them that will intangle flies or other light things that happen to fall thereon, after which come long and ſtraight cods (not crooked like the greater ſort hereof) with that browne ſeed therein lying in a white kind of downe, like vnto the Swallow-wort: this yeeldeth a milky ſap like the other, and thought to be both dangerous, although I know no hurt that hath beene done thereof.

5. *Planta ſcandens Virginiana Caſſeminoides Americanum maximum flore phœniceo.* Virginian Iaſmine.

Iaſmine I may well make bold to inſerte in this place to the reſt this Indian, I intitle him with baſtardy for the reaſons hereafter ſpecified, whoſe deſcription I giue you in this manner. It ſhooteth forth ſundry weake woodily ſtemmes not able to ſuſtaine themſelues without helpe of ſtakes or tailening to ſome wall but ſpreading and climing high or farre, branching forth on all ſides into many ſmall ones, at whoſe ioynts come two long winged leaues ſeauen or nine ſet on a middle ſtalke, each whereof is ſomewhat broad and long point-

rod and dented somewhat deeply about the edges, and of a sad greene colour full of veines very neere resembling the leaves of the great Sermane Burnet Saxifrage. This never bore flower with mee, nor any one to hath it in our country that I could heare of: but in the native all place, as also beyond sea, at *Rome*, and other hotter countries, it beareth a great tuft of flowers together hanging downewards, each whereof is large and deepe long, somewhat like to the Foxglove, but rather Bell fashion, small at the bottome lying in the stalke, wide open at the mouth, cut in on the brims into five or six lips as it were or divisions, of a sad Orenge tawny yellow colour, with some yellow threds, & a whitish stile in the middle: after the flowers are past, arise hard crooked & flattish double edged crooked and pointed cods, containing within them a double row of flat, thin, browne skinny and winged seedes, with a thinne wooddy skine separating them in the middle all the length the cod: the roote groweth not very deepe but spreadeth, yet runneth not under ground, the leaves fall away from the brambles every winter, and are renewed every spring. By this that hath beene said you may perceive the reason why I place it among these dangerous climers, although it have no obnoxious or hurtfull qualitie therein for any thing I can learne, and doe not call it a Jasmine as many others do, nor a Honysuckle as all the Colonie at *Virginia* first did, nor a Bell flower as since they have done, nor yet place it with the other Climers the last Chapter, because of the pods with seede, neither yet doe I entitle it *Cissi facie nam hedera arcum sulcum* that good French goose doth, whose horned name is preferred to his workes of great judgement no doubt, for it beare an Ivy title that hath so little resemblance thereto.

The Place.

The first groweth in *Syria* and those Eastern countries, the other groweth in *Italy*, in *Apulia* and *Calabria* the kingdome of *Naples*: the third likely groweth in *Italy*, the seede being sent from thence, as also all the three last sorts came all from our English plantations in *America*.

The Time.

They flower very late in the yeare, if they flower at all, that is, not untill the end of *August*, and in the end of *September*.

The Names.

It is called in Greeke Ἀπόκυνον and Κυναγχὲς, *Apocynon* and *Cynanchen*, quasi canis suffocans, *Dioscorides*: it was also called of divers in his time *Cynorexia*, *Brassica erratica* but it is an extraordinary name not fit and other *Peculiar* of divers; which is as well a word common to all sorts of herbes, that climbe by and about trees, and other things as peculiar to these called *Periplocæ*, whose *Periplocæ* are of some sorte the *Periclymenos* of *Asclepias*, as the *Anthora* is unto the *Thora*, and *Herba Paris* unto *Paralysis*: *Columna* seemeth in doubt, that the Herbarists and Apothecaries in *Italy* did take the *Apocynon* for *Asclepias* in their Medicines, with his deadly, in stead of *Asclepias*, and that they did not know the true *Asclepias* indeed, into whose defection that which is called *Asclepias* with ours and in deede not at all, but although it have a number of rootes, yet they doe not smell well, say *Dioscorides* saith the rootes of his *Asclepias* do smell well, nor yet hath it seeds like unto *Scandix* Harchet Teeth, but hath leaves, flowers, cods, with silken

Digitized by UNIVERSITY OF MICHIGAN Original from UNIVERSITY OF MICHIGAN

seede in them, like unto the *Apocynum* of *Dioscorides*, and differing in nothing but in the milkye juice it yeeldeth, which as he saith, in that, is white like milke (but *Dioscorides* saith, that his *Apocynum* giveth a yellow juice or milke) and in this, is of a pale yellowe colour like unto the poyson of the viper, that lurketh in the gums of his teeth, which he saith he hath often shewed to his friends, to shew them the likelihood of danger to be in the *Asclepias*, which yeeldeth such a likely poyson, or at the least to cause them to be more cautelous in the use of it: but assuredly if there *Asclepias* (which is the same with ours called also *Vincetoxicum* as I thinke) doe give a yellowish milke, yet doth it not in our Country, neither the white nor blacke: he saith also, that the leaves where have set forth divers sorts of *Apocynum* under the name of *Asclepias* of *Dioscorides*, for that they doe not know, nor have seene the true *Asclepias* of *Dioscorides*, unlesse his *Apocynum* and *Asclepias* be all one, set forth in divers places, and by divers names: thus were *Fabius Columna*, led away onely by the sight of that yellowish milke in their *Asclepias*, which as you heare he acknowledgeth not to be the right (how soever the use thereof was frequent with them, and taught be as he acknowledgeth also, a counterpoison as the true *Asclepias* is accounted) but rather an *Apocynum*, but I thinke he did not thorowly consider that the true kindes of *Apocynum*, have all of them woodily, yet pliant branches, as *Dioscorides* giveth to his *Apocynum*, not to binde any thing, which abide and dye not downe to the ground, as all the sorts of *Asclepias* doe, which is the true note to distinguish the *Apocynum* from *Asclepias*. The names of them all, as they are in their titles hereof set downe, doe little or nothing vary, howsoever that all other Writers give them some calling them *Apocynum*, and some *Periploca*, and therefore I needlesse labour any further repetition of their divers appellations, onely the fourth *Dodonæus* calleth a Vine, and calleth it so also the *Necamone* of *Egypt* and *Arabia*, and the first and last of the second kinde of *Asclepias* of *Clusius*, the last, because of the woodily pole with the manner of the climing, moveth me rather to joyne it to the Vines, although I know nee of any vitill quality thereon, and therefore give it a bastard name.

The Vertues.

There is no property herein for the use of mans body, appropriated by any, either ancient or moderne Writers, see the place in *Theophr.* page 556. is mistaken or scarce to be believed, where he saith the seede of *Asclepias* taken in water, killeth the pleurisie, and all paines of the side, (unlesse he thought it to be like the herbe Iris that can doe as much) and yet after words saith it killeth dogges, and all other brute beasts, being given them in their meate, for *Galen* saith it is a poyson to man, and being of a strong sent in a last, and that not in a second degree, although it is not drying in the same, and is not to be medicined outwardly, to discusse humours. *Clusius* saith, that the most illustrious Prince, *William Landtgrave of Hessia*, in appointing his Physitions to make tryall of the *Terra Sulfurea*, which was taken at *Strigon*, whether it had those properties to expell poysons, as they that brought it to sell reported of it, caused divers poysons to be given to dogs, as *Aconite*, *Napellus*, or Helmet flower, and *Oleander* or the Rose bay, and the Dogs bane also, which beeing of those dogges, had that earth given to him in drinke, did cast some fits or pallions recover, but those that had none thereof given them dyed all, but none so speedily as those that had this Dogs bane given unto them, yet *Pena* and *Lobel* in their *Adversaria*, speaking of that kind of Dogs bane, say thus; If it be the right Dogge bane that I reason of, it is probable that it is *Apocynum* (for in their title, they make a doubt thereof) of *Dioscorides*: but say they, wee have it for certaine, and of long time found true by experience and tryall, that this is a counterpoyson against other sorts of poyson given to dogges, thus you see the reports of these two are flat contrary, the one unto another, so that which of them to believe, I leave to every one as they thinke good: peradventure, this their *Periploca Græcorum latioribus hederarum*, (for so they call it) is the same vulgar or common *Asclepias*, that *Fabius Columna* saith, was used in *Italy*, as is before said, and not that *Apocynum* (as I take it) of *Clusius*.

CHAP. XXI.

Asclepias sive Vincetoxicum. *Asclepias* or Swallow-wort.

HAving now shewed you all the Venemous Plantes, as also those that procure sleepe and those that are hurtfull and dangerous; let me now shew you also those that are accounted Counterpoysons, so those deadly or dangerous herbes, as also to other sorts of Venome or poyson, and yet not all, for some are dispersed in this worke, in the severall Chaples thereof, and some are spoken of in my former booke, as you may there find. The first of them that I shall set forth unto you is the Swallow-wort, because it is so like unto the Dogs bane in the last Chapter, and is his Antidote, whereof there are three sorts as followeth.

1. *Asclepias flore albo.* Swallow-wort with white flowers.

This Swallow-wort pitcheth up with divers slender weake stalkes, to be two or three foote long not able to beare, scarce able to stand upright, and therefore for the most part, leane or lye downe upon the ground, if it findeth any thing to sustaine it, and sometimes will twine themselves about it, whereon are set two leaves at the joynts, being somewhat broad and long pointed at the end, of a darke greene colour, and smooth at the edges: at the joynts with the leaves towards the toppes of the stalkes, and at the toppes themselves, come forth divers small white flowers, consisting of five pointed leaves apeece, of an heavy sweet sent; after which come small long pods, thicke above and growing lesse and lesse to the point, wherein lye small flat browne seede, wrapped in a great deale of white silken downe, which when the pod is ripe, openeth of it selfe, and sheddeth both seed and cotton upon the ground, if it be not carefully gathered: this yeeldeth no milke at all white or yellow in our Country as the Dogs bane doth, or any that I have observed, but a thinne watery juice, the roote is a great lush, of many strings fastened together at the head, smelling somewhat strong while they are fresh and greene, but more pleasant when they are dryed: both leaves and stalkes, dye downe every yeare to the ground, and rise new in the Spring of the yeare, when the stalkes at their first springing are blackish browne.

2. *Asclepias flore nigro.* Swallow-wort with blacke flowers.

The blacke Swallow-wort groweth in the same manner that the former doth, having his long slender rough branches, rise to a greater height then the other, and twining themselves about whatsoever standeth next unto them,

1. *Asclepias flore albo.*
Swallow-wort with white flowers.

2. *Asclepias flore rubro.*
Swallow-wort with blush flowers.

them, having such like darke greene leaves set by couples, but somewhat smaller then they: the flowers likewise stand in the same fashion, but somewhat smaller also and of so darke a purplish colour, that it seemes to be a blacke, and are scarce discerned unlesse one looke very carefully upon them: after which come the pods orderly then in the former, such like cods, with a white silver downe, and seeded in them as in the former: the roots hereof are not so bulbous as in the other, neither smell so strong, nor doth it give any milke but a watery juice when it is broken, so farre as ever I could observe.

3. *Asclepias Cretica.* Swallow-wort of *Candy*.

This *Candy* Swallow-wort, riseth up in the same fashion that the former doth, with many slender long greene branches, with leaves set at the joynes, on either side, as the white kinde hath, and are very like unto them, but somewhat of a paler greene colour: the flowers stand in the same manner, three or foure together upon a stalke, but are somewhat of a paler white colour, not so white as they, to whom succeede sometimes but one, but most usually two pods together, which are thicker and shorter then those of the white kinde, ribbed all along, and double locked at the ends, wherein lye seedes and silke as in the former: the roote likewise of so many strings as the rest, and have as well as the rest of the Plant, a strong smell resembling Boxe leaves.

The Place.

The two first grow in rough untilled places, and in mountaines in divers places, both in *France* about *Narbon*, *Montpelier* and *Montelliers*, and *Mompelier*, and in *Italy* also, and in other places. The last grew in *Candy* from whence I had the same.

The Time.

They all flower in the moneths of June and July, and sometimes not untill August, if the yeare be backward, and their cods with seede is ripe about a moneth after: the empty huskes abiding on the dry branches, when the seed and silke is fled out, and fallen on the ground, or blowne away with the wind.

The Names.

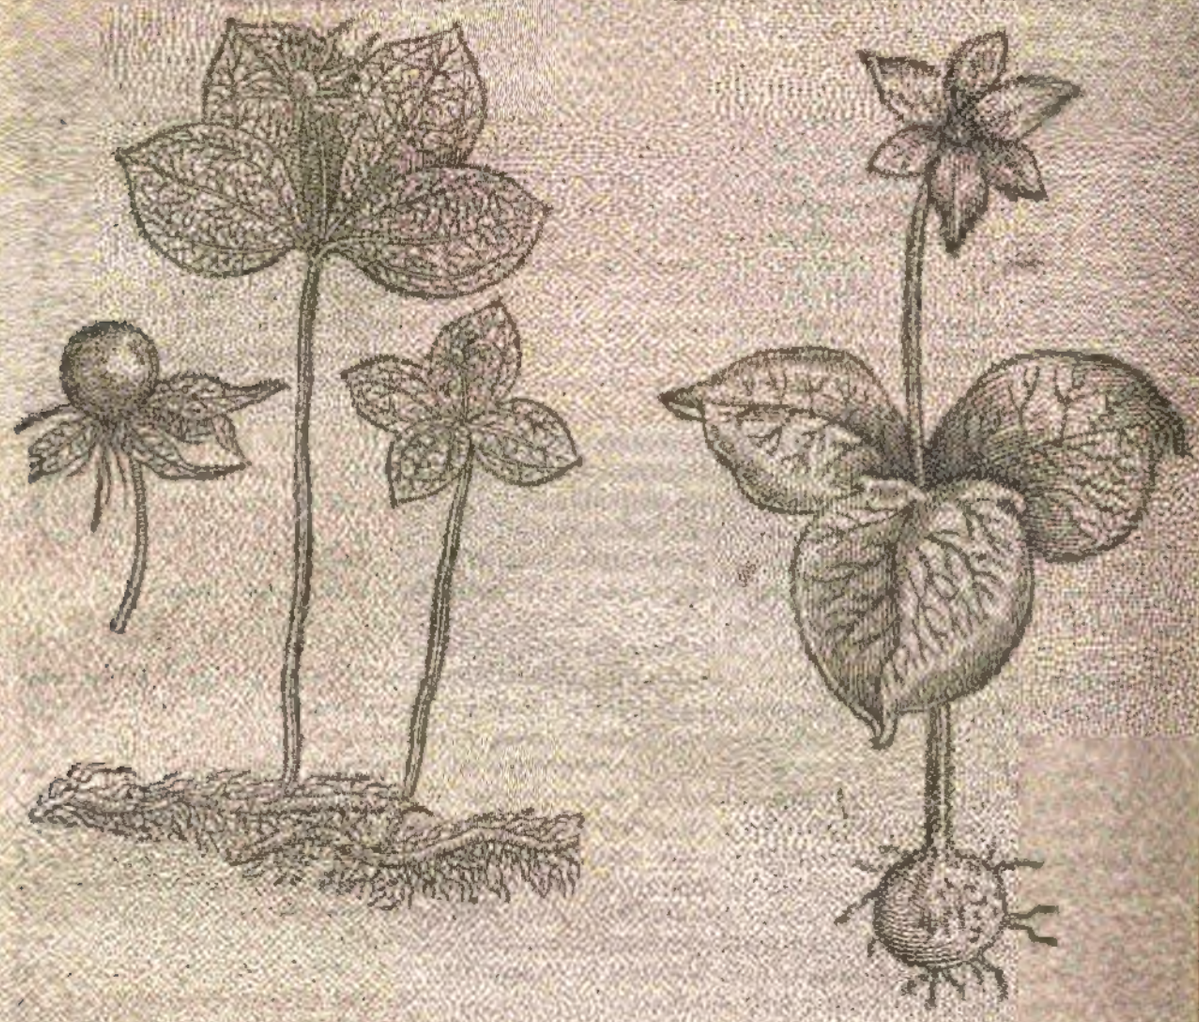
It is called in Greeke ἀσκληπιὰς ἀλλὰ ἡ Ἐφεσία, quia à nomine Græco antiquo nomen [illegible] some Inland names it hath also, as *white great leder vala*, and *common the two fashion*: and therefore of some of the forme of the leaves like unto Ivy: *Knellius* calleth it *Hederacea*, in Latine was called usually *Asclepias* and *Vincetoxicum*, which is as a generall word to denominate any Counterpoison, for *Vincetoxicum* [illegible] *Asclepias* [illegible] *Asclepias* [illegible] of *Chelidonium* maior and minor, he also called *Hirundinaria*: of some, *quia* [illegible] *vide tanquam* [illegible] called Swallow-wort of some, because the pointed cods when they are open, and the silke appeareth out of them doe somewhat resemble a Swallow flying: others say from the likenesse of the seede: [illegible] the downe about it: it is called in *Italian Vincetossico & Asclepiade*, in high *Dutch Schwalben wurtz*, in low *Dutch*

Dutch, in those *countries*, and in *English*, Sea-side Sow-wort, and of some silken Ciely: It is generally by the most writers, and most iudicious heretofore now alwayes, acknowledged to be the true *Alcipus* of *Dioscorides*, although *Amatus* doubteth of it, and *Matthiolus* denieth it and contendeth against *Fuchsius* that said it was *Vincetoxicum*, for first concerning the leaves, to be like Ivye, as *Dioscorides* saith and long as it is in some copyes: but *Fuchsius* saw such barbe it, not to; and *Matthiolus* doth therein not agree, but peradventure as he saith by the sight of some ancient copies, the leaves being like unto Ivy leaves, but sharper pointed; secondly that the flowers had no sting or evill sent; thirdly that the leaves and rootes did not smell sweet; and lastly, the seede was not like those of *Periclymenum*, the Hatcher Perch; all which *Dodonæus* reporteth saying, all his exceptions and reasons are nothing worth, but I may say all *Dioscorides* his comparisons are not so strickely to be stucke unto; for in the description of the cods of *Apocynum*, he saith they are like Beane cods, which as all know they are more like the cods of *Periclymenum*; and in the discription of the leaves of *Periclymenum* he saith they are like those of Ivy, unto whom they are in all mens judgements very little like, and so in a number of other things: Concerning the rootes, *Matthiolus* saith that an ancient Manuscript hath not the word ἀσπάλακος, but ἀσπαλάθους, but which of them both is taken doth not much alter the matter: but that they are not sweete, no man that hath his sence of smelling perfect, can say so, if he taste their dent, as they grow naturally in the Mountaines; and for the evill smell of the flowers, the word ἀηδόσμους signifieth, is not in all things of one equality: and for the seede although it be not so found as *Dioscorides*, yet is flat, and in colour and bignesse like it. *Fabius Columna* as it is set downe in the Chapter before, tooke the *Italian Alcipus*, to be rather *Apocynum* of *Dioscorides* and *Lobel* also calleth the Hatcher Swallow wort *Periploca minor*, belike because it riseth higher, and clambereth like a *Periploca*, or more than the white, in peradventure because of the blacke flowers, but I shewed you before the chiefest note, to know *Alcipus* from *Periploca* or *Apocynum*. There is little variation in the denominations of these plants by any writers, more than is here expressed, some calling them by the one, and some by the other name, and therefore not worthy further trouble.

The Vertues.

The rootes have a most soveraine quality against all poysons, but in particular as is said before, against the *Apocynum* or Dogs bane; It is effectually given to any that are bitten by any venemous beast, or stinge by any Serpent or other Creature; as also against the biting of a mad dogge, a dramme and a halfe thereof taken in Carduus *Benedictus* water, for divers dayes together; It is taken also in wine every day against the Plague or Pestilence: a dramme thereof taken in Scorzell or Bugloss water is very effectuall against all the passions of the heart: if a few Citron seedes be taken therewith, taken in the same manner and measure, it easeth all the griping paines in the belly: the decoction of the rootes, made with white wine, taken for divers dayes together, a good draught at a time, and sweating presently thereupon cureth the dropsie: the same also helpeth the jaundise, provoketh urine, and easeth the cough and all defects of the chest and lunges: the powder of the rootes taken with Peany seede, is good against the falling sickenesse, or with Saffill seede or the rinde of Pomecitrons is good against Melancholly: and taken with the rootes of *Dictamnus alba* or *Fraxinella*, bastard *Dittany*, will kill and expell the wormes of the maw or belly: the rootes are very effectually used with other things, made for bathes for women to sit in, or over, to ease all paines of the mother, and to bring downe their courses: the decoction likewise of the rootes hereof, and of Cumfrye made with wine, is much commended to helpe those that are burlen or have a ruptures: also for them that have beene bruised by a fall, or otherwise: the powder of the rootes or leaves, is no lesse effectuall to cleanse all putrid rotten and filthy ulcers and sores whatsoever, then the rootes of *Aristolochia* or Birthwort, and may safely be used in all salves, *Unguents* and *Lotions*, made for such purposes, in the stead thereof, the one for the other: the leaves and flowers boyled and made into a pultis, and applyed to the hard tumours or swellings of womens breasts, cureth them speedily, as also such evill sores as happen in the matrix, although they be inveterate or hard to be cured: the downe that is found in the cods of these herbes, as well as in the Dogs bane, doe make a farre softer stuffing for cushions or pillowes or the like, then Thistle downe, which is much used in some places for the like purposes.

Chap. XXII.



Herba Paris. Herbe True love or one berry.

Besides the small and knowne *Herba Paris*, I have two other herbes like thereunto, to bring to your consideration, which I thinke is fit to take up the roome here.

The ordinary *Herba Paris*, or Herbe true love hath a small creeping roote, of a little binding, but of unpleasant loathsome taste, running here and there, under the upper crust of the ground, somewhat like a Couch grasse roote, but not so white, and not much lesser then the toute of the white Lillie of the Gardens, and of a dark a colour, but much like thereunto in creeping: shooting forth stalkes with leaves, some whereof carry no berries, and others doe, every stalke being smooth without joynts, and blackish greene, rising to the height of halfe a foote at the most, if it beare berries (for most commonly those that beare none, doe not rise fully so high) bearing at the toppe foure leaves, set directly one against another in manner of a crosse, or a lace, or ribbon, tyed as it is called, in a true Lovers knot, which are each of them a part somewhat like unto a Nutmeg leafe, but somewhat broader (yea in some places twice as broad as in others, for it will much vary) sometimes having but three leaves, sometimes five, and sometimes six, smaller and sometimes larger, either by a quarter or halfe, or as I said before, twice as great: I have seene in the Low countries, that the foure leaves being twice as large as the ordinary, have beene dented in, both at the edges and points, which have beene parted or forked, (and have borne greater berries then the ordinary) all which are of a fresh greene colour, not dented about the edges in the middle of those foure leaves, there riseth a small slender stalke about an inch high, bearing at the toppe thereof one flower spread open like a starre, consisting of foure small and narrow long pointed leaves, of a yellowish greene colour, and foure other lying between them

Herba Paris.
Herbe true love, or one berry.

2. *Herba Paris Canadensis rotunda radice.*
Herbe true love of Canada with a round roote.

them lesser then they: in the middle whereof standeth a round darke purplish button or bead, compassed with eight small yellow mealy chives or threads, which three colours make it the more comely to behold: this button or head in the middle, when the other leaves are withered, becommeth a blackish purple berry full of juice, of no hot nor evill, nor yet of any sweetish taste, of the bignesse of a reasonable grape, having within it many white seedes: the whole plant is almost insipide, without any manifest taste, and by its effects, in repelling humours and inflammations is accounted as cold as the Nightshade.

3. *Herba Paris trifolia Bruſilana.* Herbe true love of *Brasil*.

The roote of this herbe is small and creepeth like the other, sending forth a slender stalke of foote or foote and a halfe high, having three broader and longer leaves set thereon, then are in the former, the stalke riseth about three inches above them, bearing at the top three much narrower leaves, as it were the huske to the flower, standing in the middle, consisting of three white leaves having some veines in them, and are about three inches long, and one broad.

4. *Herba Paris Canadenſis rotunda radice.* Herbe true love of *Canada* with a round roote.

This herbe groweth with three large leaves like the last, and at the toppe of the upper stalke one flower, consisting of six leaves, three whereof are greene and small, which are as it were the huske to the other three which are larger and longer, of a darke purple colour, and in some white, in the middle whereof groweth a small round blackish berry, full of small seedes like Nightshade seede: the roote hereof creepeth not so farre as the former, but groweth into a small round tuber.

The Place.

The first groweth in our woods and copses, as also sometimes in the corners and borders of fields, and olde grounds, in very many places of this land, for besides those places which *Gerard* hath set downe, which are almost all wasted and consumed, every one runneth thereunto, that is next him, and gathering it: it is a plentie *Hunbury* wood, three mile from *Maidstone* in *Kent*, in a wood also called *Harwarth*, where to *Plumpton* halfe one mile from the said *Maidstone*, in a wood by *Chiſſelhurſt* in *Kent*, called Long wood, and in the next wood thereunto called *Hertt* wood, especially about the skirts of a hoppe garden bordering thereon, in a wood also over against *Beech* Abbay a mile from *Maidstone* in great abundance, not farre from the hedge side of the wood, through which runnes a riveler, related by Mr. *George Baker* a young Mercerman, of excellent knowledge in these things. The second was found as *Bauhinus* saith in the woods of *Brasil*, but I had the knowledge of it given me from *Monsieur Lemeau* of *Rochell* Preacher, who had it out of *Canada*. The last was brought out of *Canada*, and mentioned by *Cornutus* in his booke of *Canada* plants.

The Time.

They spring up in the middle of Aprill, or May, and are in flower soone after, the berries are ripe in the middle May, and in some places in June.

The

The Names.

This herbe hath not beene knowne, to either ancient Greeke or Latine Writers, that we can finde by their writings, it hath found therefore diverse names, by divers of the moderne Authours, every one according to his opinion and judgement led him: for although *Matthiolus, Calthapinus, Dalechampius, Camerarius, Lobelius*, and *Lugdunenses*, following them, doe call it *Herba Paris*, as it is now generally termed of all Herbarists, yet in the former times, *Fuchsius* reckeneth it to be *Aconitum Pardalianches*, and to be deadly, or at least dangerous, whom *Matthiolus* contradicteth, and *Cordus* in his History of plants, seemeth to be of *Fuchsius* opinion, calling it *Aconitum sive Pardalianches nonnullorum*, but because it was found by good experience not to be hurtfull, but helpfull, *Tabernamontanus* calleth it *Aconitum salutiferum*. Some called it *Trea herba Tragi* not knowing any Latine name, that other called it by, giveth it the name of *Aller*, from his owne countrie people, who called it *Sweckruyt*, but he added thereunto, *sed non Anticum*, because it might be knowne, he did not account it the *Aconitum Anticum* of *Dioscorides*, and others: he also calleth it *Trea lupina*, after the *Germane* word *Wolffsbeer*, whereby they in other places usually call it, as also *Lonicerus*: the *Italians* call it *Herba Paris*; the *Spaniards Cruciata*; the *French Raisin de Renard*; the *Dutch Wolffsbeen*, and *Spinne cappen*. *Gesner* in horto *Germaniæ*, and *Lobel* and *Pena* in their *Adversaria*, call it *Solanum trifolium*, from the forme of the leaves and berries: in both, and *Bauhinus* as leaning unto their judgement, calleth it *Solanum quadrifolium Bauhinorum*. The second *Bauhinus* calleth *Solanum trifolium Brasilianum*; and *Herba Paris trifolia Brasiliana*, because I doe not account the *Herba Paris* to be any kinde of *Solanum*. The last *Lugdunists* calleth *Solanum trifolium Canadense*.

The Vertues.

Although some have worthily held account this herbe to be dangerous, if not deadly, as by the name of *Aconitum*, it may be gathered, they gave the same thereof (ped in their such assumption, yet have not set downe any evill symptomes that it wrought, and therefore *Pena* and *Lobel* say, they made much triall thereof upon dogs, & other creatures, to finde out whether it would worke any dangerous effects unto them, but did not see any harme come to them: they had eaten it, and therefore upon report of the contrary effect it would worke, they made triall likewise thereof upon two dogs, to whom was given of *Arsenicke* and *Sublimate*, of each halfe a dramme in meate, unto one of them, about an houre after their eating of it, when their furious & foming fits were over, that they became more quiet, as if they were ready to die, there was given one of them, two drammes of the powder called *Pulvis Bezoardicus*, (the receipt whereof hereafter followeth) in red wine, who presently thereupon grew well, the other dying without help: the receipt of the powder is thus. Ref. *Radicum Angelicæ, Imperatoriæ, Gentianæ, Tormentillæ, Pimpinellæ, Serpentariæ, Dictami & Tormentillæ ana unciam dimidiam, Corticis Mezerei concisi, Lacrimæ Aloes, granorum Kermes ana drachmam unam, Bezoardici orientalis cum toto drachmas 36, ex rubiis & corticis in aqua macerati, fiat alis ut exterius & misce fiat omnium pulvis*: the leaves or berries alone are also effectuall, to expell poisons of all sorts, but especially that of the *Aconites*, as also the plague and other infectious sicknesses, of which there hath been observed saith *Matthiolus*, as well from my owne experience, as from *Baptista Sardus*, the Author that enlarged the *Pandects*, that some have been holpen hereby, that have lyen long in a lingring sickenesse, and others that by Witchcraft (as it was thought) were become halfe foolish, as wanting their wits and senses, by the taking a dramme of the seedes, or the berries hereof in powder, every day for twenty dayes together, were perfectly restored to their former good estate, and health: the leaves dried and given in powder, have the like operation, yet in a weaker manner; it is thought also that the berries procure sleepe, being taken at night in drinke: the roots in powder ease the paines of the collicke incontinently, being taken in wine: the leaves are very effectuall, as well for greene wounds, as to cleanse and heale up old filthy ulcers and sores, and is very powerfull to dissolve all tumours and swellings, and to allay all inflammations very speedily, as also those tumours that happen in the cods, privy parts, or in the groine: the juyce or distilled water of the leaves, taken away all heate and inflammation in the eyes: the same leaves also or their juyce applyed to fellons, or those rankes of the hands or toes, that have impostumes or sores gathered together at the roots of them, healeth them in a short space.

Chap. XXIII.

Bistorta. Bistort or Snakeweede.

There be divers sorts of Bistorts, some being of late, others of elder account.

1. *Bistorta major vulgaris.* Common Bistorte or Snakeweede.

This common Bistort hath a thicke short knobbed roote, blackish without, and some what red within, a little crooked or turned together, of an harsh or astringent taste, with divers blackish fibres growing thereat, from whence spring up every yeare divers leaves standing upon long foote stalkes, some what long and broad, very like unto a Docke leafe, and a little pointed at the end, but that it is marked with certaine colours on the upperside, and of an Ash colour gray, and a little purplish underneath, having divers veines therein; from among which rise up diverse small and slender stalkes, two foote high, almost naked and without leaves, or with very few, and narrower, bearing a spikie head of pale flesh coloured flowers, which being past, there abideth small seede somewhat like unto Sorrell seede but greater.

2. *Bistorta major inverta radice.* Bistort with more crooked rootes.

This Bistort differeth not much from the former, being a little lesse, both in leafe and roote, which are more wrinkled and crooked than the former; the spikie flowers, &c. are equall also almost unto them, and so is the seede square seede.

3. *Bistorta Alpina major.* Great Mountaine Bistorte.

The great Bistort hath many very long and pointed leaves, of the same colour with the first, both above and underneath, some of a cubite or a foote and a halfe long, and but narrow in comparison of the length, being about three inches broad, these stalkes rise almost twise as high as the first, almost bare without leaves thereon, which are much smaller, bearing a spike of bluish flowers, foure inches long at the toppes: the roote is foure times bigger than the common sort, blacke without, with many blacke fibres at them, but not so red within as the first, but rather whitish.

4. *Bistorta*

4. *Bistorta minor noſtras.* Small Biſtort of our owne Countrie.

This ſmall Biſtorte ſendeth forth three or foure ſmall narrow leaves, fearſe an inch broad, and almoſt foure inches long, greene above, and gray underneath; the ſtalkes are ſlender, and bot with one or two leaves thereon, at the toppes whereof ſtand ſmall long round ſpikie heads of white flowers, with diverſe ſmall green leaves among them; after which come reddiſh ſeede almoſt round, which being drie, become blackiſh, and are bigger than thoſe of the firſt: the roote is ſmall in proportion, but ſomewhat crooked or turned like the common kinde, being of a blackiſh colour without, and ſomewhat whitiſh within, of the ſame auſter binding taſte that the reſt hath.

5. *Biſtorta minor Alpina.* Small Biſtort of the Alpes.

This ſmall Biſtort hath broader leaves, and not ſo long as the laſt; the tuft of flowers likewiſe at the toppe is cloſer ſet together, in other things not differing.

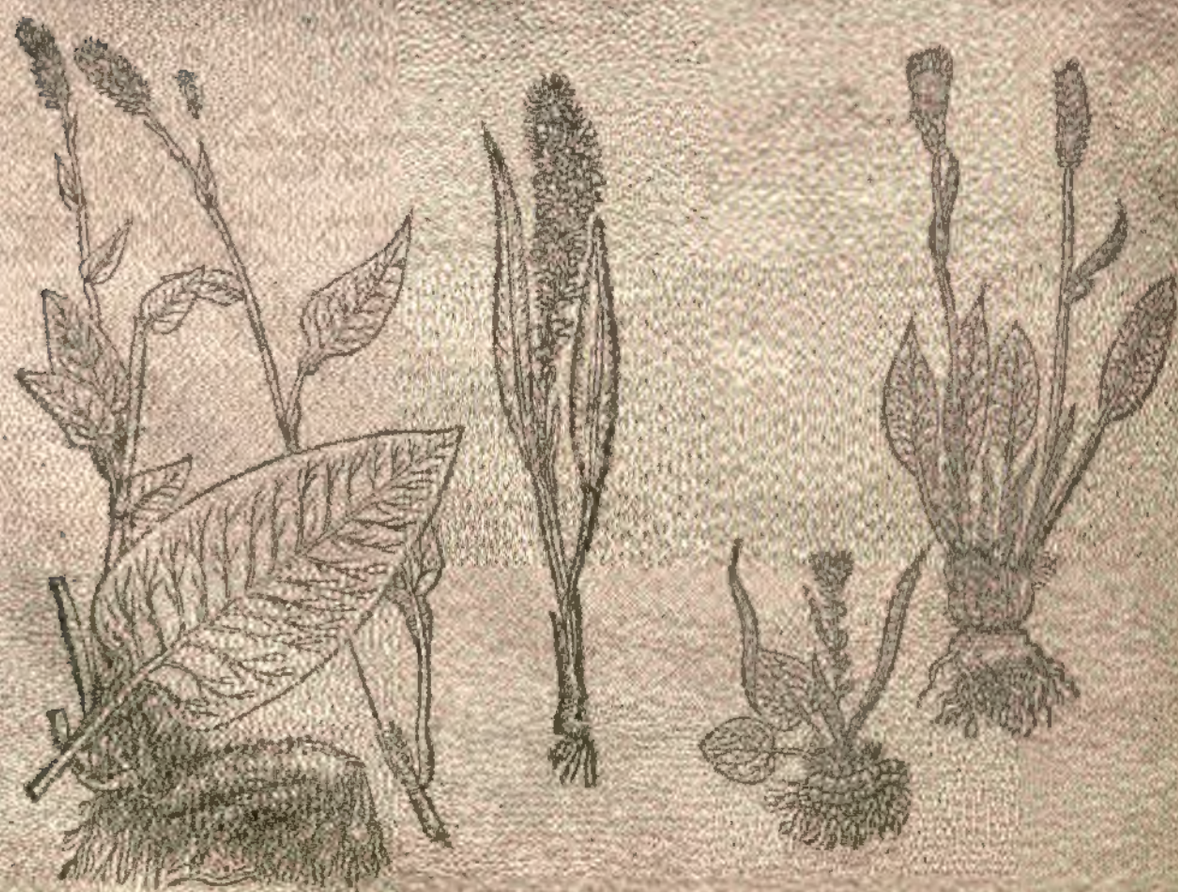
6. *Biſtorta Alpina pumila variis.* Variable leafed ſmall Biſtort.

This Biſtort hath not onely two or three broad and ſhort almoſt round leaves pointed at the ends, but two or three very narrow and long leaves alſo with them comming from the roote, the ſtalke is ſcarſe an inch breadth high, with many ſuch whitiſh flowers thereon as are in the other ſmall ones.

The Place.

The two laſt grow at the foote of hills, and in the ſhadowie moiſt woods neare unto them, in many places of *Germany*; and in our countrie likewiſe in the like places, but chiefely is nourished up in gardens. The firſt groweth on the high hills in *Alpibus*, and other places; the fourth groweth eſpecially in the North, as in *Lancaſhire*, *Yorkſhire*, and *Cumberland* in diverſe places. The two laſt are found likewiſe on the Alpes in many places, but the laſt among the *Switzers*.

The Time.



They all flower about the end of May, and the ſeede is ripe about the beginning of July.

The Names.

It is called generally *Biſtorta, quod radice in ſe ſerpentis modo contorta, & convoluta conſtet*, of *Tragus*, *Lobel*, and others *Colubrina*, from the *Germane* name of *Schlangenwurtzel* and *Natterwurtzel*; of *Fuchſius Serpentaria quod venenoſorum ſerpentium ulcus ſecuribus* of *Geſner* and *Lobel*; *Germanis Limonium*, *Francofurtis* called it *Lapathum*, as well as *Biſtorta*. *Lobel* and *Cordus* thinke it may be *Bardana* of *Dioſcorides* and *Pliny*. *Tabern.* calleth the firſt, *Biſtorta major radice minus intorta*. Some call it *Rubea rotunda*, others take it to be *Pentaphyllon* of *Pliny*. Some alſo doe take it to be the ſecond *Dracunculus* of *Pliny lib. 4. cap. 6.* the ſecond is called by *Tragus*, *Colubrina minor*. *Bauhinus* calleth it *Biſtorta major radice magis intorta*. The third *Bauhinus*, that ſtalkie ſort, he ſetteth forth as I thinke, calleth it *Biſtorta Alpina maxima*; the fourth I take to be differing from the next, and therefore call it *Noſtras*: the fifth is called by *Camerarius*, *Cluſius*, *Lobel*, *Bauhinus*, and all others that have written

7. 4. *Biſtorta major vulgaris noſtras.*
Great and ſmall Biſtorte or Snakewoode.

7. 6. *Biſtorta minor Alpina & minus pumila variis.*
Small Biſtorte of the Alpes and variable leafed Biſtorte.

Original from UNIVERSITY OF MICHIGAN

thereof a good deale, or *Aldrouandus* onely *Cesalpine in hortis Germaniæ* reckoneth it to be a small sort of *Limonium*: but in that *Britannie* cannot be *Britannica* this therein: in the description thereof that the leaves are rough or hairy, where these are smooth, and that the rootes of *Britannica* are small and shorte, when these are not small although short; and *Gerard* in his first booke of simples, saith that although the leaves of *Britannica* be somewhat like unto Docke leaves, yet they are blacker and more hairy. And that it cannot be *Rubea rubrum*, the faculties doe easily declare, for the rootes of the true *Rubea rubrum & albrum*, are both sweete in smell, and are of an hot qualitie, that they are effectuall to procure venery, or bodily lust which these cannot: the last is not remembred by any Author before this time. The *Italian, Spaniards* and *French* doe follow the Latine, as we doe also, the *Low Dutch* doe keepe to their appellations, which is *Natterwortele*.

The Vertues.

Both the leaves and rootes of Bistort, have a powerfull facultie to resist all poyson, a dramme of the roote in powder taken in drinke, expelleth the venome of the plague or Pestilence, the small Pocks, Measells, purples, or any the like contagious sickenesse, driving it forth by sweating: the same roote in powder, or the decoction thereof in wine being drunke stayeth all manner of inward bleeding, or spitting of blood, as also any fluxes of the body in man or woman; as also when one is troubled with vomiting: the powder also of the roote, or the decoction thereof being drunke, is very available against ruptures or bursting, or all bruises or falls whatsoever dissolving the congealed blood, and easing the paines that happen thereupon: the same also helpeth the laundise: the water distilled from both leaves and rootes, is a singular remedy to wash any place, bitten or stung by any venemous creature, as Spiders, Toades, Adders, or the like, as also for any the purposes before spoken of; and is very good to wash any running sores or ulcers: the decoction of the roote in wine being drunke, hindereth aborsion, that is, when women are apt to miscarrie in child bearing, the leaves also killeth the wormes in children, and is a great helpe to them that cannot keepe their water, if they but therefore some juyce of Plantaine; and applied outwardly doth give much helpe in the *gonorhea* or running of the reines: a dramme of the powder of the roote, taken in the water thereof, wherein some iron or steele being red hot hath beene quenched, is an admirable helpe thereunto, to as the body be first prepared and purged from the offensive humours: the leaves or seedes, or rootes, are all very good to be put into decoctions, or drinkes, or lotions, for either inward or outward wounds, or other sores; and the powder strowed upon any cut or wound in a veine, &c. that is apt to bleede much, staieth the immoderate fluxe thereof: the decoction of the rootes in water, wherein some Hongrone Pilles, and flowers are added, forceth for an ejection into the matrice, as well to ease the swelle of humours in the ulcers thereof, as also to bring it to the place being fallen downe, and to helpe to stay the abundance of their courses: the roote of Bistort and Pellitory of *Spaine*, and burnt Allome of each alike quantitie, beaten small & made into a paste with some honey, a little peece hereof put into an hollow tooth, or holden betweene the teeth, if there be no hollownesse in them, staieth the defluxions of rheume upon them, when it is the cause of paine in them, and helpeth to cleanse the head, and avoide much offensive matter: the distilled water is very effectuall to wash those sores or cankers that happen in the nose or any other part, if the powder of the roote be applied thereto afterwards: it is good also to soften the gummes, and to take away the heate and inflammation, that happen as well in the joyces, almonds of the throte or mouth, if the decoction of the rootes leaves, or seedes, be used, or the juyce of them: the rootes are more effectuall to all the purposes aforesaid, than either leaves or seede.

Chap. XXIV.

Tormentilla. Tormentill or Setfoile.

Although formerly there had but one kind of Tormentill or Setfoile beene knowne to our *English* Writers, yet now there is found out and made knowne to us two other sorts, which shall be all declared in this Chapter.

1. *Tormentilla vulgaris.* Common Tormentill.

The common Tormentill (is so like unto *Cinquefoile*, that many doe mistake it, for it may well be reckoned as one of them) hath many reddish slender, weake branches, rising from the roote, lying upon the ground, or rather leaning, than standing upright with many short leaves that stand closer to the stalkes than the leaves *Cinquefoiles* doe, with the foote stalke encompassing the branches at severall places, but these can give little or no stay upon long foote stalkes, each wherof are like unto the leaves of *Cinquefoile*, with jagged edges, but somewhat longer and fatter, and dented about the edges, many of them divided into five leaves, but most of them into seaven, whereof it tooke the name Setfoile, and standing round with the divisions like a starre, and therefore called *Septifolia*) yet some may have five and some eight, as the nature of the soile hath moved it to worke: at the toppes of the branches stand divers small yellow flowers, consisting of foure leaves, like unto those of *Cinquefoile*, but smaller: the roote is smaller than Bistort, somewhat thicke but tender, without, and red within, yet sometimes a little crooked, having many blackish fibres thereat.

2. *Tormentilla Alpina major.* The greater Tormentill.

This Tormentill differeth not from the former, but in the largenesse of the leaves and rootes, which are much greater and rounder, and of a better scent, in all things else agreeing with the former.

3. *Tormentilla argentea.* Silver leafed Tormentill.

This Silver Tormentill, hath many short, low, and thicke spread reddish stalkes, with leaves like unto a *Cinquefoile*, but much smaller than the first, and consisting of five leaves in many of them, and five and seaven in some of them, & sometimes more from some what longer, & each of them set upon very long foote stalkes greene on the upperside, and of a silver shining white colour underneath, smooth and not snipt at all about the edges: the flowers are smaller than in the first by the halfe, and of a white colour, set about the stalkes at the toppes, of three or foure, and standing in small huskes, wherein afterwards is contained small yellowish seede: the roote

1. *Tormentilla vulgaris.*
Tormentill or Setfoile.

2. *Tormentilla argentea.*
Silver leaued Tormentill.

shoote is thicke and somewhat long, joynted or knotted, blackish on the outside and somewhat barked over with many fibres thereat.

The Place.

The common sort groweth as well in woods and shadowie places, as in the open champion countrie and borders of fields in many places of this land. The second groweth among the *Herbarians* of *Switzers*, as also in the country of *Tyrol*: the last groweth upon the Alpes in divers rockie or stony places, as also upon the *Pyrenæi Mountaines*, and among the *Vineyards* likewise.

The Time.

They doe all flower in the Summer, from the beginning to the end, but the last is latest.

The Names.

It hath hitherto not yet been knowne by any of the antient Greeke or Latine Writers, yet it hath obtained a Greeke name from the forme of the leafe, *Pentaphyllum*, or *Septifolium*, Setfoile, or Seuen leaues, but not properly, for they haue not seuen leaues, but the number is seuen of the diuisions of euery leafe; for to speake properly, euery leafe standeth but vpon fiue leaues, one, and not seuen leaues: for this is a generall rule in all leaues, whether they be herbes or of trees, that what leafe fall away wholly together with his stalke and not in parts, and at one time, is but one leafe, whether winged as we call it, as the leaues of the Ash tree, the Elder, the Walnut, Horse Chestnut, *Virginia Sumach*, &c. the great Centory, Agrimony, Dandewort, Parsnep, *Tormentill*, the fiue Cinkefoiles, and this Setfoile, in the beginning in all these and the like the whole stalke, with the leaues thereon together, and not any part of those leaues at one time, and part at another, as in all other trees and herbes that haue not winged diuided leaues. Although this narration be somewhat too prolixe and extrauagant, yet it may haue some good purpose, in regard the vse thereof may be profitable to young Herbarists, that know not as yet nor so much before: the first is called *Tormentilla vulgaris*, and of some *Sterilis*, from the forme of the leaues, yet there are diuers other herbes called *Sterilis*, as shall be shewed in their places, and some *Consolida* from the efficacie and colour of the roote. The second *Tormentilla montana* or *herba*, called *Tormentilla Alpina* and *Tormentilla Alpina vulgaris major*. The last is very variably controuerted by diuers, as *Pentaphyllum argenteum*, *Pentaphyllum Alpinum petræum & montanum* by *Tabernæmontanus*, *Pentaphyllum primum & Alpinum* of *Tabernæmontanus*, *Caspar Bauhine* calleth it to be *Chamæmilla arborum genus*, and *Clusius* is somewhat learned in that opinion, calling it *Hippophaes*, *Tragus* calleth it rashly the true *Pentaphyllum* or *Chiliophyllon*, and *Tragoselinum*, because as *Tragus* allowed to haue but fiue leaues, as seuen, and *Lobelius* in some *Germane* Apothecaries shops *Sicilian Origanum*, and *Argentina Hospitalis* vpon most shops, and of *Lugdunenses*, *Tormentilla arborea*, *Chamæmilla* it is very likely to be the *Pentaphyllon lupini folium* of *Thalius* in *Hercynia sylua*, *Pentaphyllum Alpinum petræum*, *Alpinum fore fructu*. Some Herbarists doe thinke it is *Chrysogonum* of *Dioscorides*, but therein he hath but a very bare description, saying *Chrysogonum* buddeth thickely with Oaken leaues, whole flower is very like unto *Cerastium*, the roote whereof is like a Turnepie, very red within and blacke without; but this hath no leaues like an Oake, neither is the flower of any such beauty, or respect, that it ought to put into the *Dioscorides Corbasian Coronarium*; which is thought to be the *Lychnis Coronaria* Rose campion with the red

ſe and ſmall flower for garlands. For no other *Cinkefoyle* is knowne to be put to that uſe, neither is the roote like a Turneppe, whereby you may ſee what great difference there is betweene this and that. But the true *Pentaphyllum* of *Dioſcorides*, *Rowellione* found among the corne fields, not farre from *Alpha* in *Cambridgeſhire* ſetteth it forth, in his Appendix to the generall Hiſtory of Plants; and *Pena* alſo ſheweth it in his *Italian* deſcription of Mount *Baldus*, as you ſhall have it more fully in his proper place: the *Germans* call it *Bimmerwell* and *Kormarwell*, that is, *radix Sanguinaria*, and *radix rubra*, and ſome after the Latine *Tormentill*, as moſt of the other Nations doe.

The Virtues.

Tormentill is of the ſame temperature and qualitie, that Biſtort is, which hath cauſed divers to account it a kinde thereof, being cold in the ſecond, and drie in the third degree, and therefore moſt excellent to ſtay all kinders of fluxes of bloud or humors, in man or woman, whether at the noſe, mouth, belly, or any wound in the veines, or any where elſe; the juyce of the herbe or roote taken in drinke, not only reſiſteth all poyſon or venome of any creature, but of the plague and peſtilence it ſelfe, and peſtilentiall feavers, and infectious diſeaſes, as the pockes, meaſells, purples, &c. by expelling the venome and infection from the heart by ſweating if the greene roote, is not at hand, or not to be had readily, the powder of the drie roote is as effectuall, to the purpoſes aforeſaid, to take a dramme thereof every morning: the decoction likewiſe of the herbe and roote made in wine, and drunke, worketh the ſame effect, and ſo doth alſo the diſtilled water of the herbe and roote, rightly made and prepared, which is to ſteepe them in wine for a night, and then diſtilled in *Balneo Mariæ*: the water in this manner prepared taken with ſome *Venice* Treakle, and thereupon being preſently laid to ſweate, will certainly by Gods helpe expell any venome or poyſon, or the plague, or any feaver or horror, or the ſhaking be that happeneth, for it is an ingredient of eſpeciall reſpect in all antidotes or counterpoyſons, never to be forgotten out of them. It is ſo effectuall in the operation againſt the plague, yea it is ſaid that good ſhepheards doe carefully preſerve this herbe, and give it their Sheepe for the rot, and many other diſeaſes in them: I have not found any roote, more effectuall to helpe any ſlixe of the belly, ſtomacke, ſpleene, or blood ſtaieth, prepared after what manner one will, to be taken inwardly or applied outwardly: the juyce taken doth wonderfully open the obſtructions of the liver and lungs, and thereby certainely helpeth the yellow jaundiſe in a ſhort ſpace. Some there be that uſe to make cakes hereof, as well to ſtay all fluxes, as to reſtraine all cholericke belchings, and much vomitings with loathings in the ſtomacke; in this manner, take the powder of the roote, and of a piece of a Penny bread, made up with the white of an egge and as much meale of Oates, as all theſe ſhall drinke up, which being baked, is to be taken every morning one, untill you finde helpe: or the powder of the roote only, made up with the white of an egge, and baked upon an hot tile and ſo eaten. *Andreas Vidius* in his *Bible Chirurgie*, pag. &c. holdeth this opinion hereof, that the decoction of the roote is no leſſe effectuall to cure the *French* poxe, than *Guaiacum* or *China*: becauſe it ſo mightily reſiſteth putrefaction: *Lobel* ſaith that *Wardeſton* uſed it in the ſtead of, or in the ſame manner, that he uſed *Hermodactiles* for joint aches: the powder alſo, or the decoction to be drunke, or to ſit therein as in a bath, is an aſſured remedy againſt abortion in women, that is, when they uſe to miſcarrie often in childbearing, if it proceede from the over ſlipperineſſe or weakeneſſe of the inward retentive faculties, as alſo a plaiſter made therewith and vinegar, applied to the reines of the backe doth much helpe; it doth much helpe likewiſe thoſe that cannot hold their water, the powder taken in the juice of Plantaine, and is commended alſo againſt the wormes in children: it is very powerfull in ruptures and burſtings, as alſo for bruſes and falls, to be uſed as well outwardly as inwardly: the roote hereof made up with pellitorie of *Spaine* and allome, and put into an hollow tooth doth not onely aſſwage the paine but ſtaieth the fluxe of humors thereunto, which was the cauſe thereof: the juice hereof alſo being drunke, is found effectuall to open the obſtructions of the liver and gall. Tormentill likewiſe is no leſſe effectuall and powerfull a remedy, for outward wounds, ſores and ſorts, than for inward, and therefore it ought to be a ſpeciall ingredient in all wound drinkes, lotions and injections, for foule and corrupt rotten ſores, and ulcers of the mouth, or ſecret parts, or any other part of the body; and to put either the juice, or powder of the roote into ſuch ointments, playſters, and ſuch things that are to be applied to wounds and ſores, as cauſe ſhall require: it doth alſo diſſolve all knots, kernells, and hardneſſe gathered about the eares, the throate and jawes, and the Kings evill, if the leaves and roote be bruiſed and applied thereunto: the ſame alſo eaſeth the paines of the *Stomach*, or Hippocrot, by reſtraining the ſharpe humours that flow thereunto: the juice of the leaves and roote uſed with a little vinegar, is alſo a ſpeciall remedy againſt the ſtinking ſores in the head, or other parts, ſcabbes alſo, and the itch, or any ſuch eruptions in the skinne, proceeding of ſalt and ſharpe humours: the ſame alſo is effectuall for the hemorrhoides or piles in the fundament, if they be waſhed and bathed therewith, or with the diſtilled water of the herbe and roote: it is found alſo ſpeciall to drie up any ſharpe rheume that diſtilleth from the head into the eyes, ſtaying redneſſe, paine, watrineſſe, inflammation and the like: it is uſed prepared *Tabis* or white Amber, be uſed with the diſtilled water hereof many women that are ſo watrie as a proverb to helpe themſelves and others, when they are troubled with the ſlouthfulneſſe of the waters or reds, as they call them, both to be drunke, and injected by a Syringe.

Chap. XXV.

Pentaphyllum ſive Quinquefolium. Cinkefoile or five leafed Graſſe.

The next unto the Tormentill muſt come the Cinkefoile to be intreated of, not onely for the likeneſſe of the outward face, or forme of the plant, but of the properties alſo, as you ſhall heare hereafter. Now whereas there are many more ſorts found out, and now made knowne, than formerly there was, and therefore I thinke it fit to expreſſe them in ſome method and order, that is in three ranks; the firſt ſhall be of thoſe ſorts, that beare white or whitiſh flowers; the ſecond ſhall be of thoſe that beare yellow flowers, and lie downe with their leaves upon the ground, or runne with their roote; the third ſhall be of thoſe that ſtand more upright bearing yellow flowers.

Primus

Primus Ordo. The firſt Ranke.

1. *Pentaphyllum majus luteo flore vel albo.* Great white or yellow Cinkefoile.

THis firſt and greateſt ſprigge Cinkefoile, hath many leaves ſpring from the roote, each upon his owne ſeverall ſtalke, diuided in five parts, as if they were five ſeuerall leaues, dented about the edges, and ſome what round pointed, very like the great common yellow Cinkefoile, but larger and a little hairy: from among which riſe vp ſtraight or vpright ſtalkes, and not much leaning downe to the ground, as the next that follow are alſo a little hairy alſo, and diuided at the toppes into two or three branches, and they vpwards into other ſmaller, vpon euery one whereof ſtandeth one flower, of a white colour and larger than in others, but reddiſh vnder the leaves, as all others doe: in the middle whereof ſtandeth a ſmall downy head, enuironned with many reddiſh yellow threds: the roote is ſomewhat thicke and long, and reddiſh withall.

2. *Pentaphyllum majus album.* Common great white Cinkefoile.

This other white Cinkefoile, which is more common with all Herbariſts, haue many leaues growing from the roote, diuided into five parts, euery of them ſomewhat longer, a little dented, and pointed all ouer of a freſhe greene on the vpper ſide and hairy white vnderneath, betweene theſe leaues grow weake branches, ſtraggling downe to the ground, ſome a foote long, with many ſuch like leaues vpon them, but leſſer than the lower: the flowers of theſe are almoſt as large, as thoſe before, and of a white colour, conſiſting of five more pointed leaues, than the greater haue, yet with a nicke in the middle, with many ſmall yellow threds in the middle, ſet about a woolly head, hauing many ſmall ſeedes ſet together, like vnto a Crow foote head: the roote is ſomewhat thicke and long, blackiſh on the outſide, but reddiſh within, with many fibres. Of this ſort there is an other whoſe greene leaues are not dented about the edges, little differing from the other in any thing elſe.

3. *Pentaphyllum ſilipuſtris, ſeu locuſtum albidum.* Codded Cinkefoile of *Arabia*.

This Cinkefoile of *Arabia* riſeth vp with a tender tranſparant browne ſtalke about a ſpanne or halfe a yard high, and afterwards groweth to be a foote high or more, hauing ſome leaues at the ground, and ſome on the ſtalke: each of them ſet at the end of pretty long footeſtalkes, ſtanding vpright, hauing a little couert in the middle, and rolled at the ends, which leaues are ſoft, and of a ſad greene colour, diuided into ſeuen parts, whereof thoſe two that are on both ſides next the ſtalke, at the firſt are very ſmall, the next three are euery bigger as they, and the ninth in the middle, bigger by halfe then either of the laſt: but after they haue ſtood a good while, the two loweſt leaues onely grow ſomewhat larger: the ſtalke diuideth it ſelfe into three vp to the middle ſtalke, into diuers reddiſh branches; ſet at euery ioynt with the like leaues as the reſt

1. *Pentaphyllum majus luteo flore vel albo.*
Great white or yellow Cinkefoile.

2. *Pentaphyllum majus album.*
Common great white Cinkefoile.

wherof

3. *Pentaphyllum fragiferum hirsutum rubrum.*
Coddled Cinkefoile of Arabia.

7. *Pentaphyllum fragiferum.*
Strawberry Cinkefoile.

where of grow a long ſpiky buſh of flowers, one ſet above another, flowring one after another, thereby enduring very long with flowers on them, which before they are blowne reſemble ſmall cups, ſet in ſmall greene huskes, with pointels in the middle, but being blowen open, conſiſt of foure little long and narrow hard leaves, of no purple but a faiſen white colour with me, but blush with others, not ſtanding as other Cinkefoiles doe, but upright all of them together almoſt, on the one ſide of a button, which is in the middle of the huske, and the pointell below them on the other ſide, ſtanding forth an inch long, ſmall at the bottome, and bigger at the further end, of a very darke or browne colour, having foure ſmall purpliſh threds, with yellow chives hanging at the ends about it: at the joynts all along the ſtalkes, where they beginne to flower, come forth much ſmaller greene leaves, divided onely into three parts: the ſeede did not come to perfection in my Garden, but withered by ſome early cold blaſtes, pulling downe all the heades, that were full of flowers and cods, to have ſeeded, but *Alpinus lib. de exot.* ſaith it beareth long and tender round and pointed pods, containing ſmall round blacke ſeed, the roote neither ſpreadeth deepe nor wide, but periſheth with the firſt froſts.

4. *Pentaphyllum album minus.* Small white Cinkefoile.

This ſmall Cinkefoile, hath many bushy upright ſtalkes, growing thicke together, with many hoary white leaves, in forme like the common white Cinkefole, and at the toppes of them many white flowers, like unto others, compoſed of five round pointed leaves, with a nicke in the middle: the roote is blackiſh and threddy, more then the former, and the whole plant, both ſtalkes, leaves, and flowers, are both lower and leſſer, in other things little differing.

5. *Pentaphyllum album minimum.* The leaſt white Cinkefoile.

This leaſt Cinkefoile hath his low ſtalkes ſomewhat haire, but not hoary, being little more then one handbreadth high, whereon grow upon ſhort footeſtalkes, ſmall leaves conſiſting of five parts, dented onely at the ends, the toppes of the ſtalkes are divided into many branches, whereon ſtand many white flowers like the laſt, but ſmaller, the roote is ſmall and blackiſh.

6. *Pentaphyllum minus argenteum.* Small ſilver leafed Cinkefoile.

This other ſmall Cinkefoile ſpreadeth on the ground, with very many whitiſh branches, covered next unto the roote, with many ſhort woolliſh threds or haires, more like then leaves, above which come forth the leaves, made like five parts, as ſmall as the laſt, but round pointed, and not dented at the end, of a ſad greene colour on the upper-ſide, and of a moſt fine ſhining ſilver colour underneath: on the tops of the branches ſtand a confuſed number of greenish heads or huskes, ſet round about long branches, much differing from the other ſorts, out of which appeare very ſmall whitiſh flowers, hardly to be diſcerned, which turne into a very ſmall yellowiſh ſeed, ſomewhat brown, the

Original from UNIVERSITY OF MICHIGAN

roote is small, long haird and tuberous, abiding diverse yeares, and buddeth out eache yeare so thicke, that it doth ouergrow a great deale of ground.

7. *Pentaphyllum fragiferum Clusij.* Strawberry Cinkefoile.

This Cinkefoile hath divers long hairy stalkes of leaves, rising from the roote, not set close together as the Cinkefoiles are, but parted or divided more like unto a winged leafe, sometimes into five, and sometimes into seaven leaves, rough and hairy also, dented about the edges, greene above and gray underneath, two set one against another, with a little space betweene, but those three at the ends, standing some what closer together, the stalke that riseth up among these leaves, is about a foote high or more, reddish and hairy, and divideth itself at the toppe into lesser foot stalkes, with divers leaves thereon, divided into three parts, on the toppes whereof come large white flowers, very like unto Strawberry flowers, but some what lesse, with many yellow threds in the middle; which being fallen there succeede small round heads, very like unto Strawberryes, but smaller, and without any juice therein, having small reddish seeds within them: the roote is some what thicke, long, lasting, woody, reddish within and blackish without, with divers small long fibres thereat.

The Place.

The first *Bauhinus* saith, was found on the walls of *Wallstat*, a City of the *Switzers*. The second as he saith, groweth in many of the woods, upon the mountaines in *Austria*, extending to the *Alpes*, as about *Trento*, *Bassano*, in *Italy* also, and divers other places: the other sort of that kinde, *Tragus* saith, he had out farre from *Limbs*, a City of the Empire; the third was brought out of *Egypt*, or out of *Arabia*, as the picture declareth. The fourth grew in stony places, about *Coria* of the *Switzers*. The fifth grew saith *Clusius*, in stony and rocky places of the *Alpes* in *Austria* and *Styria*. The sixth is a Plant raised from the seede that lay among other sorts of seedes, sent me from beyond sea: the last groweth in divers places of *Hungaria* and *Austria*.

The Time.

They doe all flower in the Sommer moneths of June and July, and the third in August.

The Names.

It is called in Greek Πεντάφυλλον, and in Latine *Pentaphyllum* and *Quinquefolium*, *Quinquefolium*. Columella calleth *Theophrastus* calleth it *Quinque petrum*. *Tragus* sheweth his mind and opinion concerning the *Pentaphyllon* of *Dioscorides*, and *Theophrastus*, that our Tormentill is their best and most noble *Pentaphyllum*, and is moued to beleeue as he saith, by the text of *Theophrastus*, in his ninth booke and fourth Chapter, (which yet commeth to my judgement ne in my mind) for he there saith, that all the leaves are five parted, and his roote reddish when it is fresh, and blackish and square when it is dryed; but Tormentill hath more leaves of seaven diuisions, yellow and hath alwayes yellow flowers, when as *Dioscorides* saith his hath whitish. The first *Bauhinus* calleth *Quinquefolium album majus caulescens*. The second is his *Quinque folium album majus alterum*, and by reason of those, *Pentaphyllum* or *Quinquefolium album*, the other of that kind *Tragus* calleth his owne, that is *Pentaphyllum Tragi & nobile*. Unto the third I have given the name as *Alpinus* doth, from the forme of his leaves and from the place of his naturall abiding, but *Pona* in his *Italian Ballon* calleth it, *Lupinus Arabicus sive Pentaphyllum peregrinum*. The fourth *Bauhinus* calleth *Quinquefolium album minus*. The fifth is *Clusius* his second, which calleth *Quinquefolium minus flore albo*, and as he saith is the same that *Lobel* calleth *Pentaphyllum angustifolium*, but that as *Clusius* saith, his kinde hath as large flowers as the Strawberry, which *Lobels* hath not, *Clusius* is therein much deceiued, for *Lobels Pentaphyllum per rotum or petrosum*, is declared before to be the *Fragaria sterilis*, and with *Bauhinus*, *Quinquefolium album minus alterum*. The sixth hath the name of *Pentaphyllum repens*, and because it is most of the great ones, I have added thereunto. The last *Clusius* calleth, *Pentaphyllum fragiferum*, and is the *Fragaria spuria Tragi*. The *Italians* call it *Cinquefoglia*, the *Spaniards Cinco Hoias*, the *French Quintefueille*, the *Low Country Dutch Vijf vinger kruyt*, the *Dutch men Vijf vingerkruyt*, we in *English* Cinkefoile and Cinkefoile, and five finger grasse, or five leaued grasse.

Secundus Ordo. The second Ranke.

1. *Pentaphyllum vulgarissimum.* The most common Cinkefoile.

THe common small Cinkefoile spreadeth and creepeth farre upon the ground, with long slender lasher Strawberries which take roote againe, and shooteth forth many leaves, made of five parts, and some of seven, dented about the edges, and some what hard, the stalkes are slender, leaning downewards and bearing many small yellow flowers there on, with some yellow threds in the middle, standing about a smooth cup, which when it is ripe, is a little rough, and containeth small brownish seede: the roote is of a blackish red colour, seldome so bigge as ones little finger, but growing long with some threds or fibres thereat, and with small strings it quickly spreadeth over the ground.

2. *Pentaphyllum incanum repens Alpinum.* Creeping Mountaine Cinkefoile.

The creeping Mountaine Cinkefoile, shooteth forth many leaves from the roote like unto the former, dented about the edges, but softer in handling, and some what of a grayish greene or hairy colour: the stalkes are slender and trayle almost upon the ground, with some lesser and lesser divided leaves on them below, bearing many gold yellow large flowers, with yellow threds in the middle, and like unto the former: the roote is smaller and more fibrous then the former, but spreadeth in the like manner.

3. *Pentaphyllum repens minus.* Small creeping Cinkefoile.

This small Cinkefoile, creepeth and spreadeth upon the ground like the last, and is in stalkes and leaves like also, saving that the leaves are somewhat larger and nothing hoary or shining, but greene and have soft hairy downe on them, and the flowers are not so gold a yellow colour, in other things not differing.

4. *Pentaphyllum minus repens lanuginosum.* Small woolly creeping Cinkefoile.

This woolly Cinkefoile is very like the last for growing, both of stalkes, leaves and flowers, but is

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

4. *Pentaphyllum quinquefolium.*
The moſt common Cinkefoile.

4. *Pentaphyllum minus Pyrenaicum hirſutum.*
Smaller rough ſtraggling Cinkefoile.

a little ſlender, not greene but reddiſh, the leaves are more woolly, and the edges deeper dented in, the flowers alſo are of a deeper gold yellow colour then the laſt.

5. *Pentaphyllum minimum repens.*
The ſmalleſt creeping Cinkefoile.

This ſmalleſt Cinkefoile, is leſſe creeping then any of the former, having many ſmall leaves of five parts, as others have, but a little whitiſh hoary underneath, this ſcarſe reacheth any ſtalke, with ſmall pale yellow flowers, having a purpliſh head in the middle, which growing ripe is hard, and like a ſmall ſtrawberry head as all the reſt have the roote is ſmall, but ſomewhat harper in taſte then the others, but yet aſtringent withall.

6. *Pentaphyllum ſupinum Potentillæfacie,*
Low Cinkefoile with wild Tanſy leaves.

This ſmall Cinkefoile creepeth not, nor yet ſtandeth upright, but branch downe with his weake ſtalkes to the ground ward, having very long ſtalkes of leaves on them, divided into many parts neere the ground, ſet on each ſide thereof two at a place one againſt another, and an odde one at the end, all of them dented about the edges, very like unto wild Tanſy leaves, but not hoary or ſilver like as they, but greene: the flowers come at the joynts with the leaves towards the toppes of the ſtalkes, which are there, leſſer and leſſe divided then thoſe below, every one by it ſelfe, which are ſmall and of a pale yellow colour, with a head in the middle, which after it is ripe, is like unto the other Cinkefoile ſtrawberry-like, that is like unto a ſmall hard dry ſtrawberry: the roote is ſmall long and blackiſh, like the former Cinkefoile.

7. *Pentaphyllum Sanicula folio.*
Cinkefoile with Sanicle leaves.

There is another ſort of this kind, that *Lobelius* hath ſet forth in his *Pemptades*, whoſe ſmall ſlender ſtalkes, three or foure inches long are many, lying round about the roote upon the ground, divided into many branches, whereon are

6. *Pentaphyllum ſupinum Potentillæfacie, ſive,*
Low Cinkefoile with wild Tanſy leaves.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

long ſtalkes of leaves like unto the laſt, but divided into nine parts, each of them much narrower than the very hairy and dented about the edges: the flowers are ſmall and more yellow, ſtanding in the ſame manner and yeelding the like heade of ſeede: the roote is ſomewhat thicker and blacke ending in long ſtrings.

The Place.

The firſt groweth by woods ſides, hedge ſides, the pathwayes to fields, and in the borders and corners of fields almoſt through all the land: the ſecond groweth on the higheſt toppes of the Alpes, that are nigheſt unto *Italy*; the other *Pentaphyllum* of *Clusius* groweth in the graſſie fields of the Alpes neare *Austria*: the third groweth the moſt common of all others, by the wayes ſides, in dry grounds in *Hungary*, the lower *Austria* and *Bohemia*: the fourth groweth in the ſame places with the third, but more rare to be ſeene: the firſt *Tragus* ſaith, in many hardie grounds of *Germany*, and in the graſſie fields that are by the woods ſides: the ſixt *Clusius* ſaith he found in the borders of fields, that are by the woods ſides about *Vienna*, and in the gardens with many: the laſt groweth on the Alpes among the *Swiſſers*.

The Time.

They doe all flower in Sommer for the moſt part, yet the leafe is often in flower the earlieſt, which flowreth in Aprill, and the ſecond in May.

The Names.

The firſt is generally called by all, either *Pentaphyllum* or *Quinquefolium vulgare*: of *Bauhinus*, *Quinquefolium majus repens*: the ſecond is the third *Pentaphyllum* of *Clusius*, called by him, *Pentaphyllum Alpinum primum*, and by *Bauhinus*, *Quinquefolium minus repens Alpinum aureum*: the third is *Clusius* his firſt ſort, of the fourth kinde of *Pentaphyllum*, which *Bauhinus* calleth *Quinquefolium minus repens longifolium hirſutum*: the fourth is the other ſort, of *Clusius* his fourth kinde, and called by *Bauhinus*, *Quinquefolium minus repens aureum*. The fift is the laſt kinde of *Tragus*, called by him *Quinquefolium minimum*, and by *Lobel* in his *Adverſaria*, *Pentaphyllum minus luteum*: the ſixt is called by *Lobel* in his obſervations and *Icones*, *Pentaphyllum ſapinum Fragariæ folio*, but by *Clusius* more properly, *Potentilla ſterilis*, by *Dodonæus* according to his figure, but not the deſcription *Quinquefolium tertium repens*, which is *Matth. Gerardi Fragaria ſylveſtris ſterilis*: *Bauhinus* calleth it *Quinquefolium fragariæ affine*; and calleth the laſt (which if it be not the ſame and growing leſſe in his naturall or wilde ſtate, yet is very like it) *Quinquefolium affinis Lanceaphyllon*.

Ordo tertius. The third Ranke.

1. *Pentaphyllum majus erectum.* The greater upright Cinkefoile.

THe greater upright Cinkefoile, hath ſome what longer and larger greene leaves, than any of the former, cut into five parts, and often alſo into ſeven, and but with three leaves toward the toppes, and dented about the edges: the ſtalkes are ſtrong and upright, not much above halfe a yard high, branched divers ways, with large pale yellow flowers at the toppes of them, which turne into ſeede like as the other ſorts doe, the roote is blackiſh and ſtringie. Of this kinde, there is ſome that doth ſometimes beare white flowers, and others purpliſh, whereof their flowers make the difference.

1. *Pentaphyllum majus erectum.*
The greater upright Cinkefoile.

2. *Pentaphyllum erectum minus.*
The leſſer upright Cinkefoile.

The leſſer upright Cinkefoile, hath ſmaller and rounder leaves than the other, of a ſad greene colour on the upper ſide, and gray or hoary underneath: the ſtalkes are ſlenderer and lower, and the flowers at the toppes of them, are ſomewhat ſmaller and of a more gold yellow colour, and herein conſiſteth the chiefeſt differences the one from the other.

3. *Pentaphyllum montanum erectum.*
The Mountaine upright Cinkefoile.

The Mountaine upright Cinkefoile, hath divers upright but ſlender hoary ſtalkes, fearce halfe a yard high, divided at the toppes into ſundry branches, whereon grow divers leaves, cut into five deeper parts, and deeper dented about the edges, ſomewhat hairy alſo, and a little hoary underneath but not ſhining, whole foote ſtalkes are ſome ſhorter and ſome longer than others: but thoſe leaves that grow below, at the foote of the ſtalkes ſtand upon very long foote ſtalkes, and are for the moſt part divided into ſeven parts or leaves: at the toppes of the ſtalkes grow gold yellow flowers, like the former but ſmaller, the ſeede that followeth, is not unlike the reſt, neither is the roote, which is blackiſh.

The Place.

The firſt groweth in many places in *Germany*, *France*, and in *Saxonia* of *Narbone*: here it beareth white flowers ſay *Pena* and *Lobel*, and in *Italy* purpliſh: the ſecond groweth in *Germany* in divers places, *Fuchſius* and *Iohannes Thalius* make mention of it: the third *Bauhinus* ſaith was found on the hill *Grenier*, in the aſcending to the toppe.

The Time.

Thiſe flower for the moſt part all the Sommer long.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Original from UNIVERSITY OF MICHIGAN

The Names.

The firſt is called *Pentaphyllum majus* by *Brunfelſius* and *Lobel* in his Obſervations; and *reptans majus* by *Camerarius*: yet unto *Lobels* figure in his *Icones*, and unto *Gerards* figure, the title is *Pentaphyllum vulgare*: in the *Appendix* the title is hereof, (becauſe of the variation of their flowers in the colour as I ſaid before) *Pentaphyllum album & luteum*: with many Herbariſts in theſe dayes it is called *Pentaphyllum Heptaphyllifolia*, becauſe it hath ſometimes ſeven leaflets or leaves upon a ſtalke. *Bauhinus* termeth it *Quinquefolium reptans luteum*. The ſecond is called by *Matthiolus* in ſome editions *Pentaphyllum album*, and by *Tragus Pentaphyllum erectum*, by *Iohannes Thalius* in *Hercynia Pentaphyllum ramoſum*, by *Camerarius Pentaphyllum reptans minus*: by *Dodonæus*, *Fuchſius* and *Lugdunenſis*, *Pentaphyllum* or *Quinque folium luteum minus*: by *Gerard Quinquefolium Tormentillæ facie*, by *Tabernamontanus Quinquefolium pentaphyllum majus*, and by *Bauhinus Quinquefolium folio argenteo*. The third *Bauhine* in his *Pinax*, and *Fuchſius* termeth downe under the title of *Quinquefolium montanum erectum luteum latiori folio*.

The Vertues.

Having declared unto you all the ſeverall ſorts of this kinde of herbe, called Cinkefoile, in their Orders and Rankes, I muſt now declare unto you the chiefe properties of them altogether, and yet ſhew which is the moſt effectuall in ſpeciall: all theſe ſorts for the moſt part having one qualitie of cooling and binding, yet the binding is more incident, and naturall unto them all, then the cooling, in that ſome of them are a little tharpe or bitter in taſte, which argueth ſome more heate, yet I may ghedle the ſharpeneſſe or bitterneſſe thereof, is no more any ſigne of heate than it is in Cichory, or Poppy or *Lupine*: our common wilde creeping Cinkefoile, the greater upright one and the white Cinkefoile, are the chiefeſt for uſe, and ſtrongeſt in effect of all the reſt. Theſe three ſorts are much alike for their operation, and are held to be as effectuall for all the purpoſes, whereunto the Tormentill is uſed, as well for preſerving againſt venemous and infectious creatures, and diſeaſes in each reſpect, as in keeping from putrefaction, for binding and reſtraining fluxes, either of blood or humors, or any the other effects, whereunto Tormentill is applied; ſo that in ſtead thereof, and where it is wanting Cinkefoile may be uſed to as good purpoſe, I might returne you therefore to the properties of the Tormentill, to be enformed thereby, for the ſeverall helpes, that this doth give; but I will ſhew you ſome particular remedies, it worketh upon eſpeciall griefes and diſeaſes: as firſt, it is an eſpeciall herbe, uſed in all inflammations and feavers, either infectious and peſtilentiall or topicall among other herbes, to coole and temper the blood and humours in the body, as alſo for all lotions, gargles, injections and the like, for ſore mouthes, ulcers, cankers, fiſtulaes, and other corrupt and foule or running ſores: yet ſome are ſo fooliſh to thinke, that the decoction of one branch of leaves thereof, taken with a little pepper, doth helpe a quotidian or daily ague, that three branches helpeth a tertian, and foure a quartane ague; but this ſet number of leaves and branches, is rather an idle conceit, as it is alſo to weare it in their ſhooes, for the ſame purpoſe, then any certainety fit for a wiſe man or Phiſition to leane and truſt unto: the juice hereof drunke about foure ounces at a time for certaine dayes together, cureth the quinſie and the yellow jaundiſe, and to be taken for thirtie dayes together cureth the falling ſickneſſe, and for all fluxes in man or woman, whither the whites or the reds, as alſo the bloudy flixe, the roote boyled in milke, and drunke is held moſt effectuall of any other remedy: the roote boiled in vinegar, and the decoction thereof held in the mouth, eaſeth the paines of the toothach: the juice or the decoction is good to helpe the hoarſeneſſe of the throate taken with a little hony; as alſo is good for the cough of the lunges: The diſtilled water of both roote and leaves, is effectuall to all the purpoſes aforeſaid, and if the hands be waſhed often therein, and ſuffered at every time to drie in of it ſelfe without wiping, it will in ſhort time helpe the palſie, or the ſhaking in them: the roote boyled in vinegar helpeth all knots, kernells, hard ſwellings and lumpes growing in the fleſh in any part applied thereunto; as alſo all inflammations and *S. Anthonies fire*, all emproſtumes and painefull ſores, with heate and putrefaction, the ſhingles alſo and all other ſores of running and foule ſcales, ſores, and itches: the ſame alſo boiled in wine, and applied to any joynes full of paine and ache, the gout alſo in any of the joynes of the hands or feete, and that alſo of the hippes called *Sciatica*: and if the decoction thereof be alſo drunke, it helpeth forward the cure much the ſooner, and eaſeth alſo much paines in the bowells: the rootes are likewiſe effectuall to helpe ruptures or burſtings to be uſed with other things availeable therefore, either inwardly or outwardly or both, as alſo for bruiſes, or hurts by blowes, falls, or the like, and to ſtay the bleeding of wounds, in any part inward or outward.

Chap. XXVI.

Gentiana. Gentian or Fellwort.

Although I have ſet forth in my former Booke divers ſorts of Gentians or Fellwort, yet there remaine divers others to be increaſed of, which ſhall be here remembred: and becauſe I was there ſomewhat briefe in declaring the vertues as was fit for that worke, being but an abſtract of thoſe plants, that beare beautifull flowers to adorne a garden of pleaſure, and not a generall worke wherein all things are to be compiled, and all that may be ſaid of every one alſo, I will here more fully amplifie my ſelfe the more in their vertues, that have beene ſpoken of, which are the moſt effectuall, and of theſe alſo, for they are to be referred unto them: yet I thinke good to give you here ſome of the vertues againe before. But that I may uſe ſuch a methodicall courſe, as I have formerly held, in ſetting forth other plants which have divers ſorts of one kinde, I will divide this family of Gentians into a greater and leſſer ſorts, and of the leſſer ſort which admitteth a ſubdiviſion, and not the greater, I will divide them againe into *perennes*, perelliving or abiding, that is, that periſh not in the Winter; and into *annuas* annuall, that is, ſuch as ſpring up and periſh the ſame yeare that they flower, abiding onely the Sommer and not the Winter: I might alſo divide the leſſer ſort againe into *Vernall*, *Eſtivall* and *Autumnall* flowring plants, whereof every one in their order.

Gentianæ majores. The greater Gentians.

1. *Gentiana major flore purpureo.* Great purple Gentian.

THe great purple Gentian, is very like the great yellow Gentian in moſt things, having a great thicke browniſh yellow roote, parted into two or three great branches, with great fibres at them, but a little more fat and woody of as bitter a taſte as the other, which ſendeth forth at the ſeverall heads thereof, many long three ribbed darke greene ſtanding leaves, ſo like unto the other, that it is ſomewhat hard to diſtinguiſh them: many of theſe heads from among the leaves, ſhoote forth thicke and ſtrong ſtalkes, three or foure foote high, with divers joynts on them, and two leaves at them, one againſt another: towards the toppes whereof ſpring forth the flowres compaſſing the ſtalkes, at two or three of the uppermoſt joynts, with two leaves apeece under them, like as in the other, which are not laid open, ſtarre faſhion, like the other, but abide cloſe and hollow, the brimmes onely divided into five or more rounde parts, of a purple colour, but paler at the bottome of them, where they are ſpotted with purple ſpots on the inſide, having ſo many yellowiſh threds in the middle, as the flower hath corners, ſtanding about a long greene byforked head, which growing ripe is the ſeede veſſell, and containes there in ſuch like flat ſ owniſh ſeedes as the other, but ſomewhat leſſe.

2. *Gentiana major flore albo.* Great Gentian with white flowers.

This white flowred Gentian is very like the former, and the great yellow kinde, not much leſſer and lower in any part than the former, whoſe flowers are not purple but pure white, and hollow like the other, without ſpots in them, this making the whole difference betweene them.

3. *Gentiana major flore pallidè punctato.* Great pale yellow ſpotted Gentian.

This ſpotted great Gentian is in all things alſo like the firſt, but in the flowers, which are of a darke pale yellow colour, ſpotted both within and without with very many blacke ſpots.

4. *Gentiana major flore cæruleo.* Great Gentian with blew flowers.

And this alſo differeth neither in greatneſſe of ſtalkes, leaves and flowers, nor in the manner of growing, but in the colour of the flower, which is of a blew colour.

5. *Gentiana Aſclepiadis folio.* Swallowort Gentian.

This is diſcribed in my former booke.

The Place.

All theſe ſorts grow in many places on the Mountaines of *Germany*, and in other places, but are not to be found ſo uſually as the great yellow.

The Time.

Theſe doe all flower in June or there abouts.

The Names.

It is called in Greek *Pollaxo* in Latine, and ſo likewiſe *Gentiana*, a *Gentio Illyriorum rege primùm inventore.*

1. *Gentiana purpurea ſive fœmina colorata.*
The great Gentian of any of the colours.

Gentiana Cruciata.
Crolleworte Gentian.

Serapio & *Ruby* let it down: *Serapio* saith it was called *Basilicon* of some it was called as some copies of *Dioscorides* hath it *Centaureum minus*, of some *Aloes Gallica Nares*: *Chiromion*, and as *Pliny* saith, some *Romanes* called it *Centaurea*, and some *Centaurio*. The *Italians* and *Spaniards* follow the Latine name *Gentiana*, the *French* also *Gent aux*, the *Dutchmen Gentian*, *Enzian*, and *Bitterwurtz*: but the *Gentiana Cordata*, they call *Madelsheer*; we call it in *English* either Gentian or Fellwoort, mixed as Italy of *Latine* and *English* together, or Bitterwort, and of some Baldmony: all Authors doe generally call them all Gentians, and distinguished according to the colour of the flowers, as they are in their rules.

Gentianæ minores vernales perennes. The lesser Gentians of the spring abiding.

1. *Gentianella major sive Gentianella Alpina latifolia magno flore.* The greatest small Gentian of the Spring.

This greatest of the small Gentians is very like unto the Gentian of the Spring, that I have already set forth, yet it is not the same, having larger greene leaves, of two inches long and one broad, somewhat round pointed, with three ribbes or veines running through them, as the others have, the stalke rising from the middle of these leaves, groweth about foure inches high, with a small leafe or two thereon, bearing at the end thereof a large huske, sustained by two small and long leaves, from the middle whereof shooteth forth a very large and great hollow blew flower, ending in five small points: the roote is small yellowish, and fibrous.

2. *Gentianella angustifolia verna.* Small narrow leafed Gentian of the Spring.

This small Gentian of the Spring, shooteth from the roote, which is long slender much spread under the ground and yellowish, many heads of divers small long and narrow leaves set together, somewhat longer then the next that followeth; from some of these heads, (for all flower not in one and the same yeare, those flowring the yeare following, which flowred not the yeare before, and those that did flower, not flowring againe the next yeare after,) riseth up a small slender stalke, somewhat higher then the former, bearing thereon two such like small leaves at a joynt, and at the toppe one flower for the most part, (seldome more or the stalke branched) much smaller then the last, narrow long and hollow like a huske or huske of one entire leafe at the lower part, but ending above into five corners or small pointed leaves, laid open like a starre, having small peeces of leaves like as it were eares, set at the bottome of the divisions of them, both of them of a perfect blew colour, but not so deepe as the former, having a white line in the middle of each of them, and the ground or bottome of the flower whitish also, with a few threds standing about a small head, not to be seene until the flower be almost or fully past, under one open it; which after it is ripe is small and long, containing very small brownish seede.

3. *Gentianella minor Verna.* The smaller Vermall Gentian.

This little Gentian groweth in all things like the last, saving that the leaves are not so long and narrow, but are small, and of the breadth of the naile of ones little finger, somewhat pointed at the end: the stalke is much about the same height, and beareth such a like small blew flower, sometimes having those small peeces or eares at them, and sometimes without them: and these be the chiefest differences betweene them.

4. *Gentianella omnium minima.* The least Gentian of all.

This least Gentian (so called because of the bitternesse in it, else it might very well be accounted rather a kind of mosse) spreadeth, and as it were matteth upon the ground, with many small and long leaves, among which

1. *Gentianella Alpina verna major.*
The greatest of the small Gentians of the Spring.

Gentianella verna minor.
The smaller Vernall Gentian.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449
Public Domain / http://www.hathitrust.org/access use#pd
Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

rife small little foote-stalkes, little more then an inch high, bearing each of them one flower, larger then the proportion of the plant may seeme to beare, of a pale blew colour scarse appearing out of the husks, the roote is small and white.

The Place.

The first groweth upon the *Alpes*, that are neere unto *Switzerland* as *Bauhinus* saith. The second groweth on the dry cold hils of *Sevoy*. The third *Clusius* saith he found as well upon the *Pyrenean* hils neare *Spaine*, as also upon divers hils of *Austria* and *Hungary*. *Gerard* saith it is found upon *Salisbury* plaine, in *Sussex*, and neere St. *Albons*, but I doubt he was mistaken, for that which groweth in those places, as farre as I can learne or learned as also in many other of our owne land, is not this Vernall kinde, but some other, that flowreth some in the Summer, some in Autumne, as you shall understand by and by. The last as *Bauhinus* saith groweth upon the hilles among the *Switzers*.

The Time.

The two first sorts doe usually flower in Aprill, the third in May, and the last Iuely, and it is but casuall, if they flower at any other time, for their leaves abiding greene all the Winter, they do encrease at the roote and may be easily parted.

The Names.

These are called by most writers, *Gentianella quasi Gentiana minor*, and *verna* because they doe chiefely flower in the spring time. *Lugdunensis* saith, they may be called *Thylacitis major & minor*. The first *Bauhinus* in his *Pinax* and *Prodromus* calleth *Gentianella Alpina latifolia magno flore*, as it none had made mention of them before, but assuredly it is the same that *Lugdunensis* setteth forth, although that of *Lobel* and *Clusius* is lesser of that sort, which is that I have already set forth in my former booke, which he calleth *Gentiana Alpina angustifolia exigno flore*. The second is the *Gentianella angustifolia* of *Lugdunensis*, which differeth from the *Alpina minor* of *Clusius*, although *Bauhinus* doth not distinguish them, but calleth it *Gentianella Alpina minor*, when all others call it *minor*. *Gesner in horto Germaniæ* calleth it *Calathiana verna*, and *Lugdunensis Thylacitis Lobelii Lampsanæ* or *Prosperi dicta*. The third *Clusius* calleth *Gentianella minor verna*, and is thought by divers to be *Cantabrica* of *Dioscorides*. *Cesalpinus* taketh it to be *Centaureæ species pusilla*. The *French* by a speciall name, both the greater and the lesser of this sort *Reperre*. The last *Bauhinus* calleth *Gentiana omnium minima*, as it is indeede, and peradventure is the *Gentianella Bavarica* of *Camerarius* in his *Icones*, but that this he saith hath long and that rounder leaves.

Gentianella aliæ. Small Gentians of the Sommer.

1. *Gentiana Pennæi carnea punctata.* Doctor *Pennies* blew spotted Gentian.

Although I am in some doubt, whether this be a Gentian, and dare not affirme it to be any of the true kind of Gentian (and *Clusius* also to whom Dr. *Penny* gave both the figure and description, was doubtfull of it) not to be of the smaller kinde, let mee therefore place it either as the last of the greatest Sommer sorts, or first of them, or first of the Sommer kinde, but greater then any of the smaller, whose description is as followeth. It hath a jointed stalke about a foote and a halfe high, somewhat reddish toward the bottome next to the roote, with two leaves like the great Gentian, set at each joynt, but much smaller, and with more veines or ribbes therein then it, each standing upon a reddish footestalke, greater below then those above, where they do in a manner compasse the stalke, from the middle of the stalke upward come forth the flowers at the joynts with the leaves, on both sides of the stalke, three for the most part standing together, except the uppermost of all, where they stand five together, each of them with a short footestalke under them, consisting of five small pointed leaves, spread like a starre, of a pale blew colour finely spotted, with many small blacke prickes on the inside, having a small umbone in the middle, and five small threds, tipt with yellow standing about it: the seede that followeth, is enclosed in such heads or husks, as the Gentians have: the roote is small and yellow, with many fibres annexed unto it. Hereunto I may referre another very like unto it, found in the North parts of this land, namely in *Lancashire*, by Mr. *Hesketh*, a Gentleman in his life time very skilfull in the knowledge of Plants, whose figure I here exhibit, that some other may be stirred up to finde it out againe, that we may have further knowledge thereof.

Gentiana Pennæi carnea punctata.
Dr. *Penny* his blew spotted Gentian

Gentiana nobis ita dicta.

2. *Gentianella flore cordato.* Small Heartlike Sommer Gentian.

This Sommer Gentian, hath a small long fibrous, but woodily yellowish roote, (and thereby may be judged to be but annuall and not abiding) from whence arise small leaves, somewhat round pointed, with a greenish yellow ribbe in the middle of them, two always set one against

another: the ſtalke is ſquare, about halfe a foote high, with the like leaves at the joynts and diuided from the middle vpwards, into diuers ſmall ſhort branches, on the toppes whereof ſtand very large flowers, in comparion to the ſmallneſſe of the Plant, which is of a whitiſh blew colour before it be open, and whitiſh reg cther, like to many of the flowers of the ſmall Bindeweeds, but being opened conſiſteth of a long hollow round huſke ending in five hard leaves, ſomewhat broad and pointed like a thorne, of no brave a deepe blew colour, as any of the former: betweene thoſe greater leaves, there are other ſmaller leaves ſet, each of them round at the ends and deuided in, making them ſeeme like into a heart, as it is painted, from whence the name of the title *cordata* hearteſlow, was impoſed upon it, the like forme being not obſerued in any of the other: the ſeede veſſell after the flower is paſt, groweth to haue a ſmall long necke, and bigger aboue, which being ripe openeth it ſelfe at the head, contrary to the reſt, containing within it much blacke ſeede, but twice as bigge and as long as the other.

3. *Gentianella eſtiua purpurea cærulea.* Small purple Sommer Gentian.

This purple Sommer Gentian ſhooteth forth a reaſonable ſtrong ſtalke, a foote and a halfe high, with diuers joynts, and two leaues at every one of them, ſomewhat broad at the bottome, where it ioyneth to the ſtalke, not hauing any foote ſtalke to ſtand on, growing ſmaller to the end, and long pointed: the ſtalke at the toppe hath ſome ſhort branches, whereon are ſet five or ſix or more ſmall purpliſh blew flowers, ending in five ſmall pointed leaues, after they are fallen and paſt, come up ſmall long couered pods, or ſeede veſſels, containing much ſmall ſeede: the roote is tender long and horous, and periſheth after bearing, hauing it ſelfe agame from its owne ſowing, and if the Spring before Winter, it will endure it well and flower the next yeare, but if it riſe in the Spring, it will abide all the full yeare and flower and ſeede the next.

4. *Gentianella eſtiua flore longinoſo.* Sommer Gentian with a cottony flower.

This Sommer Gentian ſpringeth up with many long and narrow leaues, lying in compaſſe upon the ground with three ranges in every one of them, as is vſuall in all or moſt of the Gentians, from among which ſtandeth a ſquare ſtalke, about a foote high or more, bearing at every joynt two ſuch like leaues as grow below, but leſſer and longer pointed: at the joynts with the leaues, toward the toppes of the ſtalkes, ſhoote forth two or three ſhort branches, bearing every of them three or foure flowers, larger then the former and bigger bellyed, ending in five points or leaues, of a paler purple colour, hauing a ſmall purpliſh cottony downy neſſe, at the bottome of each of the leaues, where they are diuided on the inſide: after the flowers are fallen, there appeare ſmall long huſkes, like hornes, full of ſmall round ſeede, the roote is ſmall and long, of a pale colour ſomewhat woodily, periſhing as all the Sommer Gentians.

5. *Gentianella eſtiua flore breuiore.* Sommer Gentian with ſhort flowers.

This kinde of Gentian is ſomewhat like vnto the laſt, but that the leaues are broader by the halfe, two alwaies ſtanding at a joynt, of a deeper greene colour, the ſtalke is ſquare and branched at the toppe in the ſame manner, bearing diuers flowers on every of them, which are both ſhorter and greater then they, and of a pale blewiſh colour, the ſeede and roote are much alike: all theſe kinds as well as the former are very bitter, which cauſe them to be referred to Gentian.

6. *Gentianella eſtiua minima Neapolitana.* The ſmall Sommer Gentian of *Naples*.

This ſmall Gentian hath ſmall ſquare ſtalkes, little more then halfe a foote high, but fuller of branches and flowers then the laſt, the leaues thereon are ſomewhat long and narrow, the ſtalkes are branched from the bottome, with many ſmall flowers on them, ſtanding in ſmall huſkes, which are long like a cuppe, the brimme ending in foure parts, ſomewhat diſtant one from another, making the ends to ſeeme the longer, of a purpliſh colour inclining to redneſſe, with a ſmall woollineſſe at the bottome of each of the foure leaues, where they are diuided, and white alſo on the inſide, at the lower part of them, and of a paler purple about the edges, at or which ſeeme vp ſmall long heads forked at the toppe, wherein is contained ſmall round ſhining yet owniſh ſeed, yet bigger then any of the former, the roote is longer and more full of threds or fibres then the laſt, ſpreading vnder ground.

The Place.

The firſt *Clusius* ſaith, Dr. *Penny* of *London*, ſhewed him the figure, and gaue him the deſcription, and told him that he gathered it vpon *Buckmore* a hill of the *Suttcors*, and the other of that kinde, as is ſaid in ſome places of *Lancaſhire*, but we know not where. *Columna* ſaith he found the ſecond vpon the hils at *Equicoli* in *Naples*. The third and fourth groweth in the meddowes, at the foote of hills in many places of *Germany*, as *Clusius* ſaith. The fifth groweth on the toppes of hills onely, in many places of *Auſtria*. And the laſt on the hills in *Naples* as *Columna* ſaith.

The Time.

Theſe doe all flower in the Sommer Moneths of July, and Auguſt, and not before, the ſeede growing ripe ſoone after, which ſhedding themſelues continue their kinds, but will hardly endure tranſplantation, or riſe of the ſeed ſowen in a Garden, as both *Gesnerus* and others haue obſerued, and my ſelfe can ſay the ſame.

The Names.

Theſe are called *Gentianellæ eſtiuæ*, and are *mediæ inter Gentianas & Centaurias minores*, as partaking of both in forme and vertues, *Clusius* calleth them *Fugaces*, becauſe they abide not a Winter, vnleſſe it be vpon their firſt yeare ſowing, that they doe not mount vp to flower, for ſo they may be ſaid to abide two yeares, yet they are called fugall in that they periſh after flowring. *Bauhinus* calleth them *pratenſes*, becauſe they grow in meddowes, yet ſome of them are onely found on the toppes of hils. The firſt Dr. *Penny* called *Gentiana punctata*, but *Clusius* referreth it to the Chaffe of his *Fugaces*. *Bauhinus* calleth it in his *Phytopinax Alpina folio globoſo* laſt in his *Prodr.* *Gentiana ſaliſolio latifolia flore punctato*. *Columna* calleth the ſecond *Gentianella cærulea cornuta*, for the cauſe expreſſed in the deſcription, which *Bauhinus* entitleth *Gentianella utriculis ventricoſis*. The third is *Clusius* his firſt kind of *Gentiana fugax*, which *Bauhinus* calleth *Gentiana autumnalis ramoſa*, which title many inconſtancies not correſpondent to the Plant, as indeed in theſe ſmall Gentians, as well as in many others, he is much and often miſtaken, making two ſorts of one, and ſometimes miſapplying the authors titles, to thoſe that are not right, for neither is this plant onely full of branches, to beare the title *ramoſa*, for others of this ſort are ſo alſo, neither doth it flower ſo late to be made an *Autumnalis*, more then the other in this order, which

which for the most part are past before the Autumnall kindes be in flower. The fourth is *Crispus* [illegible] which *Lonicerus* calleth *Gentiana purpurea flore hexagono*: the fift is *Cluſius* his third [illegible] which *Rembertus* calleth *Gentiana purpurea flore breviore & magore*: the laſt *Columna* calleth [illegible] *minima*.

Gentianellæ autumnales. Small Autumne Gencians.

1. *Gentianella Autumnalis Pneumonanthe dicta.* The greater Autumne Gentian.

THe greater of theſe ſmall Gentian, that doth flower in Autumne, riſeth ſometimes with more, ſometimes with fewer ſtalkes, ſometimes alſo they riſe higher, to be two foote high at the leaſt, and ſome but not above a foote high, according to the fertilitie of the ſoile, of a browniſh greene colour, having many long and narrow darke greene leaves, ſet by couples on them, up to the toppes, which ſeldome branch forth, but bears every one, a reaſonable large hollow flower, bigger than any of the reſt that follow, of a very deepe blue purple colour in moſt, yet in ſome a little paler, ending in five points or corners: the roots are many ſmall and long, ſtriuling downe deeper (for the moſt part) into the ground, then thoſe before named, and dies after ſeede time, one perishing as the reſt.

2. *Gentianella autumnalis fimbriata flore.* Autumne Gentian of *Naples*.

This Gentian of *Naples*, from a long yellowiſh ſmall roote, creeping like Couchgraſſe, doth ſhoote forth many long and narrow leaves, ſome what like unto the leaves of Line or Flaxe, but ſhorter, but thoſe that grow higher on the ſtalke, unto the middle thereof are ſtill larger, and from the middle to the toppe, decreaſing againe: but in all places two ſet at every joint, and ſtriped from every one of the ſame on both ſides all the long: the ſtalke, which being greene and about a foote high, beareth at the toppe thereof a purpliſh greene tuft or [illegible] conſiſting of foure large pointed leaves enclоſing the flower, which before it blow open is long and round, of a pale blew colour, but being open, is of a deeper blew colour, ending in foure leaves ſomewhat long, and more pointed about the edges, with a little hairineſſe at them alſo, having a ſmall leafe at the bottome of [illegible] them, and a few yellow threds in the middle, ſtanding about an umbone or head, which when the flower is fallen groweth to be the ſeede veſſell, forked into two parts at the head, where it is ſomewhat greater then below, wherein when it is ripe is contained very ſmall blacke ſeede.

3. *Gentianella autumnalis Centaurei minoris folio.* Autumne Gentian with ſmall Centory leaves.

This Autumne Gentian groweth up with ſundry ſtalkes, not a foote high, parted into divers ſmall branches whereon ſtand two ſmall leaves together, as is uſuall in all the Gentians, very like unto thoſe of the leſſe Centaury, which are not ſo long as either of the former, a little broader and of a whiter greene colour: the toppes of the ſtalkes and branches grow divers orient blew flowers, not ſo large as either of the two former.

1. *Pneumonanthe.*
The greater Autumne Gentian.

2. *Gentianella autumnalis Centaurei minoris folio.*
Autumne Gentian with ſmall Century leaves.

Original from UNIVERSITY OF MICHIGAN

fet in small long husks, halfe way rising above the toppes of them: after which come small seede in long horned vessels: the roote is small and full of threds.

4. Alia flore Centaurio minoris similis, foliis magnis.

Another with small Centory like flowers.

I have seene in Mr. *Thomas Penble* his garden at *Mortlake* a sort that was more spreading than the former sorts, small but with larger leaves and flowers than Centory, and of the same colour of the Centory flowers, yet more plentifully stored and longer lasting, the plant perishing as the other.

5. Gentianella Centaurea minoris folio minor.

A smaller Gentian with Centory leaves.

This small Gentian is very like unto the last, in the fashion and order of the leaves, but that they are somewhat smaller, and the stalke much lower, being not above three inches high, yet stored with many small branches, whereon are set long and somewhat large blew flowers, very like unto the lesser Vernall Gentian, after which the seede and vessels being ripe shew to be like the last: the roote is likewise small, but with many more fibres thereat then others.

6. Gentianella autumnalis elegantissima Bavarica Camerarij.

Other excellent sorts of Autumne small Gentians with Centorie like leaves.

The greater of them spreadeth sundry branches upon the ground, set full of small Centory like leaves, but a little pointed, and at the toppes of each, an orient blew flower made of five leaves. The other is even the smallest of all, with small round leaves (which the cutter hath perverted) and Starre-like blew flowers like the last.

6. Gentianella autumnalis elegantissima Bavarica Camerarij.
Other excellent sorts of Autumne small Gentians with Centorie like leaves.

The Place.

The first groweth in many places of *Germany*, and other places beyond the seas, as also in divers places of our owne land, as neare *Longfield* by *Gravesend*, neare *Greenehithe* and *Cobham* in *Kent*, in the fields about Sir *Percivall Harts* house at *Lullingstone* in *Kent*, and in a chalkie pit, not farre from *Dartford* in *Kent* hard by a Paper Mill, in the West Country also in divers places: it groweth as well in wet as in dry grounds. The second groweth on the hills in *Naples*, as *Columna* saith. The third groweth in *Kent* in divers places, as about *Southfleete* and *Long-field* upon the Downes, as also upon *Barden* hills in *Bedfordshire*, upon a peece of waste Chalkie ground, as yee goe out of *Dunstable* way, towards *Gorhambury*, and not farre from the ruines of the old Citie *Verulam*, which is not farre from Saint *Albones*: the fourth is not knowne from whence it came: the fift upon divers of the Alpes: and the last according to the first in *Bavaria*.

The Time.

These flower for the most part not untill *August*, and that is later than the former, and therefore deservedly have the name of Autumne Gentians.

The Names.

The first is set downe by *Matthiolus*, *Lobel*, *Cordus*, *Clusius* and others; some under the name of *Gentiana minima*, as *Matthiolus*; some *Pneumonanthe*, as *Cordus* and *Lobel*; some *Calathiana viola*, as *Gesner in horto Germaniæ*; some *Campanula Autumnalis* as *Dodonæus*, and of *L. Lugdunensis Campanula pratensis*: the second *Columna* onely mentioneth by the name of *Gentianella caulis foliosis angustifolia autumnalis*, *Bauhinus* calleth it *Gentianella caulis prostratis*: the third is the tenth *Gentian* of *Clusius*, and called by *Lyciotensis horti author Gentiana vernalis minor flore cæruleo*. *Lobel* calleth it *Gentiana minima*, *Bauhinus Gentiana angustifolia autumnalis flore albo aut luteo pilosa*: the fourth is not mentioned by any before: the fift is the eleventh small Gentian of *Clusius*: the last is called by *Camerarius*, *Gentianella elegantissima Bavarica*; *Bauhinus* referreth it to the *Gentiana verna Alpina*, and to the *Calathiana vernal Dalechampij* of *Lugdunensis*; but that *Camerarius* saith it floweth in Autumne.

The Vertues.

The greater Gentians are more used in Physicke with us then the smaller, although they be neare of one progeny, and stand as effectuall both inwardly and outwardly, and in the places where the smaller are in plentie to be had, and the greater not so readily to be gotten, they doe very well serve in their stead. They are by their bitternesse so available against putrefaction, venomme and poyson, the plague also or pestilence, being a most certaine and sure remedy, that the *Germanes* accounte it their Treakle, holding nothing to be a more commodious counterpoyson, and for this purpose did formerly make a Treakle therewith and other things, at *Jene* which was much pressed into this country, and we thereupon called it *Jene* Treakle, made of Gentian, *Aristolochia*, Bayberries and other things, which were all good, wholesome, and effectuall for griefes and paines in the stomacke, and especiall medicines against the infection of the plague, to expell the malignitie of that, and all other infectious diseases, and to preserve the heart, to strengthen it also against faintings and swoonings, which Treakle was bitter, and therefore the more likely to worke these, and other good effects; but that *Jene* Treakle, which hath since crept into the place of it among the vulgar, because it is sweet and pleasant, is for that cause greedily sought after, and for the cheapenesse, of most sorts of poore people desired, but there is nothing in it, that can doe them good, nor hath beene found to helpe them of any disease, being nothing but the drosse and worst part of Sugar, taken

Original from UNIVERSITY OF MICHIGAN

taken from it in purifying, the which they call refining: and because the good is bitter, therefore but few can away with it: yet in *London* it hath beene upon occasion, both censured and condemned by a Jury, and some hundred weights thereof, beene publikely burned in the open streetes, before their doores that sold it, as a sufficient witnesse to all (if they would understand their owne good, and be perswaded by reason, true judgement and experience) that it is not a thing tollerable in a Common-wealth. I have thus farre digressed from the matter in hand, and yet I hope not without good and just cause, to informe all of our countrie to submit their wills and affections into those of learning and judgement in Phisicke, and not be obstinate in their owne wilfull opinions and ignorance; for assuredly if that kind of *Treacle* Treakle were wholsome or effectuall to any good purpose, it were as easie for the Phisitians to give way to the use thereof, as for any other reiterated medicine; but the saying is most true, *Nitimur in vetitum semper, cupimusque negata*, the more a thing is forbidden the more it is desired; for the wrong opinion of many is to thinke, that it is for the private profit of some that the thing is forbidden, and therefore rotten bread is sweetest: but to the matter now in hand. The powder of the dried roote taken in wine, either of themselves or with other things, as Myrrhe, Rue, Pepper, and the like, is a certaine remedy against the stings or bitings of Serpents, Scorpions, or any other venemous beasts, and against the biting of a madde dog, being taken three or foure dayes together, and are taken to keepe open the wound with Vinegar & salt water, and to cleanse and dresse it in order as it should be; the same rootes also taken in wine helpeth those that have obstructions in their livers, or are liver growne as they call it, or have paines in their stomacke: those also that cannot keepe or rellish their meate, or have dejected appetites to their meate, for hereby they shall have present ease and remedy: being steeped in wine and drunke, it refresheth those that are over wearied with travell, and are by cold and ill lodging abroad, growen starke or lame in their joynts: those also that have stopping paines in their sides, as prickings, stitches or the like: it helpeth those that are bruised by blowes or falls, by dissolving the congealed blood, and easing the paines: the same also is held very effectuall against all sores: take of the roote not in wine, but some other drinke, or the water distilled of the herbe: the fresh roote, or dried made into a pessary, and put into the matrice, expelleth the dead child, and the afterbirth, for it strongly worketh upon those parts, and therefore not to be given to women that are with child, and being taken orderly, procureth their courses being stopped, and the urine when it is staied: the decoction of the roote is very pernicious effectuall to helpe those that are pained with the stone: the same also taken in wine doth marvellous much good to those that are troubled with crampes and convulsions in any parts: it doth much good to those that are bursten, and have any ruptures. *Dioscorides* saith that there is so great power and efficacie in the rootes hereof, that it helpeth not men onely, but beasts also that are troubled with coughes, and the ordures of their intrailes, and that it expelleth the wormes of the belly: it breaketh much winde in the body, and causeth to avoid; and generally it is available in all cold diseases, either inward or outward, and as *Galen* saith, most effectuall, where there is any needs to extenuate or make thinne, thicke flegme or grosse humours, cleansing matter and filthy sores or ulcers, purging of peccant and offensive humours, and opening the obstructions of the liver and lungs, gall and spleene, and freeing the parts affected, with any the diseases incident into them: of all those things, *Galen* holdeth it to worke by the facultie of bitternesse therein; for assuredly if our stomarkes could brooke the sad and other bitter medicines, and were not so nice and daintie to refuse whatsoever is not pleasing to the palate, it would worke admirable effects in the curing of many desperate and inveterate diseases, by cleansing and healing foule corrupt and desperate sores and ulcers outwardly, and therefore the *Italians* undeservedly, doe call the *Gentiana cruciata, Pneumonica, quasi mederi in bursa*, put it into your purse: *Matthiolus* saith that it was to be gathered wheresoever it was found and fit to be kept in ones purse, ready to be used upon all occasions, or that it did by curing of diseases, get store of crownes to be put into the purse: so excellent they accounted this roote and herbe to be used: the decoction of the leaves, or the juice of them, as the rootes, worketh the same effects: and so doth the distilled water of the leaves, flowers, and rootes, artificially made in Glasse, and drawen by the vapours of a *Balneum* or Hot water; for this water drunke, hath often times tried to cure in a wonderfull manner, all those sorts of agues that breede by the obstruction of humours or blood, and killeth the wormes of the belly: the said water used to the face, cleanseth it from all sorts of spots, freckles, morphew, and other defections, or discolourings of the skinne whatsoever, if it be often bathed therewith: the powder of the roote, or the juyce thereof healeth all wounds that are fresh, as also most inveterate and effectuall for all sorts of foule, putride, or rotten ulcers whatsoever, yea although they be hollow or filthulous, cancrous also fretting or running, for it mightily cleanseth and drieth and healeth up also: the juice also or the powder of the dried rootes applied to the ulcers, knots, or kernells of the necke or throate, which is called the Kings evill, healeth them certainely and speedily, as also the painefull swellings of the hemorroidall veines, which are called the piles when they are fallen downe and grow ulcerous or sore: the juice either inspissated or condensate, that is, made thicke by extraction and evaporation to his consistence fit to be kept, is used to be infused into the eyes, to take away inflammations and rednesse in them, and to cleare & cleanse them from cloudes or filmes growing upon them: the roote or the juice of them, or the decoction of the herbe or roote, is given likewise very often to carrell to drinke, to free them from the Botts, and wormes, and many other diseases, to which when they begin to swell, being poisoned by any venemous worme or ticke, which they often licke up with their grasse; as also when such wormes or other hurtfull vermine have bitten Kine by the udders or other secret places, which presently thereupon swell, and put the cattle to much paine, making them forbeare their meate: which when the country people see, they bruising the leaves of any of the Gentians, growing neere unto them, and wringing out the juice, stroke therewith the udder, or bitten place, and they by two or three times so doing are helped and cured: the rootes of the smaller Gentian of the Spring, being dried and given in powder to drinke, will cause much venting or farting, and is given with good successe to helpe the torments of the wind collicke, and other sore and grievous pangs, or paines in the stomacke or bowells, it is also profitable against the yellow jaundise, as also any evill disposition in the liver or body, engendred by long sicknesse or ill diet, whereby they pine away by a consumption.

Gen-

CHAP. XXVII.

Scorsonera. Vipers Graſſe.

Although I have ſet forth in my former Booke two ſorts of *Scorſonera* or Vipers Graſſe which are the *Spaniſh* kinde and the low purple kinde, yet becauſe there are ſome others that *Cluſius* and others have made mention of, and ſome alſo not yet publiſhed by any, I thinke it meete to declare all thoſe not ſpoken of before, in this place and Chapter.

1. *Scorſonera major Pannonica latifolia.*

The greater *Hungarian* broad leafed Vipers Graſſe.

This greater *Hungarian* Vipers graſſe is very like unto the *Spaniſh* kinde, in all things almoſt, the leaves hereof are more in number, that ſpring from the head of the roote, as broad and long as they, but not crumpled about the edges, nor of that grayiſh greene colour, but ſmooth, and of a darke or evill greene colour; this hath two or three ſtalkes rising up among the leaves, and ſometimes but one, according as the roote hath encreaſed into ſeverall heads, having ſome leſſer leaves upon them, and at the top a ſcaly ſomewhat long greene head, from the middle whereof groweth the like double yellow flower as the *Spaniſh* kinde hath, and the like ſeede alſo lying in ſuch downy ſubſtance, neither of them to be well diſcerned the one from the other, after they have growne any time in the garden together: the roote alſo is long and great, ſpreading into many branches, and ſhooting forth into divers heads, from the upper part thereof, blackiſh on the outſide, and white and pleaſant within as the other, yeelding milke in every part in the ſame manner alſo, abiding many yeares and not periſhing after ſeede time, as the Scorſonera Teardo doe, whereof all theſe are accounted as kindes.

2. *Scorſonera humilis latifolia Pannonica.* The dwarfe *Hungarian* Vipers graſſe.

This dwarfe or low *Scorſonera*, ſhooteth forth not ſo many long leaves but almoſt as broad as the laſt, ſomewhat ſhorter and ſhorter, and of the ſame greene colour; from among which ſpringeth up one ſtrong, but hollow and ſlender ſtalke, not above an handbreadth high, bearing ſome few ſmall and ſhort leaves thereon and a yellow flower, out of the like greene ſcaly head, but ſhorter than the other, with the like ſeede therein alſo: the roote is blacke without, and white within, yeelding milke as the other doth.

3. *Scorſonera minor anguſtifolia Pannonica.* The ſmall *Hungarian* Vipers graſſe.

This ſmall Vipers graſſe hath long and very narrow greene leaves, very like the leaves of *Tragopogon* or Goates beard, but ſhorter and not ſo many, the ſtalkes are ſlenderer and much lower then the firſt, bearing ſmaller and more ſingle flowers upon the top of it, and leſſer ſeede, but like in all other reſpects, lying in ſuch downes: the roote like unto is long and blacke without and white within, but ſmaller and ſlenderer, never growing to be halfe ſo great, neither yeelding ſuch ſtore of milke as the other doth.

1. *Scorſonera major Pannonica latifolia.* The greater *Hungarian* broad leafed Vipers graſſe.

2. *Scorſonera humilis latifolia.* The ſmaller *Spaniſh* Vipers graſſe.

3. *Scorſonera humilis latifolia & anguſtifolia.* The greater low, and the higher tall *Hungarian* Vipers graſſe.

4. *Scorzonera Latior angustifolia Pannonica.* Tall narrow leafed Purple Vipers graſſe.

The taller purple Vipers graſſe, hath many ſuch like narrow long leaves as the laſt, and longer ſtalkes with ſome leſſer leaves on them, divided ſometimes into two or three branches, bearing every one a tuft of flowers unto the laſt, but of a blewiſh purple colour, ſtanding in a thorny greene head, wherein is contained longer and thicker ſeede then in the former, the roote is long, and blacke without and white within, like the other, yeelding alſo but little milke, yet abiding as the reſt.

5. *Scorzonera minima tuberoſa radice Hiſpanica.* The ſmalleſt Spaniſh Vipers graſſe.

This leaſt Vipers graſſe hath diverſe leaves very ſmall and narrow, lying on the ground, ſome rootes ſmooth leaves, and others crumpled about the edges, the ſtalkes are very ſmall and ſcarſe rising three or foure inches high, bearing out of a long ſmall leafy head, a very ſmall and ſingle pale yellow flower, whereof ſmaller blacke ſeedes, and enclоſed in lanke huſkes downe them in any of the other, the roote is as thicke a fingers or more, but much ſhorter then in any other kindes, blackiſh without, and ſomewhat whitiſh within yeelding very little milke, when it is broken, but abideth the Winter almoſt as well as any of the reſt.

6. *Scorzonera Illyrica.* Vipers graſſe of Sclavony.

The multitude of long narrow leaves with flower ſtalkes in them, to the number of fifty or an hundred twenty ſlender ſtalkes, of ſmall yellow flowers, and ſmaller ſeed after them then moſt of the former, ing blacke and thicke, maketh this kinde differ from the reſt.

The Place.

The firſt groweth in many places of *Germany*, *Bohemia*, and *Hungary*. The ſecond on the hilly by *Ba* *many*. The third in many of the ſame places with the firſt. The fourth on a ſmall hill nigh unto *Mo* is twen *Dutch* miles from *Poſonium*, a chiefe City in *Hungary*, and in other places thereof. The *Spaine*, and good ſtore of the rootes being brought hither, I planted ſome of them in my Garden, them in forme to differ from others, which growing yeelded ſuch leaves, flowers, and ſeede, as is downe. The laſt in *Illyria* or *Sclavonye*, as *Alpinus* ſaith.

The Time.

They doe all flower in May, and their ſeede is ripe before the end of June.

The Names.

The firſt knowledge of *Scorſonera* to the world, came by *Monardus* a famous Phyſition in *Seville*, as was found out, and the uſe of it likewiſe, thirty yeares before he wrote thereof, who made a ſmall thereof, and of the *Bezoar* ſtone, which *Clуſius* tranſlated out of the Spaniſh into the Latine, ſcanned it liſhed it with other of his workes tranſlated alſo, and annexed to his booke of ſtrange or *Exotick* things, in it is ſet downe that a Moore, a bondſlave did helpe thoſe that were bitten of that venemous beaſt, as it is called by others) which they of *Catalonia*, where they breed in abundance, call in their language (from whence *Scorſonera* is derived,) with the juice of this herbe, and the roote given them to eate, both rooke away the poiſon and healed the bitten place very quickely, when Treakle and other things no good, which ever ſince hath growne in eſtimation, as well againſt venome or poyſon, as againſt as you ſhall heare by and by. The firſt is called by *Clуſius*, *Scorſonera major Pannonica*, by *Bauhinus* *Batemans*, whom *Lobel* and *Tragus* ſelfe follow, *Tabermontanus* and *Gerard*, call it *Scorzonera*, and *Ba* *Latifolia altera*. The ſecond is called by *Clуſius*, *Scorſonera humilis anguſtifolia Pannonica*, by *Tabermontanus* *Lanceolata Pannonica*, and by *Bauhinus*, *Scorſonera humilis anguſtifolia*. The third is called by *Lobel* *altera*, by *Tabermontanus*, *Scorſonera humilis anguſtifolia*, and by *Bauhinus* *Scorſonera ſpica* fourth is called by *Clуſius*, *Scorſonera anguſtifolia altera Pannonica*, by *Tragus*, *Scorſonera* by *Bauhinus*, *Scorſonera anguſtifolia altera*. The fifth ſecond is taken from *Scorſo* entitled it according to the bigneſſe and forme thereof, *Scorſonera minima tuberoſa radice Hiſpanica*. It is ble that *Bauhinus* in his *Prodromus* doth meane this plant, it commeth to here unto is willed he *Pinacem cap. Hiſpa* ſore, for he ſaith it better agreeth to a *Scorſonera* ſuch like as it. The laſt ſet forth under the ſame title it hath, ſome doe call them *Viperaria* and *Viperina*, and ſome *Scorſonera*.

The Vertues.

Bauhinus ſaith that the rootes of the Spaniſh kinde, hath in their naturall places ſome bitterneſſe, be ſo (for I never ſaw ſuch) is not perceived in thoſe that have growne many yeares in our land, it ra that the temperature of the Climate, doth alter in ſome part the bitterneſſe thereof, but *Monardus* thoſe that grow in *Spaine* are ſomewhat ſweete in taſte like a Parſnippe, and may be eaten in the ſame the roote hereof ſaith *Monardus*, whether raw or diſtilled, or condited, as alſo the juice of the herbe themſelves, or with any other cordiall or Counterpoyſon, doth not onely helpe the biting of that venem Serpent the *Eſcarſio*, but of the Viper, and all other virulent creatures, the leaves diſtilled in glaſſes, a ſent remedy for all contagious fevers, for by cauſing ſweate the infection is evaporated, and the bo ſtored, the ſame alſo or the roote it ſelfe taken, is good againſt the paſſions and tremblings of the vein againſt ſwounings, ſadneſs, & melancholy, the roote preſerved and taken faſting, or the ſeed in water fifteene dayes together, doth open the obſtructions of the liver, ſpleene, and the other inward parts, be alſo bringing downe womens courſes, and to eaſe the ſuffocation, or other diſeaſes of the mother & ſuffocations whole feminine griefes it hath a very powerfull effect, as hath beene often and certainely found true very good againſt the ſwimming or turning of the braine, and all other paines in the head, it wonderfully all both to ſtrengthen the vitall ſpirits, when they are much ſubject to faint or ſwoune, as alſo againſt or idleneſſe, that ariſeth without manifeſt cauſe, if the diſtilled juice of the herbe be ſet in the ſame dayes, and the peter liquor thereof mixed with a little hony, be dropped into the eyes, it doth ſtrengthneth the ſight, and taketh away the ſpots and blemiſhes in them. The rootes preſerved with not onely very pleaſant to the taſte, but effectuall for many of the aforeſaid griefes.

Cap.

Chap. XXVIII.

Tragopogon. Goates beard.

Although it is not certainely knowne, that the Goates beardes have the like *Alexipharmicall* property, to expell venome and poyson, as the *Scorzonera* or Vipers grasse, yet because they are so like unto them in outward forme and manner of growing, they being but as *species eiusdem generis*, the *Tragopogon*, or Goates beard, being the standard or *genus*, and herein principally differing, that all the *Tragopogon* are but annual, or perishing after they have borne seede, and all the sorts of *Scorzonera*, living after seede time many yeares. I have thought it not amisse to joyne them in neighbourhood as they be in kindred, whereof there be sundry sorts, some delivered in my former worke, others here to be expressed, and of them some not written of by any before.

1. *Tragopogon æstivum.* Sommer Goates beard.

The Sommer Goates beard, (which I so call because it is but annuall, to be sowen in the Spring, and perishing in the end of Sommer, when it hath given seed) is a small Plant, rising up with one stalke little above a foote high, whereon grow three or foure long and narrow leaves, yet shorter then in any of the other, that hath beene described in my former booke, broader at the bottome then they, and growing lesse by little and little to the end, of a pale greene colour, with a whitish ribbe in the middle: the stalke branches out into two or three parts, each of them bearing a large greene head, wherein is contained a small flower, of a pale purplish, whitecolour, opening onely in the morning, and shutting up before noone, the long pointed ends of the huske or head, rising above the flower, which is not usuall in most of the other Goats beards; which being past the head groweth greater, having the outermost seedes greater and thicker then the rest, spreading one from another, with no downe at all at the ends of them, but the smaller seede being in the middle, are smaller then any of the other, the roote is somewhat long, woodly, perishing before winter, and yeeldeth but a very little shew of milke, when the leaves are broken, or the rootes being young.

2. *Tragopogon minus luteum.* Small yellow Goates beard.

The small yellow Goates beard, hath a small slender stalke, about a foote high, with very few leaves thereon, which are somewhat long and narrow, as it were dented but rather sawed about the edges, and of a pale greene colour, at the toppe of the stalke standeth one greene head, like other Goates beards with pointed ends, enclosing a large flower of a pale yellow colour, like unto the greater yellow kinde, which yeeldeth small seed with downe at the endes of them, and spreading in the same manner, the roote is somewhat long, and yeeldeth milke as the other doth.

3. *Tragopogon latifolium serratum.* The greater Goats beard with jagged leaves.

This jagged Goats beard hath thin soft leaves, long, narrow, and smooth at the edges, like unto the pulpie Goats

1. *Tragopogon æstivum.* Sommer Goats beard.

2. *Tragopogon latifolium serratum.* The greater Goats beard with jagged leaves.

Original from UNIVERSITY OF MICHIGAN

beard, long and narrow at the bottome, and broader towards the ends, but those that rise up afterwards, and those that grow next unto them upon the stalke, are jagged or torne as it were on the edges, on both sides in some leaves, and in some but upon the one, in some also more divided, and others lesse, of a paler greene colour underneath then above, the stalke riseth up to be about two foote high, with such leaves but smaller on it to the toppe, but lesse divided, and the uppermost not at all, where it is branched into three or foure smaller parts, every one bearing a small greene head, like unto the ordinary kinde, not having any pointed leaves rising up, as is in the purple and some other sorts, encloling within it a smaller yellow flower, then the ordinary yellow sort, opening in the morning, and shutting at noone, which being past, there commeth such like seede, but smaller and not rough, the roote is long and blackish on the outside, and white within, yeelding milke as others doe, and perishing after seede time, as others doe.

Tragopogon purpureum.
Purple Goates-beard.

4. *Tragopogon laciniatum minus.*
The lesser Goats beard with jagged leaves.

This lesser kinde, shooteth forth from a long and somewhat thicke roote, brownish on the outside, divers long and very narrow leaves, more finely cut in on the edges, and into farre smaller parts then the former, among which riseth up the stalke a foote and a halfe high or better, with some such like leaves thereon, but smaller, and lesse divided at the toppe where it is divided into three or foure branches, with every one a flower on them, like unto the last, but of a paler yellow colour, standing in greene heads, without beardes, as most of the sorts of yellow Goats beards doe, and after yeeldeth the like head of long rough seede, with downe at the ends of them as others doe.

5. *Tragopogon luteum angustifolium.*
Common Goats beard with narrow leaves.

This Goatsbeard is very like unto the common yellow kind, but that it is not so great, nor riseth up so high, and hath much narrower, or rather grasse like leaves, and almost as long, the flowers are not so large, nor so thicke of leaves and give the like seede.

6. *Tragopogon hirsutum humile.* Small rough Goats beard.

This like wise differeth not much from the last, but that it is lower, and the leaves are not so long and narrow, but a little broader, shorter, and rough withall, on both edges set with haires, as in the hairy wood grasse, the flowers are small and yellow like the last, but lesser, and so is both seede and roote.

7. *Tragopogon luteum Apulum.* Goats beard of *Naples*.

This Goats beard of *Naples*, hath many very long narrow leaves, somewhat broader then the next small purple kind, but somewhat hairy, some of them growing upright, and others bending downewards, among which a stalke riseth fearle higher then the leaves, bearing a large greene bearded huske, contrary to all other, with yellow flowers, containing a flower which consisteth of many yellow short leaves, more like a Hawkes-weed then a Goats beard, which passeth with the downe at the seed like others, and not halfe so great but yellower, and smaller at the lower end, where others are greater.

8. *Tragopogon crocifolium purpureum.* Small purple Goats beard.

This small purple Goats beard hath many very long and narrow leaves, lying on the ground at the head of the roote, the stalke divideth it selfe into three or foure reddish branches, set with some leaves thereon, all of the narrower then grasse leaves, very like unto the narrow long leaves of the ordinarie or *English* Saffron, with a white line downe the middle of them, and hard in handling, each of the branches bearing a bearded greene head with a darke purple flower therein, dented at the endes of the leaves thereof, and having yellow threds compassed with meale as it were in the bottome of them, as the greater purple flower hath, and openeth but in the morning, and closeth at noone in the same manner, after which come the seeds, spreading into a round globous head, with the downe at the ends of them, as in the greater, the roote is great and long, yeelding milke as others.

9. *Tragopogon Apulum flavo rubens.* Rose coloured Goats beard.

The Rose coloured Goats beard sendeth forth many long and narrow leaves like unto grasse, with a white line in the middle of them, smooth and gentle, if you rake them upwards, but as rough as Barley leaves, if you rake them downewards, and broadest at the setting on of the stalke, which is two foote high, seldom dividing into any branches, but beareth at the toppe one large and great head, in respect of the Plant, parted into many long leaves or beardes, in the middle thereof is the flower, consisting of twelve or twenty leaves, of a purple or bluish colour, neere unto a Damaske Rose, having divers blackish threds therein, with a little of a mealy dust upon them, which being past, the head or huske groweth somewhat narrow, with a long seed containing within it the seed, which is not fashioned into a round globe, with downe at the head of the seed as in all the former except the first, it hath five longer and greater seeder on the outside, with little or no downe at the ends of them, and the lesser in the middle, with a little downe at the ends, which are yellowish and blackish but the least of all other: the roote is long and slender, even the smallest of all, white downewards, and somewhat

hard but more reddish at the roppe. This is very like the former or annuall Goates beard if it be not the same. *Camerarius* in his *Hortus Medicus* maketh mention of one with a white flower, which I never saw yet nor heard *Florebat* of in any where.

The Place.

The first was sent me out of *Italy* among other seedes, but from whence they had it I know not. The second as *Lobelius* saith groweth about *Montpelier*, and so doth the fourth also. The third groweth in many places, both in *Italy* and *Spaine*, for I had seedes thereof out of *Spaine*, by my friend *Barlet* that gathered them: the first I found in the Medowes at out *London*, and other places of our land, but not so plentifully as our greater yellow kinde: the sixth, seventh, eighth and ninth, grow on the hills in *Naples*, as *Columna* recorderth, both in his *Phytobasanos*, and *Purpurum minus cognitarum historia*.

The Time.

These doe flower about the time of the others, which is in the end of *May*, or in *June*, and the seede is ripe soone after: but all of them, except the first, doe abide greene the first Winter after it is sowen, or doth rise of its owne sowing, and floweth and seedeth the next yeare after: but the first as I said, floweth and seedeth the same yeare, and must be new sowen every yeare, for I never knew it spring from any seede, that it shed it selfe.

The Names.

It is called in Greeke, τραγοπώγων, and τραγοπώγων *Tragopogon*, *Barba hirci* and *Barbula hirci*, and τρίτον τοῦ *Barba-ioue*, quod a calyce foemina premitur hirci et Iouis barbe instar pendens; to say both *Dioscorides* and *Theophrastus*. The first came to me with the same name, I have set with it in the table *Tragopogon officinarum*: the second *Bauhinus* calleth *Tragopogon folio oblongo sinuato*: the third, both *Anguillara* mentioneth, calling it *Scorzo Theophrasti* as he saith others did, and *Fabius Columna* in his *Phytobasanos Tragopogon laciniato folio*. The fourth *Bauhinus* calleth *Tragopogon semissime Lusitanicum*. The fift is called by *Tabernamontanus Barbula hirci minor* and by *Bauhinus Tragopogon graminea folio radice villosa*. The sixt *Columna* calleth *Tragopogon Apulum hirsutum humile*, and *Bauhinus Tragopogon hirsutum*. The seventh *Columna* calleth *Tragopogon Apulum humile hirsutum latifolium*: the eighth *Columna* also calleth *Tragopogon erucifolium montanum florem nigro purpureo*, and *Bauhinus Tragopogon purpureo carulescente rosefolium*. The last is called by *Columna Tragopogon graminea folio pruno rubente simo*. Some have doubted that this is not the *Tragopogon* of *Dioscorides* and *Theophrastus*, because the leaves of the most of them are greater then the leaves of the Saffron, but notwithstanding it is generally taken to be the right, because of the head of seede, which agreeth so well thereto, as no plant else can doe the like: and besides *Columna* hath set forth three of those before recited, which agreeth better with *Dioscorides* and *Theophrastus* Saffron leaves, than any of the rest, which therefore he taketh to be the truest. It is called in *Italian Salsefrica*, and with some *Salsifica*, and *Herba Abrego*: in *Spanish Racea Cabruna*, and *Barba di Cebron*: in *French Barbe de bouc*: in *High Dutch Bockbart*: in *Low Dutch Boxbaert* ende *Iosephs bloemen*: in *English* Goates beard, and goe to bed at Noone, or Noone tide, and *Herba* sauce of *Ierusalem*, and others after the *Dutch* word *Iosephs* flowers of some also Saxifrage.

The Vertues.

The rootes of the greater wild yellow kinde chiefely, as also of the other kindes here set forth, being dressed as a Parsnippe is more delicate and pleasant to the taste in eating: the rootes boyled and dressed (or as some do eate them raw) in a fine sallet likewise to be eaten cold, and are very acceptable to the stomacke, helping to strengthen them that are growing into a consumption, or are become spare and leane by some long sickenesse: the distilled water saith *Tragus*, is the most present remedy that is to helpe inward impostumes (such as is the Pleurisie) and all other paines and stitches in the sides: the *Italians* use it much and often against all the griefes of the stomacke, both to take away the heart burne as we call it (which is an hot and sharpe humour in the stomacke heating and paining it) and doth helpe also in a dejected appetite, to incite and stirre it up, as also against the diseases of the heart or liver, and to helpe to expell gravell and the stone from the reynes, kidneies, and bladder, whereof the name *Saxifraga*, which is as much as breakestone, declareth the properties: some doe hold opinion, that the purple and azure-coloured kindes being more bitter, astringent and obstructive, have a more binding and cleansing qualitie than the others, and are therefore onely to be used for medicament, and the others as nutriment, and that they only are effectuall to all the purposes before recited.

Chap. XXIX.

Echium. Wilde Bugloss, or Vipers Bugloss.

Gesnerus Latinus that painefull and industrious searcher of plants, hath given us the knowledge of many more sorts of Vipers Bugloss as he hath done of many other plants, than any before him; whereof I meane to entreate more at this place, and with them some others also.

1. *Echium vulgare.* The common Vipers Bugloss.

The common Vipers Bugloss hath many long rough leaves, lying on the ground, from among which rise up divers stalkes, very rough, as if they were thicke set with prickles or haires, wherein are set, such like long rough leaves or prickly and greene leaves, somewhat narrow, the middle ribbe for the most part being white: the flowers stand at the roppe of the stalkes, branched forth into many long spiked leaves of flowers, standing or turning like the Tumefole, all of them opening for the most part on the one side, which are long and hollow, standing up like trumpets a little, of a purplish violet colour, in them that are fully blowne, but more reddish whilst they are in the budde, and not blowen open, as also upon their decay and withering, but in some like to a paler purple colour, with a long pomcell in the middle, fethered or parred at the roppe: after the flowers are fallen, the seedes (growing to be ripe, and enclosed in round heads) are blackish, cornered and somewhat like unto the head of a Viper: the roote is somewhat great and blackish and woodily, with many strings thereat: it flowreth and seedeth in June, and perisheth in the Winter.

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

2. *Echium vulgare album.* White flowred Vipers Bugloss.

There is little difference in any thing betweene this and the former, but in the colour of the flowres, which this is of a white colour wholly, and the leaves of a little fresher greene colour, and in some places greener greater.

3. *Echium flore rubro.* Red flowred Vipers Bugloss.

The red wilde Bugloss is like the former, but all the hairy stalkes are sometimes marked with red spots, and the leaves thereof somewhat broader: the flowers which stand on the same crooked and bowing manner, upon short foote stalkes, are of a brave red colour, and in some a little paler: the seede and roote are alike and differ not.

4. *Echium pallidiflorum.* Vipers Bugloss with darke reddish purple flowres.

This wilde Bugloss hath shorter stalkes, and not so rough, but rather soft and woolly, whereon stand leaves more thinnely placed, and without order: toward the toppe of the stalkes it brancheth forth into divers long sprayes, with some flowres on them, but not so plentifully as in the former, and are of a dead or darke bluish purplish colour: there is no disagreement either in seede or roote.

5. *Echium Creticum hirsutum rubrum.* Red flowred Vipers Bugloss of Candy.

This Candy wilde Bugloss, hath large rough leaves lying on the ground, of a thicke browne green colour, and fewe lesser leaves betweene whom riseth up round rough stalkes, two foote high, sometimes divided into many branches, with divers rough smaller leaves on them to the toppes, which are bowing in the same manner with the former, from whence grow hollow flowres, ending in five cornered brummes like unto the rest, of a reddish pale red or bluish colour at the first, and more purplish afterwards, standing in rough huskes, made of five long leaves a peece: the seede that followeth is like the rest.

6. *Echium Creticum maculosum variorum.* Spotted Vipers Bugloss of Candy.

This spotted wilde Bugloss hath rougher leaves and stalkes than the last, rising not fully so high, as both stalkes and leaves marked with red spots, almost as much as the stalkes of Dragons, but the spottes on the leaves are paler than on the stalkes: the leaves are very long, but narrower than the last: the flowers stand in the same manner that the others doe, of a crimson red colour, that they will not lose it, but keepe their brauery many yeares keeping drie: in the rest it is like the former.

7. *Echium pumilum flore luteo.* Dwarfe yellow Vipers Bugloss.

This dwarfe kinde is in all things like the former Vipers Bugloss, but in the smallnesse of the whole plant growing to be a foote high: the leaves likewise are thereunto answerable, and so are the flowres also, of a pale yellow colour but not so bullate as it.

8. *Echioides luteo minimo.* The least yellow bastard Vipers Bugloss.

This little bastard wilde Bugloss, hath divers leaves lying upon the ground, not above two inches long, as

1. *Echium vulgare.*
The common Vipers Bugloss.

2. *Echium flore rubro.*
Red flowred Vipers Bugloss.

Generated on 2021-10-19 18:53 GMT / https://hdl.handle.net/2027/mdp.39015045801449

Original from UNIVERSITY OF MICHIGAN

not full halfe an inch broad, thicke, rough, and a little hard, but those that grow upward upon the stalke which is a foote high, are somewhat broader, rough and whitish, the leaves that grow towards the toppes being marked with yellowish purple spots: the toppe of the stalke is branched, and beareth small yellow long hollow flowers, like the other, the seede contained in the huskes are small, foure for the most part set together in a head or husk, and somewhat like the rest: the roote is small and somewhat long, browne on the outside, and white within.

2. *Echioides parva alba.* The small white Vipers Bugloss.

This small white wilde Bugloss, is in most things like unto the last, but that the leaves have no spots upon them, and the flowers are pale almost white: the seede differeth not, but the roote is very small and threddy, yet browne as the other.

3. *Echium Hispanicum flore calcari donato.* Small *Spanish* Vipers Bugloss with spurres.

This small plant which *Bauhine* referreth unto the kindes of wilde Bugloss, because I am not well acquainted with it, moll pulle as he hath called it, and that you may know it, he thus describeth it; from a woodie fibrous browne root, grow forth divers round and somewhat hairie stalkes, some of an hand breadth long, and others shorter, standing downewards compassed with a few thicke leaves like unto the mountaine Speedewell but thicker and rougher: the flowers that grow at the tops, are hollow, long and ending in foure brimmes like unto the other kinde, but of a blew colour, having a spurre or taile behind, like those of Todeflaxe: the seede is long, rough, and darke like the other.

4. *Echium Creticum album.* Hoarie white Vipers Bugloss of *Candy.*

This *Candy* plant hath many stalkes long and narrow with hoary leaves, somewhat like those of Alkanet, but full of sharpe haires, from whence rise sundry small hand-high stalkes, round and rough likewise with a few smaller leaves sparedly set thereon, at whose toppes stand tufts of yellow flowers in small long rough huskes unto whom doth white seede succeede of the likenesse of Vipers heads, and of the bignesse of wheate cornes: the roote is long blacke, small and woodie, divided into other smaller partes.

5. *Echium Creticum nigrum.* Blacke Vipers Bugloss of *Candy.*

This Vipers Bugloss groweth high with many sharpe prickly blacke stalkes bending downewards reclining themselves as sharply set with prickly haires as the stalkes, and ending in a sharpe point: at the joynts of the stalkes, and likewise at the joynts with the leaves, come forth faire large bell flowers with open brimmes, some of skie hewe blew, other pale or deepe, others more purple with foure or five small threds in the middle of the same, which fading rise blacke Viper-head-like seede in long cods, or seede vessells, from whence the name of Vipers Bugloss was imposed to distinguish it from the other with white seedes; it hath a single long white root of a thumbs bignesse, and small at the end: the whole plant is of little sent, but of a sweetish sharpe taste.

The

The Place.

The first groweth wilde almost every where. The second about the Castle walles of *Leves* in *Saxony*. The third and fourth in *Hungary*, and *Austria*. The fifth and sixth are unknown. The seaventh and ninth in *Spaine*. The eight and ninth on the hils in the Kingdome of *Naples*, as *Columna* reporteth. The eleventh and twelfth in Italy.

The Time.

They all flower in Summer, and their seede is quickely ripe after.

The Names.

It is called in Greeke [illegible] *Alcibion*, and *Alcibion*, or *Alcibiadeum*, of the finder thereof, who being bitten by a Viper, gathered this herbe, and chewing it, and swallowing downe the juice, and applying the rest of the herbe to the bitten place, freed himselfe from danger, *Apuleius* saith it was called *Dipsacus theriobiton*, *Dipsacus agrestis*, and *Scabiosa*, from the forme of the seede, which as *Dioscorides* saith is like the head of a Viper, and thereof tooke the name *Echium*, yet some others say from the effects in the roote, to cure the bitings of the Viper, in Latine also *Echium*, of most Authours, yet of some *Buglossum sylvestre*, *Viperinum*, & *Serpentaria*, and some also tooke it for *Anchusa*, as *Thalius*, and *Calepinus*. and under that name hath the seede of the Garden sorts been sent him. *Cordus* on *Dioscorides* called the first *Lycopsis* and *Echium sylvestre*. *Camerarius* and *Matthiolus* mention the second, *Clusius* the third, fourth, fifth, and sixth, to the seventh in his *Opus posthumus*, *Columna* the eighth, and ninth, and *Bauhinus* the tenth, under their several titles as they are here expressed, the two last by *Alpinus* in his booke *de plantis exoticis*. It is called of the *Italians* *Echio*, and *Buglossa Salvatica*. Of the *Spaniards* *Yerua de la Serpentaria*. Of the *French* *Bourache sauuage*, and *Herbe aux viperes*. Of the *Germans* *wild ochsen zung*. Of the *Dutch* men *wilde ossentonghe*. In *English* wild Bugloss, and Vipers Bugloss.

The Vertues.

It is as you have heard, by the first finder out of it, an especiall remedy against the biting of the Viper, and all other Serpents or venemous creatures, as also against poyson, and poysonfull herbes, it is added further by *Dioscorides* and others, that whosoever shall take of the herbe or roote, before they be bitten, shall not be hurt by the poyson of any Serpent. And I thinke from this and some other the like qualities in herbes, in curing diseases, whereof some forme may be seene in them, hath come the application of many other, which never have beene imagined to have beene found in them, which they call *Signatura plantarum*, whereof *Crollius* in his *Basilica chymica*, hath given demonstration of all the parts of the body, from the head to the foote, and moreover of many the diseases of the body, and of divers other things, whereof they that will reade his worke may be better informed that desire the knowledge thereof; the rootes or seedes, are thought to be most effectuall in the foresaid causes, as also to comfort the heart, and to expell sadnesse, and causelesse melancholy, it purifies the blood, and allayes the hot fits of agues, the seede drunke in wine prouoketh abundance of milke in women brests; the same also being taken, easeth the paines in the loines, backe, and kidneies. the distilled water of the herbe, when it is in his chiefest strength, that is in flower is excellent to be applyed inwardly or outwardly, to all the griefes aforesaid. There is a syrupe made hereof, very effectuall for the comforting of the heart, and expelling sadnesse and melancholly, which is made in this manner. Take of the clarified juice of the common wilde or Vipers bugloss foure pound, of fine Sugar three pound, of the infusion of the flowers three one pound, boyle these gently unto the consistence of a syrupe, which keepe by you, to use as you shall see cause. But because it is somewhat hard to presse forth this juice, by reason of the sliminesse thereof, you must that after you have beaten the herbe well, put it close covered in a cold cellar, or other cold, and moist place for two daies and nights, and then wring or presse forth the juice, and clarifie it with the whites of eggs beaten and passed gently of it selfe, through a thicke *Hippocras* bagge; and because many know not how to make the infusion, before spoken of rightly as it should be, it is thus. Gather of the flowers of the sole wilde bugloss a good quantity, which you shall put into a pot, with some water, being made boyling hot, after cleansing the pot close untill it be cold, and then wring forth the infusion; you may renew the infusion, by putting fresh flowers as before, once or twice more, if you will have it strong of the flowers.

Chap. XXX.

Fraxinella sive Dictamnus albus. False white Dittany.

HAve given you the descriptions of all the sorts of false Ballard Dittany, or white Dittany, in my former Booke, whereunto I referre you. I shall onely here exhibite the figure and ample description of Vernay.

Fraxinella may more fitly be called Hasle white Dittany, then ballard Dittany, because there is one already set forth in the first Tome or Classis by the name of *Pseudodictamnus*, Ballard Dittany, and two herbes should be called by one name, and their natures should be well understood when they were of so contrary qualities, it is most requisite therefore to avoid confusion.

The Vertues.

The false white Dittany then is bearing and drying, the rootes which are most in use doe attenuate grosse humours, it openeth obstructions, prouoketh the menstrues and urine, and cleanseth that which is corrupt or contagious. It is very effectually both against poyson, and the venome of serpents, and other poysonfull creatures, and against the pestilence, and other contagious diseases, to take a dramme or two of the powder of the roote in wine or broth, the same also taken, killeth the wormes of the belly, breaketh the stone, (boiling it to a small quantity) it warmeth and cleanseth the matrice, expelleth the dead childe, and after-birth, if the powder be mingled with it and Pennyroyall or taken in Wine it easeth the paines and torments in the inward parts, it cleanseth and healeth inward hurts and wounds; it is much commended against the Epileptic or falling sickenesse, and other cold griefes of the head and braines, and is held to be of great good use against the *French* disease, if it be used with the decoction of *Guaiacum*.

Fraxinella vulgaris.
The small common blue white Dittany.

CHAP. XXXI.

Galega, Goats Rue.

1. Galega sive Ruta Capraria.
Goats Rue.

Because this herbe is so effectuall against all infections, I could do no lesse then intent it here, and take it from the other leguminous plants, where it might be placed, which otherwise I would not have done; and hereunto I must adjoyne another, for the neerenesse both for forme and vertues.

1. *Galega vulgaris.*
Common Goats Rue.

The common great small Goats Rue, sendeth forth many round hard stalkes, foure or five foote high, whereon grow one above another set severall joynts, long winged leaves, that is, many leaves set on each side of a middle ribbe, which are small yet somewhat broad and long, and pointed at the end, smooth on the edges without any denters, somewhat like unto the leaves of vetches, and of a faint greene colour, at the toppes of the stalkes stand many small Leguminous flowers, one above another, of a pale blew with purple colour, and in some plants pure white, after which come small round pods, about an inch and a halfe long, a little bunched out in some places, but couched like unto the Cods or Huskes of Tares or Fetch, wherein lie three or foure small pale seeds like unto a Vetch; the roote is white and woody, spreading well in the ground, and abiding divers yeares.

2. *Galega [illegible]*
[illegible] Goats Rue.

The other Goats Rue likewise sendeth forth divers round hard [illegible] rising through the former, whereon groweth such [illegible] set directly by one another, but broader and thicker set [illegible] about all or the edges, but having the middle

Digitized by UNIVERSITY OF MICHIGAN
Original from UNIVERSITY OF MICHIGAN

ribbe of every leafe, raised up a little high: at the toppe of the ſtalkes ſtand divers ſuch like flowers as the former, but all on one ſide of a pale colour, tending to yellow, which afterward yeeld ſmall, long, blackiſh pods, wherein lie ſmall flatriſh ſeede, like unto Lentills: the roote is ſomewhat great and blacke, tending forth very long ſtrings, whereby it faſteneth it ſelfe deepe in the ground.

The Place.

The firſt groweth commonly wilde by the way ſides of moiſt fields and meadowes, both in *Italy*, *Spaine* and other places; it alſo found of late growing wilde in the Medowes by *Linton* in *Cambridge ſhire*: the other on the toppes of mountaines, where any plaines are found.

The Time.

They flower in the end of *June* and *July*, and the ſeede is ripe in *Auguſt*.

The Names.

This herbe hath not beene knowne to the ancient Authors, and therefore hath no name, but is uſually called in Latine *Galega* or *Ruta Caprarum*, for they that firſt found it and the vertues, gave that name of *Ruta* thereunto, finding it no leſſe effectuall than the beſt Rue: ſome call it *Orobica*, and ſome *Herba Gallica* as *Tragus*, and of ſome *Capraria*: the *Florentines* call it *Lavanda*; in other parts of *Italy* it hath divers other names, as *Matthiolus* ſaith *Calfreonne*, *Lavanna*, *Thuringa* or *Tuſcana*, *Marranica*, *Saracenica*, *Capragina*, *Herbanaſe*, and *Granella Arabica* ſaith. Some with us call it *Italian* Vetch, but moſt commonly Goates Rue. The other *Lugdunenſis* calleth *Galega montana*; and *Bauhinus* referreth it to the *Orobus Pannonicus* of *Cluſius*, which it cannot be, for he ſaith it periſheth every yeare; and alſo to the *Cytiſchus latifolius* of *Dodonæus*, which it cannot be neither, for *Dodonæus* ſaith, his *Cytiſchus* is called of divers *Ervum Venetum*, which differeth little or nothing at all from Cole or firſt *Orobus Pannonicus*, ſo that in this, as in very many other things, he is much miſtaken.

The Vertues.

Goates Rew is moſt effectuall againſt the bitings or ſtings of any venemous creature, yea thoſe *Italian* writers (as *Pena* and *Lobel* ſay) that uſe to gather Vipers (which are certainely Adders with us, by the iudgement of the beſt) doe account it more effectuall to preſerve them being bitten or ſtung, than any Treakle that is made, or to defend them from any other infection, and therefore eate it continually, as other herbes or meates otherwiſe in their meates and brothes. It is no leſſe powerfull and effectuall againſt poiſon then the plague or peſtilence, or any infectious or peſtilentious fevers or diſeaſes, that breake forth into ſpots or markes, as the meaſles, purples, and the ſmall pocks, in all which it is admirable, what effects it worketh, both to preſerve from the infection, and to cure them that are infected, to take every morning ſome of the juice thereof, as alſo to eate the herbe it ſelfe, every morning faſting, but it will be the more effectuall if the juice be taken with a little good Treakle and ſome Tormentill roote in powder, mixed with *Cardus benedictus* water, or with ſome vinegar and the bole armonicke, and Treakle in the ſaid water, and preſently to ſweat two houres thereupon, which in ſome ſort it ſelfe, and may be uſed as well when any is infected, as when any feare themſelves to be infected with the plague; a ſpoonefull alſo of the juice given in a morning faſting, is very effectuall to kill the worms in children, or the herbe it ſelfe tried with a little oyle of bitter Almonds, and laid hot unto the navell, as alſo to helpe the falling ſickneſſe before it grow ſtrong, and old upon them; it is very profitably applied to ſinewes pained with grypings of winde and the collicke, being fried and laid to warme: in the ſame manner alſo laid upon plague ſores before they be broken, either diſperſeth them (yet defending the heart, not ſtriking it inwardly) or draweth them forth, and healeth them: it is alſo effectually applied with vinegar to ſpreading, running ulcers and ſores, to lay the malignitie of them in their fretting and ſpreading, and to defend the vitall ſpirits from danger: it is held alſo to be very cordiall to preſerve the heart from palpitations, trembling and ſwoonings, and againſt melancholike vapours oppreſſing it. Some uſe a Syrupe made of the juice, and ſome the diſtilled water as a more familiar medecine, to take upon all occaſions inwardly, for all the purpoſes aforeſaid; and ſome uſe to make an oyle of the flowers digeſted in the Sun, by often repetitions of infuſions, to annoint the wriſts of the hands where the pulſe is felt, as alſo the region of the heart, to defend it from the diſeaſes aforeſaid, and danger of infection: it is no leſſe effectuall for Sheepe, Goates, and Cattle, for from the experience of Goate-heards therein, came the name of *Capraria* added unto it: it fatteneth beaſts alſo wonderfully, and cauſeth them to lay egges the more plentifully. The other Mountaine Goates Rew, is held alſo almoſt as effectuall againſt poyſon and infection of the plague as the other.

CHAP. XXXII.

Phalangium, Spiderwort.

THere are divers ſorts of Spiderwort, ſome of antient knowledge, others of later acceſſe, of all which I have given the deſcriptions in my former Booke, which although I meane not to repeate here, yet I thinke it not amiſſe both to give you ſome of them names & figures, and to ſet downe their names. It is thought it tooke the name [illegible] *Phalangium*, and *Phalangium* of the forme of the ſeede veſſells, others from the forme of the leaves like to that ſpider, but moſte certainely I thinke from the propertie of curing the dangerous poiſon of that great Spider [illegible] purpoſe both *Dioſcorides* and *Galen* doe commend the flowers, leaves, and ſeedes of it, as alſo againſt the [illegible] of Scorpions and other Serpents, and to diſcuſſe the torments that riſe from their bytes or ſtings. The names of thoſe deſcribed are theſe *Phalangium Alliobrogicum*. The *Saxon* Spiderwort, *Phalangium album*. The greater *Dalmatian* Spiderwort, *Phalangium non ramoſum vulgare*. Vnbranched Spiderwort. *Phalangium ramoſum*. Branched Spiderwort. *Phalangium Ephemerum Virginianum Iohnſoni*. *Tradeſcants* Spiderwort of *Virginia*, or *Iohn Tradeſcants* Spiderwort of *Virginia*, which is of a deepe purplish [illegible] Whereunto may be added of later knowledge one with a white flower, and another with a reddiſh or Carnation

CHAP.

Chap. XXXIII.

Petasites vulgaris. The Butter burre.

THE Butter burre is of two sorts, the one greater the other lesser, differing also in the flowers, as you shall heare; but because they are so like one another, one discription shall serve for them both. Both of them sticck up very early in the peare, rooted in a great, with a thicke stalke about a foote high, whereon are set a few small leaves, or rather scales, and at the toppe a long spiked head of flowers, in the one white, in the other more rare to finde, wholly white, and of a better scent than the other (yet found by it selfe to stink) in the greater which is more common with us of a cloth or deepe red colour according to the soile wherein it groweth, the clay ground bringing a paler colour somewhat weake, & before the stalke with the flowers have shooten a moneth above ground will be withered and gon, blowen away with the winde, and the leaves will begin to be sprung, which when they are full grown are very large and broad, that they may very well serve to cover the whole body, or at the least the head like an Umbrella from Sunne and Raine, being somewhat thicke and almost round, whose thicke red foote stalkes most a foote long, stand toward the middle of the leaves, the lower parts being divided into two round parts close almost one to another, and of a pale greene colour above, and hoary underneath, that with white flowers being ingrailed lesser leaves than the other, and having divers fibres and strings thereon; the roote is long & creeping under ground verie in some places no bigger then ones finger, in others much bigger, blackish on the outside, and white within, of a bitter and unpleasant taste.

Petasites vulgaris.
The common Butter burre.

The

The Place and Time.

Both these sorts grow in low and wet grounds by rivers and waters sides, their flowers, as is said, rising and decaying, that is, in *February* or *March* before the leaves appeare in *Aprill*.

The Names.

It is called in Greeke ἀδιάντος and *Persolata* also in Latine, deduced a *Persio, Iudæi magi, a quo hanc Neapolitani Iuppiter pallet.* Some take it to be *Iphium* of *Theophrastus*; and some to be *Perpensa* or *Perpensa* of *Plinie*. *Camerarius in horto* calleth the more common *mas*, and the other *fœmina*; but in his Epitome upon *Matthiolus* he and *Matthiolus* call the greater sort *Trifillago major*. The *Italians* call it *Capelluzzi*; the *Spaniards Sanicula*, the *French Herbe aux ingueux*; the *Germans Pestilentz wurtz*; the *Dutch Duck bladeren*.

The Vertues.

The rootes hereof are hot in the first degree, but as *Galen* saith drie in the third, and are by long experience found to be very available against the plague and pestilentiall fevers by provoking sweat, if the powder thereof be taken in wine; it also resisteth the force of any other poyson, the roote hereof taken with *Treacle* and *Mithridate* or without them helpeth the suffocation or rising of the mother: the decoction of the roote in wine being taken is singular good for those that wheeze much and are short winded: it provoketh urine also and womens courses, and killeth the flat and broad wormes in the belly: the powder of the roote doth wonderfully help to drie up the moisture of sores that are hard to be cured and taketh away all spots and blemishes in the skin.

CHAP. XXXIV.

Polybiza Virginiana. The rattle Snakeweede of *Virginia*.

THis plant of *Virginia* so certaine a remedy against the biting of that venemous rattle Serpent, or as we call it which breedeth in *Virginia*, must not be forgotten among the rest, for it is a soveraigne plant to be compared, and I thinke preferred before any the soveremembred most soveraigne plant against poysons: whose description as farre forth as hath yet come to our determination, is thus: it riseth with divers small square stalkes, spreading not much above halfe a foote long, whereon are set long dusky hoary greene leaves, somewhat ragged as it were with many veines and somewhat resembling the leaves of *Pestilentz*, wherewith it may be referred but smaller, set without order one at a joint: the flowers grow out at the bottome of the stalkes next the roote than on the branches as the *Pestilentz* doth and are not much unlike but of a darke or swilsh yellow colour, and somewhat lesse also: after which come very small seedes which be somewhat like to the *Pistolochia* but lesser: the rootes are a number of very small blackish grey fibrous threds, as small almost as haires, which have both an aromaticall and resinous smell, when they are dry, better than when they are greene, and of an aromaticall resinous allmygent taste, without any great or manifest heate.

Polybiza Virginiana. The rattle Snakeweede of *Virginia*.

The Place.

It groweth very frequent in the upper parts of our *Virginian* plantation, in the fields and champion grounds where under the grasse and herbes, that venemous rattle snake lurketh and shroudeth, ready to bite whosoever shall come neare unto it.

The Time.

It floweth with us in *June* and *July*.

The Names.

This may very well be referred to the *Pistolochia* I said, but I have covered a temple emptie as touching but by what Latine name it might best be called, either *Pistolochia Virginensis*, or as I doe *Petrocoptis*, I leave it to every man to doe as he will, or untill a better Latine title may be given it, it is thought convenient our people in *Virginia* doe there call it the Snakeweede, or Snakeroote, and thereupon may be called

[illegible] ...ryeth, how keepe the same [illegible] ...mine, untill another all over ripe it may be given notice, but [illegible] ...ommeth that among his [illegible] ...plants, which shall [illegible] ...plume on his head for his la- [illegible] ...bour, [illegible] ...ze, [illegible] ...ze was cast. Wherein he seemeth to [illegible] ...ld colour it in that he [illegible] ...ore one, but all the [illegible] ...ion, it were a gentle direction that he were whipt at the [illegible] ...le for it.

The Vertues.

It is both a most certaine and present remedy against the venome of the Kanfe Snake, which is a serpent of [illegible] ...ze, [illegible] ...ere is there any Snake or Adder within, having naturally under the throate, [illegible] ...ome knot- [illegible] ...ny scales, which by motion grate one against another, making a cracking noise, which our people called [illegible] ...ttles, not that it hath any rattle indeed, but this noyse it maketh, [illegible] ...ere it selfe never be mooved, yet usually it is [illegible] ...quicke and wary in leaping at one, that it doth it not but suddenly: Now the manner of the same hereof, is [illegible] ...ed of the grandame, providing a remedy out of the same place and ground, from whence the evill doth [illegible] ...proceed.] as [illegible] ...ome as any is given by that creature. [for oftentimes it happeneth that Kafre are bitten before [illegible] ...ware of the serpent, the manner of them creeping to leape suddenly upon one, that the party cannot be aware [illegible] ...before he be bitten:] they take of this herbe and chew it in their mouthes, and swallow downe the juice there- [illegible] ...of, and also apply of the herbe to the wounde in three place, which instantly cureth them; for being taken [illegible] ...quickly after they be bitten, it doth so defend the inward parts, that the party feeleth not so much thirst as any [illegible] ...inward paine, much lesse any of those inward symptomes, are incident to those that doe not presently use this [illegible] ...remedy, that is the present helpe of the present hurt, but if it so happen that any being bitten, cannot get of this herbe in any reasonable time, he dyeth certainely, yet if within twelve houres after the biting, he doe use this remedy, it will assuredly recover him, but with more trouble and paine, and with longer time, before it have wrought a perfect cure. For it is evident, that the poyson of this serpent pierceth the blood, which runneth with [illegible] ...all the speed it can unto the heart, the chiefest fortresse of life and health, which being infected, death must ne- [illegible] ...cessarily and speedily follow, but if it be defended by the vertue and force of any medicine, it preserveth the [illegible] ...one, and expelleth and vtterly defeateth the intent of the other. The powder of the herbe and roote taken in [illegible] ...wine or other drinke, hath likewise found a certaine and present cure for the biting of a mad dogge: as also to [illegible] ...cure both the quartane ague within three times taking, viz. halfe a dramme, or if need be a whole dramme [illegible] ...an houre before the accesse of the fit, and any other ague or pestilentiall feaver, or the pestilence it selfe.

Cap. XXXV.

Alexipharmacum Indicum Hispanorum. The Indian Spanish Counterpoyson.

BEcause the roote of this herbe also is of assured cure, to helpe all sorts of venome and poyson [illegible] ...(as well of hurtfull beasts, as of herbes, roots, &c. wherewith the Indians by dipping their ar- [illegible] ...row heads therein, and all whom soever they wounded, (as the former *Virginia* Plant, I thought [illegible] ...it to intyse thereunto, although we have no more knowledge thereof, then what we may ga- [illegible] ...ther from seeing and observing the dryed rootes and from the relation thereof by *Hernandez*, out of [illegible] ...*Pancratius Pisanus* his letter to him, which is extant in his booke of the simple that are brought out [illegible] ...of the West Indies, which *Hernandez* translated out of the Spanish into the Latine tongue, and hath published it with [illegible] ...the rest of his workes, and joyned it unto his booke of *Exotickes*.

Cortex arboris Hippocrepidis fructu Orbiculato Cassiæ.
The Indian Spanish Counterpoyson.

It hath much *Nymphæa*, the roote of a Flower-deluce, and is of the small of a Peggeroe leafe: this is all the discription that *Hernandez* hath made of it: but *Pisanus* in his little map doth seem to set the leaves to be like the Ribbewort Plantaine, [illegible] ...nine leaves also wrote thereof as he saith of *Hernandez*, [illegible] ...of the *Indies*, and to *Dalechampius*, and in his booke of Jeremy [illegible] ...maketh short of it in two chapters, the one is of *Chirocoma*, [illegible] ...where he remembreth *de Caracoa seu Brasca*, whereby he intended the herbe or roote whose is found in the [illegible] ...middle of a *Brasca* tree when it is broken, which he accounteth [illegible] ...to be of sound vertue, but the flowe it selfe, wherein it is [illegible] ...esteemed, but we in seeing many dryed rootes that came [illegible] ...from *Spaine* and *Italy*, have discerned no good forme of any [illegible] ...Flower-deluce in the same, nor have seene any roote to ex- [illegible] ...ceede the bignesse of ones thumbe, and not one of many to be [illegible] ...greater, for the most part of the bignesse of a finger or [illegible] ...lesse, and one inch to foure, but usually no lower then a joynt [illegible] ...or two at the most, not to touch on the outside as the roote [illegible] ...of white *Hellebore*, the blew violet is yet more exact in all [illegible] ...is some measure [illegible] ...Rooting out all about the [illegible] ...fibres, which are of [illegible] ...and some as bigge as [illegible] ...smaller at the [illegible] ...as it were by little spaces, as the [illegible] ...roote of *Dentaria* [illegible] ...of a yellowish browne colour [illegible] ...and a long more blacke, but white on the [illegible] ...inside, [illegible] ...growing from them, the [illegible] ...or creeped under the upper crust of the ground, [illegible] ...like the Flower-deluce, Tormentill, Bistort, and the like.

doe, and doth not grow downe right, like other sorts of roots, and are fleshy, yet one or two in a while, upon the tongue, drawing water as Pellitory of Spaine, but nothing so hot nor sharpe, or drawing rheume in so much which is not well perceived, unlesse heedfully observed, neither doth it scarce abide any long time after the roote but is soone gone, leaving the roote almost like a dry chippe, without any manifest tincture, astringency or acrimony, that I could perceive, although Monardes saith it hath, and judgeth it to be hot and dry in the second degree.

The Place.

It groweth (saith *Monardes*) in *Charcas*, and as *Ferrus* affirmeth, saith in *Tomoglia*, provinces in *Peru*, and in the *Indies*, and in some other places there, and from thence brought into *Spaine*, and so to other Countryes.

The Time.

We must abide the time to know further here of, before we can declare it to any other.

The Names.
